1. INTRODUCTION

The area of consulting practice amongst academicians is increasingly gaining importance in pursuit of scaling up standards in academic delivery. Greiner and Metzger (1983) defines management consulting services as "an advisory service contracted for and provided to organizations by specially trained and qualified persons who assist, in an objective and independent manner, the client organization to identify management problems, analyze such problems, and help, when requested, in the implementation of solutions" (p. 7). Consulting is considered as an important task among the management teachers' career due to several reasons: Firstly, consulting experience helps management teachers to gain practical wisdom beyond the knowledge of text books. Secondly, participation in management consulting, will further aid in academic teaching and training through sharing of experiences. Thirdly, management consultancy enables academicians to work for the benefit of the wider audience of the society (Blake and Mouton, 1976). Since, consultation alone deals with "here and now" problems, when solved, makes a real difference in the lives of the people. Lastly, modern management consulting brings academicians into corporate board rooms (Ainamo and Tienari, 2002) which will further build synergies between the theory and practice of management as a discipline (Docherty and Smith, 2007) through exchange of resources, wisdom and intellectual dialogues.

While knowledge created by researchers is often disciplinary driven, consultancy work is usually problem-driven (Jacobson et al., 2005). Hence, faculty is keenly interested in, and highly motivated towards part-time consulting work to further enhance their skills (Quittmeyerer, 1960). However, some university administrators consider academic consulting only as a "distracting activity" that diverts faculty from the primary mission of the university (i.e., teaching and scholarly research), enriching only a few individual faculty members at the expense of the university resources (Sennetti, 1981).

While financial rewards as motivation for taking consulting assignments is widely acknowledged, to date there is only scarce scholarly research on motivations of management teachers behind undertaking consulting exercises beyond personal / financial benefits. While

payment system had a lot of potential and would benefit consumers in several ways, its adoption was very low. The adoption and acceptance of an innovation depends on the consumers as well as the factors which motivate them to use it or inhibit them from doing so. In the case of NFC-mobile payment services too, the motivating factors included the ability to use smartphones; and the facts that it was time saving, transactions were secure, people could carry less cash, and it was convenient. The factors inhibiting adoption of NFC-mobile payment services included consumers being reluctant to use the mobile mode of payment, lack of NFC-chip installed in POS machines, and lack of awareness programs. Since the NFC mode of payment could be beneficial on several counts, the government needed to take several initiatives to educate the consumers about the processes and benefits of NFC-mobile payment services. This could encourage them to adopt it. Furthermore, a promotional campaign needed to be carried out to enhance the consumer base for NFC-mobile payment services. This would help reap its benefits in the future and ensure that India did not lag behind other countries across the globe in the use of this technology.

Pedagogical Objectives:
This case is designed to enable students:

- Analyze the factors influencing the adoption of new technology and a new payment system in a developing country.
- Challenges in the adoption phase of the NFC-mobile payment services.
- Roadmap for popularizing the use of the NFC-mobile payment services in India.
- Design a promotional campaign to create awareness and widespread use of NFC-mobile payment services in India.

Evidence of algorithmic trading from Indian equity market: Interpreting the transaction velocity element of financialization

Ritesh Kumar Dubey*[,a], Yogesh Chauhan[b], Sudhakara Reddy Syamala[a]

HFT

ABSTRACT

Technology and innovation have been the driving forces behind financialization across the globe. One such technological advent, in the pursuit for minimizing the risk and maximizing the return and in order to adhere to the financial sector changes, is Algorithmic Trading (AT). Though AT is being used extensively across the world, there is a lack of academic research on the evidence of AT in most of the markets. The lack of evidence stems from the ambiguity in definitions of AT and High Frequency Trading (HFT) and their usage interchangeably. The lack of evidence also hinders the understanding and interpretation of the impact of ever-increasing unprecedented growth in the velocity of financial transactions on the social machinery of global economies. We take advantage of the clear definition and identification of AT in the Indian equity market to provide evidence of AT and interpreting it as the transaction velocity element of financialization. We also attempt to decipher the impact of AT, symbolizing the transaction velocity element of financialization, on the price discovery process.

1. Introduction

Lagoarde-Segot, (2016) suggests that the unprecedented velocity of financial transactions coupled with expansion of financial sector and complex and sophisticated financial products has led to drastic change in the equation of society, economy and finance. The changing socio-economic-financial dynamics can be described as financialization. Ma and McGroarty, (2017) encapsulate the changing socio-economic-financial dynamics in the concept of Social Machinery and argue that technological innovations have aided financialization and have transformed the financial markets. Automated/High Frequency Trading/Algorithmic Trading have been one of the critical elements of financialization which has led to the tremendous growth in the transaction velocity. In this paper, we symbolize the transaction velocity (an element of financialization in the conceptual framework suggested by Lagoarde-Segot, (2016)) with AT.

Johnson, (2010) suggests that Algorithmic trading (AT) "is computerized rule based system responsible for executing orders to buy or sell a given asset". It reduces and sometimes eliminates the manual interventions of a trader and comes up with efficient decisions regarding time, price, and quantity of orders. The decision-making is based on the information gathered by dynamically monitoring the market conditions across the securities and trading venues. The idea behind this is to reduce the market impact by optimally breaking the large orders and closely tracking benchmarks over the execution intervals. As an investor or trader, everyone aims at maximizing the profits and minimizing the risks by carefully choosing different investment avenues (Markowitz, 1952). This is what the algorithmic trading intends to do as well. But, Muniesa, (2014) is of the view that, "*in reality, stock prices are not discovered.*

Abstract

The policy makers in the post liberalization foreseeing the unequal income distributions which will widen the gap between the haves class and have-nots class in the society, took a different path than that of the earlier mechanisms to bridge the gap in the society in India. Obviously the government needs to extend various basic amenities and to support the underprivileged. One of the most important of the policies is to address the issues that the financially excluded population and intricacies government would face due to exclusion; and thus devised extension of banking and financial services through Microfinance to cater to the excluded. Accordingly, the policy initiatives on financial inclusion, a holistic approach initiating multiple services like providing insurance, payments and remittances, besides enabling financial discipline through saving and extending support to have income-generating activities to unbanked rural segment was made possible. In this backdrop, this paper makes an attempt to identify the significance and major initiatives taken for growth of Microfinance in India, how it facilitated the financially excluded with services, how the ecosystem and framework of MFIs is supporting the cause and the important challenges that MFIs faced are elaborated.

IMPROVED IMAGE RETRIEVAL USING IMAGE NOISE REMOVAL TECHNIQUE

D. Saravanan

Faculty of IT & Operations, IFHE University, IBS Hyderabad.

ABSTRACT

Technology brings image data more interesting and more usage for various applications. Creation of quality image information are challenging tasks today. Today every information's are produced in terms of images, quality images only produced good information's and result, so it is necessary to the user community produced quality images. This paper brings a new filtering technique for corrupted and noisy image files. Most of the existing technique removes the error but quality of the images get spoiled. Proposed technique removes the noise in stepwise process, each step particular nose information get removed. This helps to preserve the quality of input image. Experimental results verified that proposed technique produced quality images.

Keywords — Image retrieval, noise removal, image pixel, histogram value, duplicate elimination, mining.

I. INTRODUCTION

Instead of text based information technology brings image based inputs. This image based functions are used many fo the fields today. Image and motion images are play very important role it helps in various application such as education s, medical, military, space and more. Image information give more-clear and accurate content for the user community. But most of the images are spoiled due to various factors, images are not captured by quality camera or user are not trained properly to handle the images. Due to this quality of the image are corrupted and it introduce noise or unwanted information on the input data sets. This bad quality image produces many unconstructive effects in image processing. For this image filters are required to remove this kind noise in the image data sets. Many techniques and filters are used currently for removing error on the image set, one the technique fuzzy based technique. This mapping function also called association functions. Image distinctiveness are extended into association functions. This association functions are evaluated based on the value assigned with that function, values zero and one are accepted. Another advantage is their using this technique any user knowledge is easily converted to rule based information, satisfied information only accepted. This function is based on rule based functions such as bad or good, long or short, high or low. In image processing this function is helpful find the difference between the two image or pixel value high or low by using image threshold technique.

Technique uses two differences of information either accepted or unaccepted information. For any value only one value considered, normally this difference not identified by human by own without using any techniques. In pixle value difference this value helps to differentiate one pixel to other pixel, values are high or not high. In some cases, this value difference is very high, on those situations use the moderate value mean differrence between the two data set points.

Image base analysis done with help of image base colors such as red, green and blue. Proposed technique works well based on the image color model, quality of indivial color are identified with help of this value the differences are identified and it corrected. Given input image are first create collection of lesser values. Based on this construction information are processed either by systematically or any technique are used to perform. Proposed technique logically good for arithmetic construction for any computation operations.

II. EXISTING SYSTEM

In image processing image quality is one of the most important for information extraction technique, un quality image retrieve un quality output for this image input data set should maintained high quality data sets. For this before processing the operation, image preprocessing application such as image noise are removed first. This noise removal is one of the most important application in digital image processing. Number of image restoration technique available most of this technique are based on image filtered concepts example image wavelet technique. This image restoration technique one of the most developments stages in researchers and most growing filed today. Other number of filtering functions are used for image restoration such as image filtering using incomplete disparity equation. This filtering functions are used for image restoration.

A. Proposed System

Any image analysis techniques are based on constructing image based color model such as red, green and blue. Images are made of pixel every pixel are assigned a value using this value image pixel calculation are done. This value helps the user to find the differrence between the images and find error values easily. In the proposed technique image frame constructed after in the frame unwanted information i.e. noisy image pixel are identified, then further discover phase also identified. In the affected or error pixels are identified this value is replaced with most similar values identified with help of image frame comparison technique. Find the similar frame and pixel values that values are replaced with noisy pixel this way unwanted i.e. noisy pixels are removed successfully. In the proposed technique image basic color model are used ie with help of red, blue and red.

a) Advantages in proposed system

Image restoration are effective. Technique are easy to implement and finding relationship between images are esay. No pre-calculation is required.

Image noisy operation done in two phases it reduces the users burden.

ABOUT

Abstract

The concept of learning organisations has many applications across various disciplines in different sectors that aim at continuous improvement. Universities, being a knowledge intensive organisation, often face the criticism of not being a learning organisation. To withstand the prevailing competitive scenario, it becomes a conscious mandate for universities to unlearn the conventional process and switch over to the process of organisational learning. This requires effective leadership. We, therefore, propose resonant leadership for the immediate department heads-supervisors in universities since resonant leadership has its origin from emotional intelligence. There is a dearth of studies that has investigated the role of resonant leadership in Indian universities. This paper presents a model and empirically examines the impact of affective commitment on learning organisation when mediated by resonant leadership and psychological empowerment in university faculty context.

EXPLORING MOODLE FUNCTIONALITY FOR MANAGING OPEN DISTANCE LEARNING E-ASSESSMENTS

Indira KONERU
e-Learning Department
Icfai Business School
Hyderabad, India

ABSTRACT

Current and emerging technologies enable Open Distance Learning (ODL) institutions integrate e-Learning in innovative ways and add value to the existing teaching-learning and assessment processes. ODL e-Assessment systems have evolved from Computer Assisted / Aided Assessment (CAA) systems through intelligent assessment and feedback systems. E-Assessment (electronic assessment) connotes using electronic technology and tools to design and administer assessments, collect and store students' assessment evidences, grade performance, provide feedback and generate reports. The widely recognized advantages of e-Assessment over traditional, paper-based assessment include: lower long term costs, instant feedback to students, greater flexibility with respect to location and timing, improved reliability with machine marking, improved impartiality, and enhanced question styles that incorporate interactivity and multimedia. The advent of Learning Management Systems (LMS), such as Moodle (Modular Object-Oriented Dynamic Learning Environment) paved the way for integrated advanced services for: interactive dialogue, controlling knowledge at different stages of distance process and e-Assessment systems. Moodle provides the complete integrated environment for handling all aspects of e-Assessment from authoring questions through to reports for course teams (Butcher, 2008). This study explores how Moodle functionality: supports diagnostic, formative, summative and competency-based assessments and facilitates ODL institutions design, administer and manage e-Assessments.

Keywords: Competency-based assessment, e-assessment, e-learning, Moodle, learning management system, open distance learning.

INTRODUCTION

Current and emerging technologies enable Open Distance Learning (ODL) institutions integrate e-Learning in innovative ways and add value to the existing teaching-learning and assessment processes. E-Learning has emerged to describe the application of information and communication technologies (ICTs) to enhance distance education, implement open learning policies, make learning activities more flexible and enable those learning activities to be distributed among many learning venues (Farrell, 2003).

The advent of Learning Management Systems (LMS), such as Moodle paved the way for integrated e-Assessment systems. Moodle (Modular Object-Oriented Dynamic Learning Environment), an open source LMS supports self-assessment, peer assessment, formative, summative and competency-based assessment. Moodle-enabled e-Assessment provides students with e-submission facility; reduces carbon footprint and expedites assignment return process with timely feedback. This paper explores how Moodle functionality: supports diagnostic, formative, summative and competency-based assessments and facilitates ODL institutions design, administer and manage e-Assessments.

Product Positioning & Promotional Strategy of Fevicol

ABSTRACT

The case discusses the product positioning and promotional strategy of Fevicol, the largest selling adhesive in Asia with a presence in over 50 countries. Fevicol had become successful not only due to its quality but also because of its unique advertising campaigns. The case discusses the innovative promotional strategies adopted by Pidilite, the parent company of Fevicol, to enable an industrial product like Fevicol to carve out a niche as a top consumer brand in both the urban as well as rural markets in India. The creative strategy employed for Fevicol is to make bonding a Fevicol attribute and its advertising has used intelligent humor to convey this meaning.The biggest challenge for the brand going forward would be to retain its dominant position in the Indian glue market in light of increasing competition from the unorganized sector. It remains to be seen whether the uniqueness of its advertising strategy will give Fevicol a competitive advantage in the future. .

Kraft Merges with Heinz: A Case Study

Case - Reference no. 117-0025-1
Subject category: Finance, Accounting and Control
Authors: Rajneesh Ranjan Jha (ICFAI Business School, Hyderabad); Chetna Priyadarshini (ICFAI Business School, Hyderabad)

Published in: 2017

Length: 14 pages
Data source: Published sources
Topics: Merger; Announcement effect; Cash and share transaction; Synergies; Kraft and Heinz merger

About

Abstract

This case deals with the basic understanding of mergers by focusing on synergies involved in the merger of Kraft and Heinz. This merger created a new company Kraft Heinz Company (KHC) on July 2nd 2015 with a ticker symbol of KHC on NASDAQ from July 6th 2015. KHC became the third largest Food and Beverage Company in North America and the fifth largest Food and Beverage Company in the world. The merger was announced on March 25th 2015 which involved the merger of a publicly traded company Kraft Foods Group and a privately held firm H J Heinz Company. The investment firms, 3G Capital and Berkshire Hathaway, backed this USD62.6 billion deal which was one of the giant mergers in the US in 2015. Warren Buffett's Berkshire Hathaway owned about 325 million shares in Kraft Heinz Company after investing about USD9.5 billion. The expected synergy from the deal was expansion of Kraft's products internationally through Heinz's global outreach and cost cutting through effective operations. The other benefit of this merger came from Kraft's much better credit rating than that of Heinz. Heinz expected to refinance its high-yielding debt with low-yielding, investment-grade debt.

RESEARCH LETTER

Are tourist arrivals stationary? Evidence from BRIC countries

Aruna Kumar Dash, Suresh K.G.* and Aviral Kumar Tiwari

Department of Economics, IBS-Hyderabad, IFHE University, Hyderabad, India

(*Received 22 May 2015; accepted 13 September 2015*)

In this study, we attempted to analyse whether the shocks to tourist arrivals in BRIC countries are temporary or permanent, by analysing the stationary characteristics of the data in panel framework. We found that, for Brazil, Russia and India, tourist arrivals are stationary process, whereas for China it is non-stationary process. This implies that shocks to the tourism sector in Brazil, Russia and India have only temporary effect, whereas the shocks to China's tourism sector have permanent effects.

Keywords: tourist arrivals; panel unit root test; shocks; BRIC

Downloaded by [Nanyang Technological University] at 07 09 November 2015

1. Introduction

The present paper contributes to the literature by analysing the unit root properties of tourist arrivals to Brazil, Russia, India and China (BRIC) from main source countries. Tan and Tan (2014, p. 481) note that:

> from a policy point of view, if tourism arrivals are non-stationary, the impact of a shock will be permanent and the arrivals will not be able to adjust towards their long-run trend path, raising some doubts as to the sustainability of the tourism industry. Moreover, a non-stationary process implies that the instability of tourist arrivals increases over time, and any policy or marketing campaigns that are developed with the aim of simulating the number of tourist arrivals would be misguided efforts, make it unfeasible to carry out planning and promotion strategies. The opposite is true when the impact of shocks is transitory.

The BRIC countries are major growth drivers of the world economy and account for three billion people. They have made significant progress in attracting tourists from different countries and engage in promotional activities to ensure sustainability of tourism growth. However, time series properties of tourist arrivals to BRIC are not much discussed in the literature. Since the tourism industry is highly vulnerable to political and economic events, it is important to analyse the mean reverting properties of tourism data for policy formulation.

2. Methodology

After confirming the cross-section dependence of data, we perform second-generation panel unit root tests such as Choi (2006) and Demetrescu and Hanck (2012) which assume cross-section dependence.

Exploring the role of website attractiveness in travel and tourism: empirical evidence from the tourism industry in India

Santanu Mandal[a], Souvik Roy[b] and Amar G. Raju[b]

[a]Department of Operations & IT, IBS Hyderabad, Hyderabad, India; [b]Department of Marketing, IBS Hyderabad, Hyderabad, India

ABSTRACT

The purpose of this paper is to comprehend the causes and outcome of website attractiveness in the travel and tourism context. To address this, we proposed three constructs, namely website analytics, website agility and website resilience, and tried to explore the contribution of each of these constructs to website attractiveness. This study conceptualizes website attractiveness as a very significant component of a travel/tourism website especially from the customer point of view because a customer will continue using the services of particular travel site depending on how responsive the website services are to the needs of the customers. Based on insights from resource-based view theory, supply chain and marketing perspectives, antecedents and consequence of website attractiveness are identified. The partial least squares method was used for exploring the relationship of website attractiveness with proposed antecedents and consequence. Website analytics and website agility positively impacts website attractiveness. Further positive association was also found between website analytics and website agility along with website resilience. Lastly, website attractiveness was found to positively influence website revisit intention of visitors.

KEYWORDS

Website; analytics; agility; resilience; revisit intention

1. Introduction

With the mushrooming of websites providing travel-related information to potential travelers, customers have gained the tools with which they are more equipped to take an optimal rational travel decision than ever before. Information such as timetables, routes, accommodations and restaurants are easily available on various websites to help travelers plan their travels (Chiang & Huang, 2015) and hence the importance of web analytics in increasing the reach of travel websites is growing everyday (Vinod, 2011). According to a study by Expedia Media Solutions in 2013, travelers who visited a destination marketing organization site made 38 visits to that particular travel site before purchasing a vacation package from it (Expedia Media Solutions Study, 2013).

Travel websites are competing in increasing their agility, flexibility and visibility; for example, Global Business Travel, one of the world's largest travel agency networks, expressed its plans to use NetSuite OneWorld to power its core end-to-end financial

A Conceptual Framework of the Mediating Effects of Human Interactions in Supply Chain Relationships

Shankha Sengupta* and Anusha Sreeram**

The present study intends to initiate discussion regarding the influence of employee interaction within individual organizations towards the development of inter-personal relationships among the employees and the various peer groups, supervisors and other departments, as also, to propose a conceptual framework reflecting the antecedents that might affect successful relationship development through the mediating role of inter-personal interactions, and finally to determine the effect of intra-organizational employee interaction on the establishment of inter-organizational relationships within intermediaries in a supply chain.

Introduction

Supply chain management has been broadly defined as the conglomeration of activities related to the movement of raw materials and their subsequent metamorphosis into finished value-added goods, to be made available for 'end users', with simultaneous information exchange among the intermediaries (Handfield and Nichols, 1999) to enhance process integration and firm performance. However, definitional discrepancies have existed with regard to the term 'supply chain. While Chopra and Meindl (2001) have considered customer order fulfillment as the primary responsibility, "improving the long-term performance of the individual companies and the supply chain as a whole" has been described by Mentzer *et al.* (2000) as the major obligation. As such, supply chain encompasses the sequential motion of acquired raw materials from upstream suppliers, through the production processes being transformed into value-added products, to the distribution channels, and finally, delivered to consumers, in

Abstract: We consider a firm that offers two products to serve the market using two dedicated resources and one flexible resource. We model the firm's capacity acquisition decision as a two-stage stochastic optimisation problem with recourse. In the first stage, the firm determines the capacity acquisition level before realisation of products demand. Whereas, in the second stage, after the products demand is realised, the firm determines the production allocation level. Our objective is to study the impact of both strategic and operational cost parameters as well as products demand correlation on optimal capacity acquisition decision. We conduct post-optimality sensitivity analysis via numerical example, and found interestingly that the firm's processing network exhibits complementarity as well as substitution effects. We discuss our results and implications in the context of multi-resource processing network.

Keywords: capacity acquisition; demand uncertainty; demand correlation; processing network; flexible resource; two-stage stochastic optimisation.

FINANCIAL PERFORMANCE RANKING OF OIL AND GAS COMPANIES IN INDIA USING TOPSIS METHOD

Santosh Kumar Yadav[1], Rohit Kapoor[2] and Amol S. Dhaigude[3]

Abstract: *This paper analyzes the financial performances of oil and gas companiesusing Technique for Order of Preference by Similarity to Ideal Solution (TOPSIS) method. Financial ratios of the oil and gas companies were calculated for each and every company separately. The computed ratio was transformed to show the performance rankings of oil and gas companies by using entropy and TOPSIS method. Ranking of the companies was done by arranging according to their performance. The time period for assessment of oil and gas companies was from 2011 to 2015 and results show each year's company performance ranking. The result showed that Hindustan Ltd. has the highest ranking in the year 2011, BPCL for the year 2012, Gail Ltd. for the year 2013, and in the last two yearsPetronet had the highest ranking. Every year different companies had the lowest ranking.*

Keywords: *Performance Measurement, Financial Ratios, TOPSIS Method, Oil and Gas companies, India.*

JEL Classification: M10, M21, M49.

1. INTRODUCTION

The oil and gas sector comes under top six industries and is the backbone of the society and economy in Indian context. It is the source of power for other parts of the economy. This sector has over 15% contribution to the Indian GDP. As the economies are growing the demand for oil and gas in increasing. Government of India has come up with various plans and policies in order to supply the oil and gas to the needed sections of the economy.

One of the policies named as New Exploration Licensing Policy (NELP) was designed to minimize the gap between supply and demand during 1997-98.

LINKING SUPPLY CHAIN NETWORK COMPLEXITY TO INTERDEPENDENCE AND RISK-ASSESSMENT: SCALE DEVELOPMENT AND EMPIRICAL INVESTIGATION

Samyadip CHAKRABORTY

Department of Operations and IT, ICFAI Business School (IBS) Hyderabad, IFHE University, Dontanapalli, Shankarpally Road, Hyderabad – 501504, Telangana State, India
E-mail: samyadip@ibsindia.org

Received 08 December 2014; accepted 25 May 2015

Abstract. Concepts like supply chain network complexity, interdependence and risk assessment have been prominently discussed directly and indirectly in management literature over past decades and plenty of frameworks and conceptual prescriptive research works have been published contributing towards building the body of knowledge. However previous studies often lacked quantification of the findings. Consequently, the need for suitable scales becomes prominent for measuring those constructs to empirically support the conceptualized relationships. This paper expands the understanding of supply chain network complexity (SCNC) and also highlights its implications on interdependence (ID) between the actors and risk assessment (RAS) in transaction relationships. In doing so, SCNC and RAS are operationalized to understand how SCNC affects interdependence and risk assessment between the actors in the supply chain network. The contribution of this study lies in developing and validating multi-item scales for these constructs and empirically establishing the hypothesized relationships in the Indian context based on firm data collected using survey–based questionnaire. The methodology followed included structural equation modeling. The study findings indicate that SCNC had significant relationship with interdependence, which in turn significantly affected risk assessment. This study carries both academic and managerial implications and provides an empirically supported framework linking network complexity with the two key variables (ID and RAS), playing crucial roles in managerial decision making. This study contributes to the body of knowledge and aims at guiding managers in better understanding transaction relationships.

Keywords: supply chain, complexity, risk assessment, interdependence, scale development.

JEL Classification: C83, D22, D81, L14.

Introduction

As a buyer firm plans of strategizing its relationship with its major suppliers, a plethora of vital questions peep in the minds of the decision making managers: what are the pros and cons involved? How complex is the network environment? What will be the level of dependence? What are the alternatives? What is the risk involved? While searching for answers to these frequently asked questions, often one word keeps flashing in mind, 'network complexity'. The word "network complexity" nowadays has become a very common vocabulary in supply chain parlance and frequently heard in managerial discussions on network issues. It has been highlighted as a major breeding ground of supply chain issues and conflicting network wide partner relationships (Gilmore 2008; Bode, Wagner 2015). One of the most vital and omnipresent stumbling blocks that stares glaringly at the managers before such decision making is, how complex is the system or the process or the network in the question? Thus, network complexity has become inherent to today's business scenarios, which cannot be avoided; rather understanding the complexity involved and quantifying it becomes vital for making effective and viable decisions aimed at managing complexity. In modern business setting the competition for competitive advantage

ICT-driven financial inclusion initiatives for urban poor in a developing economy: implications for public policy

Shailendra Singh Bisht and Vishal Mishra

IBS, Hyderabad, Hyderabad, India

ABSTRACT

A key agenda of policy-makers in both the developing and the developed worlds is to have an inclusive growth. Financial services have been recognised as one of the fundamental services that have the potential to achieve this objective and help move towards a more just and equitable society. This paper attempts to assess the impact of three information and communication technology-driven initiatives in the field of financial services by differentiating them on the basis of service design. This study goes beyond the stated objective of these services and uses Sen's capability perspective to study their impact across three non-economic outcome variables viz. literacy, service-specific well-being and empowerment. The data for the study are collected from the urban poor across different locations in a large metropolitan city in South India where the three different services are being offered. The study follows a quasi-experimental design (field study) and ensures matching of the treatment and control groups through propensity score matching. The matched data are analysed using an independent sample *t*-test. The result of the analysis shows that service design plays a key role in increasing service literacy, improving service-specific well-being and empowering end users. The study suggests that the true challenge for providers (government and partner agencies) of these services is in designing a service that ensures a balance of structure and flexibility without constraining the choice of end users through innovative service blueprints.

1. Introduction

Stakeholders (state as well as non-state) in the agenda of development face a continual challenge of prioritisation and resource allocation. The predicament of prioritisation and resource allocation is due to various inter-related dimensions of development (education, health care, finance, water, sanitation, electricity, infrastructure, housing, etc.) which are equally important and call for extensive investment of resources. A significant fraction of these dimensions of development is associated with services (World Bank 2004) and therefore understanding such services and their impact could be of tremendous value in fulfilling the aforementioned agenda. Researchers argue that, from the development perspective (as opposed to traditional customer-centric approach), it is more meaningful to characterise services in terms of their potential for change, social transformation and well-being, which could result in a more inclusive, sustainable and collaborative society (Akter et al. 2013; Anderson, Ostrom and Bitner 2011; Sangiorgi 2011).

Since finance (or its equivalent) forms the basis of any transaction/exchange in modern society, financial services are classified as services that have the potential to bring about change and transformation (AusAID 2010; United Nations, Department of Economic and Capital Development Fund 2006). It naturally follows that achieving financial inclusion is one of the first steps towards attaining the objectives of development. Given this premise, the aim of the present research initiative is to evaluate and compare the (developmental) impact of different models of (information and communication technology (ICT) enabled) financial services in India by examining differences in service design. Further, the study uses Sen's (1993) capability theory perspective to measure the impact of different models of financial services. The work assumes importance because of the failure of traditional models of financial services in achieving the objective of financial inclusion. Evidence of a favourable/unfavourable impact of any of these models could provide directions and pave the way for financial inclusion not only in India but across the developing world.

The remaining paper is organised as follows: the next section discusses the importance of financial services; the succeeding section makes a case for leveraging technology in realising the change potential of financial services; the subsequent sections discuss the characteristics of

Abstract: Tourism supply chains need to be agile, i.e. they should be in a position to respond in a speedy manner to customer's requirements. Hence we argue in this study using resource-based view that firms in tourism supply chains will use their variable, renewable, inimitable and non-substitutable (VRIN) resources and non-VRIN resources to develop tourism supply chain agility. Further, we posit such tourism supply chain agility as a dynamic capability that may impart competitive advantage. Perceptual data were gathered from different entities in tourism supply chains and were analysed using PLS. Empirical findings based on 233 complete responses suggest VRIN and non-VRIN resources to as significant enablers of tourism supply chain agility and such a capability results in a competitive advantage for the associated supply chains. Further, our study revealed perceived environmental dynamism as a dominant moderator influencing the proposed linkages among resources and tourism supply chain agility.

Keywords: tourism supply chain; agility; environmental dynamism; VRIN resources; competitive advantage.

Wealth Effects and Macroeconomic Dynamics – Evidence from Indian Economy

Vighneswara Swamy
Professor, IBS–Hyderabad
vighneswar@ibsindia.org

Abstract

The wealth effects on consumption are a subject of continuing interest to economists. The conventional wisdom states that fluctuations in household wealth have caused major fluctuations in economic activity. This study analyses the macroeconomic dynamics of wealth effects in India and examines the nexus between the changes in housing wealth, financial wealth, and consumer spending. Using the quarterly data for the period 2005:1–2016:1, I estimate vector autoregression models and vector error-correction models, relating consumption to income and wealth measures. I find a statistically significant and rather large effect of housing wealth upon household consumption. The results show that (i) wealth effects are statistically significant and comparatively substantial in magnitude (ii) housing wealth effects tend to be greater while stock market wealth effects are considerable (iii) private consumption responses to the shocks to housing market wealth are relatively stronger than to the shocks in stock market wealth. There is a bidirectional causality running from private consumption to the two wealth forms and vice versa. Overall, the private consumption expenditure response to the changes in different wealth forms is observed to be substantial and significant.

Keywords: wealth effects; consumption; stock price; housing price; economic growth; inflation; fiscal deficit; exchange rate.

Impact of Union Budget on Sectoral Indices of NSE

Dr. P. Bhanu Sireesha[1]

Abstract

The union budget creates enormous market volatility and turnover in the stock market. Along with the two broad market indices in India, Sensex and Nifty, other sectoral indices are also affected depending on the nature of the budget announcements. Hence, the present study examines the impact of the Union Budget on the behavior of 12 sectoral indices of NSE. Event windows of short term, medium term and long term involving the closing prices of the indices prior to and subsequent to the budget day are categorized. The nature and extent of impact of the budget on the index prices is analyzed using the Wilcoxon matched pairs test.

Key Words: *Stock Market, Union Budget, Sectoral Indices, National Stock Exchange*

Introduction

The budget has traditionally been an important part of the financial year, with the government announcing what it wants to do for the next year, and how it has succeeded in completing its last year's announcements. Broadly the budget impacts the economy, the interest rate and the stock markets. How the finance minister spends and invests money affects the fiscal deficit. The extent of the deficit and the means of financing it influence the money supply and the interest rate in the economy. Higher interest rates mean higher cost of capital for the industry resulting in lower profits and hence lower stock prices.

The movement of stock prices is highly unpredictable due to certain factors responsible for such abrupt incline and decline of the prices. These factors include micro variables like company size, earnings and dividends per share, and book value per share; and macro variables like inflation rate, index of industrial production, bank rate of interest, foreign currency, and budget announcements. Going by the trends in the past, the stock market has always been highly volatile on budget days. The stock market response to a budget is often viewed as an important summary statistic of the 'quality' of a budget in terms of improving macro-economic prospects (Thomas & Shah, 2002)

Abstract

The rising importance of CSR over the last few decades has stirred the interest of academia and corporate on the subject. CSR attracted attention in the Indian context with the implementation of the Companies Bill, 2013, which mandated firms to invest 2 per cent of their net profits in social activities. The linkages between CSR and profitability using factors such as corporate reputation, competition intensity, and advertising have been tested in the developed countries. These linkages have sparsely been tested in emerging economies such as India, which motivated me to conduct this study. Neville et al. (2005) proposed a theoretical model integrating stakeholders, and internal and external factors influencing the CSR-FP relationship. This study modified and used Neville's et al. (2005) model to test the proposed linkage in the Indian context. Structural Equation Modeling revealed a significant relationship between CSR Intensity and corporate reputation; significant role of social initiative and corporate strategy fit in enhancing the corporate reputation of a firm; and a significant role of advertising and promotion in enhancing corporate reputation. Other variables such as competitive intensity, supplier power, customer power and employee power were found to have no significant role on the proposed relationships.

Introduction

Liberalization and globalization, presence of MNCs in Asian markets, rising consumer expectations from businesses, and emergence of pressure groups have augmented the cause of CSR in the Asian sub-continent. Responding to social pressure is important for a firm as it can directly affect its market value by pushing away investors from the firm or indirectly by harming the reputation or brand equity of the firm. Firms may be encouraged to perform socially responsible activities to ward off negative attention from NGOs (Baron 2009). Moreover, Indian consumers have become increasingly aware of the wider social role of business in the society (Mishra and Suar 2010). Consequently, Indian companies have started focusing on CSR activities to build trust amongst their significant stakeholders (Mishra and Suar 2010; Carroll and Shabana 2010). CSR is instrumental for a firm to gain public appreciation; to make up for perceived wrong doings of an industry; and/or manage their reputation. The Companies Bill, 2013, India, which aimed at bringing the management of the corporate sector in line with global norms, directed companies to invest in social and ethical causes. Given this statutory requirement, companies need to invest in CSR activities that have an impact on firm performance and ensure that the CSR expenditure undertaken on their part is beneficial to them in the long run. This study accordingly addresses the CSR-FP link in the Indian context. Neville et al. (2005: 1190) proposed a theoretical model integrating stakeholders, internal factors (Reputation Management Capability; Social Initiative and Corporate Strategy Fit) and external factors (Stakeholder Power; Competitive Intensity) that affect the link between CSR and FP. The model also envisaged the moderating role of stakeholders in the CSR-FP relationship. This study intended to test the validity of the model in the Indian context. The postulates provided by Neville et al. (2005) consider stakeholders in its entirety which is an erroneous approach. Given the presence of several different groups of stakeholders (Freeman 1984: 25) with their varying significance to a firm, they need to be analyzed separately. Previous research (Rose and Thomsen 2004)

ABSTRACT

Investors are constantly looking at diversification of risks by combining equities with other assets in their portfolio. Apart from fixed income securities and real estate related instruments, commodities are also being increasingly used as a portfolio diversification strategy. But the overwhelming presence of financial institutions and funds in the commodity markets has resulted in financialisation of commodity markets leading to a greater correlation between equities and commodities especially during recession. This has lead to a reduction in diversification benefits. The paper attempts to study the diversification benefits of investing both in Indian commodities and equities markets in different economic environments using VAR Impulse Response Functions with an aim to find out whether financialization exists. The research found that there was absence of interdependence between the Indian equity and commodities markets which offered a good opportunity for diversification. Also the equities market and commodities market during recession were totally decoupled which showed that the financialization was not present in Indian commodities market and there was a greater scope for diversification during the recession.

Keep calm and carry on: A crisis communication study of Cadbury and McDonalds

Achyut TELANG

IBS Hyderabad, Telangana, India
E-mail: achyutktelang@ibsindia.com

Amruta DESHPANDE

IBS Hyderabad, Telangana, India

Abstract. *Many organizations, at some point or another, have to face a crisis situation. In that scenario, the way in which the organization communicates makes or breaks the organization's success in dealing with the crisis. Especially after the emergence of the social media, the impact of crisis communication on the process of successful crisis management has become even greater than before. Organizations have to take the initiative, to be proactive and create a plan for crisis communication. This paper is focused on the comparative study of the communication approaches followed by Cadbury and McDonalds during a period when the companies were dealing with a crisis. The findings of the content analysis show that a company should respond to the crisis as quickly as possible to avoid loss in terms of sales. The initial statement of the companies during a crisis should be clear, positive and through the right channel to help the company regain its reputation on the market. Advertising is the best way to convey the message across the world because the crisis situation that has come up in one market can soon catch-up in the other markets where the company operates. The company has to connect with the consumers on emotional grounds because the crisis breaks down the faith of the consumers in the company. The recovery actions that support the statements also play an important role during the crisis situation. By following the above-mentioned communication strategies, organizations can achieve damage control as well as turn the crisis into an opportunity to grow.*

Keywords: crisis communication strategies, organizational communication, public relations, Cadbury, McDonalds.

Introduction

With the increase in media coverage and in the level of people's sensitivity to public issues, every company's employee must know how to communicate during a crisis situation. A crisis can be defined as a situation which has undesirable results for an organization (Coombs, 1999). Crisis communication is the communication between an organization and the public during, after or before the critical event (Fearn-Banks, 2007). In a crisis, information resources are not easily available, there is pressure to respond to the stressful situation and every stakeholder of the organization such as customers, vendors, employees, or media demands relevant information. Hence having an efficient communication system is an important element of effective management. With advanced technology and the

Abstract

Parents are real beneficiaries of school services. Their involvement in school based activities has changed the role breadth of teachers. Schools can handle this parental involvement through the extra-role behaviors of teachers. These beyond the job behaviors or organizational citizenship behaviors (OCB) of teachers are crucial for the schools. Despite the prescribed roles and duties, the schools cannot predict and infer through formally stated in-role job description, the entire range of extra-role behavior exhibited by teachers during and after school. In this study, teacher's role breadth is examined under the broad spectrum of Organizational Citizenship Behavior (OCB) which resulted into a conceptual model on the determinants of teacher's OCB. A qualitative evaluation (grounded theory) of 40 interviews has been conducted with all the stakeholders of school in India viz., principals, fellow-teachers, students, and parents. The most striking finding is that teachers are displaying prosocial behavior. Teacher's OCB is found to have three determinants—OCB-Individual, OCB-Organization and OCB-Prosocial. Involvement of parents in school are redesigning and affecting the actions of teacher. Further, the implications and directions for future research have also been discussed. © 2016: Musarrat Shaheen, Rity Gupta, Y. L. N. Kumar and Nova Southeastern University

Examining the roles played by a store satisfaction-love framework in shaping the influence of store loyalty programs

Received 30 June 2014

Abstract

Purpose – This study aims to investigate how the influences of store loyalty programs on store loyalty and store relations can be mediated by the store satisfaction-love framework.

Design/methodology/approach – The survey data were collected from selected retail stores using stratified random sampling. The hypotheses were tested using structural equation modeling.

Findings – The results indicate that the impacts of store loyalty programs on store loyalty and store relations are mediated both by store love and store satisfaction.

Practical implications – This study's findings help practitioners by empirically demonstrating that the combined cognitive satisfaction of consumers with store loyalty programs and affective store love mediate the influences of loyalty programs on consumer loyalty toward the store and on the consumer–store relation. Therefore, cognitive satisfaction with loyalty programs alone cannot create strong loyalty and a customer relationship. Cognitive satisfaction with various loyalty programs must be converted into affective store love for the mediation to be significant and effective.

Originality/value – This research adds value to the domain of store loyalty research by empirically establishing the mediating role played by the cognitive satisfaction-affective love framework in shaping the influences of loyalty programs designed by store management on the final store loyalty and customer–store relationship.

Keywords Store loyalty, Customer loyalty, Store satisfaction, Loyalty programs, Self-expansion theory, Store love, Store relationships

Paper type Research paper

Introduction

The question of how to retain a loyal customer base has bothered marketing practitioners for a long time. The reason is that retaining loyal customers can provide a long-term competitive advantage to the firm (Webster, 1992). Developing a strong and

Evidence of information transmission across currency futures markets using frequency domain tests

Satish Kumar *

Department of Finance, IBS Hyderabad, (ICFAI Foundation for Higher Education), Survey Number 156/157, Dontanpally Village, Shankarpally Mandal, R.R. District, Hyderabad, Telangana 501203, India

Currency futures
Information transmission
Spillover
Frequency domain

ABSTRACT

In this article, I examine the returns and volatility spillovers in the currency futures market incorporating the recently developed frequency domain tests. Such analysis allows differentiating between permanent (long-run) and transitory (short-run) linkages among the currency futures markets by investigating the causality dynamics at low and high frequencies respectively. I detect significant informational linkages between USD, EUR, GBP and JPY futures contracts in the Indian currency futures market. Evidence of innovations from USD futures market to other markets is the most significant for returns spillover and for volatility spillover, EUR is found to be the most significant compared to other currency futures contracts. The results would have implications for the market participants and policymakers.

1. Introduction

Examining the relation between currency markets is an important issue and has received considerable attention from various stakeholders in the market such as academic researchers, practitioners and regulators for at least two reasons. First, the behavior of comovement between exchange rates can be useful to determine the level of policy coordination among international monetary authorities. For example, Fratzscher (2005) argues that the exchange rate interventions by the central banks are coordinated internationally, consistent with the information transmission across currency markets. Second, the comovement among exchange rates could have wide implications for portfolio managers in terms of designing the portfolio allocation and risk mitigation strategies.

A number of studies have been conducted to examine the linkages among major exchange rates for volatility spillovers since Engle, Ito, and Lin (1990). Among other studies in this field, Asimakopoulos, Ayling, and Mahmood (2000) examine the return spillover across currency futures markets and report the evidence of nonlinear causality. Elyasiani, Kocagil, and Mansur (2007) explore the linkages between currency futures contracts using a variance decomposition analysis and report significant dependencies. From the viewpoint of volatility spillovers, Nikkinen, Salhstrom, and Vahamaa (2006) examine the linkages using implied volatilities from currency options prices and show significant influence of EUR on GBP and CHF. Inagaki (2007) provides an evidence of unidirectional volatility spillover from EUR to GBP. Kitamura (2010) finds strong evidence of intraday volatility spillovers from EUR to GBP and CHF. Kearney and Muckley (2008) investigate the volatility

Abstract:

Tourism supply chains need to be resilient so as to restore operations from increasing disruptions. Hence we argue in this empirical examination using dynamic capability view that firms in tourism supply chains will use their variable, renewable, inimitable and non-substitutable (VRIN) resources and non VRIN resources to develop tourism supply chain resilience to recover from disruptions in a swift manner. Further, we posit such tourism supply chain resilience as a dynamic capability that will impart positive supply chain performance for partnering firms. Empirical findings obtained as a result of 233 complete responses and analyzed using PLS suggests VRIN and non-VRIN resources to as significant enablers of tourism supply chain resilience and such a capability result in a positive tourism supply chain performance. Further, our study revealed perceived environmental dynamism as a dominant moderator influencing the proposed linkages among VRIN; non-VRIN resources and tourism supply chain resilience.

1. Introduction

Supply chain management (SCM) is currently the dominant management approaches for incorporating and designing vital suppliers and clients and businesses for distributing product and services to the end customer (Chen 2009). Extending this value chain management philosophy to travel and tourism industry; the last few years has witnessed the development of a new area known as tourism supply chains (TSC) (Page 2011).

The TSC does not resemble like traditional value chains, and it is more complex in nature consisting in multiple entities that vary in size and scale of operations (Chen 2009). TSC consists of a series of organizations like attraction providers, transportation and hospitality suppliers, souvenir shops, travel agencies,

AN ECONOMETRIC INVESTIGATION OF THE DETERMINANTS OF SUSTAINABLE WELLBEING OF COUNTRIES

ABSTRACT

In this study, we intended to analyze the socioeconomic, political and environment factors affecting the sustainable wellbeing of nations (measured by the Happy Planet Index), for a sample of 108 countries for the year 2009.The empirical evidence showed that Human Development Index (HDI), Carbon emission, political freedom and colonial background of nations are significant predictors of the sustainable wellbeing of nations. HDI has a direct effect on HPI of nations, while the level of carbon emission is negatively related with HPI. The HPI levels among different political regimes are different, while the countries without colonial background are better off in terms of achieving sustainable wellbeing than countries with colonial background.

Key Words: happiness, sustainable wellbeing, HPI, multiple regression

An Empirical Text Mining Analysis of Fort McMurray Wildfire Disaster Twitter Communication using Topic Model

Kaila Rajesh Prabhakar[1]* and Satish D.[2]

1. SIBM, Hyderabad, Symbiosis International University, Survey Number 292, Off Bangalore Highway, Kothur Mandal,Village: Mamidipalli, District: Mahboobnagar, 509 217, INDIA

*rajesh.prabhakar@gmail.com; satishd@ibsindia.org

Abstract

Twitter has emerged as one of the most preferred disaster communication medium particularly in those countries where it has significant presence. Fort McMurray, Canada was engulfed in a wildfire in May 2016 that burnt down major part of the city and the disaster communication on twitter related to this was studied. Tweets related were downloaded and analyzed using frequency analysis, correlation analysis and Topic Model Latent Dirichlet Allocation (Gibbs Method). The LDA model automatically discovered the most relevant topics that are highly correlated probabilistically to the effective and reliable disaster communication.

The disaster communication pattern also followed the various disaster stages as initially most of the information was related to intensity, evacuation and relief efforts followed by the updates and status of the wildfire and firefighting efforts and finally related to phased returning of residents back to city.

Keywords: Disaster Management, Disaster Communication, Twitter, Text mining, Topic Model, Latent Dirichlet Allocation.

Introduction

Social Media, particularly Twitter has drastically transformed communication during the natural disasters as during crisis situations, communication between affected people, rescuers and people involved in relief efforts is of utmost importance. Many studies highlighted the important role played by Twitter during disasters and also as a potential disaster risk reduction and management tool for communities across the world. Twitter has been widely used by Disaster Management Agencies, Local and Federal Governments for disseminating critical information before, during and after natural disasters as Twitter excels in reliable information interconnectivity, fastness and breadth of information in terms of text, pictures, videos that can be targeted towards the targeted populations.

* *Author for Correspondence*

Governments, Disaster Management Agencies, Healthcare personnel and other stakeholders have a crucial responsibility in educating the citizens in terms of personal disaster and emergency readiness. Natural Disasters destroy communities, villages, towns and cities and local populations need to be trained and educated in terms of Disaster Risk Management for reducing the mortality and morbidity caused by disasters. Fort McMurray Wildfire in Alberta Canada that started on May 3rd, 2016 swept through the community destroying approximately 2,400 homes and buildings and forcing the largest wildfire evacuation. Local authorities evacuated people but could not control the fire that damaged the major part of Fort McMurray.

Social Media including Twitter played a crucial role in providing such community level training and education initiatives so as to increase the disaster preparedness. Houston et al[5] developed a comprehensive framework for disaster social media tools, formulation and implementation of processes for users including communities, government, individuals, organizations etc. They also identified fifteen distinct disaster social media uses ranging from preparing and receiving disaster preparedness information such as warnings, updates etc. for signaling and detecting disasters prior to occurrence and connecting all relevant stakeholders and effected parties following a disaster.

Review of Literature

Cooper et al[3] study concluded Twitter as a crucial disaster communication tool and contributed significantly to improve mortality and morbidity results during the 2013 Hattiesburg, Mississippi EF-4 Tornado. Takahashi, Tandoc and Carmichael[9] examined Twitter use during and after Typhoon Haiyan that struck Philippines and explored external factors like time stamps and geographic location, internal factors like type of stakeholders (e.g. ordinary citizens, Government, etc.) in terms of social media engagement and concluded dissemination of second-hand information, coordination of relief efforts and details of people died, injured and missing are the primary information transmitted by different stakeholders on social media.

Chatfield and Brajawidagda[1] conducted content analysis on Indonesia's Twitter early tsunami warning system during the period of 2010-2012 when three earthquakes occurred off the west coast of Sumatra. The study concluded that the

ABSTRACT

This study uses market-to-book ratio decomposition to examine whether firms that issue equity through initial public offerings or seasoned equity offerings exploit mispricing because of investor enthusiasm or to finance growth opportunities. We find strong evidence that, on average, firms do not issue mispriced stocks to exploit investors but, rather, to finance their investment opportunities in the form of real assets, inventory, and capital expenses. Firms that issue overvalued stocks with the view to increase their cash holdings experience poor long-run performance. Overall, our results show that stock mispricing drives equity offerings through IPOs and SEOs. Nonetheless, high transparency and balanced regulation in the marketplace deter issuing firms from investing their proceeds in non-value-creating activities. This evidence is robust to alternative measures of valuation and long-run performance.

1. Introduction

A large body of literature documents that equity offerings through initial public offerings (IPOs) or seasoned equity offerings (SEOs) are among the most important events in a corporation's life. Although the decision to go public or to issue equity after-listing could be driven by different factors, both offerings are motivated by the need to finance growth opportunities or, in some instances, to exploit temporary overvaluation in the marketplace.[1] For instance, on the one hand, for IPOs, overvaluation rises because firms are private, disclose minimum information on their performance (usually only for three-year period), are not well-known to the market, and are likely to list during a hot market period (Demers and Joos, 2007). On the other hand,

"Are Shocks to Real Output Permanent or Transitory?" Evidence from a Panel of Indian States and Union Territories

Suresh K. G.
Assistant Professor, IBS-Hyderabad IFHE University,Hyderabad

DOI:

https://doi.org/10.14665/1614-4007-23-1-008

Keywords:

India, Mean reversion, Panel Unit root test, Per capita GDP, Unit root

Abstract

Mean reversion properties of per capita SDP of 31 Indian states and Union territories have been analyzed using panel unit root test assuming cross sectional independence among Indian states and later relaxing this assumption. The first generation panel unit root test assuming cross sectional independence shows that Indian per capita GDP data contains unit root. The second generation panel unit root test, relaxing the cross sectional independence assumption, also provides no evidence for mean reversion (stationarity) of Indian per capita GDP. Our results indicate that Indian output data is not reverting back to the natural rate and stabilization policies are required to bring the economy to the equilibrium path.

Measuring customer-based place brand equity (CBPBE): an investment attractiveness perspective

Sunny Bose[a], Sanjit Kumar Roy[b]* and Abhay Kumar Tiwari[a]

[a]*Marketing, IBS, Dehradun, India;* [b]*Department of Marketing, The University of Western Australia, Perth, Australia*

(*Received 9 March 2015; accepted 30 March 2015*)

Place branding has increasingly gained attention in last the two decades. However, there is a lack of measuring instrument for place branding effectiveness and subsequent place brand equity. This study develops a measurement instrument for customer-based place brand equity (CBPBE) for a place from the investment attractiveness perspective. Exploratory factor analysis followed by confirmatory factor analysis were used which resulted in an 11-item CBPBE scale. The dimensions of the scale consist of brand awareness, brand image, perceived quality, and brand loyalty. The study makes both theoretical and managerial contributions by offering a refined scale for the measurement of CBPBE which provides a tool for effective place branding activities and strategies.

Introduction

Twenty-first century heralds a new form of competition in the market place. The traditional battle for the customers' wallets among the business entities got amplified and geographies started competing among each other for trades, investments, and businesses. Nations and regions are competing for tourists (domestic and international), investments (foreign direct investments [FDIs] and domestic), students, and exports. The reports by Anholt-GfK (2012) and FutureBrand Country Brand Index (2012) on nation brand index indicate that countries with highest brand index ratings attract higher share of investments, tourists, and students. This kind of competitive rivalry among regional entities has resulted in gradual development of a new stream of marketing in the form of place branding (Anholt, 2005, 2010; Dinnie, 2004). Place branding incorporates the traditional and non-traditional approaches of the marketing discipline with particular focus on branding strategies for promotion, development and enhancement of saleability of a particular place or region towards its prospective customers that include tourists, investors including FDIs, students, and exports. Countries that are considered as powerful place brands tend to enjoy increased inflow of FDIs, tourists, and students (UNWTO Highlights, 2013). This in turn makes a place, a desired location for prospective investment as the returns can be high.

Interestingly, investment attractiveness is a key driver for place branding as it has direct relationship with exports and tourism. Exports by existing domestic and/or

Attracting Job-Seekers Through Online Job Advertisements:
Application of RJPs, Blogs and Video Podcasts

Pratyush Banerjee, Department of HRM & Soft Skills, IBS Hyderabad, IFHE University, Hyderabad, India

ABSTRACT

Online recruitment research has time and again addressed the issue of lack of credibility of online job advertising media compared to traditional media such as newspapers and the issue of poor quality web design in E-recruitment. In this paper, the issues of lack of credibility and quality of E-recruitment channels have been addressed through the introduction of a) realistic job previews (RJP), b) company independent channels for advertising jobs online (for example Blogs), and c) podcasts for corporate previews in online job website design. Final year post-graduate students about to enter job market (N=457) took part in a 2x2x2 factorial experiment. The findings give distinct indications of the advantage of use of the above mentioned web design features on applicant perception of quality, credibility, and their subsequent development of organizational attractiveness and intention to apply for a job in the firm. Recommendations for practitioners have been highlighted through illustrated examples.

KEYWORDS

E-recruitment, Media Credibility, Online Job Seekers, RJP, Web 2.0

INTRODUCTION

The rise of the internet has revolutionized the traditional human resource (HR) function of recruitment of employees. Electronic recruitment (henceforth, E-recruitment), the application of internet technologies in recruitment related activities, has developed into a cost and time efficient proposition for HR departments for searching and hiring potential talent (Maurer & Liu, 2007; Tyagi, 2012). There are different platforms of E-recruitment– the company career website, classified advertisements in online newspaper, through third party E-recruitment service providers/ job boards/ E-recruitment portals (henceforth referred to as E-recruitment portals) and henceforth (Borstorff, Marker & Bennett, 2005).

E-recruitment is rapidly developing into a cost-effective proposition for HR managers but it is not without its drawbacks. One of the major concerns of E-recruitment is how to enhance the credibility of online job advertisements since traditional advertising media are considered more credible than electronic media (Cable, Aiman-Smith, Mulvey & Edwards, 2000; Young & Foot, 2005). Recruiters have sometimes tried to enhance credibility of their recruitment message by providing employee testimonials in job advertisements to give the applicants an insider view as to what it feels like to work

Potharla Srikanth[2]

Abstract

Increased integration of stock markets with other stock markets in the world and other segments of domestic and foreign financial markets is the fundamental reason for the increased volatility in the Indian stock market. Though volatility is an instinct behaviour of stock market, its reasonable prediction can help an investor in making a profitable investment plan. Research on volatility measurement and forecasting is as old as the existence of stock markets. Ex post measures of volatility have lost their significance in the light of evolution of ex-ante measures of volatility, especially, 'Implied volatility'. Implied volatility can be estimated with the help of option pricing models. The present study examines the role of various determinants of the probability of exercising call options. Volatility, one of the key elements of option pricing, has been measured in three different variants, that is, historical volatility, realized volatility and implied volatility. Probit and Logit model are commonly used in qualitative regression estimation and they are applied to estimate the probability of exercising call options. The results of the analysis brings out the fact that neither the historical volatility nor the Black- and Scholes-model-based implied volatility can demonstrate significant influence on the estimation of probability of exercising call options. Realized volatility based the probability of exercising call options has greater magnitude of impact on Nifty 50 Index returns compared to that of historical volatility and implied volatility based probability of exercising call options. In the estimation of probability of exercising call options, Logit model outperforms the Probit model. The comparatively heavy fat-tailed distribution of Logit model is attributable to the better performance of the model.

Keywords

Call options, implied volatility, Black and Scholes model, Probit model, Logit model

Abstract

Purpose

Research investigating brand devotion among young consumers is scarce particularly in emerging Asian market context. The objective of this study was to qualitatively explore the evolutionary process leading to brand devotion amongst the young Indian consumers.

Design/methodology/approach

Semi-structured depth interviews were conducted to collect data. Data was analyzed using grounded theory method.

Findings

The grounded theory framework developed shows single brand devotion in a product category as the key phenomenon along with the associated factors and evolutionary processes.

Originality/value

This study explores how single brand devotion is distinct from romantic brand love, as experienced by consumers. Value of this article also lies in developing a grounded theory framework for single brand devotion in emerging Asian market context.

SOCIAL RESPONSIBILITY AND COMMITMENT IN MANAGEMENT INSTITUTES: MEDIATION BY ENGAGEMENT

Manish GUPTA[1], Omer SAYEED[2]

Faculty of Management, IBS, IFHE University, Shankarapalli Road, 501203 Hyderabad, India
E-mails: [1]manish.gupta.research@gmail.com (corresponding author); [2]omersayeed@gmail.com

Received 05 April 2015; accepted 04 March 2016

Abstract. Due to its major influence on individual's performance, engagement is increasingly becoming popular among practitioners. While its influence on performance has been well established, research on the influence of variables related to organizations on engagement is still in its nascent stage. Therefore, this study examines the mediating role of employee engagement in the corporate social responsibility (CSR) – organizational commitment relationship. Multiple regression results using responses from 150 academics working in Indian management institutes predominantly owned by business groups partially support the relationships hypothesized. The findings may encourage Indian management institutes owned by business groups to consider CSR in teaching and research as serious investment areas in order to have a more engaged and committed workforce.

Keywords: corporate social responsibility, employee engagement, India, management institute, multiple regression, organizational commitment.

JEL Classification: M120.

Introduction

The concept of employee engagement (EE) has received considerable attention of academics and practitioners in the last decade. While the initial need for research in EE was felt mainly in industries, a few research studies invigorate the need of extending the study of EE to the academia (e.g. Brexo, Boud 2009). Although, scholars have conducted EE studies on the academics working in higher education institutions (e.g. Ouweneel *et al.* 2012), little theory or empirical research accounts for the role of EE in linking corporate social responsibility (CSR) and organizational commitment (OC) especially in the context of Indian subcontinent wherein the engagement is at an alarmingly low level (Kohli, Grover 2013). This is reflected in the news that in the year 2013 itself, about 94 management institutes[1] applied for closure (Chhapia 2013). Therefore, the examination of its possible causes makes sense. One prominent cause could be that such institutes prioritize their own bottom lines over their social duties even though both the things can and should co-exist (Porter, Kramer 2002). Nevertheless, studies suggest that corporate social responsibility (CSR) can help in developing organizations which are not only profitable but also socially responsible.

Kahn (1990) first introduced the concept of engagement which due to its major implications for industries received widespread recognition in both, industry and academia. Recent research studies have successfully refined EE to the extent of measurability. For instance, the 12-item scale developed by Gallup and three – factor scale by Schaufeli *et al.* (2002) are often used to measure EE. According to Kahn (1990), engagement is a psychological state, in which, people attach themselves with their work roles. Employees are engaged if they can freely express themselves physically, cognitively and emotionally in their official roles. In order to test the nexus among CSR, EE and OC, in the context of Indian management

1 An Indian management institute for the purpose of this study is defined as an institute that offers at least one management program affiliated by The All India Council for Technical Education (AICTE).

Abstract

This paper explored the scope of disruptive and reverse innovation in emerging-market context and economic value creation for a sustainable competitive advantage by companies in the service sector. As a conceptual paper, it draws significantly on innovation literature. Illustrative Indian companies/ brands have maneuvered such skills by redefining the accepted innovation logic and cycle. There is symmetry in economic value creation at intermittent stages of the innovation cycle within a global value delivery network. Innovation-led economic value creation is insignificant of geographical subscription. Theory of economics explains the macro environmental factors defying the [illegible] straight extension to cross border markets and warrants for dual adaptation or new product [illegible] host country. Flow of innovation, with timely intervention, can create economic value, and [illegible] both commercial and societal needs. With a growth in venture capital funding for start-ups and [illegible] start of "Make in India" kind of initiative by the government, this study becomes more pertinent.

Abstract

Food neophobia can be defined as the reluctance of the consumers to try novel foods, including food products, dishes and cuisines. In the present study, it was suggested that the food neophobia is positively related with food addiction and negatively with the food involvement. More the consumers pertain the characteristics of food neophobia, more they will be dependent on the familiar kind of food, that is, they will consume only the food products they are familiar with and will be reluctant in consuming or trying new food products. If the consumers are more involved with their food, they will show the lower levels of food neophobia as their involvement will reduce their perceived risk or phobia about that particular kind of food product. The results obtained showed that the food neophobia is negatively related to the food involvement but do not share any relationship with the food addiction.

Do the calendar anomalies still exist? Evidence from Indian currency market

Satish Kumar and Rajesh Pathak
Department of Finance, IBS Hyderabad, ICFAI Foundation for Higher Education, Hyderabad, India

Abstract

Purpose – The purpose of this paper is to examine the presence of the day-of-the-week (DOW) and January effect in the Indian currency market for selected currency pairs; USD-(Indian rupee) INR, EUR-INR, GBP-INR and JPY-INR, from January, 1999 to December, 2014.

Design/methodology/approach – Ordinary least square regression analysis is used to examine the presence of DOW and January effect to test the efficiency of the Indian currency market. The sample period is later divided into two sub-periods, that is, pre- and post-2008 to capture the behavior of returns before and after the 2008 financial crisis. Further, the authors also use the non-parametric technique, the Kruskal-Wallis test, to provide robustness check for the results.

Findings – The results indicate that the returns during Monday to Wednesday are positive and higher than the returns on Thursday and Friday which show negative returns. The returns during January are found to be higher than the returns during rest of the year. Further, all currencies exhibit significant DOW and January effects in pre-crisis period, however, post-crisis; these effects disappear for all currencies indicating that the markets have become more efficient in the later time. The findings can be further attributed to the increased intervention in the forex markets by the Reserve Bank of India after the crisis.

Practical implications – The results have important implications for both traders and investors. The findings suggest that the investors might not be able to earn excess profits by timing their positions in some particular currencies taking the advantage of DOW or January effect which in turn indicates that the currency markets have become more efficient with time. The results are in conformity with those reported for the developed markets. The results might be appealing to the practitioners as well in a way that they can consider the state of financial market for financial decision making.

Originality/value – The authors provide the first study to examine the calendar anomalies (DOW and January effect) across a range of emerging currencies using 16 years of data from January, 1999 to December, 2014. To the best of the authors' knowledge, no study has yet examined these calendar anomalies in the currency markets using data which covers two important periods, pre-2008 and post-2008.

Keywords Returns, Indian currency market, January effect, Calendar anomalies, Day-of-the-week effect
Paper type Research paper

1. Introduction

Several studies have documented the presence of various calendar anomalies which violates the well-known theories of asset-pricing models. For example, holiday effect (Ariel, 1990; Vergin and McGinnis, 1999), monthly or January effect (Kim and Park, 1994; Rendon and Ziemba, 2007; Agnani and Aray, 2011), week-end effect (Lakonishok and Levi, 1982; Jaffe and Westerfield, 1985), turn-of-month effect (Compton *et al.*, 2006; Kumar, 2015), day-of-the-week (DOW) effect (Dubois and Louvet, 1996; Berument and Dogan, 2012), and week-of-the-year effect (Levy and Yagil, 2012). Among them, January effect and Monday effects are well known and have attracted much attention equally from academicians and practitioners (Alt *et al.*, 2011). Previous studies have made attempts to investigate the occurrence of these anomalies; however, still we do not have

The BRICS

ABSTRACT

Studies proved that output growth is mainly associated with the Total Factor Productivity (TFP) growth and variables that affect the TFP have an important explanatory power on output. In this regards, the aim of this study is to examine the causal relationship between different types of energy consumption and TFP growth in the BRICS from 1992 to 2012. A panel bootstrap Granger causality test by Kónya (2006) [68] was employed to investigate the direction of possible connection between energy consumption and TFP growth. Results show that no remarkable causal link exists between renewable energy consumption and TFP growth in the BRICS. However, in the case of non-renewables, energy consumption creates a positive externality that contributes economic development in Brazil and South Africa by the growth of TFP as well as energy use itself. In this respect, policies that promote coal and non-renewable electricity consumption in South Africa and natural gas consumption in Brazil may be beneficial for their economic development.

1. Introduction

International agreements on environmental policy such as the Kyoto Protocol counseled that one of the ways of reducing environmental damage is to substitute use of non-renewable energy sources with renewables. This may create an opportunity for reducing emissions caused by the usage of non-renewable energy sources in the production process that in turn have negative externalities on economic growth through deterioration of the health of productive agents and the quality of natural resources [1–4]. Besides, using renewable energy sources may improve an economy's technical efficiency [5–8], whereas others decrease [9–11]. Domac et al. [12] also states that, as a combination of *social* (i.e. increased standard of living, social cohesion and stability), *macroeconomic* (i.e. security of supply/risk diversification, regional growth, reduced regional trade balance and export potential), *supply side* (i.e. increased productivity, enhanced competitiveness, labor mobility and improved infrastructure) and *demand side* aspects (i.e. employment, income and wealth creation,

VOLATILITY INFORMED TRADING IN THE OPTIONS MARKET: EVIDENCE FROM INDIA

Rajesh PATHAK

Department of Finance and Accounting, IBS-Hyderabad, IFHE, Dontanpally, RR District, Telangana 501203, India
E-mail: rpathak@ibsindia.org

Received 02 December 2014; accepted 23 February 2015

Abstract. The purpose of this paper is to investigate the trading activity in options market based on information about expected future volatility in spot market. We employ Common Implied Volatility as a measure of expected volatility and options volume and changes in Open Interests as measures of options trading activity. We first test for simultaneous information flow in the two markets using multiple regression technique. Next, we test for information based or hedge based use of options using Tri-variate Vector-auto Regression framework. We further consider the classes of options moneyness and the market trends in our analysis to examine if the trader's preference of options changes with change in description of options intrinsic value and market environment. We use daily closing data of S&P CNX Nifty Index options traded on National Stock Exchange, India. We, for the most part, find negative and significant relationship in contemporaneous regression suggesting active trading by arbitrageurs. A feedback relationship is observed in vector auto regression analysis suggesting that options are traded in India for both information based trading and hedging purposes. We also observe the relationship to be varying when market trends and classes of options moneyness are considered. This indicates that traders are not indifferent in their choice of trading venue when market conditions and factors change. The results of this study are helpful for traders in managing the risk and return of their portfolio based on volatility forecast. This study is distinctive as it examines the scarcely researched area of volatility informed trading in an emerging market set up.

Keywords: options, volatility, informed trading, moneyness, volume, open-interest, hedging, arbitrage.

JEL Classification: G1.

Introduction

While financial theory has well emphasized the role of derivatives in trading a gamut of risks in financial markets (such as equity risk, exchange rate risk, interest rate risk, and credit risk), their role as a vehicle to trade on information has emerged as an additional economic function in empirical financial research. Market microstructure theory suggests that, price movements are largely caused by the arrival of new information and their incorporation into market prices through trading. A sizeable literature[1] have documented the use of derivatives on directional information and their role in predicting future price movements but, the corresponding issue of trading of derivatives based on non-directional information, like information about future volatility, remains to be examined in literature in detail. Since volatility forecast is central in finance due to its use in pricing of derivatives as well as for financial activities like portfolio selection and asset management, a study on volatility informed trading of derivatives becomes essential.

The theory of options pricing is unclear about the exact nature of volume-volatility relationship (Sarwar 2005). Black (1975) argues that informed traders may be attracted towards options due to the economic benefits like lower transaction cost and higher leverage associated with trading

Word-Of-Mouth, Trust, and Perceived Risk in Online Shopping:
An Extension of the Technology Acceptance Model

Farrah Zeba, IBS Hyderabad, Hyderabad, India
Shirshendu Ganguli, T A PAI Management Institute, Manipal, India

ABSTRACT

This paper aims to understand the role of word-of-mouth, trust and perceived risk in extended technology acceptance model on online purchase intention. Firstly, EFA was used to test the dimensionality of these constructs. Next the reliability and validity of these constructs have been established using CFA in AMOS 16.0. Then the hypotheses were tested using SEM in AMOS 16.0. It was found that word-of-mouth has a positive and significant impact on online purchase intention whereas perceived risk has a negative and significant impact on online purchase intention. It was also found that word-of-mouth has a positive and significant impact on trust and trust has negative and significant impact perceived risk. Word-of-mouth, trust and perceived risk should be viewed as the levers in the adoption process of online shopping in the extended technology acceptance model. Examining the role of these three constructs on online purchase intention explicated the dual process of perceived risk acting as an inhibitor whereas word-of-mouth acting as an enabler.

KEYWORDS

Enjoy, Entertainment, Perceived Risk, SEM, TAM, Technology Acceptance Model, Trust, Word-of-Mouth

INTRODUCTION

The acceptance of online shopping can be traced way back to the era of internet boom in 1999-2000 when Amazon.com, the online book shop, created history (Fink, Fink, Grullon, & Weston, 2010). After, this break-through many other product categories became popular online. From utilitarian products like books and e-ticketing, several hedonic products like tourism and fashion also got popularized online. The latest being the virtual marketplace (Sarkar, 2013) where a consumer can get a wide variety of products ranging from groceries to jewellery (one-stop online shopping destination). This on-going popularity of online shopping is resulting in continuous erosion of the market share of many big traditional brick-and-mortar organizations (Fink et al., 2010). This has already been envisaged by Wessel & Christensen (2012) that online shopping is like a missile which if not properly gauged can uproot the established brick-and-mortar firms sooner than they can realize.

Fuelled growth of online shopping has not caught up with the same speed with which it was expected to grow (Chang, Cheung, Lai, 2005) and has not even got near the take-off point of diffusion of S-curve (Roger, 1995). The major impediment to the adoption of online shopping is the risks perceived by the consumers (Tan, 1999). Though, perceived risks associated with use of credit card and net banking has been mitigated to a large extent by the banks through their upgraded security and

Highlights

- Findings supported the applicability of TPB in predicting green purchase intention.
- Additional constructs (environmental concern & knowledge) were included in TPB.
- The study supported the inclusion of additional construct in the TPB.
- Additional constructs improved the predictive power of the theoretical framework.
- Environmental concern emerged as the most significant predictor of green purchase intention.

FEEDBACK

Self-Image Enhancement through Branded Accessories among Youths: A Phenomenological Study in India.

- **Source:** Qualitative Report . 7/1/2016, Vol. 21 Issue 7, p1203-1215. 13p.

- **Author(s):** Acharya, Anitha; Gupta, Manish

- **Abstract:** Fashion not only forms an important part of everyday consumption decisions, but also plays an important role in all daily events such as, the clothing we wear, how we think and also what we eat and where we eat. In realism, fashion is an outcome of a dynamic culture and common shifts in the tastes and style of individuals. The center of the debate appears to be that branded fashion accessories involvement is likely to be associated with differences in sensitivity to one's social surroundings (Auty & Elliott, 1998). The question is: "Whether involvement in fashion accessories with its strong brand image and sensory components, has similar capabilities to be seen as a significant possession creating a fulfilling life, because of the happiness, success, and central position it may occupy in the lives of some?" Branded fashion accessories are increasingly becoming popular among India's youth population. However, less attention has been given to understand the reasons behind this changing consumer behaviour in India. Thus, this study aims to understand the role of branded fashion accessories in self-image enhancement of India's youth. For this purpose, semi structured in-depth interviews were conducted using college students who wear and who do not wear branded fashion accessories. Interpretive phenomenological analysis (IPA) of the data revealed that "social belongingness," "sense of completeness," "self-confidence," and "style and price" are the important factors that play a vital role in affecting youth's self-image. These findings may encourage retailers to focus their product and sales strategies on consumers' positive emotions and promote their products among non-consumers by explaining how these products can benefit them.

An Application of Brand Personality to Green Consumers: A Thematic Analysis.

- **Source:** Qualitative Report . 8/1/2016, Vol. 21 Issue 8, p1531-1545. 15p.

- **Author(s):** Acharya, Anitha; Gupta, Manish

- **Abstract:** Green products are increasingly becoming popular in India as a fashion statement. Yet, limited attention has been given to understand why users of green products associate themselves with green brands in India. Therefore, the purpose of this study is to investigate the applicability of brand personality to green products. Thematic analysis of semi-structured interviews and focus group discussions of green product consumers revealed six dimensions of green brand personality (GBP). GBP is a set of human characteristics associated with a green brand. By focusing on the green brand personality dimensions discovered in this paper, marketing managers can better understand why people buy green products. Companies can use this enhanced understanding to promote their green products in order to enhance sales and encourage/attract non-green product customers to switch to green products.

Brand analysis of global and local banks in India: a study of young consumers

Ankur Srivastava and Dipanjan Kumar Dey
Department of Marketing and Strategy, IBS Business School, IFHE University, Hyderabad, India

Received 18 May 2015
Revised 19 August 2015
5 October 2015
Accepted 9 December 2015

Downloaded by Universite Laval At 15:25 05 April 2016 (PT)

Abstract

Purpose – The purpose of this study is to investigate the perceived differences in brand analysis dimensions, such as brand-specific association (represented by perceived brand quality, brand price, brand emotional value and brand social value), brand impressions (represented by perceived brand image and general brand awareness) and brand credibility (represented by perceived brand trustworthiness and brand expertise), for young consumers in the context of banking services in India. All three types of banks operating in the Indian market are compared: state-owned banks, private (Indian) banks and global (foreign) banks.

Design/methodology/approach – The authors follow a cross-sectional design in this study. A structured questionnaire is created with the help of well-established scales. Reliability and validity tests are performed on all the dimensions of the scale. Exploratory factor analysis, ANOVA and ordinary least squared multiple regression analysis are performed to test the proposed hypotheses empirically.

Findings – The authors report significant differences in perceptions among young consumers among the three types of banks for all the dimensions of brand-specific associations, that is, perceived quality, perceived price, perceived brand social value and perceived brand emotional value. The authors find partial support for the hypotheses presented in this study concerning differences in three bank types among young consumers related to general brand impressions and brand credibility.

Practical implications – The results provide insights on the perceptions of the global and local brands among young consumers in the context of the banking industry. This will aid practitioners in assessing the relative position of their brands with respect to their global/local counterparts. These insights would help brand managers to design effective marketing mix strategies to target the young Indian consumers more effectively.

Originality/value – This is the first study that includes the concept of brand credibility along with brand-specific associations and general brand impression in investigating purchase intention of banking services by young consumers.

Keywords Brand credibility, Brand-specific associations, General brand impressions, Global and local brands, Purchase intentions

Paper type Research paper

Introduction

Globalization has resulted in noticeable behavioral changes among the Indian consumers (Kinra, 2006). Recently published studies indicate that the post-liberalization era, after 1991, has seen significant changes in tastes and preferences of the Indian consumers (Gupta, 2011; Bhardwaj *et al.*, 2010; Kaur and Singh, 2007). These shifts in Indian consumer's lifestyles are attributed to the recent economic upsurge coupled with the influence of Western culture brought through access to foreign media

ABSTRACT

This paper examines the stationarity properties of the renewable-to-total electricity consumption ratio. For this purpose we use Becker et al.'s (2006) flexible Fourier stationarity test as a benchmark, and the recent advanced Fourier ADF unit root test, for 90 countries, over the period 1980–2011. The results of the first test document the stationarity of the renewable-to-total electricity consumption ratio for 65 countries from different geographic areas, namely Africa, America, Asia-Pacific and Europe. However, when validated, the Fourier ADF test shows that the null hypothesis of unit root is rejected in all the cases, except for the United Kingdom. The fact that the stationarity in the share of renewable-to-total electricity consumption is documented by the new proposed, more powerful tests, does not necessarily mean that the renewable energy policies are ineffective, as the previous literature states. A wide range of elements might influence the stationarity or non-stationarity of this ratio. However, our findings are important from the modeling perspective, as the empirical studies on renewable energy can produce reliable results and use appropriate techniques for modeling and forecasting only if the stationarity or non-stationarity is correctly documented.

A Historical Analysis of the US Stock Price Index Using Empirical Mode Decomposition over 1791–2015

Aviral K. Tiwari, Arif B. Dar, Niyati Bhanja, and Rangan Gupta

Abstract

In this paper, the dynamics of Standard and Poor's 500 (S&P 500) stock price index is analysed within a time-frequency framework over a monthly period 1791:08–2015:05. Using the Empirical Mode Decomposition technique, the S&P 500 stock price index is divided into different frequencies known as intrinsic mode functions (IMFs) and one residual. The IMFs and the residual are then reconstructed into high frequency, low frequency and trend components using the hierarchical clustering method. Using different measures, it is shown that the low frequency and trend components of stock prices are relatively important drivers of the S&P 500 index. These results are also robust across various subsamples identified based on structural break tests. Therefore, US stock prices have been driven mostly by fundamental laws rooted in economic growth and long-term returns on investment.

ACCEPTED MANUSCRIPT

Abstract

The purpose of this paper is to assess the level of co-movements, contagion and rolling correlation between the stock markets of the PIIGS and those of the UK and Germany. We thus resort to a novel time-frequency approach, namely the continuous wavelet transform, and we analyze the co-movements of the stock index returns at different frequency-scales. We also test the influence of different macroeconomic factors on stock markets co-movements at different time-frequencies. The wavelet analysis results show that, in the short-run, the correlation level is high only during financial distress episodes, while in the long-run, the co-movements are present for the entire analyzed horizon. In addition, at low-frequency levels, the PIIGS stock markets are more correlated with Germany than with the UK. An opposite result is obtained at high-frequency decomposition levels. We also discover that the stock markets' correlation does not increase after all crisis events and depends on the wavelet decomposition levels.

Keywords: Portfolio risk management; co-movements; wavelet transform; rolling wavelet correlation; European stock markets.

Smooth breaks

ABSTRACT

We examine the stationarity properties of per capita CO_2 emissions for 35 countries in Sub-Saharan Africa covering the period of 1960–2009. For this examination, we use a nonlinear time series and panel unit root tests. Becker et al.'s (2006) test statistic demonstrates that nonlinearity exists in our data and hence should be incorporated in a test for the unit root. Further, Becker et al.'s (2006) test shows evidence of mean reversion in the per capita CO_2 emissions for 27 of the countries in Sub-Saharan Africa. However, when we use a panel unit root test with a SPSM procedure, we find that the per capita CO_2 emissions for 15 of these countries are stationary. Moreover, when we add a Fourier function to the panel unit root test, we find evidence of stationarity in the per capita CO_2 emissions series for all of the 35 countries analyzed.

1. Introduction

The concentration of carbon dioxide (CO_2) emissions is a source of great debate among government policymakers, social and environmental scientists, and economists. In the empirical research, there are several studies that analyze the various relations associated with CO_2 emissions: CO_2 emissions and economic growth, CO_2 emissions and energy consumption, CO_2 emissions and openness, etc. These studies use either a time series or a panel data approach. Many economic activities, particularly productive process, treat energy as one of their factor inputs. Consequently, energy-consuming economies are expected to continue emitting large quantities of CO_2, which is one of the major contributing factors to global climate change (Tiwari, 2011a,b,c). The negotiation of the Kyoto Protocol was completed in 1997 and requires that the consenting countries reduce their CO_2 emissions radically and that per capita emissions should gradually reduce further.

In this respect, understanding the behavior of a per capita CO_2 emissions series is constructive for researchers and policymakers when discussing environmental regulations. To achieve this understanding, the usual method adopted is the

Research Note

Whether tourist arrivals in India convergent?

Aviral Kumar Tiwari [a,b,*]

[a] IBS-Hyderabad, IFHE University, India
[b] Montpellier Business School, France

The international tourism sector has experienced sharp expansion and diversification in the last six decades, and become one of the largest and fastest growing sectors in the world by accounting 6% of world exports and contributing about 9% to world GDP, according to the United Nations World Tourism Organization, 2013. India is also giving special emphasis to boost the international tourist arrivals which have increased to 6.97 million in 2013 from 1.28 million in 1981. Given the importance of the Indian tourism sector, this research note analyses whether India's 17 major tourist source markets are converging by using the annual data over the period 1981–2014. Following Narayan (2006), convergence may be defined as the reduction in the difference between the log of total visitor arrivals and log of visitor arrivals from a particular country to India and convergence is achieved when this difference approaches zero. Narayan (2006) documented several policy implications, indicating the importance of testing the convergence hypothesis in the tourism industry such as (1) it is helpful for policy makers in making marketing policy in a targeted tourism source market; (2) it is helpful in measuring the effectiveness of marketing policy by identifying the source markets from which tourist arrivals has increased as a share of total tourist arrivals. Thus, evidence supporting the convergence hypothesis would indicate that tourism diversification and expansion strategies are successful and vice-versa.

There is a considerable amount of literature available analyzing the several issues related to tourism. For example, Aslan (2014) and Antonakakis, Dragouni, and Filis (2015) are the few recent works attempted to validate the tourism led-growth hypothesis using several time series and panel data estimations techniques. There are also few studies (for example Yilanci & Eris, 2012; Ozcan & Erdogan, 2015) examining the convergence hypothesis for different shcountries using different econometric methods. To the best of the author's knowledge, there is only one study by Bhattacharya and Narayan (2005) for the Indian context which documented that the effects of shocks to visitor arrivals are temporary. There is no study for the Indian context testing the convergence hypothesis in the major tourism markets. Besides, we used two advanced unit root tests developed by Lee, Strazicich, and Meng (LM test, 2012) and Meng and Lee (RALS-LM test, 2012) based on a two-step approach and three-step approaches respectively. These tests are more powerful than other endogenous unit root tests in terms of accurately identifying breaks and have better size properties. Further, the RALS-LM test has improved power with non-normal errors and is fairly robust to some forms of non-linearity.

Oil price and exchange rate in India: Fresh evidence from continuous wavelet approach and asymmetric, multi-horizon Granger-causality tests

Aviral Kumar Tiwari [a], Claudiu Tiberiu Albulescu [b,*]

[a] Faculty of Management, IBS Hyderabad, IFHE University, Dontanpalli, Hyderabad 501203, India
[b] Management Department, Politehnica University of Timisoara, 2, P-ta. Victoriei, 300006 Timisoara, Romania

HIGHLIGHTS

- We assess the relationship between the oil price and India-US real exchange rate.
- We use a wavelet approach and asymmetric, multi-horizon Granger-causality tests.
- Co-movements are noticed in the post-reform period, especially for 2–4-years bands.
- The Granger-causal relationship between variables is non-linear and asymmetric.
- The short run oil price movements are important for the exchange rate stabilization.

Granger causality
India

ABSTRACT

We use a continuous wavelet approach and deploy asymmetric, multi-horizon Granger-causality tests between the return series of the oil price and the India-US exchange rate, over the time-span 1980M1–2016M2. The results highlight important co-movements in the post-reform period, especially for the 2–4-years band. The wavelet Granger-causality tests show that the exchange rate Granger-causes the oil price in the long run, while the opposite applies in the short run. Moreover, we find that the Granger-causal relationship between variables is non-linear, asymmetric and indirect, which will help policymakers and traders to make better strategic and investment decisions.

1. Introduction

The effectiveness of energy policies are of vital importance for the macroeconomic environment due to supply-side shocks which might generate. After the 1973 oil crisis many researchers have empirically examined the relationship between oil prices and various macroeconomic issues, underlining the link between oil shocks and recessions [1]. The empirical literature has blossomed again after the remarkable fluctuations recorded by international oil prices in 2008–2009, but especially after the 2014 free-fall in oil prices, highlighting the impact of energy policies in general and of oil prices in particular, on business cycles and inflation [2–4], on stock prices [5–7], on non-energy commodity markets [8], or on other monetary issues like the exchange rate [9,10]. However, because the oil represents one of the most traded commodities, assessing the impact of oil price shocks on the exchange rate deserve a special attention.

There is a well-established theoretical link between the international oil price and the US Dollar exchange rate. On the one hand, Golub [11] and Krugman [12] document how the oil price explains exchange rate movements. In brief, according to these authors an

Co-movements and contagion between international stock index futures markets

Claudiu Tiberiu Albulescu[1] · **Daniel Goyeau**[2] · **Aviral Kumar Tiwari**[3]

Received: 5 August 2014 / Accepted: 29 April 2016
© Springer-Verlag Berlin Heidelberg 2016

Abstract In this paper, we explore the co-movements and contagion between six international stock index futures markets. In contrast to the empirical studies which dominate the literature and focus on the case of spot markets, relatively little is known about the returns and the volatility dynamics of the futures markets. To address this deficiency, we employ a time–frequency approach and discover that the co-movements between the international markets manifest especially in the long run. Nevertheless, the contagion phenomenon associated with the very short-run horizon is present in particular in the case of the European markets, due to their higher level of integration. The rolling wavelet correlation increases after severe turbulence episodes, but fluctuates over time and across frequencies. Our findings can guide the international investors in stock index futures markets to accurately diversify their portfolio in crisis periods.

Segment Based Indexing Technique For Video Data File

D.Saravanan

Dept of Operations & IT,IFHE University, IBS Hyderabad501203,Telangana State, India.

Abstract

A video is an effective tool to exchange the information in the structure of showing the brief text message due to the advance developed technology. Video capturing is effortless process but the related video retrieval is the difficult process, for that process the videos must be indexed. Retrieval is the method that retrieved a video using a user query .The query will be image or texts depend upon the query result output system that returned a particular video or image based on that query. In this project we create a indexing for video file by using segment based indexing technique. Here video will be divided into a hierarchy which is in storyboards of film making. For instance, a hierarchical based video search is composed into multi stage abstraction for assist the users to locate the specific video segments/frames logically. This paper brings out the reduced bandwidth and reduced delays the video through the network of searching and reviewing. Experimental results verify this.

Key terms: Video data mining; video content retrieval; image query ; indexing ; clustering ; key frame ; Grouping.

1. Introduction

Data mining is a process of detecting knowledge from a given huge set of data. Of the available huge data set, multimedia is the one which contains diverse data such as audio, video, image, text and motion, and video data plays a vital role in the field of video data mining. In short, the application of video data is called video data mining. Data mining technique can be applied in various documents. The acquisition and storage of video data is an easy task but retrieval of information from video data is challenging. The general method of representing each video segment is shot that is a sequence of key frame(s) where those frames contained the 'meaningful' frames also the frame contained the important contents of the shot. The key frame(s) based shot method is specifically assisted for searching the video content as clients provided image query/search where an image will be matched with the indexed key frames with assist of resemblance distance. As a result, the key frames selection is most significant and several methods are used to automate the process. The key frame selection is having two main issues:

1. The number of key frame(s) utilized, (The first issue is tackled by where the amount of key frames for every shot will be decided arbitrarily using the shot length).
2. The significant representative frame(s) selection in a shot. (The second issue is generally complicated for choosing the frames automatically with maximum semantic value. This issue is handled through minimizing the redundant frames with the help of the methods, for example relevance ranking)

The main objective of this research work is to increase the performance of clustering in video retrieval process.

RGB value of frame is used to eliminate the redundant frame.

Segment based indexing technique is used to indexing the key frames.

Hierarchical clustering algorithm is used to clustering the frames

Few basic properties about an image can be obtained from using a Histogram, The shape and the concentration of the colors in the histogram will be the same for similar objects even though they are of different colors The system has to differentiate between the both the basic concept behind the histogram generation is simple. Each pixel in the image is scanned and the respective color or intensity value is obtained for the pixel.

iColor = (16 * p1[0]) + p1[1] * 4 + p1 [72] Then a graph is generated with total number of pixels against the pixel intensity.iHistoArr [iColor] = iHistoArr [iColor] +1

1.0 Existing System

The existing methods for video lecture segmentation, annotation and classification mainly focus on either audio features or low-level visual features. Some of the works make use of high level semantic information like, drawing,

Downloaded by FREIE UNIVERSITAT BERLIN At 14:23 27 April 2017 (PT)

Abstract

Purpose – This paper seeks to examine the nature of spillovers between output and stock prices using both a long annual time series spanning 200 years and a shorter but quarterly observed data set.

Design/methodology/approach – The authors' particular interest is to examine both the time-varying nature of the spillovers and spillovers across the frequency using wavelet analysis.

Findings – The results reveal an interesting detail that is missed when considering spillovers for the raw data. Using annual long run data, spillovers in the raw data are in the order of approximately 10 per cent for stocks to output and 25 per cent for output to stocks. But this increases up to 50 per cent and above (in both directions) when considering different frequencies. Similar results are reported with the quarterly data, although the differences between the raw data and the wavelets are smaller in nature. Finally, output explains more of the variation in stocks than stocks explains in output.

Originality/value – The nature of these results is important for policy-makers, market participants and academics alike, while the use of wavelets provides information across different frequencies.

Keywords GDP, Spillovers, Wavelets, Stock prices, Time-variation

Paper type Research paper

1. Introduction

The presence of a relation between stock prices and output is assumed to exist and is generally well-accepted. However, the exact nature of that relation and the interactions between output and stocks is less well-known and understood. Yet, knowledge of this relation is important for policy-makers, market participants and academics alike. For policy-makers there is a need to understand whether movements in the stock market affect or predict future changes in output through, for example either a wealth effect or as a leading indicator. Market participants would be interested in whether output can aid market-timing decisions, while academics are interested in how output affects stock prices in terms of, for example expected future cash flows and discount rates (Campbell and Shiller, 1988).

Much of the existing work examining the relation between output and stock returns is focused on whether economic growth rates and volatility can provide predictive power for stock returns and volatility (selected examples include Balvers *et al.*, 1990; Fama, 1990; Chen, 1991; Marathe and Shawky, 1994; Pesaran and Timmermann, 1995, 2000; Rodriguez *et al.*, 2002; Rangvid, 2006). While this approach ignores the nature of long-run relations, this has nonetheless been considered in a limited number of papers (Mukherjee and Naka, 1995; Cheung and Ng, 1998; Nasseh and Strauss, 2000; Chaudhuri

Advergames
Persuasion knowledge
Limited capacity model
Brand placement
Ad recall

ABSTRACT

This study explores the effect of advergame speed, brand placement strength and consumers' persuasion knowledge on brand recall from the perspectives of attention and elaboration. Results show that low-speed advergames result in high brand recall as compared to high-speed advergames. A two-way interaction effect between advergame speed and brand placement strength reveals that for a low-speed advergame, a prominent brand placement results in higher brand recall than a subtle brand placement; for a high-speed advergame, there is no difference in brand recall between a prominent brand placement and a subtle brand placement. Further, for a low-speed advergame with prominent brand placement, subjects with high persuasion knowledge report higher brand recall than subjects with low persuasion knowledge. However, for a high-speed advergame with prominent brand placement, there is no difference in brand recall between subjects with high persuasion knowledge and subjects with low persuasion knowledge. Implications are provided.

1. Introduction

Advertising is continually changing. A number of new and highly effective advertising tools have emerged that have made advertising extremely effective, but also challenging. Advertising on the internet via online games, by viral marketing, or on social networks are but a few of the still new non-traditional advertising tools on which big corporations are expending significant dollars for their brand promotions (Goh & Ping, 2014; Gross, 2010). For example, the large US companies spent around 16.6 billion US dollars on advertising from 2012 to 2014 (Statista, 2014). One report projects the gaming market to double and reach nearly 23.9 billion US dollars by this next year (Newzoo, 2013). Despite this augmented status and the significance of advergames as an advertising opportunity, limited scholarly insights exist about the effectiveness of brand placements in online games. While considerable academic work has used brand recall as an advertising effectiveness measure, less is known about the potential factors that affect brand recall in advergames. Further, the elements of advergames such as game speed, location of brand placements in games and gamers' persuasion knowledge could be important factors in understanding consumer brand outcomes in the context of advergames.

Hence, the purpose of this research is to explore the conditions under which gamers' mental resources impact their processing of in-game brand placements. Specifically, this study explores the interaction effect of game speed, brand placement strength and persuasion knowledge on gamers' brand recall by utilizing insights from the Limited Capacity Model of Attention (Kahneman, 1973) and the Persuasion Knowledge Model (PKM) (Friestad & Wright, 1994) because these theories 1) explain how cognitive resources are allocated when individuals discern both the game and brand content while playing an online game embedded with brand messages, and 2) explain how individuals process in-game advertising when they demonstrate their persuasion knowledge about advergames.

2. Background

2.1. Advergames

Advergames are the interactive online games embedded with

A comparison of different univariate forecasting models forSpot Electricity Price in India

G P Girish
Department of Finance, IBS Hyderabad, IFHE University, India

Aviral Kumar Tiwari
Department of Economics, IBS Hyderabad, IFHE University, India

Abstract

In this study we compare the forecasting performance of ARFIMA model, Auto-ARIMA model, Taylor's double seasonal Holt-Winter's model, Exponential smoothing state space model and theta forecast for spot electricity price of Indian electricity market which has never been done before. The forecasting performance results of different univariate forecasting models provide crucial insights about Indian spot electricity price behaviour and help electricity producers and consumers of Indian electricity market to forecast prices more accurately.

Price forecasting

ABSTRACT

In this study we investigate Spot electricity price forecasting performance of Autoregressive-GARCH models on Indian spot electricity price series. Hourly spot electricity price data for each of the five regions of Indian Electricity market from 1st of October 2010 to 15th November 2013 is used for the study to evaluate forecasting performance of the calibrated models. The conditional mean and conditional variance equations are estimated and one-step-ahead forecasts with a rolling window is performed. The fact that India being the only country in the world having power exchanges in-spite of demand outstripping supply and peak power shortage even to this day, further emphasizes the significance and criticality of spot electricity price forecasting from a power market participant's perspective and its practical relevance for Open access consumers in India.

© 2016 Elsevier Ltd. All rights reserved.

1. Introduction

The Indian Electricity Act[1] (IEA) 2003 has paved way for trading of electrical power and is now a separate and completely distinct activity with licensing from the Central Electricity Regulatory Commission (CERC) of India. Post the enactment of IEA 2003, private players and licensees have started their operations in Ahmedabad, Mumbai, Kolkata, Surat, Delhi and other major cities in India for Generation of electric power, Distribution of electricity and proper Operations in system. Electricity sector in India has been opened up for 100% Foreign Direct Investment (FDI) in power Generation, Distribution and power trading. In the last few decades, electricity markets world-wide are gradually transforming from being highly regulated by the Governments of the respective countries in-to deregulated and competitive markets and Indian Electricity market is the latest entrant to this list.[2] Electricity is a very distinctive commodity which cannot be cost-effectively stored and the end-user demand exhibits strong seasonality.[3] Earlier we had electric utilities which were vertically integrated and now we have deregulated competitive markets worldwide [3,35] with the sole objective of introducing competition in power industry, thereby, providing more options for power market participants to choose from [3]. With the deregulation and increased competition, today, participants of power markets are facing new challenges.

Short term, medium term or long term power trading is not a technical business any-more. It has transformed in to one in which, the product is treated similar to any other commodity [41]. Events such as non-availability of resources (e.g., variation or shortage of coal for thermal power stations), power plant outages, flawed transmission grid reliability or breakdown of electrical transformers tend to have tremendous effect on electricity spot prices. In a power market, for both spot markets and long-term contracts, price forecasts are essential input so that power market participants can devise effective bidding strategies or negotiation skills for maximizing future profits. An Independent power producer (IPP) or a Generator capable of predicting spot electricity prices accurately will be in a better position to adjust its own production schedule by buying/selling power from power exchange depending on when it is more profitable, ensuring power requirements are met and

E-mail address: gpgirish.ibs@gmail.com.

[1] The Indian Electricity Act was enacted by the Parliament of India on the 26th of May 2003 aimed at introducing competition and completely reorganizing the Indian power sector.

[2] Weron [47]; Girish, Panda and Rath [22] have reviewed the evolution of organized day-ahead spot electricity markets world-wide. Girish and Vijayalakshmi [24] have focused on role played by energy exchanges for facilitating electricity trading in India.

[3] Demand of electricity and electricity prices exhibit seasonality at annual level, monthly level, weekly level, daily level and intra-day level [1,17,23,28,29,47].

Abstract

The cryptocurrencies increased in popularity and have become nowadays well known to a wide audience. This article seeks to assess the issue of Bitcoin price formation from a novel perspective. We use a new technique called Empirical Mode Decomposition (EMD) with which a complicated data set can be disentangled into a small number of independent and concretely implicational intrinsic modes that admit well-behaved Hilbert transforms. Even though Bitcoin is usually labelled as a purely speculative asset, EMD views that it is extremely driven by long-term fundamentals (above one year).

(Received 30 April 2015, revised 29 December 2015)

Abstract

The process of managerial decision making is complex, challenging and often critical to the success of a business. Such a process affects and is affected by a number of factors. Owing to the vital role of decision making in today's businesses, we explore, examine and discuss the measures of *manas–buddhi–ahamkaar* (MBA) model of managerial decision making processes. MBA model of managerial decision making processes was suggested by Professor Subhash Sharma in his well–known book 'Western Windows Eastern Doors'. This model has its roots in the classical Indian 'Sankhya philosophy'. For this purpose, we started with qualitative analysis of focus groups and interviews that resulted in a total of 10 scenarios. Out of these 10, experts rated three most dominant scenarios - one each of *manas*, *buddhi* and *ahamkaar*. Exploratory factor analysis of 338 responses led to the development of a 17-item MBA measure consisting of three dimensions namely, seven-item *manas* scale, six-item *buddhi* scale and four-item *ahamkaar* scale. Other standard tests were carried out in order to ensure validity and reliability of these scales. The implications of these findings and direction for future research are also discussed in this paper.

Keywords: ahamkaar, buddhi, decision making, manas, mixed method

1. Introduction

The process of decision making is so finely engrained in our daily lives that we hardly step back and look at the dynamics of it. The inputs to decision making are situations in external environment and the outputs manifest as actions or solutions to them. Scholars and practitioners have tried to explain the black box of the process of decision making; and in this process have come up with varying models. These models bring forth many modes of decision making like rational, irrational, emotional, etc. Each of these modes has its proponents and opponents. In the context of business, decision making is one of the most

Structural and Nonstructural mitigation measures in coastal area threats

D. Saravanan

Faculty of Operations &IT, IFHE University, IBS Hyderabad, Telangana

Abstract

Oceans are a support system for many creatures in the environment; it also supports humans by providing various benefits. The coastal area faces various threats like earthquakes, storms, cyclones, floods and erosion. This is a huge cause for concern to the people living in coastal areas. Nearly 38% of the population in the world are living near coastal areas, and are directly exposed to the various threats due to any changes in the ocean. People residing in coastal areas need to receive scientific data and have to disseminate information properly to avert these threats. This paper brings one such decision making model called the tsunami model. It provides critical information during emergencies to help communities to protect themselves even before the event occurs.

1. Introduction

Emergencies can happen anywhere at any time little or more seriously. The best protection in any emergency is to be prepared for the unexpected and know what to do from this situation. This will help in controlling the situation better and allow recovering more quickly. This also involves the current and accurate information such as hospitals and health centers, Governmental buildings. Any emergency is bring out the people from the initial shock and find the immediate response With the lot of damages from disaster increasing globally reports from international various agencies clearly stated that the developed and under developing countries are most affected by this disaster. For avoiding the disaster affects today all countries they developed the disaster management activities. Every disaster management functions are classified in three major parts. First pre disaster activities this performs the disaster operation in advance i.e. various possible emergence operations in aspect of disaster management. The second operation response to the event, this identifies the affected information due to disaster. Identify the losses example during the flood, emergence sources are drinking water, proper communication, evaluate the people from the flooded place to

Achyut Telang[1]
Souvik Roy[1]

With change in the demographics in the country over the past 10 years the average car buyer's age today has dropped drastically. With a plethora of opportunities for youngsters today & the general change in attitude to life & access to finance, the automobile industry has found an entirely new bracket of buyers ranging from the age group of approximately 25 to 32.

—Sanjay Gupta (17 September 2014, interview).[1]

Abstract

In the 1980s, Maruti had no real competition in India, and it did not even have to market its products. There were long waiting lists, and they made more than half of their cars in white, thus saving costs. However, once Hyundai entered the market, things started to change. Hyundai started focusing on quality, customer care and service. It talked about its technology like multi-point fuel injection (MPFI) which emitted lower emission and met Euro norms. It brought in Santro Zip Drive version which was the first small car with a power steering. It advertised Santro as being a five-seater as opposed to Maruti Suzuki's products, and it brought in fluidic sculpture design with Verna and promoted it. As a result, Maruti Suzuki, which controlled 70 per cent of the Indian market at its peak, came down to 52 per cent in twenty years, whereas Hyundai reached around 22 per cent. It was a long battle in a sector whose dynamics were changing as a result of government policies, such as excise duty cuts, increase in customs duty, lower interest rates and the introduction of goods and service tax (GST) besides the ambitious 'Make in India' campaign.

Keywords

Indian automobile industry, Maruti Suzuki, Hyundai, Make in India campaign

Introduction

Hyundai finished the year 2014 on a high scale with a market share of 22 per cent, which was the highest it had ever reached. Maruti Suzuki was way ahead, but it had also started fifteen years earlier. Hyundai,

Efficiency of Commodity Futures in Price Discovery and Risk Management : An Empirical Study of Agricultural Commodities in India

Siddula Narsimhulu [1*], S. V. Satyanarayana [2]

Affiliations

DOI: 10.17010/ijf/2016/v10i10/102990

Abstract

The present study examined the efficiency of commodity futures in price discovery and risk management for agricultural commodities in India. The price discovery function was examined by using Johansen's test of cointegration (1991), vector error correction model (VECM), Wald chi-square test, and Granger causality test. The risk-management function was examined by using ordinary least squares (OLS) method and VECM to estimate optimal hedge ratio (OHR) and hedge effectiveness (HE). The study used secondary data consisting of daily closing prices of spot and futures markets for a period of 10 years (2004 – 2013) for three agricultural commodities, that is, Chana, Chilli, and Turmeric, which are traded in National Commodity & Derivatives Exchange Ltd. (NCDEX). It was found that there is a long-run association between commodity spot and futures prices of Chana, Chilli, and Turmeric. The VECM results revealed that there is a long-run causality running from futures prices to spot prices, which enable the spot market to adjust its short-run deviations from long-run equilibrium path with nearly 2.17%, 2.78%, and 4.41% speed of adjustments in Chana, Chilli, and Turmeric, respectively. The Granger causality test results revealed that there is only a unidirectional causality from futures returns to spot returns of commodities - Chilli and Turmeric. However, in the case of Chana, there is a bidirectional causality between futures and spot returns. According to hedge ratios of OLS and VECM results, it was found that the commodity futures provide 50%, 56%, and 55% variance reduction in their spot prices of Chana, Chilli, and Turmeric, respectively. It is observed that the commodity futures are more effective in hedging, and the near month futures contracts are suitable for hedging.

Exploring Dimensions of Teachers' OCB from Stakeholder's Perspective: A Study in India

Musarrat Shaheen, Ritu Gupta, and Y. L. N. Kumar
IFHE University, IBS Hyderabad, India

Parents are real beneficiaries of school services. Their involvement in school based activities has changed the role breadth of teachers. Schools can handle this parental involvement through the extra-role behaviors of teachers. These beyond the job behaviors or organizational citizenship behaviors (OCB) of teachers are crucial for the schools. Despite the prescribed roles and duties, the schools cannot predict and infer through formally stated in-role job description, the entire range of extra-role behavior exhibited by teachers during and after school. In this study, teacher's role breadth is examined under the broad spectrum of Organizational Citizenship Behavior (OCB) which resulted into a conceptual model on the determinants of teacher's OCB. A qualitative evaluation (grounded theory) of 40 interviews has been conducted with all the stakeholders of school in India viz., principals, fellow-teachers, students, and parents. The most striking finding is that teachers are displaying prosocial behavior. Teacher's OCB is found to have three determinants—OCB-Individual, OCB-Organization and OCB-Prosocial. Involvement of parents in school are redesigning and affecting the actions of teacher. Further, the implications and directions for future research have also been discussed. Keywords: Organizational Citizenship Behavior (OCB), Grounded Theory, Schools, Prosocial Behavior, India.

Changes and amendments in educational policies in India have affected both the function of schools and the role of teachers. New educational practices in India such as National Policy for Education (NPE), Sarva Shiksha Abhiyan, Right to Education (RTE), and Education for All (EFA) have increased the accountability for student's learning by putting greater emphasis on academic content standards, student assessments and teacher quality (MHRD-NUEPA, 2014; Somech & Oplatka, 2014). Moreover, teachers are now expected not only to comply with schools' rules and regulation, but also to exhibit proactive behaviors for enhancing the school's ability to adapt to these environmental changes (Somech & Oplatka, 2014). Teachers handle multiple roles and do not restrict themselves to be simply knowledge provider. An empirical study on teachers' OCB in both public and private schools of India had been conducted by Garg and Rastogi (2006). They confirmed that teachers are involved in beyond the job behavior to fulfill the new standards of educational policies. Similarly, Bangotra (2016), stated that in today's dynamic school environment teachers are not only educators but they are now supporter to the students, facilitator in class and advisor to the parents.

Further, schools have acknowledged that parents actively participate in various school based activities which affects the prescribed role of teachers (Ule, Živoder, & du Bois-Reymond, 2015). Parent maintains a regular interaction with the teachers and other school members to keep themselves updated on the progress of their child (Johansson, 2016). Parents are deciding the trajectories for their children's education and even assisting them in

Currency market

ABSTRACT

We examine the day-of-the-week, the January, and the turn-of-month effects in developed, advanced and emerging currencies from 1985 to 2014. The returns on Monday, Tuesday and Wednesday are found to be positive and significantly different from zero. The returns on Thursday and Friday are negative and significantly smaller than the returns during first three days of the week. January returns are higher than the returns during the rest of the year. TOM returns are negative and significantly lower than that of non-TOM returns. The calendar anomalies are found to be stronger for emerging currencies compared to advanced and developed currencies. The subsample analysis shows that the calendar anomalies are stronger during the initial subsample and gradually diminish by the last subsample. We also show that for each calendar anomaly, our implied trading strategy can outperform the buy-and-hold strategy in the initial subsamples not so in the last subsamples. Overall, our results indicate that the calendar anomalies have disappeared in the recent times and the markets have become efficient.

Are exchange rates interdependent? Evidence using wavelet analysis

Satish Kumar[a], Rajesh Pathak[a], Aviral Kumar Tiwari [a,b] and Seong-Min Yoon[c,d]

[a]Faculty of Management, IBS Hyderabad, a Constituent of IFHE (Deemed to be) University, Hyderabad, India; [b]Center for Energy and Sustainable Development (CESD), Montpellier Business School, Montpellier, France; [c]Department of Economics, Pusan National University, Busan, Republic of Korea; [d]IPAG Business School, Paris, France

ABSTRACT

We examine the co-movement in daily returns of USD–INR, EUR–INR, GBP–INR, and JPY–INR currency pair futures contracts traded on the National Stock Exchange of India (NSE) using the wavelet cohesion approach. This study contributes to the literature by examining the scantly studied area of co-movement in exchange rates and using the wavelet approach, which allows us to analyse time–frequency-wise co-movement of the time series. The empirical results indicate that the currency futures markets are nearly perfectly integrated in the long run (monthly, quarterly and biannual scales) offering little potential gains from international portfolio diversification. The discrepancies between currency futures markets are small and almost fade away within 3–6 months. Moreover, international currency diversification might offer relatively higher potential gains at intraweek, weekly, and fortnightly time horizons owing to lower correlations among the currencies under consideration. Finally, our multiple-wavelet correlation and cross-correlation analysis shows that GBP acts as a potential leader/follower across scales. The results of our analysis indicate the dynamic pattern of co-movement among the major currency futures contracts, which provides several implications for portfolio managers and international investors participating in the Indian market.

KEYWORDS
Currency futures; wavelet cohesion; multiple-wavelet correlation; interdependency; international portfolio diversification

I. Introduction

The issue of co-movement across stock markets has received considerable attention from various stakeholders in the market, such as academic researchers, practitioners, and regulators. The behaviour of co-movement has become important because of its wide implications for portfolio managers in terms of designing portfolio allocation and risk mitigation strategies. An impressive range of researchers has examined the behaviour of co-movement across markets using stock returns (Brooks and Del Negro 2006; Forbes and Rigobon 2002; Lee 2004; Karolyi and Stulz 1996), volatility of stock returns (Arouri, Jouini, and Nguyen 2011; Lin, Engle, and Ito 1994; Theodossiou and Lee 1993), and linkages between various macroeconomic variables (Ramsey and Zhang 1996, 1997). However, the issue of co-movement in exchange rates has not received due attention until recently (Nikkinen et al. 2011; Yang et al. 2016). Therefore, it seems quite exciting to examine the co-movement of exchange rates, especially in the time–frequency domain, given the paucity of literature in this area.

On econometric front, most existing studies have employed conventional empirical methodologies such as the correlation coefficient (Brooks and Del Negro 2004), the co-integration approach and error correction models (Arouri et al. 2013), the copula approach (Aloui, Hammoudeh, and Nguyen 2013; Bekiros and Uddin forthcoming; Samarakoon 2011), and the ARCH/GARCH models (Balcilar, Demirer, and Hammoudeh 2015; Lin, Engle, and Ito 1994; Mensi et al. 2016; Theodossiou and Lee 1993), to examine the co-movement in stock markets. These empirical approaches, despite their recognized utility, offer mixed results and fail to capture the frequency domain of co-movement, which portfolio managers are more concerned with (Aloui and Hkiri 2014).

Markets consist of traders operating in different time horizons who can behave differently depending on the different times for which they stay invested in the market (daily, weekly, and monthly). This means short-term investors are interested in currency returns at higher frequencies, that is, short-term

Coastal Hazard and Resilience due to Disaster A survey

D. Saravanan

Faculty of Operations & IT, IFHE University, IBS Hyderabad, Telangana

Abstract

The term Disaster management gives the complete information of disaster related functions. In olden days, disaster management activity involved only after the disaster i. e. action taken various disaster relief activities such as reconstruction, mitigation and more. Today, there are various modern information technologies that provide pre disaster activities to over the disaster safely. This pre disaster activity brings with success with various communities to bring back the routine economic, agricultural, industrial information in normal. This paper brings the various disaster pre and post activities and their effect during a disaster with the various mitigation steps.

Key Terms: Coastal prone area, Cyclone, Hazard, Vulnerability, Disaster Causes, Environment Change.

1. Introduction

Disaster management defined an sudden event or sudden cause. It also defined that the range of activities are preformed and this activities are controlled over disaster and the tragedy situation provide help to the affected personality to avoid the disaster or overcome the disasters effect. Every disaster activities in modern days performed by prior to disaster management that is per activities are consider for the disaster it may be respond to natural and manmade disaster. It involves the various activities such as training, education, awareness camp etc. The second phase response to the disaster or during the disaster activity it brings the various mitigation steps in detail how we responded to the event, it also brings the both natural and manmade disaster activities. The later on most the disaster management perform the operation i. e. post disaster activity or after the disaster. It brings the various activity bring the environment in normal activities. Any disaster management activates are defined in that way "It include the all the functionality or activities with help of certain programs or functions helps to bring back the people or environment before and after a disaster with certain help of certain factor of avoiding, reducing the cause or recover from the affect.

VIDEO SUBSTANCE EXTRACTION USING IMAGE FETURE POPULATION BASED TECHNIQUE

D. Saravanan
Faculty of Operations & IT, IFHE University, IBS Hyderabad, Telangana, India
E-Mail:sa_roin@yahoo.com

ABSTRACT

In networking and multimedia technologies the digital video contents over the web availability is growing at a scare speed. By using many different devices the huge amount of videos can be played and downloaded from everywhere. The tremendous success of websites like YouTube, Google and iTunesvideos are based on the popularity where people can upload and download any videos. . In such scenario, a tool for performing video browsing would be really appreciated. To overcome the browsing the video files today many indexing, techniques are proposed. In recent years video content management and mining has become more important. This is because of increasing amount of digital video system. The amount of audio/video data produced is rapidly increasing due to various digital equipments. Here a new mechanism is proposed in this work which implements a population based clustering mechanism for clustering and efficient video retrieval.

Keywords: data mining, video data mining, knowledge extraction, clustering, segmentation.

INTRODUCTION

Nowadays the users used many different types of video sharing websites like YouTube and yahoo videos for sharing and viewing the videos. In the existing work they describe the human action fetching from client videos on the web. It was fully focused on actor-independent action. The main drawback of the existing process only concentrate on action based video mining. Human motion detection specifies only a particular region and only boosts the selected features.

In this paper we proposed a clustering techniques used for easy retrieval. The video format we can't able to find the accurate points, so we convert the video into frames format. The frames are stored in the database. After completion of noise removal the frames are grouping together with the help of RGB value. The key frames taken from each segment, and then find the average value of key frame. K-Nearest Neighbour algorithm is used for clustering process. Finally features matching produce the relevant image for query image.

LITERATURE SURVEY

The main objective of this paper is to retrieve the video using a clustering mechanism. To implement a new feature extraction method a new clustering mechanism is used for clustering key frames by identifying pattern using a new similarity mechanism."Discovery of Collocation Patterns: from Visual Words to Visual Phrases" (Junsong Yuan *et al*, 2007). The problem stated here is the visual word lexicon construction by using clustering primitive visual features, and a visual object can be described by a set of visual words. However, in practice, the clustering of primitive visual features tends to result in synonymous visual words that over-represent visual patterns, as well as polysemous visual words that bring large uncertainties and ambiguities in the representation. Real-Time Human Pose Recognition in Parts from Single Depth Images"(Jamie Shotton*etal*,2013) the problem of predicting the human pose recognition in parts in a single depth image is discussed here. A new method should be proposed to quickly and accurately predict the position of the body joints from a single depth image. On "Probabilistic Packet Marking For Large Scale IPTraceback" (Michael T. Goodrich *et al* 2007) proposed An approach to IP traces back based on the probabilistic packet marking paradigm which we call *randomize-and-link*, uses large checksum *cords* to "link" message fragments in a way that is highly scalable, for the checksum serve both as associative addresses and data integrity verifiers. Video Mining with Frequent Itemset Configurations (Till Quack *et al*, 2013), here A new method for mining frequently occurring objects and scenes from videos is proposed. Object candidates are detected by finding recurring spatial arrangements of affine covariant regions.

EXISTING SYSTEM

- Visual discovery pattern fully concentrate with shift scheme for fast and protection human motion for detection and segmentation. In this existing system proposed deployed over 3D-SIFT Interest points.
- In this pattern model it's provide two different types. The high-level abstraction frequently used the A Prior based frequent item to discover the video patterns.
- Bag-of-features and the mined patterns used for proposed the optimal human action, with ranking the sample queries into the boosting objective.
- Boosting based feature selection is used for best fits the potential action.

DISADVANTAGES

- It considers only the action based video mining.
- Human motion detection specifies only a particular region.
- Only boost the selected features.

PROPOSED SYSTEM

- It first pre-processes the query image and extracts the features of that image.

Abstract: Adoption of ERP systems is becoming a big challenge to the enterprises. Several personal, managerial and organisational issues contribute to successful adoption. This research paper attempts to identify potential issues that lead to successful adoption of ERP systems in enterprises. A vast research has been done on identifying different issues that contribute to satisfactory adoption of ERP systems in organisations. Questionnaires were developed around the significant influencing issues reported in literature and the feedback of industry people having good experience with ERP systems. Exploratory factor analysis was applied on the feedback data to derive prominent factors that contribute to successful adoption of ERP systems. A confirmatory factor analysis (CFA) was also applied to further examine the derived constructs. From the results, it is found that the implementation issues and cultural issues together establish a strong base for successful adoption of ERP systems in organisations.

Keywords: enterprise systems; enterprise resource planning; ERP; technology adoption; information technology.

Abstract

The convenience of association standards is firmly restricted by the gigantic measure of conveyed principles. To defeat this disadvantage, a few strategies were proposed in the literature, for example, thing set concise representations, repetition lessening, and post preparing. In any case, being for the most part in light of factual data, the greater part of these routines doesn't promise that the extricated standards are fascinating for the users. In this manner, it is pivotal to help the chief with a productive post handling venture so as to lessen the quantity of principles. This paper proposes another intelligent way to deal with prune and channel found guidelines utilizing Data Mining. To begin with, we propose to utilize ontology's keeping in mind the end goal to enhance the incorporation of user learning in the post handling errand. Second, we propose the Rule Schema formalism amplifying the detail language proposed by Liu et al. for user desires. Besides, an intuitive structure is intended to help the users all through the examining undertaking. Applying our new approach over voluminous arrangements of standards, we were capable, by coordinating domain expert learning in the post preparing venture, to diminish the quantity of guidelines to a few handfuls or less. In addition, the nature of the sifted principles can also be validated by the domain expert at different focuses in the intuitive procedure.

Key terms: Data mining, Association Rules, Pre-processing, post-processing, User Knowledge, Rule based system, Datasets.

Abstract: With increasing dynamicity in customer's tastes and preferences, firms are finding a tough time to sustain their positions in the market. Further newer technologies in every sphere are increasing the competition gradually. Therefore, firm operations have also become all the more global and more prone to increasing uncertainties. In this backdrop, supply chain agility helps a firm to sustain its competitive edge through fulfilling its customer's requirements in a speedy manner. Therefore, supply chain agility is a dominant supply chain capability that deserved special attention and investigation. Many theoretical lenses have been used for investigating different attributes of this essential supply chain capability. The current study adds to the growing literature by using a social exchange perspective on the development of supply chain agility through integrated logistics capabilities and its impact on firm performance. Specifically, the study explores the role of trust, commitment, reciprocity and power under social exchange theory in influencing integrated logistics capabilities and supply chain agility. Data collected from 177 logistics and supply chain professionals largely support the proposed relationships.

Keywords: supply chain agility; logistics capabilities; trust; commitment; reciprocity; power; social exchange theory; firm performance.

A Social-Exchange Perspective on Supply Chain Innovation

Santanu Mandal, IBS Hyderabad, Hyderabad, India

ABSTRACT

Supply chain innovation has become all the more important in today's competitive world. Supply chain innovation is the development of newer technologies and procedures along with implementation of new ideas of products and services through necessary supply chain activities. As supply chains are network of inter-connected firms; hence the importance of relational and social exchange attributes like trust, commitment, reciprocity and power are paramount in developing supply chain capabilities. The current investigation adopts a social exchange perspective and investigates the importance of trust, commitment, reciprocity and power on integration of logistics capabilities and their subsequent role in developing supply chain innovation. As supply chain innovation aims to provide better performance implications for the focal firm; the impact of supply chain innovation on firm performance was also explored using a service perspective. Data collected through a web-based survey from 173 logistics and supply chain professionals largely support the proposed relationships.

KEYWORDS

Commitment, Firm Performance, Integrated Logistics Capabilities, Power, Reciprocity, Social Exchange Theory, Supply Chain Innovation, Trust

INTRODUCTION

With increasing length of operations across the globe, supply chain operations are growing in complexity and increasingly vulnerable to disruptions (Gunasekaran et al., 2008; Wagner and Bode, 2008). Further the unit of competition has shifted from firm to supply chains in recent times (Gligor et al., 2013). Accordingly, the focus is more on supply chain capabilities rather than firm specific capabilities. Hence firms are in strong need of innovation in their supply chain capabilities so as to provide a proactive response to growing environmental uncertainties. Accordingly, supply chain innovation has been identified as an essential and critical supply chain capability in modern times. To encourage innovation in supply chains various efforts are being taken different recognized bodies. For e.g. one such effort was by ACSCMP (American Council of Supply Chain Management Professionals) in identifying the most innovative organization and rewarding the same with their "Supply Chain innovation Award". Arlbjorn, Haas, and Munksgaard (2011) noted in this regard "*.....among the nominees have been prestigious organizations such as the U.S. Air Force, Motorola, Kellogg's, and Blockbuster Inc. The list of award winners includes companies like Intel, Cisco Systems Inc., and Hewlett-Packard. The winner is selected out of 45–50 submissions each year, based upon criteria related to the degree of innovativeness, impact on overall supply chain, and sustainability in results (revenue, cost savings, etc.)*".It is argued that supply chain innovation is a must therefore for the following reasons: (a) for gaining competitive edge in the market (b) for managing the different types of risks prevailing in the supply chain (Wagner and Bode, 2008) and (c) for meeting proactively the different forms of uncertainties in the adjoining environment. However, the literature on supply chain

SAGE

Sangram K. Jena[1]

Abstract

The study attempts to gather additional evidence on the sequential information arrival hypothesis by examining the dynamic relationship between the trading volume and the volatility of CNX Nifty index futures traded on the National Stock Exchange of India. The documented result using a linear Granger causality model shows a unidirectional causality from volatility to trading volume, thus rejecting the theory of sequential arrival of information in Nifty index futures. Further, under a non-linear GARCH framework of analysis, it is reinforced that a lagged trading volume has no explanatory power of current conditional volatility, even in the presence of market depth surrogated by open interest in the Nifty futures market. Consequently, given the trading volume, the possibility of forecasting the price variability of Nifty futures is rejected.

Key Words

Nifty index futures, Granger causality, GARCH (1, 1), Linear and Non-linear causality, Volatility and sequential arrival of Information hypothesis

Introduction

The modern history of the Indian stock market, during the first decade of the twenty-first century, has witnessed sharp price movements on either side characterized by high volume and increased volatility. Further, this phase witnessed the introduction of trading in index futures, that is, Nifty index futures, on the National Stock Exchange (NSE) on 12 June 2000, which reported a marginal monthly turnover of just ₹ 350 million. Subsequently, in June 2007, the NSE reported a monthly turnover of ₹ 7,795,540 million, implying 22,227 times growth.[1] The slowdown from 1997 to 2003 was followed by the spectacular bull run that started in 2004 taking the Nifty to an all-time high of 6,357 on 8 January 2008 supported by huge market activities in the derivative segment, achieving an all-time high trading volume. Further, as a favourite instrument of players in the derivative market, such as hedgers, speculators and arbitrageurs, Nifty futures contracts witnessed huge trading activity accompanied by enormous price fluctuations.

The subprime-related global financial crisis during 2008–2009 resulted in a decline of more than 60% in Nifty from the highest level to a three-year low accompanied by a huge volume in the futures and options segment and with huge volatility. These market occurrences indicate a possible well-built interrelationship among the sign and scale of price movements, volatility of prices and the trading volume as shown in many previous studies (Gallant et al., 1992).

The study on price–volume relations in financial markets has long been an interesting phenomenon for many researchers in financial economics. The section of finance literature dedicated to exploring the relationship between the volatility, return and trading volume of futures contracts tried to provide evidence about either of the two complementary information theories, namely, the mixture distribution hypothesis (MDH) advocated by Clark (1973) and the sequential information arrival hypothesis (SIAH) backed by Copeland (1976). Although both models provide support for the pragmatic relationship between price changes and trading volume, they diverge in terms of consistency.

According to the MDH, the relationship between asset price volatility and trading volume is a function of a common latent variable, that is, the rate at which information arrives in the market (Clark, 1973; Epps & Epps, 1976; Harris, 1987). To put it simply, new information in the

Influence of Organizational Learning Culture on Knowledge Worker's Motivation to Transfer Training: Testing Moderating Effects of Learning Transfer Climate

Pratyush Banerjee[1] · **Ritu Gupta**[1] · **Reid Bates**[2]

Published online: 30 April 2016
© Springer Science+Business Media New York 2016

Abstract The purpose of this study was to examine how organizational learning culture influences employees' motivation towards transfer of training. Also, how this relationship was affected by the existence of a favorable learning transfer climate in context of knowledge workers. Sample for this study (n = 122) was drawn from academicians working at various business schools in India. The perception towards their own organization's learning culture, learning transfer climate and their willingness to transfer knowledge from Faculty Development Programs to their teaching and research was measured. Hierarchical regression analysis was used to test the hypotheses and it was found that a positive perception of organizational learning culture was positively related to willingness to transfer training. This relationship was significantly moderated by an important dimension of learning transfer climate which are resistance to change and partially moderated by another dimension- performance coaching.

Keywords Organizational learning culture · Learning transfer climate · Motivation to transfer training · Signaling theory · Knowledge worker

In this age of rapid innovation, one way for organizations to achieve a sustainable competitive advantage over competitor firms is to foster an organizational culture that advocates knowledge development and learning (Barney 1991; Bates and Khasawneh 2005). Organizations make huge investments on employee training and development each year (Silverman 2012). However, transfer of knowledge acquired through training programs to company stakeholders is not as easily achieved (Salas and Kosarzycki 2003). At best, only 15 % of the total learning that takes place during training gets transferred at work, as per some optimistic speculations (Cromwell and Kolb 2004). Several instances of failed training programs and inadequate learning have been noted. For example, the training program conducted by Burger King that resulted in its employees burning their feet while trying to walk over hot coal (Bunch 2007) or the ineffective team-building exercises conducted by the U.S. Postal Service (Feiden 2003) that cost the firm millions of dollars. The learning disseminated through majority of training activities gets lost within a span of a year as per experts (Salas et al. 2012).

Past research has repeatedly highlighted the need for fostering a learning environment in organizations (Kolb and Kolb 2005) such that employees are motivated to actively learn new things and then share their knowledge with their peer. At the organizational level, research has identified organizational culture as a key driver for promoting a sense of healthy knowledge sharing among employees (Confessore and Kops 1998; Garvin 1993). Employees need to first realize that their firm expects them to disseminate the learning generated from a training exercise among the organizational members who did not attend the training (Bunch 2007; Clarke 2004). Unfortunately, this is seldom the case (Cromwell and Kolb 2004). Parallel studies on organizational climate have shown that climate can affect culture perceptions among employees (Bates and Khasawneh 2005; Kopelman et al. 1990) and can drive employees to share training acumen with peers (Egan et al. 2004).

Design deficiencies in corporate career web-sites in India: A content analysis

Pratyush Banerjee* and Ritu Gupta
Department of HRM, IBS Hyderabad, a constituent of IFHE University, India

Abstract. A content analysis of career websites of 100 employers of India featured in the 2015 '*Best Companies to Work For*' survey for Indian organizations was conducted followed by a cluster analysis to categorize the different types of career websites. The content analysis was carried out on the basis of frequency of presence of primary, secondary and tertiary website features. A k-means clustering approach was adopted to differentiate career websites in terms of their focus. The analysis revealed four distinct clusters- Dual-purpose (42 websites); Deficient (10 websites); Recruiting-oriented (10 websites) and Screening-oriented (38 websites). The study should help HR managers comprehend that attracting talent through online media needs to be given more thought to make sure that their firm can project itself as the most desirable employer in the eyes of job-seekers.

Keywords: Content analysis, E-recruitment, India, cluster analysis, media credibility

1. Introduction

From the beginning of the 21st century, the traditional functions of human capital management have been witnessing an enormous change in their operations. One of the major antecedents behind these changes is the high penetration of internet based services in day to day office work [28]. Twenty years back, the most natural way for a job seeker was to search for employment opportunities in the job section of newspapers or advertisements posted through employment exchanges. With the rise of online recruitment methods, this scenario has vastly changed. Electronic recruitment (henceforth, E-recruitment) has emerged as a highly cost and time efficient tool for the HR departments for searching and hiring potential talents [28,37]. In the United States of America (USA) alone, there were 110 million jobs and 20 million resumes posted in various job portals by the start of the new millennium [28]. Today, we have specialized corporate and commercial websites to cater to the work force requirements of organizations. E-recruitment has been found to help organizations in significantly reducing their recruitment related costs. For example, Dow Chemical's was able to reduce their hiring cycle from 90 to 34 days and cost per hire by 26% through online recruitment practices [28]. A survey by the

Abstract: Corporate governance guidelines all over the globe are focusing on adding independent directors to the board to improve board effectiveness. Does the addition of more number of independent directors improve firm performance? The extant literature does not give a unanimous answer. In the given background, the present work explores the impact of board independence on firm performance for the emerging Indian market. The study examines Nifty firms over a period of six years from 2005–2010 using panel regression. The results show board independence to have positive impact on Tobin's Q, the proxy for firm value. The study found no direct impact of board independence on operating performance.

Keywords: agency conflict; board independence; corporate governance; firm value; Tobin's Q; panel regression.

Biographical notes: Pranati Mohapatra has teaching and research experience of almost 11 years in the area of Accounting and Finance. Her research interest includes corporate governance, sustainability and corporate finance. She has done PhD in the area of corporate governance. Presently she is working as Assistant Professor, Finance in ICFAI Business School, Hyderabad, India.

This paper is a revised and expanded version of a paper entitled 'Board independence and firm performance in India' presented at the '3rd IIMA International Conference on Advanced Data Analysis, Business Analytics and Intelligence', IIM Ahmedabad, India, 13–14 April 2013.

1 Introduction

Board Independence has been the centre of the corporate governance reform initiatives all over the globe. The corporate governance problem arises from the separation of Ownership and Control and the board of directors plays a major role in controlling the extraction of private benefits by the management or the dominant shareholder (Sarkar, 2009). A board consisting of outside independent directors is considered to be more effective in controlling the agency conflict than the executive directors (Weisbach, 1988; Fama, 1980). Apart from controlling agency conflict, independent directors can also

Financial liberalisation and Capital structuring decisions of corporate firms: Evidence from India

Nemiraja Jadiyappa *, Nagi Reddy Vanga, Raveesh Krishnankutty

IFHE (IBS Hyderabad), India

HIGHLIGHTS

- The impact financial liberalisation on leverage and debt maturity is negative.
- Debt specialisation increased following the liberalisation.
- The effect is more pronounced for priority firms compared to non priority firms.
- We use a reform index to measure financial liberalisation.
- Reforms index captures the gradual nature of implementation of financial reforms.

ABSTRACT

We examine the impact of financial reforms on corporate financing decisions of Indian firms using the fixed effects panel estimator. The impact on the leverage and debt maturity ratio is negative while a positive effect is observed on debt specialisation. The impact is greater for priority firms compared to non-priority firms.

1. Introduction

At some time in history, most countries followed regulated financial systems which included one or more of the following forms: administered interest rates, directed credit schemes, subsidised loans, capital controls and credit ceiling. Verma (1998) observed that a "financial repression state[1]" affects the efficient allocation of resources and interferes with lending and investment decision making which results in distorted credit allocation (Blundell-Wignall and Browne, 1991). These distortions/imperfections at the macro level would then affect corporate financing decisions at the organisational (firm) level. The adopted financial reforms generally aim at correcting these distortions by influencing structural aspects such as size, efficiency and competitiveness of financial markets, which in turn determine the firm's policies on (a) capital structure (sources of capital); (b) debt maturity structure (type of debt capital), and (c) debt specialisation (number of sources of debt capital) that they want to use.

It is therefore important to empirically examine how financial reforms change corporate financing decisions at the firm level. This kind of empirical examination assumes greater importance in the context of financial reforms being undertaken by many developing countries. The initiation of Indian financial liberalisation in the early 1990s provides the best setting for the examination of these

Nonlinear ARDL

ABSTRACT

This paper examines the asymmetric impact of gold prices, oil prices and their associated volatilities on stock markets of emerging economies. Monthly data are used for the period January 2008 till June 2015. The nonlinear ARDL approach is applied in order to find short-run and long-run asymmetries. The empirical results indicate that gold prices have a positive impact on stock market prices of large emerging BRICS economies and a negative impact on the stock markets of Mexico, Malaysia, Thailand, Chile and Indonesia. Oil prices have a negative impact on stock markets of all emerging economies. Gold and oil volatilities have a negative impact on stock markets of all emerging economies in both the short- and the long-run. The results indicate that the stock markets in the emerging economies are more vulnerable to bad news and events that result in uncertain economic conditions.

© 2016 Elsevier Ltd. All rights reserved.

1. Introduction

Since the last few decades, the stock markets of emerging economies have shown rapid growth in terms of value and volume, creating investment opportunities and significant capital inflows have also been witnessed from developed to emerging markets (Beckmann et al., 2015). However, the stock markets of emerging economies are vulnerable to the global news and events resulting in a volatile and uncertain environment. Historical fluctuations in the crude oil prices show that the world will enter into the era of high oil price volatility in the near future. Ji (2012) argues that the global financial crisis of 2007-08 has disturbed the crude oil market mechanism and the synchronized casualty between crude oil prices and equity market has strengthened after the crisis period.

The investments in gold are regarded as an inflation hedge, store of value, mean of exchange, a source of wealth and a safe haven asset for stock markets during the periods of stock market troubleness (Baur and Lucey, 2010). Gold investment gives the sense of certainty to the investors during financial downturns and can be considered as an alternative and attractive investment due to simplicity of gold market (Baur and McDermott, 2010). Moreover, gold is also a good instrument of inflationary hedge because of its positive correlation with inflation (Bampinas and Panagiotidis, 2015). The investment in gold can at least retains its purchasing power during the periods of high inflation (Goodman, 1956). Gold can also be viewed as a portfolio diversifier because of its low correlation with other assets and therefore lowers the overall portfolio risk (Ciner et al., 2013). Notably, the central banks also retain gold for diversification purposes and to safeguard from economic uncertainties (Chen and Lin, 2014; Ciner et al., 2013; Kaufmann and Winters, 1989; Kumar, 2014).

Despite the role of gold investments in portfolio diversification and hedging, volatility in gold prices has a negative impact on stock markets. Lower volatility in gold prices indicates safe investment conditions (Baur, 2012). It is therefore important to understand the volatility behavior of gold markets for making hedging decisions (Ewing and Malik, 2013). The increased volatility of gold prices is an alert for the investors and exposes them to risk which in turn enhances investors' interest to understand the reaction of stock markets to the gold price volatility (Tully and Lucey, 2007).

The stock markets are impacted by various interrelated economic factors and a complex connection between these factors. However, macroeconomic variables such as gold prices, crude oil prices and their volatilities have a more profound impact on stock

Abstract: This study determines the variables influencing capital structure of firms. Firms would adapt themselves according to the economy and formulate a capital structure that would maximise their shareholder wealth. A total of 11,341 firm years from the year 2000 to 2015 are taken. This study reviews various theories (trade off theory, agency theory, pecking order theory) of capital structure. The results of this study suggest that profitability, non-debt tax shield, growth opportunity, liquidity and age of firm are negative and significant whereas size, assets tangibility is positive significant impact on the capital structure of firms. The findings allude to the reinforcement of pecking order theory which leads to establish that capital structure models forged in developed countries. It would be a helpful reference to managers/executives responsible for designing the capital structure of a company in such a corporate environment which can help to achieve the objective of shareholder's wealth maximisation.

CLASSIFICATION OF RETAIL INVESTORS A BEHAVIOURAL STUDY

Satyapriya Mishra, Biraj Kumar Mohanty**, and Raveesh Krishnankutty****

Abstract: *Investors around the world often fail to succeed in the stock market due to shortcomings in their personalattributes and approach to investment. There are numerous studies on the personal attribute of the investor but only few studies have looked into the approaches to investment in market situations. This is an empirical study which aims to classify retail investors based on their Pre Investing and Post investing approaches. We have used Exploratory Factor Analysis to identify various investor types on the basis of their approach and categorize them as Market-driven, Planning-driven, Safety-driven, Advice-driven, Time-driven, Caution-driven investors. Further, we check how the contributing approaches lead to expected return for each investor type. We find Market, Planning, and Caution- driven investors are able to achieve their expected return, whereas Advice-driven investors are not able to do so. Our study indicates that planning at individual level, market driven strategy and ability to book loss are useful in fetching desired return by the investor. Both time-driven long term investors, investing on the advice of friends and safety driven investors, who display safe approach by choosing good broker/good advisors and tangible companies, are found not to achieve expected return. Investors depending fully on brokers' advice may end up making loss in the market. The study will help in providing investor specific education by identifying their behavioral weakness.*

Keywords: *Investor Categories, Approach to Investment, Investor Behaviour.*

Achieving supply chain resilience: the contribution of logistics and supply chain capabilities

INTRODUCTION

Increasing awareness of supply chain disruptions and associated vulnerability has posed a serious challenge to the conventional thinking that the core aim of supply chain management should be upon cost and efficiency only (Juttner and Maklan, 2011) and must include risk mitigation strategies (Wieland and Wallenburg, 2013). Identification of these threats has triggered calls for effective risk mitigation through the development of resilient supply chains (Wieland and Wallenburg, 2013). Supply chain resilience (SCRES) is the capability of responding to disruptions through adequate preparation well in advance and maintaining continuity of operations (Ponomarov and Holcomb, 2009).

There is a dearth of sufficient empirical research in the area of supply chain risk management (Wieland and Wallenburg, 2013). In the domain of supply chain risk management, it is said that resilience plays a dominant role in restoring operations and mitigating risk; however the means needed to achieve resilience are not sufficiently explored (Ambulkar et al., 2015).Additionally, even recent supply chain risk management definitions urges for a collaborative approach among supply chain members (Scholten et al., 2015); the interplay between integrated logistics capabilities, supply chain capabilities and supply chain resilience remained unexplored, so far. While integrated logistics capabilities are the resultant of unifying the individual firm (firms partnering in a supply chain) level logistics capabilities at the supply chain level (Gligor and Holcomb, 2014); supply chain capabilities are the capabilities that help the efficient and effective execution of overall supply chain activities (Juttner and Maklan, 2011).
So the current investigation addresses the following research gaps:

(1) What is the inter-relationship between integrated logistics capabilities and supply chain capabilities?
(2) What is the relationship between supply chain capabilities and supply chain resilience?
(3) What is the inter-relationship among the supply chain capabilities?

THEORETICAL BACKGROUND

Supply Chain (SC) Resilience

SC Resilience received fairly conceptual attention at the beginning and empirical explorations following thereafter. Ponomarov and Holcomb (2009) in their conceptual framework posited that certain logistics capabilities (demand management capabilities, supply management capabilities and information management capabilities) when integrated appropriately will lead to supply chain resilience; which in turn will lead to sustainable competitive advantage. The study however argued that top management support, risk sharing routines will eventually impact various stages of the above conceptual framework. Following this, Pettit et al. (2010) conceptualized resilience as a balanced state constituting of vulnerabilities and capabilities.

Subsequently, Juttner and Maklan (2011) observed SC risk effect management and SC risk knowledge management to enhance SC resilience by improving the flexibility, visibility, velocity

Abstract: This study has proposed a Partner Relationship Management (PRM) index including the impact of relationship between manufacturers and channel partners on customers in Indian automobile sector. In-depth interviews and a standard methodology for scale development were followed by extensive literature review. Questionnaire survey of automobile customers, manufacturers and channel partners belonging to NCR and southern region of India was carried out. Initially for proposing PRM framework, a total of 330 responses were collected and analysed by carrying out factor analysis. Then for proposing PRM index, a case-based methodology was used, with a total of 91 (customers) and 53 (employees of automobile organisations) responses. The major factors identified include trust, commitment enhancement, customer intimacy, relationship enhancement and customer orientation. The proposed index will help in judging the impact of services on customers and possible areas for improvement with prime motive of enhancing the customer satisfaction scores on a continual basis.

Effect of Economic Factors on Fertility in Uttar Pradesh: A Regression Analysis

Shubhagata Roy*
K.K.Singh**

Under-five mortality.

Abstract

Fertility has always been compared with the socio-economic condition of people in almost every society. But, with the development of societies, high fertility became a challenge for the couples as upbringing of children incurred heavy costs. Studies suggest that the positive relationship between income and fertility is dependent on relative income (Easterlin, 1969 & 1973). The cost-benefit analysis of children suggests that the fertility decision of couples is based on the balance between advantage and disadvantage of an additional child (Leibenstein, 1953). Bongaarts (1978) had earlier talked about a set of 'proximate determinants' through which 'modernization' acts upon fertility levels. These proximate determinants include, for instance, deliberate fertility control, postpartum infecundability, waiting time to conception etc. among others. Easterlin has further added a set of 'intervening variables' between modernizations and 'proximate variables'.

In India, although child-births are declining, but level of total fertility is still on the higher side. The reasons for this decline may be attributed to change in age of marriage, mother's age at first birth, contraceptive usage, female's autonomy, breastfeeding practices etc. The present study determines the effect of various economic variables, suggested by Easterlin, viz., demand for children, supply of children and fertility regulation factors, on fertility behaviour among the females of Uttar Pradesh based on NFHS-1, NFHS-2 and NFHS-3 data. Efforts have been made to find out the most dominant factor which contributes the most towards fertility decline.

ABSTRACT

Fortune 500 organizations are executing their tasks using projects. Project management is the area of concentration across the world. Different stakeholders have a different perspective about project success. The meaning of project success had been explained in this article. In addition, the Project Critical Success Factors (CSFs) were mentioned. The research of Standish Group on project success and project success metrics was presented. Earlier research on the meaning of project success and project critical success factors was highlighted. The works of Jeffery K. Pinto and Dennis P. Slevin, David and Adam, DeLone and McLean, and The Standish Group Research were discussed in this article. The methodology included secondary research based on literature view of prominent empirical studies and the literature reviews by making note of findings and observations from those studies. The initial literature collected led to further search of articles based on their references. The research findings indicate that the top of the most success factors for many projects include project objective, top management commitment, competent project team, and user involvement.

Keywords: project success, Critical Success Factors (CSFs), software projects

INTRODUCTION

Billions of global IT spending is becoming waste or failure because of several reasons (Krigsman, 2012). If the people issues are kept aside, project management is one among the critical areas which may make a project success or failure. The main research questions are when people say a project is successful, and what the success factors for any project are. These become research questions because there are different perspectives, opinions, and practices to these questions in the literature. This research problem is addressed using the secondary research with several steps. First, keywords are identified related to the research problem. Then, the literature review based on the keywords are gathered using scholarly articles available over the Internet. The theoretical studies which give inputs to the problems in the questions include Haleem et al. (2013), Holgeid and Thompson (2013), Mian (2105), and Goff (2011). A project is considered a success if the project management is a success and the project product is a success (Shojaie *et al.*, 2016).

People say that a project is successful as far as project management is concerned if the project is complete within time, within the given budget and meets the customer requirements with the specified quality (Bodicha, 2015). Similarly, there are various parameters based on which people consider project product is successful. Different stakeholders of the project such as project manager, team members, senior management, functional managers, CEO, directors, suppliers, vendors, customers and third parties have a different perspective on project success (Ramos & Mota, 2016). For example, a project which is considered as successful by senior management may not be considered as successful by team members. This is because the team has worked extra hours and weekend as well (Project Management, 2016). Similarly, a project considered as a success by a project team may not be considered as a success by the customer. This is because the project is delayed by 20% and the costs go out of the track by 30%. Thus

IPv6 Low Power Wireless Personal Area Network (6LoWPAN) for Networking Internet of Things (IoT) – Analyzing its Suitability for IoT

C. Lakshmi Devasena*

IBS Hyderabad, A Constituent of IFHE, Deemed to be University, Hyderabad - 501203, Telangana, India; devaradhe2007@gmail.com

Abstract

Background/Objectives: Internet of Things (IoT) is going to govern the future world where all devices will be connected with each-other. The expectation with the Internet of Things is that the increase in number of devices going to be truly dramatic. **Method:** With the increase in the number of devices, the amount of traffic will grow together with data. IoT will have huge number of power sensitive smaller devices and they're going to put significant constraint on the total bandwidth of the system. This paper analyses how 6LoWPAN, a practical developed for resource constrained IP based systems suitable for Internet of Things with respect to Internet Protocol. **Findings/Applications:** Internet protocols used to be fine-tuned, modified, changed to be able to accommodate the era of Internet of Things. 6LoWPAN has different features like, support for 64 bit or 16-bit addressing, targeted at low power networks including Bluetooth low energy, header compression for IPv base as well as for UDP headers, network auto configuration and neighbor discovery, support for multicast, unicast, and broadcast, supporting the concept of fragmentation. This makes 6LoWPAN a best suited protocol for IoT.

Keywords: 6LoWPAN, Communication Protocol, Internet of Things, Internet Protocol, Smart Device Integration

1. Introduction

Internet of Things, an emerging technology that can attach all small devices with limited capability that operated by the user's control to the Internet. According to Gartner, "26 billion or more devices will be cross connected to create and innovate business opportunities"[1]. Wireless Sensor Networks (WSNs) have been recognized as very significant block of this inter-networking concept. Next-generation Internet enabled portable devices will set up advanced interactions with other devices and will make up the new Internet of Things and will result an omnipresent infrastructure[2]. Such a wide perception requires stable foundations, starting from a extensively agreed protocol and communication infrastructure, which is identified in the 6LoWPAN protocol suite[3]. 6LoWPAN is an significant enabling technology allows to combine newer and older Web services, as well as to support the IoT interaction paradigm. 6LoWPAN used to implement many IoT applications, since it replaces the Internet Protocol for communication. An example of application in Smart Lighting implemented and illustrated in[4]. Apart from that, it could be used to integrate different smart devices in health care to alert patient's information to the medical professionals[5], it could be used to monitor and control the power consumed by various home appliances[6]. This paper analyses the suitability of 6LoWPAN for Internet of Things.

2. Internet Protocol Address Space Increase

Internet Protocol (IP) is the communication protocol in the TCP/IP suite, which is normally used to do different functions like routing, delivering packets and determining packet structure. In 1974, when IP is introduced, it used 8 bits for addressing. And supported total number of two

Abstract

A pair of mixed integer linear programming model is developed for manufacturers to formulate e-waste collection outsourcing strategy in India. The pair consists of single and multi-period decision models for manufacturer to choose from based on their requirement.

Keywords

E-waste collection, outsourcing strategy, Indian electronic products manufacturer

Introduction and Motivation

The E-waste (Management and Handling) Act, 2012 mandates a manufacturer to engage in collection of e-waste activity in-house or outsource to independent collection firms (ICFs). Past literature on the collection activity outsourcing strategy was limited to collection of used products by a single collection firm in single period context (Atasu, Toktay, & Van Wassenhove, 2013; Savaskan, Bhattacharya, & Van Wassenhove, 2004).

In real-life situation, a number of potential independent firms are available at various locations to the manufacturer, to perform e-waste collection at dissimilar transfer prices. The quantity of the e-waste delivered to a collection firm is uncertain but can be estimated. The e-waste is disposed by consumers in multiple periods. Under these conditions, a manufacturer has to optimally select ICFs and in-house collection facility for performing e-waste collection for minimizing costs.

Abstract

In this paper we investigate the behaviour of exchange rates in the Central and Eastern European countries. The results strongly indicate that interactions between exchange rates have different characteristics at different timescales. Our results show that CEE exchange rates are nearly perfectly integrated in the short and medium run, since the returns obtained in any of the CEE foreign exchange market can almost be explained by the overall performance in the other CEE markets. The discrepancies between CEE exchange rates are small, but increase within three to six months and that means in the long run the integration of foreign exchange markets is weak.

Keywords: Exchange rate; Co-movements; Wavelet analysis

JEL: F31, C10, C51

1. Introduction

The introduction of the Euro in January 1, 1999 was undoubtedly one of the most important events that stimulated the regional integration in European Union. Due to the continuous enlarging of the euro area with new members that will subsequently adopt the common currency, the non-euro foreign exchange markets in Central and Eastern European countries (CEEC) became interdependent. They face similar behaviours, even though sometimes only one or two countries are affected by internal or external shocks.

In this paper we use the wavelet methodology to investigate the co-movement of exchange rates from CEEC in the time – frequency space and provide new insights on the exchange rate co-movements in selected CEEC, given the status of the Euro as anchor currency in this region.

This research is relevant in a wider context of exchange rates prediction literature. In their seminal paper, Meese and Rogoff (1983) found that the best exchange rate forecasting model is the "random walk", that is it generates better forecasts that economic models. Since then the efforts of academia were oriented to identify new models, predictors, estimation methods,

Abstract

Purpose – The purpose of this paper is to reveal the influence of social media in the development of brand sacralization in young consumers in emerging Asian market. Brand sacralization is the phenomenon where consumers (especially young) become an adherent of brands and consider brands as sacred entities. The paper specifically explores the influence of social media interaction and social media usability on brand sacralization and consequently its influence on online purchase intention (PI) and brand loyalty.

Design/methodology/approach – Perceptual responses were gathered from 232 undergraduate and postgraduate students (age: 17-27 years) studying in an Indian private university and is subsequently analyzed using structural equation modeling. The young population is chosen as the target sample as they possess majority stake in final product purchase decision nowadays and also contribute as a dominant consumer category in online market places.

Findings – The researcher found a strong positive influence of social media interaction and social media usability on brand sacralization. Further, brand sacralization is found to have a positive and significant influence on online PI and brand loyalty of young consumers. However, social media interaction does not contribute significantly to usability of social media. The researcher has also found a significant influence of brand loyalty on online PI for these young shoppers.

Originality/value – The study is the foremost to investigate the influence of social media in developing brand sacralization and its influence on online PI and brand loyalty. Further the study is the first to develop a measurement instrument for brand sacralization. The study is the foremost in developing measures for social media interaction and social media usability.

AN INTEGRATED-EMPIRICAL LOGISTICS PERSPECTIVE ON SUPPLY CHAIN INNOVATION AND FIRM PERFORMANCE

Santanu MANDAL[1], Venkateswar RAO KORASIGA[2]

Department of Operations and IT, IFHE University, IFHE Campus, Dontanapally, Shankerpalli Mandal, RR District, Andhra Pradesh-501203, India

Received 16 October 2014; accepted 20 May 2015

Abstract. Supply chains need to innovate constantly for maintaining their position in the marketplace and also to fight uncertainties. Hence firms are focusing on strategies for developing supply chain innovation. The current investigation adds to this emerging regime through investigating the influence of logistics capabilities viz. demand management capability, supply management capability, information management capability and coordination capability on supply chain innovation through logistics integration. Further, supply chain innovation helps a firm to sustain its position in the market place through generation and launching of new products and services. Accordingly, the influence of supply chain innovation on firm performance is also investigated. Data is collected from logistics, purchasing and supply chain professionals working in different industries in India. The findings based on 169 responses largely support our proposed relationships.

Keywords: supply chain innovation, logistics capabilities, demand management, supply management, logistics integration, firm performance, dynamic capability.

JEL Classification: C12, C42.

Introduction

Supply chains are more complex (Gunasekaran *et al.* 2008) and are becoming more prone to disruptions with increasing environmental uncertainties (Wagner, Bode 2008). In this context, firms are forced to contemplate on strategies and capabilities that can address these growing uncertainties. Thus today's supply chain has to respond proactively to these environmental conditions. Hence innovation in supply chains becomes a dire necessity not only to respond proactively to disruptions and uncertainties; but also to gain a competitive advantage in the market. Possibly, this may be the reason for identifying the most innovative organization by ACSCMP (American Council of Supply Chain Management Professionals) and rewarding the same with their "Supply Chain Innovation Award". Arlbjørn, Haas and Munksgaard (2011) noted in this regard "... *among the nominees have been prestigious organizations such as the U.S. Air Force, Motorola, Kellogg's, and Blockbuster Inc. The list of award winners includes companies like Intel, Cisco Systems Inc., and Hewlett-Packard. The winner is selected out of 45–50 submissions each year, based upon criteria related to the degree of innovativeness, impact on overall supply chain, and sustainability in results (revenue, cost savings, etc.)*".

However, supply chain innovation is a must therefore for the following reasons: (a) for gaining competitive edge in the market (b) for managing the different types of risks prevailing in the supply chain (Wagner, Bode 2006) and (c) for meeting proactively the different forms of uncertainties in the adjoining environment. But for developing innovative supply chains, firms must ascertain its various logistics capabilities and align them in an appropriate manner. As logistics are an essential part of supply chain (Mentzer *et al.* 2004); firms cannot develop an innovative supply chain without integrating the dominant logistics

ABSTRACT

The present paper examines levels and trends of fertility decline in Uttar Pradesh, which has occurred over time. The two major factors viz. wanted fertility and unwanted fertility have been the theme of several discussions over decades, among other aspects of population policy. Wanted births are those which are planned by couples and accepted socially, whereas unwanted births are those which do not adhere to certain social norms and may be categorized as illegitimate births, births after achieving a desired family size, births after marriage of own children etc. The study of unwanted pregnancy has been essential to demographers and public health practitioners to understand the levels of fertility and prevent unwanted childbearing. However, still a large number of the Indian women are forced to give unwanted births and this can be observed from the reports of NFHS-1, 2 & 3. Rural women in Uttar Pradesh are still having more children than their urban counterparts and the unwanted fertility rate is also higher. The fertility differentials exist by residence, education, religion, and caste/tribe in Uttar Pradesh. Research on wanted and unwanted components of fertility can lead to frame important policies which in turn may bring considerable decline in fertility and enhance the well-being of mothers and children. This paper measures the unwanted fertility by comparing total wanted fertility rate with the total fertility rate in Uttar Pradesh, which will ultimately help policymakers in designing proper action plan so that replacement level fertility can be achieved.

1. Introduction

Fertility transition can be attributed to the decline in wanted and/or unwanted births. The comparative involvement of these two sources of fertility decline has been one of the highly debatable subjects from decades, among others, because of its direct consequence on the population policy. In particular, if the decline in unwanted fertility is relatively large, then it becomes helpful in implementing the family planning services more effectively which may lead to reduction in total fertility. Unwanted births often occur due to lack of ability or intention of having a desired family size and timely usage of contraception of any form. Births or pregnancies may be unwanted because they pose a serious threat to health of mothers or children. Moreover, they do not match with certain social norms i.e. illegitimate births, births after marriage of own children, births after achieving a desired family size etc. Unwanted births falling in the last category are often of considerable extent and cause serious concerns in developing countries with high levels of fertility and population growth (Westoff, 1981; Blanc, 1982; Lightbourne, 1985; United Nations, 1987; Bongaarts, 1990 & 1997).

Bongaarts (1990) examined the levels of unwanted fertility using data from various countries from World Fertility Survey (WFS) and Demographic Health Survey (DHS). He found that the proportion of unwanted births was low in countries with very low or very high levels of fertility and highest in countries with intermediate levels of fertility. He further found that the trend in unwanted fertility had an inverted U-shape, means low in pre-transition stage, high in transition stage and again low in post-transition stage. The same reports reveal that the states which have achieved replacement level fertility and considered as developed (like Kerala, Andhra Pradesh, Tamil Nadu etc.), the unwanted fertility is only around 20 percent of the total marital fertility.

The study of unintended pregnancy has been vital for demographers in understanding the levels of fertility, to public health practitioners in preventing unwanted childbearing and to both group in promoting a women's ability to determine whether and when to have children. However, still a large number of the Indian women are forced to give unwanted births; consequently unwanted fertility rate is very high in India as per the reports of NFHS-1, NFHS-2 & NFHS-3. Studies also suggest that the type of residence, age, number of living children, marital status and socioeconomic factors including highest educational attainment and employment status are some crucial factors affecting unwanted pregnancy/birth (Westoff, 1981; Kulkarni et al., 1998; Dixit et al., 2012; Dutta et al., 2015). Hence, proper impetus needs to be given in this area which is creating a big difference in the overall development of states. Where unintended pregnancies/births are higher as compared to the developed states.

Out of the five most populous states, Uttar Pradesh stands second in terms of high total fertility rate, Bihar being the first. The rural women are still having more children than their urban counterparts and the unwanted fertility rate is also high. The fertility differentials exist by residence, education, religion, and caste/tribe in Uttar Pradesh. Research on wanted and unwanted components of fertility can lead to frame important policies which in turn may bring considerable

A RE-EXAMINATION OF REAL INTEREST PARITY IN CEECs USING OLD AND NEW GENERATIONS OF PANEL UNIT ROOT TESTS

ClaudiuTiberiuAlbulescu[a,b*], Dominique Pépin[b], AviralKumarTiwari[c]

[a] Management Department, Politehnica University Timisoara, 2, P-ta. Victoriei, 300006 Timisoara, Romania

[c] Faculty of Applied Economics, ICFAI University Tripura, West Tripura, 799210 Pin, India

ABSTRACT

This study applies old and new generations of panel unit root tests to test the validity of long-run real interest rate parity (RIP) hypothesis for ten Central and Eastern European Countries (CEECs) with respect to the Euro area and an average of the CEECs' real interest rates, respectively.When the panel unit root tests are carried out with respect to the Euro area rate, we confirm the results of previous studies which support the RIP hypothesis. Nevertheless, when the test is performed using the average of the CEECs' rate, our results are mitigated, revealing that the hypothesis of CEECs' interest rates convergence cannot be taken for granted. From a robustness analysis perspective, our findings indicate that the RIP hypothesis for CEECsshould be considered with cautions, being sensitive to the benchmark.

Abstract

This article applies the Bickerdike–Robinson–Metzler (BRM) model to examine the effect of the exchange rate of Indian rupee vs the US dollar on India's trade balance. Using the elasticity of absorption approach, we consider the link between macroeconomic variables and trade balance. We also explore the existence of J-curve relationship. The study period, 1965 to 2008, is hallmarked by major shifts in global politico-economic landscape which can potentially cause structural break in the series. Our test of stationarity properties can explicitly capture this feature in the data. We use the autoregressive distributed lag (ARDL) bounds testing approach for a long-run relation, and the impulse response functions (IRFs) and the variance decomposition method (VDM) for the short-run dynamics. We find (a) cointegration, (b) positive impact of depreciation of rupee against the US dollar on India's trade balance and (c) a J-curve relation. The findings have implications for policy for India and its neighbours.

Focus

Challenges to Agriculture Sector in Telangana Economy

KOTI REDDY AND I. R. S. SARMA

This paper examines the performance and challenges to the Telangana agricultural sector. The study using the annual data for the period 2004–05 to 2014–15 reveals that the structural change in the composition of Gross State Domestic Product by Industrial origin is the consequence of the process of economic growth during the last 10 years. In this paper an attempt has been made to study reasons for backwardness of agricultural sector in Telangana economy. The key challenges documented are related with small size of land holdings, low yields and high risk, lack of assured irrigation, growing indebtedness of the farmer households, weak institutions, and poor infrastructure. The study highlights that in order to overcome the challenges and unleash the opportunities, there is a need to reform agriculture sector, invest in agriculture, optimum utilization of micro irrigation potentiality, reprioritize agricultural research, connect invention and innovations, link farmers with markets, strengthen institutions and improve infrastructure.

Dr Koti Reddy, Professor in Economics, IBS, Hyderabad (a constituent of the ICFAI Foundation for Higher Education),
Dr I. R. S. Sarma, Associate Professor in Economics, IBS, Hyderabad (a constituent of the ICFAI Foundation for Higher Education).

Introduction

Agriculture has been the backbone of Telangana's economy. In Telangana, the agriculture sector is mainly rain fed and depends to a significant extent on the depleting ground water. Good performance of this sector is vital for inclusive growth. Telangana went in for the Green Revolution in rice cultivation in the 1970s. There have been significant changes in the structure and performance of the agrarian economy in the state in the recent years.

As nearly as 55.49 percent of the state's population is dependent on some form of farm activity for livelihoods, it is imperative to increase the farm incomes and ensuring sustainable growth in Telangana to reduce poverty. Highest priority is accorded to the agriculture sector in the state with the objective of shifting the excess labour force from this sector to other non-farm rural sectors such as rural industry through skill development. Ensuring food security and provision of gainful employment continue to be the essential premise of the socioeconomic development and employment guarantee schemes like MGNREGS and rural livelihoods programmes. The rural areas are the biggest markets for low-priced and middle-priced consumer goods, including consumer durables. Besides, rural domestic savings are an important source of resource mobilization. Any change in the agricultural sector, positive or negative, will have a multiplier effect on the entire economy. Besides, the allied sectors like horticulture, animal husbandry, dairy and fisheries have an important role in improving the overall economic conditions and health and nutrition of the rural masses. Telangana agricultural system is predominantly a mixed crop–livestock farming system, with the livestock segment supplementing farm incomes by providing employment, draught animals and manure.

US economy

ABSTRACT

In this study, we examine the time-varying correlations between output and prices, while controlling for the impact of the monetary policy stance and output and inflation uncertainties over the period 1800–2014. The results of the empirical analysis reveal that the dynamic correlations of output and prices were typically negative, suggesting a countercyclical behaviour of prices, apart from the early 1840s and from the beginning until the middle of the 20th century, when the correlation was positive, indicating a procyclicality of prices. A historical decomposition analysis based on a sign-restricted structural vector autoregressive model is able to relate the procyclical and countercyclical behaviour to the predominance of aggregate supply and aggregate demand and/or monetary policy shocks, respectively. Moreover, inflation uncertainty (monetary policy stance) was found to have a positive (negative) effect on inflation over the last 215 years.
© 2016 Elsevier B.V. All rights reserved.

1. Introduction

An important question in the business cycle literature is whether prices are procyclical (i.e., output and prices move in the same direction) or countercyclical (i.e., output and prices move in the opposite direction). However, this issue has remained unanswered for the US economy, given that evidence in this regard has been mixed (see Lee, 2006; Konstantakopoulou et al., 2009; Haslag and Hsu, 2012; Brock and Haslag, 2014; Keating and Valcarcel, 2015; and references cited therein for a detailed literature review).

While Friedman and Schwartz (1982) provided evidence that prices are procyclical, this view was challenged by Kydland and Prescott (1990), Cooley and Ohanian (1991), Backus and Kehoe (1992) and Smith (1992) suggested that the contradictory evidence is contingent on the sample period and hence the nature of the underlying macroeconomic shocks driving the business cycle.

STRUCTURE AND DEVELOPMENT IN THE RESIDUARY STATE OF ANDHRA PRADESH : 1960-2015

T. Koti Reddy

INTRODUCTION

The Residuary State of Andhra Pradesh has three distinct regions which are at different stages of socio-economic development, viz. South Coastal Andhra, North Coastal Andhra and Rayalaseema. The state has a total of 13 districts, the Anantapur District is the largest and Srikakulam District is the smallest district. The districts are divided into three regions of the state, i.e., North Coastal Andhra, South Coastal Andhra and Rayalaseema. North Coastal Andhra comprises 3 districts (Srikakulam,Vizianagaram and Visakhapatnam), South Coastal Andhra 6 districts (East Godavari, West Godavari, Krishna, Guntur, Prakasam and Sri Potti Sri Ramulu Nellore) and Rayalaseema region comprises the remaining four districts (YSR, Kurnool, Chittoor, and Anantapur).

South Coastal Andhra region is located in between the river Godavari in the north and river Krishna in the south, there are natural factors that have offered extensive possibilities of expanding irrigation through canal system, mostly due to the advantage of delta and the natural gradient which can be exploited very well by canal irrigation. North Coastal Andhra has high-potential rivers like the Vamsadhara and the Nagavali. On the other hand, Rayalaseema region is not able to access river water due to lack of gradient. But the natural advantage of 'tank' irrigation was even less in Rayalaseema. Thus Rayalaseema is the most disadvantaged in terms of access to irrigation of any type in the state of AP (Sri Krishna Committee 2010). The per centage of people below the poverty line in Andhra State in 2011-12 has been estimated as 14.7 per cent in rural areas and 20.6 per cent in urban areas and 16.3 per cent for the state as a whole (Rangarajan Committee).

GROWTH PERFORMANCE OF THE STATE : A REVIEW

The Gross State Domestic Product at factor cost of Andhra state was Rs.8778 crore in 1960-61.Since then it rose to Rs.35697 crore in 1993-94.In 2012-13 the Gross State Domestic

AGRICULTURAL CREDIT FLOW IN ANDHRA PRADESH : ACTION PLAN AND STRATEGIES

Subhendu Dutta & C.S. Shylajan

INTRODUCTION

Credit is a catalyst that helps to accelerate the farm and non-farm sector development of an economy. Investments in farm can generate farm income sustainably when credit is adequately supported by backward and forward linkages, viz. inputs of production, technology and services.

> *"Credit is often a key element in the modernization of agriculture. Not only can credit remove financial constraint but it also accelerates the adoption of new technology. Credit facilities are also an integral part of the process of commercialization of the rural economy. However, no amount of credit even at the most reasonable rates can guarantee higher productivity or income among the rural poor, as the success depends upon many factors including the availability of inputs and services, sound credit policies, well-managed institutions and appropriate delivery channels" (The World Bank, 1975).*

The credit flow to agriculture, more importantly after introduction of financial sector reforms in early-nineties, increased from Rs. 2,85,146 crore during the 9th Plan [1997-2002] to Rs.6,91,739 crore [243%] during the 10th Plan [2002-07]. Credit disbursement during the 11th Plan [2007-12] further increased to Rs.19, 20,400 crore [277%]. As against annual average disbursement of Rs. 57,029 crore, Rs.1,38,348 crore and Rs.3,84,080 crore during previous three plans the disbursement during 2012-13 alone was Rs. 6,07,375 crore, exhibiting significantly high growth of credit year after year. However, studies have brought up some issues related to flow of agricultural credit in India. First, improvement of crop productivity and output has been not so satisfactory; second, there has been a significant disparity in the flow of credit among States; third, there are significant imbalance between short-term and term loans and also between credit disbursed to agriculture and allied activities; and fourth, institutional credit is not easy to access by small, marginal and tenant farmers.

Time-frequency relationship between U.S. output with commodity and asset prices

Aviral K. Tiwari*, Claudiu T. Albulescu** and Rangan Gupta***

Abstract

Commodity and asset prices have a well-documented effect on economic growth, manifested through various channels. At the same time, the business cycle influences the commodity and asset prices. Whereas empirical evidence on the effect of commodity and asset prices on the long-run economic growth is ambiguous, most of the previous researches highlight a positive correlation in the short-run. The aim of this paper is to disentangle the short- and long-run co-movements between U.S. historical business cycles and commodity and asset prices, over the period 1859-2013. For this purpose we use a time-frequency approach and we test the historical influence of oil, gold, housing and stock prices, over the output growth. Different from other studies, we control for the effect of other prices and monetary conditions, using the wavelet partial coherency. In line with the previous works, we discover that co-movements between economic growth and commodity and assets prices manifest especially in the short-run. We also find that stock returns and housing prices have a more powerful effect on the U.S. economic growth rate than the oil and gold prices. The long-run co-movements are documented especially around the World War II. Finally, when controlling for the influence of the interest rate, inflation and other commodity and asset prices, co-movements become weaker in the short-run. In general the oil and housing prices lead the GDP growth, the U.S. output lead the gold prices, while there is no clear causality direction between business cycle and stock prices.

Keywords: Commodity and asset prices, economic growth, U.S. business cycle, historical co-movements, wavelets.
JEL codes: E32, C22, N11, N12.

1. Introduction

The impact of commodity prices, as well as the impact of real and financial asset prices on the economic growth is well-documented by the literature. The influence of different commodity prices, real estate prices and stock prices is heavily investigated. However, the empirical evidence on the short- and long-run effects of commodity and asset prices on the economic growth remains ambiguous. Therefore, given the strong fluctuation of these prices, a clear understanding of their correlation with the business cycle is crucial for anticipating the state of the economy.

The existing literature provides unambiguous link between economic growth, and commodity and asset prices. Several questions remain without a clear answer. Which are the similarities between the historical and the present co-movements of economic growth and commodity and asset prices? Is the influence of commodity and asset prices on the economic

Abstract

The present study tries to examine the relationship between Locus Of Control (LOC) and Happiness, among postgraduate students in India. Moreover, the study also examined the moderating role of gender between the above said relationship. Data were collected from postgraduate students, by using self-administered survey questionnaires. Data analysis showed that there was significant positive relationship between LOC and Happiness among students in India. No gender-wise differences were found in the sample, regarding LOC and Happiness level.

Key words: Locus of Control, Student Happiness, Gender Differences.

JEL Code: I3

1. Introduction

Locus of control consists of the degree to which people report a sense of personal control in daily occurrences and this concept has been dichotomized into internal and external locus of control **(Rotter, 1966)**. Individuals, with an internal locus of control, perceived that occurrences are the outcome of their own acts while individuals, with an external locus of control, perceived that the occurrences are the outcome of chance, luck, or the impact of other people. Especially, internality refers to the perception that the individual is in control or influential in obtaining benefits from the environment around them while externality refers to the perception that benefits are out of the individual's control and they are driven by chance or luck. It is speculated that the variable, LOC, is significant in understanding the nature of the learning process of an individual in different learning environments. This variable also helps in understanding the degree to which an individual conceives personal control as an internal or external locus of control of reinforcement. Social learning theory provides the general theoretical background for this concept of reinforcement **(Rotter, 1966)**.

Trust Betrayed – Depraved Doctor or Negligent Hospital?

Madasu Bhaskara Rao* and Madasu Mallika Rao**

Medical ethics is a system of moral principles that apply values and judgments to the practice of medicine. Medical ethics encompasses its practical application in clinical settings as well as work on its history, philosophy, theology, and sociology. The top ranking Johns Hopkins Hospital agreed for settlement of US$190 mn in July 2014 in a class action suit, the largest ever in the history of hospitals in America, for gross violation of doctor-patient trust in a case of medical malpractice. The hospital failed to protect the patient privacy rights, in evaluating existing employees and ensuring that employee performance meets the standards, norms and metrics. An obstetrician-gynaecologist betrayed the trust of patients by 'harmful and offensive sexual' contact and covertly taking pictures of their intimate parts. In this medical malpractice, nobody died because of a doctor's error. Nobody was injured. The doctor did not fail to diagnose a critical condition, nor did he have an extramarital relationship with patients. There was no evidence that the doctor shared the secretly taken images with anyone. Pelvic examination was not performed on unconscious surgical patients without their knowledge and yet the hospital faced the largest settlement ever as women were devastated due to the feeling of an extreme breach of faith, breach of trust and betrayal. The multidisciplinary nature of this case makes it interesting and serves the learning needs in human resource management, hospital administration, patient right laws, and ethics in governance. This case is an eye opener for corporate hospitals.

Do I need to take a security guard to the gynaecologist? Maybe I do"[1] lamented Maria Lennon, a victim of Dr. Nikita A Levy, a Johns Hopkins obstetrician[2]-gynaecologist[3] who secretly videotaped and photographed his female

Know Your Talent at Risk – A Tripolaire Envisaging Archetype

K Pradeep Kumar[1]
Radha Mohan Chebolu[2]
S Suman Babu[3]

ABSTRACT

Risk of talent attrition is no mirage. The anatomy of employee ambitions remains an interesting subject to distill. Employee loyalty, retention and engagement is as significant as customer loyalty. An enterprises' positive inclination towards social engagement of employees at workplace has a greater impact on latter's employment continuity and commitment than monetary rewards. The average service years rendered by the present generation of professionals is reducing and notably enterprises are estimating the costs associated to the retention phenomenon. Such talent drain affects the enterprise strategy, execution, business knowledge etc. and many a times is no gain to the next employer. Several talent management frameworks like performance management system, 9 box assessment and competency model exist to identify star performers and high potentials. These star talents are scarce and hence are classified and revered by an enterprise. Knowing the flight risk of the 'talented few' with core business knowledge is vital essentiality of an enterprise. This research article delves industry experiences and the prudence of flight risk of employees and comprehends their engagement parameters based on inputs received from over 1100 professionals across geographies in tripolaire aspects of attraction, retention and attrition in three industry segments of manufacturing, service and IT & ITeS at three different organizational hierarchiesin a novel methodology with strong use of empirical and literature findings.

KEYWORDS: *Talent Segmentation, Talent Management, Employee Loyalty Index, Talent Risk, Tripolaire Archetype.*

INTRODUCTION

The traditional talent management practices will be outpaced in this information age, Carrie, 2015. While high performers have increased affective commitment, it is

Performance Persistence of Indian Fund of Mutual Funds

S. MURUGANANDAN*
N. VIJAYAKUMAR**
PADMASANI***

Abstract

This paper examines the performance persistence of twenty seven Indian Funds of Mutual Funds (FoFs) during the period from April-2008 to March-2011. The performance measures such as average excess return, Sharpe ratio and Jensen's alpha are used to classify the sample funds as Winner or Loser and to create the 2×2 contingency table according to Goetzmann and Ibbotson (1994) methodology. Brown and Goetzmann Z-test, Malkiel's Z-test and Kahn and Rudd's Chi-square test is applied to examine the quarterly, half-yearly and yearly performance persistence. It is found that the performance persistence results are quite sensitive across study period intervals as well as alternative measure of performance that employed in this study. Moreover, it is observed that the source of persistence could be successive strong underperformers, which is evidenced by the large number of observed frequencies in the successive loser column. Hence, this study suggests avoiding past losers from the investors point of view.

I. Introduction

OVER A DECADE, mutual funds have gained popularity among the investors, who seek investment opportunities in financial markets, because mutual funds facilitate greater diversification through professional management at substantially lower cost. In recent years, numerous schemes of funds are made available to meet the needs of various investors. However, it is difficult for the investors to measure and identify superior performing funds and the quality of the management of the investment company as they do not have sufficient knowledge, time, cost and information about mutual funds. In order to overcome these problems, a new category of mutual funds is introduced, i.e., Fund of Funds (FoFs). FoFs are only an investment

Does contract size matter for price discovery and risk management in stock index futures?

Abstract

In an effort to increase the liquidity and accessibility to the investors, National Stock Exchange of India (NSE) had reduced contract size of its Nifty index futures two times from 200 to 100 and, subsequently, to 50 units. How does this change in contract size of index futures impact the informed and hedge based trading, thereby contributing to the twin objectives of price discovery and risk management, respectively? VAR model is applied to daily return volatility, volume and open interest to study the impact. Significant feedback relationship between volume and volatility following the reduction in contract size establishes the informational trading and price discovery. However, no causality from volatility to open interest implies contract size is not a determinant of hedging. But significant causality from open interest to volatility is establishing the non-informational and liquidity trading. So stock exchanges should consider the appropriate lot size before going for introducing new futures contract.

Keywords: VAR, price discovery, risk management, granger causality, variance decomposition, impulse function.
JEL Classification: G12, G14.

Introduction

Contract size is one of the important attributes of the futures contract. Because not only too large contract will inhibit small players to enter the market, but also making hedging difficult for big players. Again, changing contract size also impacts the relationship amongst the futures return volatility, and it's trading activity measured by volume and open interest. Because any change in market microstructure due to regulatory changes, it impacts the dynamics of the volatility, volume and open interest (Watanabe, 2001). This dynamic relationship plays important role in asset pricing and portfolio insurance and return predictability in futures market. Wang and Yu (2004) in their study in 24 US futures market confirm that short term profits on a contrarian portfolio (buying past losers and selling past winners) can be predicted from past trading activity variables such as volume and open interest. According to them, lag volume and lag open interest share a positive and negative relationship, respectively, with the current profit, so higher volume and lower open interest futures contract will give better contrarian profit. Further, in emerging market, index futures provide opportunity for excess risk adjusted return due to inefficiency characterized by higher persistence of return and volatility. In their comparative study of the performances of passive and active trading strategy on Taiwan stock index futures, Chiang et al. (2012) found that active index futures trading strategy outperform the passive, i.e., buy and hold strategy.

Ashutosh Dash, Ph.D., MBA, M.Com., MPhil, Associate Professor, Finance, Management Development Institute (MDI), India.

On part of the exchange, the objective of designing optimal contract size is to enhance the accessibility, attractiveness and liquidity of the futures contract, simultaneously achieving the two most important economic objectives of price discovery and risk management (Sibler, 1981). That's why redesigning the futures contract is taken as the last resort to attract the attention to unsuccessful contract wherever, diminishing in trading demand is observed (Bollen, Smith and Whaley, 2003). Apart from this, lower transaction cost and leverage attracts large number of traders to futures market making faster dissemination of information in futures market, thereby contributing towards price discovery function (Zhou et al., 2014). Also futures market helps players in managing the risk they are exposed to in the spot market (Darrat & Rahaman, 1995, Pericli & Koutmos, 1997; Darrat et al., 2002).

The study on redesigning of the contract size by Bjursell et al. (2010) found that reduction in size of the contract leads to increase in trading activities in terms of higher adjusted volume and open interest and also higher volatility due to increase in trading frequency. Further, greater liquidity in terms of lower spread and higher trading volume is documented following the reduction in contract size (Karagozoglu and Martell, 1999). Also, the study by Huang and Stoll (1998) predicted an increase in liquidity and smooth in price fluctuation following the decrease in contract size due to more participation of small investors who are so far restrained from the futures markets due to capital constraint because of higher contract value. However, Karagozoglu et al. (2003), in their study on the impact on price volatility of the reduction in contract size of S&P 500 trading in Chicago Mercantile Exchange (CME), reported no significant impact. Nevertheless, their result might have been confounded by the de-facto reduction in

An Analysis of Factors Contributing to the Performance of Employees in IT Industry: An Empirical Study.

- **Source:** IUP Journal of Computer Sciences . Jan-Apr2016, Vol. 10 Issue 1/2, p71-87. 17p.

- **Author(s):** Sastry Akella, S. S. K.; Venketeswara Rao, K.

- **Abstract:** The performance of an employee depends on different issues like ability, motivation, Perceived Organizational Support (POS) and job satisfaction. A lot of research has taken place on these factors in the general context of Human Resource (HR) development. But there is not much evidence on the relationship between the appraisal system and these factors. Due tofast changing technologies and demand for skills, the evaluation of performance of employees in Information Technology (IT) industry is becoming a challenging task for HR departments of the IT firms. In order to examine the factors contributing to the improvement of performance of employees in IT industry, this study conducted a survey among IT employees of various firms in Hyderabad. The responses of the employees were collected and analyzed. From the results, it is found that appreciation, feedback and follow-up action on the improvements required have a positive effect on employee motivation and POS. It is concluded that there is a need tofocus on appropriate follow-up mechanism so as to improve the performance of the employees.

Abstract

The study examines the causal relationship between daily price return and Net Asset Value (NAV) of the Exchange Traded Funds (ETF), from the listing date of each ETF to December 2013. The study employed Augmented Dickey Fuller (ADF) Unit Root Test for Price and NAV and Granger Causality Test. The study found that the daily time series of the Price and NAV of the selected ETFs were stationary in the first difference and the causality test revealed the existence of bidirectional relationship between them.

Key words: Exchange Traded Fund, Net Asset Value, Unit Root and Causality.

JEL : C58, C87, G11

1. Introduction

Over a decade, Exchange Traded Funds (ETFs) have become popular in India. ETFs are a group of securities, that are traded in recognized stock exchanges, throughout the trading days like stocks. This also tracks the performance of the underlying assets or the indices. The retail investors would buy ETFs in the secondary market and institutional investors would buy them in both fund houses and secondary markets. The ETF, as a financial product, was first introduced in the American Stock Exchanges, during 1993. The most popularly traded ETFs in the world are the QQQs (Cubes), based on the Nasdaq-100 Index, SPDRs (Spiders) based on the S&P 500 Index,

An Empirical Study on Factors Responsible for Not Buying Life Insurance in India: With Special Reference to Varanasi

Richa Gupta

Department of Finance and Accounting, IBS Hyderabad, India

Abstract

Life insurance is a financial product, which is generally meant for risk coverage. In fact, it is a risk management tool used for minimizing the inherent risk pertaining to economical value of life. India is a fast emerging economy, but still an under developed market for life insurance. As a matter of fact, life insurance is still considered an unsought product in India. Insured market accounts for 25% in India, which reveals that a major chunk of insurable population is uninsured. There are several reasons responsible for this gap. In order to find out such factors an empirical study has been conducted in the city of Varanasi, the cultural capital of India.

Key words: Life insurance, risk coverage, unsought product, uninsured, Varanasi

DOES OPTIMIZING THE CASH CONVERSION CYCLE AMELIORATE FIRM'S PERFORMANCE? UNRAVELING THE RELATIONSHIP IN THE INDIAN CORPORATE LANDSCAPE

Nityanand Tripathi and Naseem Ahamed

ABSTRACT

This chapter examines the impact of working capital management (WCM now onwards) which is measured by cash conversion cycle (CCC now onwards) on the financial performance of firms in the Indian context. The period of study is from the year 2000 to 2014, that is, for a span of 15 years for 4,687 companies listed on the National Stock Exchange. This chapter uses regression model to analyze panel data. Data for 4,687 listed companies have been analyzed for a period of 15 years. For some companies with data availability issues, the period of inclusion is less than 15 years. This chapter is limited to a sample of Indian firms; further research could examine the generalizability of these

Abstract

The firms mobilizing resources using innovative debt from market reduce dependence on the traditional banking and financial institutions. The firms raising resources by directly approaching public have some incentive to do so, *i.e.*, innovative firms will be able to better plan commitments of future cash outflow and inflow, increase the borrowing capacity, save taxes, etc. to create higher value to the shareholders. In this paper we have made an attempt to test whether such innovative firms' performance is higher than other firms. We also tried to understand if more variety of instruments helped create better value of share in the market for such firms.

Keywords

Firms' Performance, Innovative Firms', Innovative Financing, Innovative Debt, Value of Firm, Indian Manufacturing Firm

1. Introduction

A sharp acceleration in the pace of liberalization, deregulation and stabilization and structural adjustment programs (S&SAP) of different countries in the world in the eighties and nineties has transformed the financial systems in many countries. One of the major changes observed in the national and international finance is the innovation in the management of finance leading to the floatation of innovative financial instruments or tapping untapped (non-traditional) markets. [1] observed that "financial markets have witnessed a transformation with very vital trends, namely, globalization, securitization, and sophistication of risk management all over the world and enabled the participants in the financial markets to innovate and create innovative financial products and mobilize large chunk of funds".

Abstract

Speed of Adjustment (SOA) is a concept well studied in the area of capital structure. The concept is premised upon the fact that firms have a target capital structure for the next year and strive to achieve this target; the rate at which it attempts to achieve this target is called SOA. The SOA concept has been successfully applied to evaluate the financing decisions of firms. But most, if not all, of the existing studies in the literature are from the US or the developed world context, which cannot be generalized to emerging markets. This paper is an attempt to highlight the importance of studying the SOA of financing decisions in an emerging market context which provides for a completely different institutional setup. Studies in the direction given by this paper would provide evidence to policy makers and managers to review their existing organizational setup and take necessary action to increase their firm value.

1. Introduction

Prior to 1950s, research in the finance field was majorly dominated by studies in the areas of Investment and Dividend decision. Modigliani and Miller brought research in financing decisions to the limelight into the sphere of finance. Their paper [1] stated that under certain assumptions, the financing decisions of firms have no impact on the value of the firm. This implies that whether the firm chooses debt or equity in financing its investments had no impact on the value of the firm. Modigliani and Miller [2] refined earlier works and by relaxing the zero tax assumption, argued that the firm value will increase by the present value of tax shields when the financing is through debt in the investments. Interest on debt is tax deductible and provides a benefit (tax shield) that in-

Abstract

In this study we investigate whether stock prices and economic activity in India are co-integrated by using monthly data from 1960 to 2013 and applying high-powered co-integration tests which have an inherent advantage of permitting structural changes in the relationships being tested and in asymmetric co-integration, along with frequently applied co-integration tests of Engle and Granger (1987) and Johansen (1988). The results of the study provide empirical evidence for reasonably saying that stock prices and economic activity in India are co-integrated and validate the prediction in financial economics literature.

1. Introduction

In the last few years, India has been a bright spot in the pecking order of world economies and has been one of the fastest-growing economies in the world. Indian economy is 11th largest based on Nominal GDP terms and 3rd largest in terms of purchasing power parity terms according to International Monetary Fund. Stock markets and financial markets in India have performed remarkably well and have successfully engulfed the imagination and attention of both Indian domestic investors as well as foreign international investors. The co-movements of stock market prices with respect to industrial production (IIP) are enormously imperative for investors for making investment decisions and for policy makers to take a call on monetary policy. Relationship between stock prices and industrial production is crucial and critical from policy makers, investors and businesses' perspective. In this study we investigate whether stock prices and economic activity in India are co-integrated. In order to determine existence of long-term equilibrium among macro-economic variables, [1] and [2] have proposed co-

The Day of the Week Effect on Returns, Volatility and Volume of Shariah Index

Dharani Munusany

Department of Finance, ICFAI Business School
ICFAI University, Hyderabad, India

Email: mdharani85@gmail.com

Abstract: The study investigates the day of the week effect on stock market return, volatility and volumes of the Shariah index using a conditional variance methodology. Data include the daily value of the Shariah index for the period of January 4, 2010, through October 16, 2015. Findings indicate that the day of the week effect is present in return and volume of the Shariah index but not in volatility equations. Coefficients of the conditional standard deviation of the return equation (risk) are negative and statistically significant. These results would indicate that investors want to be compensated with higher returns for holding riskier assets. Estimated volatility coefficients of the constant and the slope terms are positive and statistically significant. This finding satisfies the nonnegativity of the conditional variances. Further, statistical evidence suggests that no presence of the day of the week effect on stock market return volatility is found. Hence, the study confirms that the day of the week effect is present in the mean and not in the variance equations. Finally, estimated coefficients of the volumes for each day are all statistically significant at 1% level. These results indicate that the day of the week effect present in the volume of the Shariah index.

1. Introduction

Islamic finance aims to prohibit payment and receipt of 'Interest'. Islamic investment is an emerging investment alternative even to withstand during financial turbulence. It is being demanded high in the recent past because of its unique nature of the socially responsible investment. Initially, Islamic finance has been started as a small cottage industry in an Arab country in the late 1970's. In the 19th century, the western style banking system introduced to provide finance for mercantile and commercial activities without interest. After the liberalization of the world economy, Shariah allowed the Muslim to play a part in the stock market activities by Shariah investment principles. According to a study conducted by Nisar (source from wealthy City), some Shariah-compliant stocks in India are much higher than in Muslim countries put together, thus providing an immense scope of parking money by Islamic investors. He claims that 61 per cent Indian companies are Shariah-compliant against 57 per cent in Malaysia, 51 per cent in Pakistan and a mere 6

Health concern

ABSTRACT

The present research attempts to understand the importance of altruistic and egoistic value in determining the young consumers' intention to buy organic food. Environmental concern was considered as the altruistic value, whereas health concern as egoistic value. Using the convenience sampling method, a total of 304 usable responses was collected from young consumers, with the help of self administered questionnaire survey approach. Data analysis was done using two step structural equation modeling (SEM) approach, i.e. measurement model and structural model. Findings indicated that, both altruistic as well as egoistic value influences the intention to buy organic food among young Indian consumers. However, egoistic value was found to have more impact on the consumers' organic food purchase intention. The present research is one of the initial attempts in the Indian context to understand the importance of values (altruistic and egoistic) organic food consumption among young consumers.

1. Introduction

In the past, studies have reported that consumption pattern of humans is one of the strongest contributors of environmental degradation (Hertwich, 2005; Hertwich and Peter, 2009). But the present decade has seen a growing consciousness in the society for the environmental protection. Considering the environment as an issue of importance for the survival of human being, the ethical consumerism has prospered (Dowd and Burke, 2013). The food related issues (consumption & production) have always been the topic of discussion in ethical behavioral literature, as it is associated with various impacts on the surroundings and environment (Tobler, 2011). A paradigm shift in the consumer's dietary choices has been noticed in the present decade. The consumers have started preferring organic over the traditionally grown foods as the organic food is considered eco-friendly and a healthier choice (Williams and Hammitt, 2001). Earlier, the concept of organic food consumption was more popular in developed nations, but the present decade has seen an organic revolution in developing nations such as India. The organic food industry in India is at its nascent stage still a tremendous positive growth in demand of organic foods has been noticed in the last few years. The Indian organic food market is transforming itself into the fastest growing organic market in the world due to the radical shift in consumer buying behavior and spending patterns (Market Research.com, 2013).

When the issues related to organic food production and consumption are discussed, it is categorized under the ethical consumption as it shows concern for the environment (organic food is considered to have a less detrimental impact on the environment in comparison to traditionally grown foods) along with the personal benefit to individual (health and taste). Various researchers have emphasized on the significance of studying human values while measuring pro-environmental/ethical behavior (De Groot and Steg, 2009; Fransson and Garling, 1999; Naess, 1990). Value is defined as 'a desirable trans-situational goal varying in importance, which serves as a guiding principle in the life of a person on other social entity' (Schwartz, 1992). Literature on ethical consumption shows that egoistic values (pro-self) & altruistic values (concern for others) are the two important drivers in the decision making of a human while behaving in the ethical way. The past researches typically suggest that altruistic value (concern for others) and egoistic value (self concern) are negatively correlated with each other (Schwartz, 1992). The concern for self and concern for others, both views are conceptually distinct and incompatible (Kareklas et al., 2014; Sultner and Maass, 2006). However, researches suggested that these distinct views may exist together within an individual & may influence their attitude (Kareklas et al., 2014). Therefore, the present research has used

Segmenting Markets Based on Consumer Decision Making Style: An Exploratory Study from India

Rishi Dwesar
Department of Marketing and Strategy, IBS Hyderabad, IFHE University, India

Ankit Kesharwani
Department of Marketing and Strategy, IBS Hyderabad, IFHE University, India

Abstract

The study attempts to segment consumers on the basis of their decision making styles. Based on consumer style inventory (CSI), nine unique consumer shopping orientations were identified. Subsequently, these shopping orientations were used to identify unique consumer segments, for which cluster analysis was performed. Relative importance of particular factors within a cluster was also analyzed. For each of these five segments demographic profiling was done to analyze dominance of a particular socio-economic section, with regard to specific style orientation. This would enable marketers to easily identify the qualifiers which would motivate particular type of customers to buy specific product categories.

Real-World Data Analytics in Global Pharmaceutical Marketing

Badal Rath and Surjit Kumar Kar***

Randomized Controlled Trials (RCT) data continues to be the gold standard as evident for clinical safety and efficacy. It supports product registration and prescriptions in pharma and healthcare. RCTs provide data in the real-world clinical settings; however, their controlled nature within the real world is a limitation. Moving from controlled environment into real-world settings gives a true picture of the medication effectiveness along the patient treatment pathway. Healthcare decision makers are demanding real-world evidence to support clinical effectiveness and safety before approval in addition to RCTs and also to support various healthcare policy developments. Real-World Data (RWD) provides data to various stakeholders, e.g., payers who are looking for cost-effectiveness; physicians to effectively manage patients; and providers looking towards reducing healthcare delivery cost. RWD gets generated via various sources but the fastest methods being observational studies and patient registries. Post-marketing studies also generate RWD which are now frequently being asked by the regulators for demonstrating efficacy, quality, and safety. This shift in trend from RCTs to real-world data has marketing implications since pharmaceutical and healthcare marketers customize the marketing messages with the help of data generated from the RCT and other evidences generated during the clinical trials. The shift from RCTs to real-world data needs a shift in focus from RCT to real-world evidences from marketing and sales perspectives. This research paper focuses on the use of RWD analytics in pharmaceutical and healthcare marketing.

Introduction

Currently, there is a major shift occurring in the pharmaceutical and healthcare landscape across the globe. Pharmaceutical companies are facing unprecedented challenges as revenues are under pressure. Even in the challenging environment, the global pharmaceutical market was valued at $1,057 bn, registering a growth of 8.4% in 2014 (Imshealth.com, 2015). This is for the first time that the industry has crossed the billion dollars mark to be valued as a trillion dollar industry. Global pharmaceutical market is showing a growth but the growth rate was low in the year 2012-13 due to various economic as well as marketing forces like patent expiry (see Table 1 for details).

J. K. Pattanayak[2]

Abstract

This study aims at examining the practicality and application of customer-based brand equity model based on Aaker's well-known conceptual framework of brand equity. The study employed structural equation modelling to investigate the relationship existing between dimensions of brand equity and the brand equity itself. It specifically measures the way in which consumers' perceptions of the dimensions of brand equity affect the overall brand equity evaluation. Data were collected from Indian youth who visited Dominos restaurants (Dhanbad, Jharkhand). The finding shows that brand association (BA) is an important dimension affecting positively the brand equity in fast-food brands. The present study has some implications as managers associated with fast-food industry have to maintain or strengthen their efforts upon the BA dimension.

Introduction

Food diversity in India is an implicit characteristic of India's diversified culture consisting of different regions and states within. Traditionally, Indians like to have home-cooked meals—a concept supported religiously by individuals. However, with the passage of time, there has been increasing awareness and influence of Western culture, which has made a paradigm shift in food consumption patterns among urban Indian families. It started with eating outside and moved on to accepting a wide variety of delicacies from world over. This phenomenon has been witnessed since the early 1990s. The subsequent entry of new players set a significant change in lifestyles and the food tastes of Indians. The emergence of fast food has gained acceptance of Indian palate after the multinational fast-food players adapted the basic

ABSTRACT

This paper investigates the effects of firm-level corporate governance practices on firm performance for publicly traded Indian firms where founder ownership is concentrated. We develop a comprehensive measure of corporate governance and show that corporate governance is positively associated with firm performance. This relationship becomes stronger when founder ownership is high. We next focus on the specific channel through which governance improves firm performance, namely self-dealing by controlling owners. We find that better governance mitigates self-dealing by controlling owners and thereby improves future firm performance. Overall, our study substantiates the key relationship between the quality of corporate governance and firm performance in the presence of founder ownership.

© 2016 Elsevier Ltd. All rights reserved.

1. Introduction

Concentrated ownership, such as within families, states, and financial firms, has been an important feature of many emerging markets. Among these types of concentrated ownership, founder (family) ownership is the most common (Claessens et al., 2002; La Porta et al., 1999). Shleifer and Vishny (1997) argue that controlling ownership is perhaps the only approach to reduce the agency problems arising from separation of ownership and control, especially when the legal enforcements and governance regulations are weak. However, this may introduce the problem of potential expropriation of minority shareholders by controlling owners, leading to conflicts of controlling with minority shareholders. In such circumstances, *to what extent are corporate governance mechanisms effective?* We address this question for Indian firms where founder owners dominate with a large ownership and have executive representation (Narayanaswamy et al., 2012). This domination may help founder owners to pursue their personal interests at the cost of the minority shareholders, particularly when investor protections and legal systems are underdeveloped (Morck et al., 2000). In such a setting, founder owners are likely to employ weak corporate governance practices that may facilitate them to expropriate minority shareholders. As a result, corporate governance may be ineffective to improve firm performance when founder owners possess a large ownership.

On the other hand, a founder owner may be motivated to improve firm performance, since his financial and human capital both are positively related to firm performance (Arregle et al., 2007). In such cases, the founder owner is likely to choose better corporate governance practices to improve firm performance. These practices may go beyond legal requirements, with the purpose of sending a signal to the market that the interest of minority shareholders will not be exploited (Mitton, 2002).

ABSTRACT

We examine the impact of controlling founder ownership (CS) and business groups (BGs) on firm board structure for Indian firms, where most of the firms are inter-connected. We argue that due to inadequate legal protection, CS and BGs should influence the board structure of Indian firms. Our empirical evidence finds a U-shaped relationship between board independence and CS. We show that firms affiliated with business groups have lower board independence compared to standalone firms. We also find that investors value CG reforms related to board independence.

1. Introduction

The role of firm boards as an important internal control mechanism is well established in the finance literature. Consequently, in a diffused ownership context, such as the USA and the UK, determinants of board structure have received extensive attention both in the policy discussion on corporate governance as well as in academia (Raheja, 2005; Harris and Raviv, 2008; Adams and Ferreira, 2007; Lehn et al., 2009; Boone et al., 2007; Coles et al., 2008; Guest, 2008) We examine determinants of board structure for an emerging nation, India, where concentrated founder ownership (henceforth, controlling ownership) and the prominent role of business groups are two of the most distinct characteristics of firms (Claessens et al.,

FINANCIAL PERFORMANCE RANKING OF OIL AND GAS COMPANIES IN INDIA USING TOPSIS METHOD

Santosh Kumar Yadav[1], Rohit Kapoor[2] and Amol S. Dhaigude[3]

Abstract: *This paper analyzes the financial performances of oil and gas companiesusing Technique for Order of Preference by Similarity to Ideal Solution (TOPSIS) method. Financial ratios of the oil and gas companies were calculated for each and every company separately. The computed ratio was transformed to show the performance rankings of oil and gas companies by using entropy and TOPSIS method. Ranking of the companies was done by arranging according to their performance. The time period for assessment of oil and gas companies was from 2011 to 2015 and results show each year's company performance ranking. The result showed that Hindustan Ltd. has the highest ranking in the year 2011, BPCL for the year 2012, Gail Ltd. for the year 2013, and in the last two yearsPetronet had the highest ranking. Every year different companies had the lowest ranking.*

Keywords: *Performance Measurement, Financial Ratios, TOPSIS Method, Oil and Gas companies, India.*

1. INTRODUCTION

The oil and gas sector comes under top six industries and is the backbone of the society and economy in Indian context. It is the source of power for other parts of the economy. This sector has over 15% contribution to the Indian GDP. As the economies are growing the demand for oil and gas in increasing. Government of India has come up with various plans and policies in order to supply the oil and gas to the needed sections of the economy.

One of the policies named as New Exploration Licensing Policy (NELP) was designed to minimize the gap between supply and demand during 1997-98.

Abstract

This paper examines the dynamic tail dependence structure for the Gulf equity indices, using the Dow Jones Islamic world emerging equity index and four macroeconomics factors (the three-month U.S. Treasury bill rate, the VIX index, gold prices and oil prices) under different market conditions and scale or time horizons. We find little or insignificant dependence at the short investment horizon but strong asymmetric dependence at middle and long investment horizons. Gold is a strong hedge and a safe haven at the short, middle and long run horizons for all Gulf markets.

Sensitivity analysis of optimal capacity acquisition under demand uncertainty for a multi-resource firm: complementarity and substitution effects

J. Prince Vijai , P. Sashikala

https://doi.org/10.1504/IJAMS.2016.078520

Published online 23 August 2016

Abstract PDF

Abstract

We consider a firm that offers two products to serve the market using two dedicated resources and one flexible resource. We model the firm's capacity acquisition decision as a two-stage stochastic optimisation problem with recourse. In the first stage, the firm determines the capacity acquisition level before realisation of products demand. Whereas, in the second stage, after the products demand is realised, the firm determines the production allocation level. Our objective is to study the impact of both strategic and operational cost parameters as well as products demand correlation on optimal capacity acquisition decision. We conduct post-optimality sensitivity analysis via numerical example, and found interestingly that the firm's processing network exhibits complementarity as well as substitution effects. We discuss our results and implications in the context of multi-resource processing network.

Today's technology development in the field of computer along with internet of things made huge difference in the transformation of our lives. Basic computer framework and web client need to make significant login signify getting to mail, long range interpersonal communication, internet keeping money, booking tickets, perusing online daily papers, and so forth. The login user name and secret key mapping validate if the logging user is the intended client. Secret key is assumed an indispensable part in security. The objective of MFA is to make a layered safeguard and make it more troublesome for an unauthenticated entity to get to an objective, for example, a physical area, processing gadget, system, or database. In the event that one element is bargained or broken, the assailant still has two more boundaries to rupture before effectively breaking into the objective. An endeavor has been made by utilizing three variable types of authentication. In this way managing additional secret key includes an additional layer of security.

1. Introduction

In the present computerized day with wonderful improvement in computer segment, single element verification, for example, passwords, is no more analyzed as secure in the World Wide Web. It has never been less troublesome in securing the system and network access. Basic, clear, and simple-to-figure passwords, for example, names and age, are easily discovered through electronic mystery key social occasion programs [1, 2]. The security and protection dangers through malware are dependably contentious both in amount and in quality. Extended access to data builds shortcoming to hacking, splitting of passwords, and online cheats. In this affiliation the routine login/password confirmation is considered insufficiently secure for a few security-basic applications, for example, login to mailing accounts, social networks, gadgets, financial records, authority secured systems, and business sites online. Obliging more than one free element builds the trouble of giving false accreditations [3].

To take care of the password issue in banking sectors furthermore for online exchange two element confirmations utilizing OTP and ATM pin/cards have been actualized. Two-element verification proposition ensures a higher assurance level by augmenting the single confirmation component [4, 5]. Today security concerns are on the rising in all ranges. Most frameworks today depend on static passwords to confirm the client's individuality. Clients have an affinity to utilize evident passwords, basic secret key, effortlessly guessable watchword and the same secret key for various records, and even compose their passwords, store them on their system, or approach the sites for recalling their password, and so forth. Usage of static passwords in this extended reliance on access to IT frameworks logically introduces themselves to hackers, ID thieves, and fraudsters [6]. Furthermore, programmers have the inclination of utilizing various methods/attacks, for example, speculating attack, shoulder surfing attack, lexicon attack, snooping attack, and social designing attack to take passwords in order to obtain entrance to their

Convenience and satisfaction: mediation of fairness and quality

Sanjit Kumar Roy[a], Walfried M. Lassar[b] and Vaibhav Shekhar[c]

[a]Department of Marketing, The University of Western Australia, Perth, Australia; [b]Department of Marketing, Florida International University, Miami, FL, USA; [c]Department of Marketing & Strategy, IBS Business School, IFHE University, Hyderabad, India

ABSTRACT

This study investigates the role of service fairness and service quality in the relationship between service convenience types (decision, access, transaction, benefit and post-benefit) and customer satisfaction. Results show that service convenience has a significant positive impact on service fairness. Both service fairness and service quality mediate the relationship between service convenience and customer satisfaction. This study provides useful insights to both researchers and practitioners on the role of service convenience in improving service fairness, service quality and customer satisfaction. Findings of this study contribute to the literature by empirically investigating the impact of service convenience types on service fairness, service quality and customer satisfaction; and by examining the mediating role of service fairness and service quality between convenience types and customer satisfaction.

Introduction

Convenience has become an important topic in consumer behavior (Farquhar & Rowley, 2009) due to socio-economic changes, technological advancements and a hypercompetitive marketplace (Seiders, Voss, Godfrey, & Grewal, 2007). Industry reports indicate that customers are finding it difficult to manage their daily routines and have to exert moderate to high levels of effort while resolving complaints with their service providers (Dixon, Freeman, & Toman, 2010). Citing the above trend, researchers consider service convenience as a potential source of sustainable competitive advantage, especially in services where the core offering is perceived to be undifferentiated, such as banking (Kaura, 2013) and mobile phone services (Colwell, Aung, Kanetkar, & Holden, 2008). Firms have also made significant investments in measures such as the launch of online channels, ATMs and mobile commerce (Colwell et al., 2008). For example, the recent launches of 'M-Pesa' service jointly by ICICI bank and Vodafone provides customers with a convenient way to bank, transfer funds and make payments in a secure environment. Such measures enable consumers to extract value through convenience, to the extent that they are willing

Abstract: This study examines the effect of competition and intellectual capital efficiency on firms' performance outcome in an emerging market context. The authors conceptualise a new theoretical model to examine the direct effect of competition on intellectual capital efficiency and firms' performance outcomes and indirect effect of competition through intellectual capital efficiency on firms' performance outcomes in the Indian market. It concludes that competition positively impacts intellectual capital efficiency and firms' market to book value and negatively impacts the farms' return on asset and competitive advantage. However, competition does not have any significant indirect effect on firms' financial performance outcomes via intellectual capital coefficient measures. The results extend the understanding of the direct and indirect effect of competition on intellectual capital efficiency and financial performance outcomes for companies in one of the fastest growing emerging economies.

Keywords: intellectual capital efficiency; firms' financial performance; competitive advantage; physical capital; structural capital; human capital; firms' financial performance; innovative capital; relational capital.

Winning Versus not Losing: Exploring the Effects of In-Game Advertising Outcome on its Effectiveness

Tathagata Ghosh

C-208, Department of Marketing and Strategy, ICFAI Business School, Donthanapally, Shankerpalli Road, K.V. Ranga Reddy, Hyderabad 501203, Telangana, India

Abstract

Prior literary works on product placement in games predominantly focus on a host of game and brand characteristics to eventually explore their effects on consumers' psychological responses and behavior. One primary facet of in-game advertising (IGA) that has largely been ignored is game outcome in terms of winning and losing and its effect on consumers' nature of information processing. This article explores the effect of IGA outcome and performance feedback shown to players on their motivation expressed in terms of induced regulatory focus. Further, the effects of regulatory focus are examined on players' implicit and explicit memory, game and brand attitude, and emotions. A conceptual framework highlighting afore-mentioned relationships is developed and empirically tested which reveals that IGA outcome and performance feedback in the form of game messages plays a major role in explaining players' motivation which in turn also affects their memory and attitude. Managerial implications, limitations, and scope for future research are also discussed.

Introduction

For decades marketers have lamented over the effectiveness of television and print advertisements. When spending for these advertisements upfront and realizing their benefits later, marketers are vulnerable to nonperforming or low-performing advertising materials. Against this backdrop, Internet-based marketing appears to offer a stimulating change because of the wide-spread reach and rapid proliferation of the Internet. Nonetheless, the success and persuasive strength of digital media has frequently been questioned because of online clutter that results in issues like diminished advertisement claim and brand name recall (Pieters, Wedel, and Zhang 2007), banner blindness (Sun, Lim, and Peng 2013), and consumers' avoidance of digital advertisements (Hussain and Lasage 2013). Therefore, as the pursuit of identifying new sources of persuasion continues, one of the contemporary media channels that has been exploited by marketers more frequently is product placement in online games, more commonly referred to as in-game advertising and advergames. Advergames are "computer games specifically created to function as advertisements to promote brands, where the entertainment content mimics traditional game forms" (Kretchmer 2005, p. 7). This format is distinguishable from in-game advertising (IGA) which follows a more traditional pattern of product placement within a gaming environment (Cauberghe and De Pelsmacker 2010). These games are available in both online and offline environments and provide an opportunity for long-term, focused exposure of the embedded brands in a reward-driven environment (Evans, Carlson, and Hoy 2013). Due to the emergence of this new advertising platform, game developers command additional revenue from companies for placing their brands in customized computer games. The IGA and advergame expenditure across the globe was $2.84 billion in 2014 and is expected to reach $4.75 billion by the end of 2019 at a compounded annual growth rate of 10.8% (PWC 2014) followed by an anticipated expansion of the gaming audience from 198 million in 2012 to 327 million in 2016 (eMarketer 2012).

Impelled by this upsurge, academicians explored the persuasive efficacy of IGAs and advergames. Studies were conducted to

Dynamic inter-relationships among tourism, economic growth and energy consumption in India

Chor Foon Tang[a], Aviral Kumar Tiwari[b] and Muhammad Shahbaz[c]

[a]Centre for Policy Research and International Studies, Universiti Sains Malaysia, Penang, Malaysia; [b]Faculty of Management, IBS Hyderabad, A Constitute of IFHE (Deemed to be) University, Hyderabad, India; [c]Energy Research Center, COMSATS Institute of Information Technology, Lahore, Pakistan

ABSTRACT

This study attempts to explore the dynamic causal and inter-relationships among tourism, economic growth and energy consumption in India. This study covers the annual data from 1971 to 2012. This study applies the cointegration and generalised variance decomposition methods to verify the relationship. The bounds testing approach to cointegration and the Gregory–Hansen test for cointegration with structural break consistently reveal that energy consumption, tourism and economic growth in India are cointegrated. We find that tourism and economic growth strongly affects energy consumption in the long-run. Additionally, we also find that tourism and economic growth in India are inter-related, but the causal effect of tourism on economic growth is stronger than the other way around in both the short- and long-run. Therefore, this study concludes that the tourism-led growth hypothesis is valid but the energy-led growth hypothesis is invalid in India. With such findings, we can confirm that tourism is an important catalyst of growth to the Indian economy. Therefore, policy-makers should promote and expand tourism industry in order to sustain the process of economic growth and development in India.

1. Introduction

Over the past decades, many studies pertaining to the engines of growth have been conducted with respect to developing countries. This is mainly due to the reason that they attempt to find an effective pillar to upgrade their status to developed countries. From our reading, we observe that energy and tourism are two common factors that are hotly debated in the economic growth literature. Numerous studies have been conducted to verify the role of energy consumption and tourism in economic growth. However, their efforts failed to find a consistent causal relationship among economic growth, tourism and energy consumption. Some studies suggested that energy consumption and tourism stimulate long-term economic growth (e.g., Hye & Khan, 2013; Lean & Smyth, 2010; Lean & Tang, 2010; Soares, Kim, & Heo, 2014; Tang & Shahbaz, 2013; Tang, Tan, & Ozturk, 2016), while other studies claimed the other way around or not related at all (e.g., Alam, Begum, Buysse, & Rahman, 2011; Cheng, 1999; Ghosh, 2002; Ghosh, 2011; Katircioğlu, 2009; Oh, 2005; Ozturk & Acaravci, 2009). Therefore, it is very hard to derive a useful guideline for policy-makers elsewhere to design appropriate growth policies for their economies.

Apart from the ambiguity in the results, almost all existing studies are likely to look at the impacts of energy consumption and tourism on economic growth separately, where these variables should be inter-related in nature. For example, tourism-related infrastructures and facilities require energy (e.g., oil and electricity) to operate them and energy is also one of the inputs of production that may link to economic growth. On the other hand, an increase in output and tourism demand such as tourist arrivals would increase the demand for energy. Then, an increase in international tourist arrivals would also affect economic growth through its impact on foreign exchange revenue, investment on new infrastructure for tourism and creating more employment opportunities. Certainly, economic growth, tourism and energy consumption should be inter-dependent and earlier studies that analysed such impacts separately may have lost the information on dynamic inter-relationships among the variables.

Abstract: Knowledge is an important and dynamic element to inculcate innovation in big organisations and also in small organisations. Discovering new knowledge and capturing, sharing and applying it properly are major activities of knowledge management (KM). Small- and medium-sized enterprises (SMEs), knowingly or unknowingly, adopt KM practices in different ways to make their processes and products more innovative for competitive advantage. This paper examines the significance of various practices grouped under each KM activity and the relationships among the four activities from the perspective of people working in different SMEs in India. First part of the study deals with analysis of variance of practices and the second part deals with the structural modelling of KM activities. ANOVA, exploratory and confirmatory factor analyses followed by structural equation modelling are used. Knowledge discovery is related to knowledge capturing and sharing, which are further related to knowledge application.

Keywords: knowledge management practice; knowledge management system; knowledge model; SMEs.

ANTECEDENTS OF ORGANISATIONAL CREATIVITY: A MULTI-LEVEL APPROACH

Ritu GUPTA[1], Pratyush BANERJEE[2]

OB & HRM Department, IBS Hyderabad, IFHE University,
Shankarpally Road, Hyderabad – 501203, Telangana, India

Received 25 February 2015; accepted 15 October 2015

Abstract. The purpose of this literature review is to provide a better understanding of the antecedents of organisational creativity with a multi-level approach. Organisational creativity is a sum total of the creativity accounted for by the individual employees of the organisation, the cumulative creativity of a team or group and creativity arising out of different structural components of an organisation. Some of the antecedents identified from the literature include personality, intrinsic motivation, group cohesion, social inhibition, cognitive interference, leader member exchange, organisational culture and climate, amongst others at individual, group and organisational level. Based on the literature review, suggestions for future research and research propositions have been proposed.

Keywords: organisational creativity, corporate creativity; group creativity; individual creativity; innovation; personality.

JEL Classification: M12.

Introduction

Creative ideas can be used for problem resolution, process improvements and the development of new services and/or products. Creativity may be defined as 'the formation of novel, appropriate and useful ideas by individuals or small groups' (see DiLileo, Houghton 2006). Woodman *et al.* (1993) defined creativity at organisational level as 'the creation of a valuable, useful new product, service, idea, procedure, or process by individuals working together in a complex social system'. The theory of organisational creativity suggests that when a working environment facilitates idea generation, knowledge sharing and creative problem solving, individuals in that environment are more likely to generate creative ideas that involve unique concepts or new applications of existing concepts (see Woodman *et al.* 1993).

Researchers also suggest that individual creativity is essential for organisational innovation (see Amabile 1988; Woodman *et al.* 1993), which in turn is imperative for long-term organisational survival and success (see DiLileo, Houghton 2006). In order to enhance the chances of long-term survival, organisations should focus on supporting individual creativity in the workplace (see Amabile 1988; Woodman *et al.* 1993). Executive creativity not only contributes to corporate differentiation and innovation, it also helps create an environment, which encourages creative contribution from others (see Ford 1996). Researchers have time and again provided comprehensive reviews of creativity in the past. For example, a review by Van Der Panne and colleagues (2001) on success and failure of innovation, implications of creativity in classroom setting (see Petrowski 2000) and an integrated review on creativity, intelligence and personality by Batey and Furnham (2006). In the context of organisational creativity, Andriopoulos has published a comprehensive literature review in 2001 taking only organisational level variables, and Klijn and Tomic (2010) contributed another review on organisational creativity from psychological perspective taking only

A Historical Analysis of the US Stock Price Index Using Empirical Mode Decomposition over 1791–2015

Aviral K. Tiwari, Arif B. Dar, Niyati Bhanja, and Rangan Gupta

Abstract

In this paper, the dynamics of Standard and Poor's 500 (S&P 500) stock price index is analysed within a time-frequency framework over a monthly period 1791:08–2015:05. Using the Empirical Mode Decomposition technique, the S&P 500 stock price index is divided into different frequencies known as intrinsic mode functions (IMFs) and one residual. The IMFs and the residual are then reconstructed into high frequency, low frequency and trend components using the hierarchical clustering method. Using different measures, it is shown that the low frequency and trend components of stock prices are relatively important drivers of the S&P 500 index. These results are also robust across various subsamples identified based on structural break tests. Therefore, US stock prices have been driven mostly by fundamental laws rooted in economic growth and long-term returns on investment.

An Empirical Analysis of Stock Market Participation Intention among B-School Students Studying Finance

Rajesh Prabhakar Kaila
IBS, Hyderabad IFHE University, Donthanapally Shankara Palli Road,
Hyderabad 501203, Andhra Pradesh, India

Abstract: Stock Market participation among B-School students studying finance is an important aspect as they are potential investors as well as work in financial services firms that actively participate in stock market and regulator SEBI, Government and financial services firms are also interested in studying the investment attitudes of B-School students. Stock Markets need to have increased participation from retail investors as they convert personal savings to investments. This study studied the stock market participation intention in terms of plan to invest among B-School students using binary logistic regression to predict plan to invest which is binary dichotomous variable based on variables like finance subject knowledge, knowledge of stock markets, instruments, risk return concepts, demat account operating, watching business news channels and discussing with family and friends about stock markets. B-School students are highly interested to invest in stock markets enforced by gaining of knowledge related to finance subject, stock markets functioning, instruments, risk return further supported by practical knowledge of demat account operating, business news channels and discussions with friends and family members.

Key words: Behavioral finance, stock market participation, binary logistic regression, B-School students, finance curriculum

INTRODUCTION

Indian Stock Market has been growing over years, expected to continue its growth in future and has become a critical component of growth for Indian economy. Stock market participation can lead to significant increase in savings as the stock markets generate higher rate of returns than the deposit rate if invested properly. Stock Market participation by post graduates passing out from business schools and universities across India is also essential as along with institutional investors retail investors particularly B-School students who are well trained and equipped . To skill and prepare the graduates for a career in stock markets and related jobs, the curriculums had been updated by introducing subjects like financial management, corporate finance as compulsory subjects at both the under graduate and post graduate level and these subjects deal with basic concepts of stock markets functioning, instruments, risk return calculations, valuation and portfolio investment strategies. Elective courses specifically for students opting finance as elective included security analysis portfolio management, financial risk management, treasury management, financial modeling and mergers and acquisitions. Not only the graduates work in financial, investment and stock market related firms but also are the future potential investors in the stock market. This study aims to empirically study the stock market participation intention in terms of plan to invest in stock market by B-School students who study finance towards investing in stock markets.

Background of study: Investor education particularly focusing on the risks and returns involved in the stock markets is critical for retail investors who invest or wish to invest in stock markets. Stock markets are considered to be high risk and a chance of investors loosing wealth is very high if they fail to understand the stock markets. Regulators and Governments realized the importance of investor education and included in the curriculum of B-Schools so that the students thoroughly understand the stock markets. B-Schools along with teaching curriculum also organize guest lectures by experienced professionals in the field of stock markets and encourage students to also watch business news channels and read business newspapers. Case study methodology and simulation games like stock market investment and portfolio games are also used as part of teaching

AN EMPIRICAL COMPETENCE-CAPABILITY MODEL OF SUPPLY CHAIN INNOVATION

Santanu MANDAL

Department of Operations and IT, Faculty, IFHE University, E-104, IFHE Campus, Dontanapally, Shankerpalli Mandal, RR District, A.P.-501203
E-mail: shaan.nitw@gmail.com

Received 16 March 2015; accepted 16 December 2015

Abstract: Supply chain innovation has become the new pre-requisite for the survival of firms in developing capabilities and strategies for sustaining their operations and performance in the market. This study investigates the influence of supply and demand competence on supply chain innovation and its influence on a firm's operational and relational performance. While the former competence refers to production and supply management related activities, the latter refers to distribution and demand management related activities. The current investigation further explores how well supply chain management processes are internally executed by the firm's employees i.e. process compliance is observed as an enabler (moderator) on the relationship between supply chain competences and supply chain innovation. Further the model also explores the moderating influence of environmental uncertainty on the linkage between supply chain innovation and firm performance. The model is empirically validated based on perceptual data collected from 166 supply chain professionals through web based survey. Implications for both managers as well as practitioners are also provided.

Keywords: supply chain innovation, supply side competence, demand side competence, firm performance, process compliance, operational performance, environmental uncertainty.

JEL Classification: C12, C42.

Introduction

Supply chain innovation is a must therefore for the following reasons: (a) for gaining competitive edge in the market (b) for managing the different types of risks prevailing in the supply chain (Wagner, Bode 2006) and (c) for meeting proactively the different forms of uncertainties in the adjoining environment (Fawcett, Waller 2011). The main aim of supply chains recently is to consolidate their footing through constant innovation in products, services and strategies of serving existing and newer markets profitably. Hence, the success of global manufacturing activities often depends upon a manufacturing firm's ability to innovate and adapt its supply chain to dynamic changes in customer needs and preferences. Now this capability to innovate for a supply chain is enhanced through efficient management of supply and demand side activities for the focal manufacturing firm. These supply and demand side competences are two fundamental building blocks of supply chain management (Blome *et al.* 2013) and would definitely contribute to developing a firm's supply chain innovation. While the former is defined as a firm's proficiency in managing its upstream (supply-related) activities (e.g. supplier and production management), the latter is defined as the firm's ability to effectively manage downstream (demand-related) aspects (e.g. demand and distribution management) (Blome *et al.* 2013; Handfield *et al.* 2004). However, their role in developing supply chain innovation was never explored. Using the tenets of resource-based view complemented with the dynamic capabilities perspective, the current study theorizes and explores the importance of both the competence for a firm's supply chain innovation.

And second, the study explores the role of process compliance as moderating the linkage between supply and demand side competences with supply chain innovation. Process compliance in the current context is defined as

Analysis of cost escalations in pharmaceutical projects

1. Introduction

The pharmaceutical industry has been advancing aggressively in India and globally as well. In this regard, India has been ranked third largest country in terms of production volume (http://www.idma-assn.org/about-idma.html). Several big companies like Dr. Reddys Labs, Cipla, Lupin, Aurobindo Pharma, Sun Pharma and Divis Labs are contributing a lot for the growth. In addition, the industry is facing high competition globally with ever mounting internal and external pressures, forcing the companies to seek new and revolutionary ways of doing their business. It is encountering several challenges with a range of environmental issues, including major losses of revenue owing to patent expirations, ever increasing cost-constrained healthcare systems and more demanding regulatory requirements (Paul et al, 2010). There have been several players in pharmaceutical sector but only a small subset seem to have tasted success with at least one approved NME (New Molecular Entity) (Munos, 2009). According to Khanna (2012), despite technological advancements and large Research & Development (R&D) investments, the number of new drug applications approved per year by Food and Drug Administration (FDA) was the lowest (20–25 per year) during six years, 2005–2010. The industry perceives a very dynamic environment because of complex development programs and increasing costs of product development.

Most of the big pharmaceutical companies commit to provide affordable and innovative medicines by focusing on customer requirements. To achieve such challenging goals, control over the supply chain is imperative so as to enable the companies offer high quality products at

Analyzing the agricultural value chain financing: approaches and tools in India

Vighneswara Swamy and Dharani M.
Department of Finance, IBS-Hyderabad, IFHE University, Hyderabad, India

Received 25 November 2015
Revised 20 April 2016
5 May 2016
11 May 2016
Accepted 12 May 2016

Abstract

Purpose – The global demand for food is expected to increase by 60 percent by 2050 when the world's population reaches 9.1 billion. To meet this challenge significant investment in the agricultural sector is required to embrace innovative financing mechanisms that can benefit sustainable agricultural development, food security and nutrition. The purpose of this paper is to analyze the agricultural value chain (AVC) financing approaches and tools in India. It presents a proper understanding of the different case studies of Indian AVC financing models and related instruments. It also offers some useful recommendations to improve their efficiency.

Design/methodology/approach – The authors employ the multiple case studies approach to research which allows for a purposive sample and the potential for generalizability of findings. This provides a more rigorous and inclusive approach than a single case study research due to the triangulation of evidence. Subsequently, the authors offer an explicit description of AVC financing models. In the next phase, a thorough assessment of these models is made. Finally, the authors formulate some useful policy recommendations based on the findings of the analysis.

Findings – There is a need to review the value chain models that exist in the context of – lead actors, business model and sustainability strategy. Determining actual and critical points of finance such as the current flows of funds and their sources of financing, what is needed and in what point in time is significant to enhance the effectiveness of the models. Further, there is a need to analyze and compare financing options such as their relative strengths, risks and costs of financing for each level of participant in the chain. The authors observe that rather than investing in one component of the chain, the financial institution can grow expertise in the chain, share this knowledge and provide financing to support services. This not only benefits clients, but also expands lending opportunities while lowering the risks.

Research limitations/implications – The study primarily focusses on AVC financing approaches and tools in India and attempts to analyze the inadequacies in the value chain models. The case study approach is adopted as the accurate data on value chain financing are not available for the analysis.

Practical implications – The study has come out with the following policy recommendations: the governments (union government as well as state governments) – in partnership with the private sector need to spearhead and develop measures aimed at making the operation of the value chain efficient, fair, profitable and sustainable; governments have to focus on creating an enabling policy and regulatory environment and, providing the necessary support services in order to attract more investments. These will lower the transaction costs, facilitate the smooth flow of finance along the chain and ultimately increase value-added; financing for processing and marketing is particularly crucial for growth and expansion of the chain; bank finance should not be limited to short-term production loans, but also include big-ticket loans with longer maturities to finance investments in farming equipment and machinery, transportation, storage, mills and other processing/post-harvest facilities.

REVIEW ARTICLE

Appraisal of literature on customer experience in tourism sector: review and framework

Atanu Adhikari[a,b]* and Saurabh Bhattacharya[c]

[a]*Indian Institute of Management, Kunnamangalam, Kozhikode, Kerala 673570, India;* [b]*London Business School, Regent's Park, Sussex Place, London NW1, UK;* [c]*Marketing Management, IFHE University, Hyderabad, India*

(*Received 27 September 2014; accepted 8 August 2015*)

A substantial body of literature has been built up in experience marketing. In spite of that there is no cohesive framework that has systematically examined antecedents, formation and implications of customer experience, or has classified different aspects of customer experiences. The purpose of this article is to derive an integrative review of published articles on consumer experience and its related topics. The study synthesizes the research on customer experience through two different but interrelated streams: (1) experience as a product attribute or a complete product and (2) consumer experience created due to customer interaction with the physical environment or people. This article develops a framework that corroborates literature related to (1) definitional aspects of customer experience, (2) formation of customer experience, (3) asserting consumer psychology in engaging in the creation of experience and its consumption and (4) the effects of customer experience. We first review available prior research and present the salient features of these articles and their findings. The research gaps are then identified and a set of propositions provided, followed by directions for future research. This article also identifies some methodological issues that are relevant in the context of individual level effect on customer experience.

Keywords: customer experience; experience marketing; review and framework; experience consumption

Introduction

The experiential consumption of products and services has of late attracted the attention of both academics and practitioners in developing marketing strategies. A plethora of articles related to the marketing of experience products and services for consumers in general and travellers in particular have been published in the last three decades in economics, marketing, hospitality and psychology journals (Adhikari, 2014; Agapito, Mendes, & Valle, 2013; Andersson, 2007; Brakus, Schmitt, & Zarantonello, 2009; Brakus, Schmitt, & Zhang, 2008; Chattopadhyay & Laborie, 2005; Holbrook & Hirschman, 1982; Huffman & Houston, 1993; Schmitt, 2003, 1999; Shaw & Ivens, 2002; Tung & Ritchie, 2011). Also, both the March 2009 issue of *Journal of Retailing* (Grewal, Levy, & Kumar, 2009; Puccinelli et al., 2009; Verhoef et al., 2009) and several issues of *Annals of Tourism Research* (Richards, 2011; Sharpley & Jepson, 2011; Tung & Ritchie, 2011) have devoted considerable space to a discussion of the creation and management of travellers' experience, taking into consideration both the strategic- and the implementation-level perspectives.

At the margins of biomedicine: the ambiguous position of 'Registered Medical Practitioners' in rural Indian healthcare

Papreen Nahar[1], Nanda Kishore Kannuri[2], Sitamma Mikkilineni[3], G.V.S. Murthy[2] and Peter Phillimore[4]

[1]*Centre for Primary Care, Institute of Population Health, University of Manchester, UK*

Abstract This analysis challenges a tendency in public health and the social sciences to associate India's medical pluralism with a distinction between biomedicine, as a homogeneous entity, and its non-biomedical 'others'. We argue that this overdrawn dichotomy obscures the important part played by 'informal' biomedical practice, an issue with salience well beyond India. Based on a qualitative study in rural Andhra Pradesh, South India, we focus on a figure little discussed in the academic literature – the Registered Medical Practitioner (RMP) – who occupies a niche in the medical market-place as an informal exponent of biomedical treatment. We explore the significance of these practitioners by tracking diagnosis and treatment of one increasingly prominent medical 'condition', namely diabetes. The RMP, who despite the title is rarely registered, sheds light on the supposed formal-informal sector divide in India's healthcare system, and its permeability in practice. We develop our analysis by contrasting two distinctive conceptualisations of 'informality' in relation to the state in India – one Sarah Pinto's, the other Ananya Roy's.

Keywords: informal practitioners, medical pluralism, RMP, healthcare system, South India, Diabetes

Introduction

Across low and middle income countries, particularly in rural settings, medical treatment and advice is often provided by practitioners who do not fit readily on either side of the dichotomy commonly drawn between biomedicine on the one hand and non-biomedical therapeutic approaches on the other. This paper examines one such case, in India, based on fieldwork in the southern state of Andhra Pradesh. Our analysis raises important issues for an understanding of the daily realities of available health care and medical treatment options in many rural contexts.[1]

Can healthcare servicescape affect customer's attitude? A study of the mediating role of image congruence and moderating role of customer's prior experience

Sreejesh S. and Debjani Sahoo
Department of Marketing, IBS Hyderabad, IFHE University, Hyderabad, India, and
Amarnath Mitra
Department of Operations, IBS Hyderabad, IFHE University, Hyderabad, India

Abstract

Purpose – The purpose of this paper is twofold. First, develop and test a conceptual model to understand the relationship between customers' servicescape perceptions, self-image congruity and attitude in healthcare context. Second, to examine the extent to which the relationship between customers' self-image congruity to attitude in a fully mediated model is moderated by their prior experience.

Design/methodology/approach – Utilizing a self-administered survey of 320 customers, the study tested the proposed relationships with robust data analytic techniques.

Findings – The results show that favorable servicescape perceptions help customers to form image congruence in terms of symbolic and functional elements and thereby strengthen their attitude. Further, servicescape accentuated image congruence have varying effects on customers' attitude depending up on customers' prior experience.

Research limitations/implications – This study emphasized the role of servicescape on self-image congruity formation and customer attitude in a new service context (healthcare), and contribute to the body of existing knowledge on servicescapes and image congruity and further verify the soundness and robustness of the integrative theoretical framework.

Practical implications – Favorable servicescape perceptions may encourage customers to form image congruence and attitude. In this respect, managers should make efforts to signal desired servicescape perceptions in order to retain existing customers and attract new ones.

Originality/value – This study was the first to apply an integrative perspective of inference theory and image congruity theory to the context of hospital services to understand the relationship between servicescape, image-congruity and customer attitude.

Introduction

Over the last few years there has been a considerable growth in the healthcare sector as well as in the healthcare-related services. A lot of competition exists within the industry, as wide variety healthcare options are now available to consumers, such as, minute clinics in drug stores, after-hour urgent care clinics, etc. (Kemp *et al.*, 2014).

Abstract

Online shopping has grown exponentially in India over the last few years. Several eCommerce companies have been established to cater to the need of the online customers. To understand consumer behaviour towards online shopping, traditionally survey, experiment or interview based researchhas been mostly used. However with the introduction of Netnography, the prospect of studying consumer behaviour by observing and capturing the real sentiments of customers has increased several folds. In the present study an attempt has been made to characterize the customers with respect to their gender, age and preference of time for posting comments oneCommerce companies through Netnography.

The findings of the study indicate that the frequency of posting comments on eCommerce companies by male participants is significantly higher than the female participants and participation of the younger generation (between 20 to 30 years) is significantly higher than the older generation (45 years and above). The most active age group of participants involved in posting comments on eCommerce companies is between 26 to 30 years, for both male and female participants. The most preferred timing for posting comments was between 12 pm to 4 pm for the female participants, and between 4 pm to 8 pm for male participants. The study has implications for marketers in terms of providing a better and more accurate profile of customers who are actively engaged in spreading online word of mouth.

Keywords: Online comments, netnography, online buyers, customer profile

Introduction

Social networking sites have generated to a network where increasing number of people are coming in contact with one another and share a common interest. Consumers tend to seek advice before they buy anything and social media has become a medium where they can not only seek advice but also gather information, opinions from people about the product. The emergence of web is one of the most influential developments in the business world that has exposed the change in the relationship between the companies and the consumers. The initiation of social media has given a platform to the marketers how to conduct their marketing strategies and reach out to the consumers. The core of any business is to have profitable customer relationship and these social networking sites are helping them to not only understand the

Design and implementation of Feature Matching Procedure for Video Frame retreieval

D. Saravanan*

ABSTRACT

Technology brings in high usage of video information today and there has been a considerable development in networking and multimedia technologies. There is no restriction for uploading and downloading a video file, and users are able to upload with many devices today. Due to this, quality of video files is reduced and a lot of repeated information is available on the net. Getting the relevant video file of good quality is really a challenging task today. For this purpose, many video indexing and retrieval techniques are available today. Video data mining has become more important in this present scenario, and it plays a very important role because of the huge video content available. Video content on the web increases daily with various electronic equipments like cell phones, digital cameras and more innovations coming up. So there is an urgent need for an efficient technique for video content retrieval. This paper brings a new technique for video content retrieval. This process consists of video classification, video clustering and pattern finding.

Keywords: Data Mining, Video Data Mining, Knowledge Extraction, Clustering, Segmentation.

1. INTRODUCTION

Today there are many video communication sits like Yahoo, face book, twitter, Gmail and whatsapp. Due to this users can share more video information on the web. From this huge content it is very difficult to get our needed information. For this a number of research papers focused on techniques like content based access, frame matching, motion-matching and time series data matching. This paper brings one such idea in video content retrieval using frame matching technique. This technique is different from the traditional video retrieval process. The existing techniques are based on video surveillance, action diction, or more specifically based on actor dependent action. All the above techniques are based on motion and time based analysis of the video data. All the above also face the problem of video segmentation and represent segmented data. Today, technology allows the user to upload any type of video from any corner of the globe. Extraction brings either this type of videos or brings the duplicated information. To overcome this situation today many new research papers and research techniques are presented for video indexing. It helps the user retrieving and grouping the video contents. For this video content mining or video data mining are more and more important in recent years. Because of limited resources and human interaction, video content mining still suffers from inefficient tools and difficulty in managing huge amounts of data. This research focuses on the recovery method which is performed without human intervention to extract the required video. This is done by defining the video contents i.e. video properties like color, RGB Values, motion etc. This paper proposes a new technique for video content retrieval which consists of train and retrieval process. Grouping of relevant video content is done with the help of effective clustering techniques and feature matching techniques.

DO TRADING VOLUME AND BID-ASK SPREAD CONTAIN INFORMATION TO PREDICT STOCK RETURNS? INTRADAY EVIDENCE FROM INDIA

Rashmi Ranjan Paital[1†] --- **Naresh Kumar Sharma**[2]
[1]*Research Scholar, School of Economics, University of Hyderabad, Hyderabad, India*
[2]*School of Economics, University of Hyderabad, Hyderabad, India*

ABSTRACT

Relying on the mixture of distribution hypothesis (MDH) and the sequential information arrival hypothesis (SIAH), this paper empirically examines the relationship between stock returns, trading volume and bid-ask spread for 50 Indian stocks using high frequency 5-minute data set for the period July 2, 2012 to December 31, 2012. This is the first study in India using bid-ask spread as yet another measure of information flow variable along with trading volume. Our empirical findings provide evidence of a positive contemporaneous relationship between absolute returns and trading volume as well as between absolute returns and bid-ask spread. The Granger causality test results show that the information content of trading volume and bid-ask spread are useful for predicting stock returns in Indian stock market. Overall results seem to indicate that information arrival to investors tends to follow a sequential rather than simultaneous process as suggested by SIAH. In summary, both trading volume and bid-ask spread serve as a good measure of information variable in India.

Keywords: Stock returns, Trading volume, Bid-ask spread, Market microstructure, MDH, SIAH.
JEL Classification: G12, G14.

Contribution/ Originality

This is the first study in India using bid-ask spread as yet another measure of information flow variable along with trading volume to investigate the relationship with stock returns.

1. INTRODUCTION

New information causes investors to adapt their expectations and this is the main source of price changes. A major issue concerns measurement of the information flow in the market. In this connection, market microstructure research has been focusing on the price-volume relationship since this empirical relation helps in understanding the competing theories of dissemination of information flow in the market. Many studies focused on to determine the true relationship between stock price changes and trading volume, both at a theoretical and at an empirical level. The majority opinion is that there exists a positive contemporaneous relationship between trading volume and absolute price changes in financial markets. On the theoretical level, the existence of such a positive relationship explained mainly by two theories; the Mixture of Distribution Hypothesis (MDH) and the Sequential Information Arrival Hypothesis (SIAH). Clark (1973) was the first to introduce MDH, and then it was extended by others such as, Epps and Epps (1976); Tauchen and Pitts (1983) and Harris (1986). They argue that absolute price changes and trading

Does FDI Affect Export Performance of India? An Empirical Analysis

Aruna Kumar Dash, Aviral Kumar Tiwari
and Mothkuri Aruna

Introduction

India has adopted the New Economic Policy (NEP) in 1991 in the wake of economic crisis. India has opened up its market since July 1991 by lowering tariff and non-tariff barriers (NTBs), and liberalizing investment policy. The NEP has removed all sorts of biases against exports initiating reforms in the areas of international trade, investment, financial sector, and industrial and public sector deregulations. While the policy has continued to rely on self reliance, the greater emphasis was put on the ability to pay for imports through the expansion of exports and production base. The inflows of Foreign Direct Investment (FDI) were encouraged to expand exports of the country as FDI would bring along with additional capital, the attendant advantages of technology, managerial know-how marketing expertise with access to global, regional and expanding home country markets (UNCTAD 2002).

Prior to globalization developing countries mostly have to rely upon financial institutions such as World Bank and IMF to meet their financial needs subject to certain conditions. But with the opening up of the economy, Foreign Direct Investment acts as another important avenue for policymakers of developing economies in attracting capital flows. Almost all nations across the globe aim to attract FDI because the higher the inflow of FDI into a country, higher expectations of that country in terms of economic performance. Indeed, FDI provides a win-win situation to both the 'investing country' as well as to the 'host country'. The investing country can take advantage of the free market accessibility that it gets in the host country. The host country on the other hand can increase its financial resources for development, boost export competitiveness, and increase its labour productivity by strengthening its skill base and enhancing technological capabilities.

An empirical assessment of the role of foreign direct investment (FDI) in a host country's export performance is important, since exports have been for a long time viewed as an engine of economic growth. Foreign direct investment plays a multidimensional role in the overall development of the host economies. There is a widely shared view that FDI promotes exports of host countries by (a) bringing in non-debt-creating foreign capital resources, (b) helping transfer of technology and new products for exports, (c) facilitating access to new

Effect of information content and form on customers' attitude and transaction intention in mobile banking

Moderating role of perceived privacy concern

Sreejesh S.

Cochin University of Science and Technology (CUSAT), Cochin, India
Anusree M.R.
Department of Operations, Rajagiri Business School, Cochin, India, and
Amarnath Mitra
Department of Operations and IT, IBS Hyderabad, Hyderabad, India

Abstract

Purpose – Although research on mobile banking (M-banking) is an emerging field, the current understanding of the information characteristics of M-banking, such as information content and form and its impacts on customers' attitude and transaction intention toward the same is limited. Furthermore, no study to date has examined how users' privacy evaluation regarding the use of M-banking (i.e. users' perceived privacy concern) influences their processing of information to create attitude and subsequent transaction intention. The purpose of this paper is to attempt to narrow this research gap by investigating the process through and conditions under which the customers' evaluation of M-banking information content and form contributes to the development of transaction intention.

Design/methodology/approach – A self-administered survey on the users of M-banking was performed to collect the response. Mediation analyses followed by conditional process analyses were carried out to test the proposed set of hypotheses.

Findings – The results show that users' favorable evaluation of M-banking information content and form creates transaction intention through favorable attitude toward M-banking. However, this relationship is found to be moderated by their perceived privacy concern, as users with high privacy concern do not process information content and form favorably, i.e., their attitude and transaction intention are found to be less, as compared to users with low perceived privacy concern.

Originality/value – Drawing on literature from areas, such as information processing, internet banking, marketing and psychology, the paper develops an understanding of the role of information characteristics of M-banking in determining users' transaction intention via user attitude. Furthermore, this is the first study that shows how information characteristics differently influence users' attitude and transaction intention based on their perceived privacy concern.

Introduction

The banking industry has witnessed a significant shift in service delivery patterns in recent years with the adoption of self-service technologies, which have emerged as substitutes to the traditional retail banking services (Wessels and Drennan, 2010). Among the wide variety of electronic-based self-services, mobile phone banking

ABSTRACT

Energy Market Integration (EMI) has been a goal for many regions, including East Asia, for quite a long time. This study treats trade and income as endogenous and estimates the overall impact of trade openness on environmental quality using the instrumental pricing variable technique for ASEAN economies. We find the impact is large in the long term, after the dynamic adjustment process, although it is small in the short term. Economic integration and trade liberalization in ASEAN had a sustained economic growth over the last several decades. Asia has become the world's most vibrant region. It maintained an impressive growth rate. Access to large markets allowed Asian countries to utilize their economies of scale on the one hand, and stimulate growth in their productive sectors on the other. With the rise of Asia, it is time for these countries to assist and become an integrated market of their own. Thus, energy is at the center of all issues due to its importance for domestic and international economy and environment. Certain countries that lag behind in energy market integration need to learn from either their past experiences or from other nations and focus their efforts on their relatively weak dimensions. A simple correlation has been used to see the relation between Trade, GDP Growth and other determinants; the results of which shows that there is a Moderate degree of Negative Correlation between trade and GDP growth, a high degree of positive correlation between trade & CO2 emissions and a high degree of positive correlation between GDP growth & CO2 emissions.

FDI AND ECONOMIC GROWTH: A COMPARATIVE ANALYSIS OF EMERGING ECONOMIES OF ASIA AND DEVELOPED ECONOMIES OF EUROPE AND AMERICA

Laila Memdani*

Abstract: *The article examines the relationship between FDI and economic growth in emerging economies of Asia and Developed economies of Europe and America, taking data of 19 Asian emerging economies and 21 Developed economies of Europe and America over a period ranging from 1980 to 2013 from UNCTAD data base. The other variables used are outward FDI, Exports of Goods and Services (EXGS) and Imports of Goods and Services (IMPGS). GDP percapita (GDP) is taken as a proxy for Economic Growth. The results reveal that the FDI, both inward and outward, are significant in increasing GDP in Developed countries but are negatively affecting GDP in emerging economies of Asia.*

INTRODUCTION

The decade of eighties saw a remarkable change in the policies of underdeveloped and developing countries. They started with the process of liberalization, privatization and globalization (LPG) of the economies. Thanks to the pressures from IMF and other international bodies to reduce subsidies and make trade free (Damooei and Tavakoli, 2006). There has been increasing competition amongst these countries to attract FDI to their countries. It has been widely acclaimed that foreign investment is a wonder pill, which will free under developed countries of all their ills (World investment report 2011, 2011). The advantage of FDI is that is the technology transfer that accompanies new investments most often. Therefore, host economies expect improvements in productivity as well as indirect spillover effects that it follows (Ahmed, 2012). The East Asian crisis of nineties proved contrary and some of the countries slowed down the process of LPG.

The relationship between FDI and Economic Growth is widely debated in economic literature (Belloumi, 2013: Sainia, Lawa and Ahmadc, 2010). Prasad *et al.* (2003) believed that financial globalization can contribute significantly to promoting growth in

GREEN consumption values and Indian consumers' response to marketing communications

Ainsworth Anthony Bailey
Department of Marketing and International Business, University of Toledo, Toledo, Ohio, USA
Aditya Mishra
Department of Marketing and Strategy, ICFAI Business School, Hyderabad, India, and
Mojisola F. Tiamiyu
Department of Psychology, University of Toledo, Toledo, Ohio, USA

Abstract

Purpose – This paper aims to report on a study that assessed Indian consumers' response to green marketing communications, based on their GREEN consumption values. GREEN (Haws *et al.*, 2014) refers to consumers' tendency to express their environmental concern through their consumption behaviors. This study applies this construct in a marketing communications context.

Design/methodology/approach – Two conceptual models involving GREEN were developed, and data to test the models were collected in a survey conducted among a convenience sample of 284 Indian consumers.

Findings – The results show that GREEN can enhance understanding of consumers' green attitudes and intentions. GREEN consumption values have an impact on how Indian consumers respond to advertising and public relations stimuli, as GREEN influences perceptions of green brand trust, attitudes toward green marketing communications and green brand support and purchase intentions.

Research limitations/implications – The research adds to the growing literature on green marketing in emerging economies and extends the application of the GREEN construct from the domain of consumer behavior to that of green marketing communications.

Practical implications – The results suggest that marketers should focus on developing green marketing communications strategy, rather than just green advertising strategies, and they can position their green products to appeal to consumers based on GREEN consumption values.

Originality/value – The study is the first to apply the GREEN construct in assessing consumer response to a brand's green marketing communications; it also explores this issue in an emerging economy.

Keywords Environmentalism, GREEN, Green consumption values, Green marketing communications

Paper type Research paper

1. Introduction

Across the globe, a growing number of companies and consumers have been focusing on environmental issues and sustainable consumption, in light of various reports regarding the negative impact that consumer behavior is having on the planet. Consequently, there has been an increasing awareness of green marketing, and consumers have been responding to brands that promote environmental responsibility, especially as companies' environmental efforts are now being widely regarded as part of their corporate social responsibility (CSR; Olsen *et al.*, 2014). This increasing awareness of environmental issues and green marketing is not confined to developed economies, as there also have been moves to generate increased awareness in emerging economies (Jain and Kaur, 2006; Carrete *et al.*, 2012; Roy, 2013; González *et al.*, 2015). The focus on green marketing among consumers and businesses has been matched by renewed academic research. There is increased academic investigation in this domain, as researchers seek answers to a number of green marketing-related issues, including identifying factors that influence consumers to behave in environmentally responsible ways (Haws *et al.*, 2014; Armstrong Soule and Reich, 2015).

As more researchers seek to understand green consumption behavior, the development of new green-related constructs and measures has not escaped research attention. Among the new constructs is *GREEN consumption values*, defined by Haws *et al.* (2014) as "the tendency to explore the value of environmental protection through one's purchases and consumption behaviors" (p. 337). In a series of studies, these researchers developed and validated a six-item scale, GREEN, to measure this construct. The scale, the developers argued, can be used to understand green consumer behavior, including response to green marketing communications. The stated usefulness of this scale motivated this current study, the

How to develop emotional attachment amongst patients towards hospitals? A qualitative investigation in the context of emerging Indian market

Abhigyan Sarkar, Juhi Gahlot Sarkar and K.S. Venu Gopal Rao

Abhigyan Sarkar is Assistant Professor (Marketing) at Institute of Management Technology, Ghaziabad, India. Juhi Gahlot Sarkar is Research Scholar at IBS Hyderabad, Hyderabad, India. K.S. Venu Gopal Rao is Professor at the Marketing Department, IBS Hyderabad, Hyderabad, India.

Abstract

Purpose – *The purpose of this qualitative study is to explore the antecedents and consequences of hospital brand attachment and associated intervening factors amongst patients and attendants in the context of the emerging Indian market where the hospital industry has a heterogeneous structure consisting of state-owned and private hospitals.*

Design/methodology/approach – *Semi-structured in-depth interviews were conducted to collect data. Data were coded using the grounded theory method to explore and validate interrelationships between the constructs that emerged.*

Findings – *Based on the data analysis, a grounded theory framework has been developed, which recognizes hospital brand attachment as the central construct, and depicts its related antecedents, consequences and intervening or moderating factors.*

Originality/value – *The study contributes to the existing body of healthcare marketing research by having discovered actionable antecedents of hospital brand attachment that could help healthcare marketers in emerging markets to formulate branding strategies that strengthen the patient–hospital brand attachment relationships. Based on the concepts explored in this qualitative study, it has been put forth that the concept of brand love or brand attachment that is well-researched in the case of general consumer brands is also applicable in the case of hospital brands, without ignoring the specific idiosyncrasies of the hospital industry.*

Keywords *Brand trust, Hospital brand attachment, Brand ethicality, Accommodation environment, Foreign collaboration, Empathetic interaction*

Paper type *Research paper*

Introduction

Attachment is an emerging area of research in the context of brand consumption. The concept of brand attachment has been borrowed from the interpersonal attachment literature (Thomson *et al.*, 2005). The basic assumption of the interpersonal attachment theory is that human infants' attachment behaviour evolves from how adult caregivers maintain proximity with infants, which subsequently shapes those infants' future proximity maintenance behaviour with regard to attachment objects (Hazan and Shaver, 1994). So, attachment is a psychological system that functions to maintain proximity to an attachment object. Shimp and Madden (1988) have stated that individuals can have emotional relationships with consumption objects, and the structure of such consumer–consumption–object relationships is largely analogous to that of interpersonal love relationships as proposed by Sternberg (1986). Thomson *et al.* (2005) developed a psychometrically reliable scale to measure emotional brand attachment. The scale has three intercorrelated dimensions – affection, passion and connection. It is very important for marketers in any industrial sector to enhance the levels of consumers' brand attachments, as brand

Identifying dimensions of employer attractiveness in Indian universities: an approach towards scale development

Chetna Priyadarshini, Sireesha Mamidenna and O.B. Sayeed

Chetna Priyadarshini is Doctoral Scholar, Sireesha Mamidenna is Assistant Professor and O.B. Sayeed is Professor, all at the Human Resource and Soft Skills, IBS Hyderabad, IFHE University, Hyderabad, India.

Abstract

Purpose – *As the global war of talent is prevalent across different industries, universities are also facing an acute shortage of faculty members because of massification of higher education system in the past two decades. The tremendous increase in the number of higher education institutions has made attracting talented professors a challenging necessity for the university management as employers. The present study, therefore, carries out a scale development exercise and explores the attractive dimensions of Indian universities as employers.*

Design/methodology/approach – *With the help of principle component analysis, exploratory factor analysis was carried out to obtain five significant constructs of employer attractiveness in Indian universities.*

Findings – *The dimensions identified in the study includes fairness and work–life balance; teaching environment and compensation and benefits; research resources and career development; organizational integrity and commitment to quality; and organizational culture consisting of respect and recognition.*

Practical implications – *The finding provides valuable insights for the university management and government bodies and posits to assist them in formulating policies with regard to attracting competent teaching staff.*

Originality/value – *Although employer attractiveness has gained scholarly attention in the past two decades, study exploring the dimensionality of employer attractiveness in the context of academic institutions and universities has not been conducted so far. The present study, therefore, is one of the pioneers in this realm.*

Keywords *University, Recruitment, Scale development, Employer attractiveness, Exploratory factor analysis, Teaching staff*

Paper type *Research paper*

Introduction

In the current business environment, irrespective of the industry it operates in, human resource has become one of the main sources of competitive advantage for an organization. The escalating war of talent has made it mandatory for organizations to communicate effectively with potential job seekers and attract them to apply for a given job position. However, as limited budget is allocated by organizations for recruitment and selection of their employees (Brasher and Chen, 1999), it becomes critical for the managers to identify the elements which play a decisive role for job seekers while applying for or declining a given job position (Taylor and Bergmann, 1987). In this regard, past research has widely captured the dimensions of organization attractiveness across different industries (Turban and Keon, 1993; Turban, 2001; Lievens *et al.*, 2001), but studies capturing the same in higher education context have remained scarce. Additionally, extant literature also maintains that being able to attract talented employees with right skill set plays a crucial role in determining the success of any organization and this phenomenon is expected to be more proximal in knowledge-based organizations such as universities (Chan, 2012). As higher education

Influence of Partner Relationship and IT Integration on Supply Chain Capabilities: An Empirical Relational Paradigm

Santanu Mandal
Faculty of Operations & IT
IBS, Hyderabad, IFHE University
India
shaan.nitw@gmail.com

Abstract

Supply chain relationships are now becoming more important due to efficient and effective information sharing and leading to integration. The purpose of this study is to investigate the influence of trust and commitment on integrated logistics capabilities. A second purpose is to explore the influence of integrated logistics capabilities on supply chain agility, resilience and robustness. The study employed a cross-sectional web-based survey of 183 logistics and supply chain professionals from Indian Manufacturing firms for data collection. Confirmatory factor analysis was employed for testing the reliability and validity of the measurement instrument. Further, partial least squares was utilized for testing the proposed relationships. The study found positive effects of trust and commitment on integrated logistics capabilities which in turn positively affect the development of supply chain capabilities viz. agility, resilience and robustness. Further, trust was found to have a positive effect on commitment. The study is the first to empirically validate the relationship between integrated logistics capabilities and three dominant supply chain capabilities viz. agility, resilience and robustness. Secondly, it also addressed the impact of two dominant relational attributes that have not been explored. The study empirically explored that logistics is an integral part of supply chain management as suggested in its definition. Further, our study undersigned IT integration as a significant moderator in the enabler-mechanism-outcome paradigm.

Market efficiency

ABSTRACT

This paper investigates a proprietary dataset of insider trades for Indian listed firms, where controlling ownership and business groups dominate. We show that the information content of insider trading is an inverted U-shaped function of controlling ownership. Further, we find that the information content of insider trading is lower when firms are affiliated with a business group. We also show that information production depends on the degree of information asymmetry between insiders and outsiders. Finally, we find that insider trades that occur prior to an earnings announcement have a larger impact on stock prices.

© 2015 Elsevier B.V. All rights reserved.

1. Introduction

A large body of studies has documented that insider trading conveys new information to the market. For instance, Seyhun (1986), and Lakonishok and Lee (2001) report positive abnormal returns following the public disclosure of insider purchases for the U.S. Similarly, Fidrmuc et al. (2006) find positive abnormal returns of insider purchases for the U.K. While an insider purchase conveys positive news about the firm's future, it is less clear what information an insider sale conveys. On the one hand, an insider sale may convey bad news about the firm's future. On the other hand, an insider sale may be less informative if it is made to meet the liquidity needs. A counter example of above studies is Eckbo and Smith's (1998) study, which finds that insider trades in firms listed on the Oslo Stock Exchange do not earn abnormal profits.

Furthermore, Huddart and Ke (2007) show that the information advantage of an insider is driven by two factors. First is the uncertainty of firm value and second is the precision of an insider's private information. In this paper, we extend

INTERNATIONALIZATION OF SMES: AN EMPIRICAL STUDY IN VIJAYAWADA CITY

Kalagadda Prasanthi* and M. Bhaskar Rao**

Small and Medium Enterprises (SMEs) sector is vibrant in many countries contributing to the economic growth. Internationalization of SMEs is a natural consequence of globalization and liberalization. SMEs have potential for innovation leading to their competitive advantage and growth opportunities and hence can expand beyond overseas. Internationalization is the process of expanding business beyond domestic markets. It is synonymous for the geographical expansion of economic activities over country's border. It means changing state of SMEs from a single market to multiple markets. The growth of the firm is the basis for considering internationalization of SMEs although to some degree both are intertwined. Internationalization would have a positive influence on innovations in SMEs, if adequately backed up by facilities for Research and Development (R&D) and marketing capabilities. SMEs play an important role in new product development, employment generation, exports and contribute to GDP in many countries. Internationalization process impacts the performance of SMEs. Most of the SMEs internationalize due to the lack of alternative market opportunities. There are many factors that contribute to the process of internationalization, with a series of interrelated activities which result in the overall growth of the firm. This paper focuses on how the internationalization process affects the firm performance. The study was carried out in Vijayawada region in the State of Andhra Pradesh in India.

Key words: Competitiveness, Competitive advantage, Economic growth, GDP, Globalization, Innovation, Internationalization, Liberalization, Research and Development.

INTRODUCTION

Small and Medium Enterprises (SMEs) account for more than 95% of the firms in many countries (Yu-Ching Chiao, 2006). SMEs contribute nearly 40% of the gross industrial value. Overall thirteen million of SME units in India are employing 41million people, having an approximate share of 45% of manufacturing output, 40% of exports, produce more than eight thousand products and contribute to 35% of gross industrial exports. SME is closely associated with the growth and performance of the country (Lu, 2001). Globalization and liberalization had given intensified competition which leads the SMEs to internationalize. Internationalization process had come into emergence from 1920s. SMEs can use the internationalization as a strategy to overcome the resource barriers. The economic internationalization process accelerated in the post-second-world-war era and appeared unrivalled until the early 1970s, when a new phenomenon of globalization started to emerge (Gjellerup, 2000).

Organizational Factors Effecting Attrition in Indian Information Technology (IT) Industry

*S K Sastry Akella **Arif A Waqif ***K.Venketeswara Rao

The Indian Information Technology (IT) industry has seen a very fast growth due to body shopping. With increased opportunities, employee job-hopping has increased. The employer has started treating employee like a commodity and employees became job hoppers. As business became more project oriented and time and money contracts are being replaced by delivery contracts, the employee continuity has become critical. The managements started looking at controlling attrition and looking for mechanisms for regaining employee commitment. However, the confusion remains whether employee loyalty can be expected in the present day IT worker if so whether the conventional concepts of organizational support and supervisor support have any relevance in today's industry. We have tested two common perceptions of employee retention theories that Perceived Organizational Support (POS) and Perceived Supervisor Support (PSS) help in obtaining employee commitment to the organization. The data is collected through online survey form IT professional working in Hyderabad. The data is subjected to Exploratory Factor Analysis (EFA) using SPSS 20.0. We have found out that both POS and PSS have significant role to play. Employee loyalty increases with the employee's liking for the organization and Job satisfaction. The supervisor can focus on reducing the stress and assign jobs that help professional growth to retain the employees. Both management and supervisor can play significant role in controlling attrition. This aspect can further be tested across the nation and comparisons made across sectors and firms.

Key Words: Attrition, Perceived Organizational support, Perceived Supervisor support, Job Satisfaction, Intention to quit, Stress

Introduction

Attrition is accepted as a fact of life in Indian Information Technology (IT) industry. Managements are attempting to control attrition with fat pay packets. Project managers are trying their best to retain the team until the completion of their projects. Employees have started thinking that job hoping is essential in IT industry for survival as well as growth. Information Technology is not yet a matured science and the poses new challenges every day to the IT workers. Employees are complaining about work stress and fatigue. Attrition is a complex phenomenon. Attrition may be due to internal organizational factors as well as external factors. The Organization as well as immediate supervisor has a significant role to play in controlling attrition. The Perceived Organizational Support (POS) and Perceived Supervisor Support (PSS) have enormous control on employee attrition. This study is an attempt to study the relation between POS, PSS and attrition. The study is based on an online survey. The participants represent employees of IT industry in Hyderabad belonging to various organizations. The organizational factors included in the study are job satisfaction, pay satisfaction, job attributes, supervisor support and intention to quit. We have conducted Exploratory Factor Analysis (EFA) and the findings are presented in this article.

Review of literature

Attrition is a challenge for Human Resource (HR) managers and two thirds of corporate spending is on people. (K Usha, 2013; Choi Sang Long, 2014; Tustin Nupur, 2010) The reasons for attrition are many. The working conditions, job satisfaction, pay, career growth, training and personal reasons are some of the factors identified as reasons for attrition. (Gupta Sangeeta, 2011; Priya 2011; Borman D Geoffrey 2008) The management's failure to reduce the difference between the desired and the actual situation or breach of psychological contract between employee and employer is considered as one of the main reasons for employee attrition. (VNOUCKOVA Lucie, 2013; Agrawal Promila, 2011) The role of immediate supervisor is stressed in many studies. Regular counseling, sharing of information, feedback and trustworthiness of the manager are the factors that play a critical role in controlling attrition. (Sindhu Shikha, 2014; Ghosh Koustab, 2011) The immediate supervisor can control feelings of stress, job dissatisfaction and lack of commitment. (Firth Lucy, 2004)

Perceived Organizational Support (POS) is based on organizational theory of reciprocity. Employee reciprocates for the support employee receives in terms of organizational procedures, supervisor

INVESTIGATING THE PROCESS THROUGH WHICH E-SERVICESCAPE CREATES E-LOYALTY IN TRAVEL AND TOURISM WEBSITES

Sreejesh S
Abhilash Ponnam

ABSTRACT. In order to address the lack of systematic research on the process through which e-servicescape creates e-loyalty in an online travel and tourism context, a conceptual model is proposed which examines the potential influence of the e-servicescape of travel and tourism websites. The underlying premise is that, given the demonstrated impact of servicescape on loyalty and outcomes in traditional physical travel and tourism settings, such atmospheric cues are likely to play a role in the online travel and tourism context. An affective–cognitive model is used as the basis of the model which posits that e-servicescape of the online travel and tourism websites, through the intervening effects of experiential–affective and functional–cognitive routes, influence the outcomes of online travel and tourism behaviors in terms of e-loyalty. Visitors' previous experience with the website is hypothesized to moderate the relationship between e-servicescape and shoppers' experiential–affective and functional–cognitive reactions. Propositions are derived and the research implications of the model are presented in a travel and tourism context.

KEYWORDS. Online travel and tourism, e-servicescape, experiential evaluation, functional evaluation, cognition, affection, e-loyalty

1. INTRODUCTION

In recent years, identifying ways to develop online consumption experience has become a predominant area of inquiry in the travel and tourism (T&T) sector (Gao & Bai, 2014; Lee & Jeong, 2012). Providing customers with unique and compelling experiences has been recognized as an important issue in developing favorable consumer behavior outcomes in an online T&T environment (Huang, Chou, & Lin, 2010; Nusair & Parsa, 2011). While seeking to understand the ways to develop differentiated consumption experiences in an online setting, researchers have highlighted the importance of managing the online environment. For example, Harris and Goode (2010, p. 210) argued that "consumers' perceptions and interpretations of online service environments exert a powerful, direct influence ... [and that] ... is associated with consumers' purchase intentions". Furthermore, studies identified the fact that managing the online environment plays an important role as it influences customer responses and behavior-related outcomes in online service settings (Darley, Blankson, &

Performance Analysis of Video Data Image using Clustering Technique

D. Saravanan*

IFHE University, IBS Hyderabad, Telangana State–501203, India; sa_roin@yahoo.com

Abstract

Objectives: This research paper focuses on design of a hierarchical clustering algorithm for efficient and effective organization of data for information retrieval. **Method/Analysis:** A classification tree is formed in COBWEB which indicates hierarchical clustering model. **Findings:** The proposed method utilizes less memory and worked well for all types of video files. Also this paper brings the comparison result of existing three types of video clustering algorithms BRICH, CURE, and CHAMELEON and their performances.

Keywords: Clustering, Hierarchical Clustering, Image Processing, Performance Analysis, Video Data Mining

1. Introduction

CHAMELEON that measures the similarity between the clusters based on an active model. Video clustering is different from normal clustering techniques. Because video content are unstructured, to perform video data mining from such unstructured information, they must first be converted into a structured format. Then those videos can be accessed based on the content available in the video file[1]. In video clustering, time plays an important role. Due to technological developments, lots of duplicate files are available on the web[2]. In the clustering process, the difference between the clusters is merged only if the inter-connectivity and closeness[3] (proximity) between two clusters are high, relative to the internal inter-connectivity of the clusters and closeness of items within the clusters. It discovers natural clusters of different shapes and sizes. For frequently inserting and querying enormous amount of data, large databases are required for storage store. For researchers extracting important models and analyzing big data sets are interesting. There are two main groups in huge database mining. Applying mining techniques and referring streaming data is one group. Solving the problem with suitable algorithm is done in the second group. For huge databases, data stream is the best approach instead of mining the entire database, as stated by many researchers. Data can be scanned once and the data may be retrieved but the accuracy is not better. The second type of clustering process is CURE. CURE performs its operations by using hierarchical clustering technique, and this algorithm is used mostly for large databases like image data bases. Because of the running time this algorithm is never applied directly to large data bases. Due to this drawback we choose stochastic data from the original data set, and then apply the partition technique. After this chief points are identified. With help of the above three steps algorithm works effectively. The third type of cluster algorithm is BIRCH is a remembrance type of algorithm, i.e., the clustering process is performed by remembrance and is carried out with a memory limitation.

Existing clustering algorithms can be broadly classified into partitioned and hierarchical[4-6] of which CHAMELEON captures the concept of neighbourhood dynamically by taking into account the density of the region. BIRCH makes full use of available memory to derive the finest possible sub clusters (to ensure accuracy) while minimizing I/O costs (to ensure efficiency). CURE is a hierarchical clustering technique where each partition is nestled into the next partition in the sequence. The main drawback of this algorithm is that identifying chief points take more time, due to this, the running time of this algorithm is more.[12] A comparative study identified the three existing

PERFORMANCE EVALUATION OF MEMORY BASED CLASSIFIERS WITH CORRELATION BASED FEATURE SELECTION SUBSET EVALUATOR FOR SMART HEART DISEASE PREDICTION

Lakshmi Devasena. C[1]

[1]*Operations & IT Department, IBS Hyderabad, IFHE University*

Abstract

Healthcare industries collect voluminous clinical data which are not able to process manually. Advancements in Technology played a vital role in storing and processing such huge collection of clinical data. Medical decision support systems are intended to support doctors in their diagnosis. This provides effort to widen knowledge and understanding of frequent specialists and facilitates the diagnosis process, using patients' data from clinical databases. Identification of heart disease is a momentous and difficult task in medicine. It is crucial to find the best fit classification algorithm that has greater accuracy on classification in heart disease prediction. This research work compares the competence of Memory based classifiers for prediction of heart diseases by taking several measures using open access machine learning tool.

Keywords—*Heart Disease Prediction; Memory based Classifiers; Performance Comparison*

----------***----------

1. INTRODUCTION

Medical data mining is an exploring field of data mining, where different data mining and classification techniques are used to predict the diseases based on the existing clinical data. Health care industries store huge amount of data of patients which can be used for this purpose. Even the serious diseases like 'Heart Attack' have some common symptoms which are used to predict the disease. Based on the past existing data if a classification model could be prepared, and then it is easy for the physician to predict the disease using basic clinical data and initiates the treatment without waiting for other medical modality results. Medical decision support systems use Medical data mining approach to support diagnosing process. Mainly classification algorithms play an important role for this purpose. The accuracy of the classification will be based on the accurate and enough training data available. Varieties of classification algorithms exist to predict the unknown data and Computer Science and Engineering Researchers have an opportunity to study the algorithms and suggest the best performing algorithm. This research work experiments and compares the performance of Memory based classifiers in predicting Heart Disease.

2. LITERATURE REVIEW

There are numerous works coming up for better heart disease prediction. Researchers showing interest in this area to find the better algorithms which gives superior accuracy and analyzing various measures to study the performance of different algorithms. The algorithms like neuro-fuzzy integrated approach, combined technique of Maximal Frequent Item set Algorithm+ C4.5+ K-means algorithm, Artificial Neural Network with Feature Subset Selection and Principal Component Analysis are analyzed for heart disease prediction in [1], [2], [3] and [11]. SPAM algorithm with Nearest Neighbor Classifier, Genetic Algorithm for variety of Optimal Reduced Set of Attributes and Naive Bayes with Decision Tree classifier, C4.5 and C5.0 decision tree algorithm with Rule reduction are compared and analyzed for heart disease prediction in [4], [5] and [6]. Cluster based Association Rule Mining using sequence number, SMO, Logistic Function and Multilayer Perceptron, K- Nearest Neighbor Algorithm are analyzed and compared for heart disease prediction in [7] and [8], [10] and [12]. Review reports on Heart Disease data set prediction by various researchers are summarized in [9], [13], [16] and [27]. The possibilities, advantages and usage of Data Mining in Health care to predict diseases are elaborated in [14] and [22]. Adaptive Neuro-Fuzzy Inference system with Hybrid Learning algorithm, Artificial Neural Network with Multilayer Perceptron using Back Propagation algorithm, Classification and Regression Tree (CART) Model algorithms are analyzed for Heart Disease prediction is described in [15], [17], [18] and [30] and these algorithms compared the accuracy of classifiers with other classifiers in the existing literature. Cascaded Neural Network Classifier and Support vector machine algorithm, Naive Bayes, Neural Networks and Decision tree Combination, CART, ID3 and Decision Tree classifier combination are analyzed and compared for heart disease prediction in [19], [20], [22], [23] and [28]. Equal Frequency Discretization Gain Ratio Decision Tree, J48 Decision Tree classifier and Bagging algorithm, Neural Network, Support Vector Machine and K-Means Clustering combination are analyzed and compared for heart disease prediction in [21] and [24]. Web-based application entitled Decision Support in Heart Disease Prediction System is offered in [25] using data mining technique. Naive Bayes, Decision Table and J48 algorithm combination for heart disease prediction is suggested in [26]. Naive Bayes, Decision Tree with K-Means and Weighted

Proficiency Comparison of Random Forest and J48 Classifiers for Heart Disease Prediction

Lakshmi Devasena C

Department of Operations & IT, ISB Hyderabad, IFHE University, Hyderabad, India

Abstract

Healthcare industries collect capacious clinical data which can be used to diagnose the patients in intelligent way. Advancements in Information & Technology played a energetic role in storing and processing such huge collection of clinical data. Decision support systems in Medical field are intended to support doctors in their diagnosis. This offers effort to widen knowledge and understanding of frequent specialists and facilitates the diagnosis process, using patients' data from clinical databases. These systems help in foreseeing the most serious cardio vascular diseases like 'Heart Attack'. The term Heart disease covers the various diseases that affect the heart. The exposure of heart disease from various symptom or factors is an issue which is not free from false presumptions often accompanied by unpredictable effects. Identification of heart disease is a momentous and tedious task in medicine. It is requisite to find the best fit classification algorithm that has superior accuracy on classification in heart disease prediction. This research work compares the efficiency of Random forest and J48 classifiers for prediction of heart diseases using different measures.

Keywords: Heart Disease Prediction, J48 Classifier, Proficiency Comparison, Random Forest Classifier

Introduction

Medical data mining is an investigating field of data mining, where diverse data mining and classification techniques are used to foresee the diseases based on the available clinical data. Health care industries accumulate huge amount of data of patients which can be used for this drive. Even the severe diseases like 'Heart Attack' have some common symptoms which are used to foresee the disease. Based on the past obtainable data if a classification model could be prepared, and then it is easy for the medical practitioner to forecast the disease using basic clinical data and starts the treatment without waiting for other medical modality results. Medical data mining approach used in Medical decision support systems to support diagnosing process. Classification algorithms play a significant role for this purpose. The accuracy of the classification will be based on the exact and sufficient training data available. Varieties of classification algorithms are available and Computer Science and Engineering Researchers have an opportunity to study the algorithms and propose the best performing algorithm. This research work investigates and compares the performance of Random forest and J48 classifiers in predicting Heart Disease.

Literature Review

There are significant works available in literature to predict heart disease. They normally compared the neural network based and nearest neighborhood algorithms for heart disease prediction. In [1], a neuro-fuzzy integrated approach of two levels is implemented to predict the Heart Disease. In in [2] and [11], a combined technique of C4.5, K-means and Maximal Frequent Item set Algorithm is used to extract and predict Heart Disease is presented. A combined approach of Feature Subset Selection with Principal component Analysis and Artificial Neural Network is used to predict Heart Disease in [3]. SPAM algorithm using Nearest Neighbor Classifier is proposed to predict Heart Diseases in [4]. Extrapolation of Heart Disease which

SOCIAL SECURITY THROUGH MICRO-INSURANCE IN INDIA

Management Insight
12(1) 70 - 77
http://dx.doi.org/10.21844/mijia.v12i1.11395

Shubhagata Roy*

sroy.sms@gmail.com

ABSTRACT:

Micro-insurance phenomenon is one of the most remarkable socio-economic developments of recent times. For a long time, the poor, because of their economic circumstances, were considered non-insurable and non-bankable. However, the "micro-insurance" and "micro-credit" phenomena have shown that the poor can be made insurable and creditworthy if they are organized in small groups. This clearly has deep connotations not just from a finance perspective but, more importantly, from the perspective of poverty mitigation.

Key words : Micro-insurance, micro-credit, micro-finance, ILO, IRDA.

INTRODUCTION:

Micro-insurance is one of the tools that provide protection to low income people against the persons earning very low-income live in risky environments, vulnerable to numerous perils, consisting illness, accidental death and disability, loss of property due to theft or fire, agricultural losses, and disasters of both the natural and manmade varieties. The poor are more vulnerable to many of these risks than the rest of the population, and they are the least able to cope when a crisis does occur. Micro-insurance financial losses occurred due to happening of above mentioned perils. It is the most unexplored area of micro finance where tremendous opportunity for insurer can be seen. It has immense importance in reducing the poverty and providing social protection to the down trodden section of society. Providing insurance services to majority of the world population which lives in the rural areas or having low income scattered over a wide dissection of geographical, socio-cultural and linguistic landscape is the major challenge for both public and private institutions delivering insurance services. The challenge is even scarier because of low literacy levels; poor infrastructure and a nascent and urban centric insurance industry at this point of time of the four billion people on earth today who live on less than USD 2 per day, fewer than 20 million currently have access to insurance. According to the United Nations Capital Development Fund, up to 80% of the 5.1 billion people in developing countries derive their incomes from the informal economy. Micro-insurance can provide solutions for these people to cope with risks in spite of low and often irregular incomes.

As far as the Indian economy is concerned it is enjoying rapid growth and benefits from youngest population in the world. Indian economy is predominantly an agrarian economy. Agriculture employs 65% of the total workforce in this country. It accounts for 40% of the GDP and accounts for 20% of the total value of exports. Nearly 80% of the total population lives in our villages. Insurance industry contributed just 2.6% of the GDP during 20013-14 and 3.17% during the financial year ending March 2015.

Despite its importance, rural sector has not been given the adequate attention it deserves. Our rural population does not enjoy the same privilege and security as their urban counterparts.

SUPPLY RESPONSE OF MILK PRODUCTION: ANALYSIS AND IMPLICATIONS FOR BRIC COUNTRIES

Poulomi BHATTACHARYA[*a],
Badri Narayan RATH[b*],
Aruna Kumar DASH[c]

Abstract

This paper examines the supply response of milk production in BRIC countries using annual data for the period 1992 to 2010. The results derived from panel data analysis support a strong positive supply response of milk prices to the number of milking animals and total milk yield. The study also finds a strong association between price of substitutes between chicken meat and milk. The non-price factors like membership in WTO and exports have a positive impact on supply response in terms of number of milking animals. The study unfolds that export of milk have a favorable impact on the supply response both in terms of number of milking animals and milk yield. The analysis suggests that milk supply in BRIC countries is responsive to the price factors and hence price support and subsidies programmes for dairy farmers in BRIC need to more visible and effective. Such results clearly make a case for introduction of Minimum Support Price (MSP) for milk famers in BRIC countries. Milk producers in BRIC countries can take advantage of the enhanced market access provided by WTO and simultaneously increase their herd size.

JEL Code: Q11, Q17, C23

Keywords: Dairy sector, Supply response, Prices, Panel EC2SLS, BRIC

1. Introduction

Dairy sector has assumed key importance in generation of income and ensuring food security in many countries. The success of dairy sector depends on production and availability of raw milk. A large section of rural population depends on livestock as their central source of livelihood. There are approximately 600 million livestock keepers in the world whose income levels stand far below poverty line. Milk production procures two advantages over other common agricultural crops. First, milk is a highly valued livestock product and second, unlike the twice harvested annual agricultural crops in developing countries, it delivers instant income on sale. Growth of world production of milk rests on two prominent pillars- a rising demand for milk and a rising supply. As per FAO projections, by 2025 demand for dairy product in developing countries is expected to spurt by 25% as compared to the current demand (FAO, 2013). So an escalating demand for dairy products brightens the sectors future potential to grow. The OECD - Food and Agriculture Organisation outlook report (FAO, 2011) states that international dairy price has increased considerably during the last two decades. A rise in dairy price can act as a deterrent to the nutritional upliftment of the poorer sections of the society. So, an enhancement in the supply of milk

Abstract

The paper investigates whether US and UK have followed sustainable debt policies during the period 1970-2012, by exploring the reaction of the primary surplus as percentage of GDP to variations in the debt to GDP ratio, as a powerful test. The main results reveal that the coefficient for UK is negative and significant, while for the US, we are unable to find a clear-cut evidence of the sustainability of public debt as the coefficient is also negative, but insignificant. In the case of the UK, the outputs reveal that government did not raise the primary surplus as the government debt increased rather reduced it and this reduction has been significant. On the other hand, the significance of the reaction coefficient demonstrates that the reaction of the primary surplus to increases in public debt varies over time.
All these evidences allow us to appreciate that the fiscal policy in the UK is not sustainable in the sense of satisfying of intertemporal budgetary constrain.

Keywords: public debt, budget deficit, time varying parameter, intertemporal constraint, sustainability

JEL Classification: C22, E62, H63

1. Introduction

In recent years, the increased budget deficit and public debt experienced by many developed and developing countries have led to the increasing importance of government finance in the long run. Most countries face extensive pressure on their public debts and deficits in the last two decades. Due to the recent financial crisis and the outstanding fiscal stimulus to drive the world economy out of recession, it is important to satisfy the budget plan of government (Fincke and Greiner, 2011a). Especially European countries and US have suffered from very persistent problem by virtue of high public deficits and increase of the public debt. This situation describes vital problem from economic and political aspects, especially US and European countries both now and in future. Some fiscal rules are applied for European countries, limiting the public debt to GDP is 60% and public deficits to GDP is 3%. These

The effect of demographic and personality characteristics on fashion shopping proneness

A study of the Indian market

Subhadip Roy
Department of Marketing, Indian Institute of Management Udaipur, Udaipur, India
Raj Sethuraman
Edwin L. Cox School of Business, Southern Methodist University, Dallas, Texas, USA, and
Rashmita Saran
Department of Marketing, IFHE University, Hyderabad, India

Abstract

Purpose – The global fashion industry is growing at a rapid pace and developing nations such as India are emerging as major contributors to the same. In such case, most academics and marketers are interested in the variables that influence fashion shopping. The purpose of this paper is to investigate the influence of consumer demographic and personality characteristics on fashion shopping proneness (FSP) in India.

Design/methodology/approach – Data were collected from 561 respondents using mall intercept survey method. Hypothesized relationships were assessed using multiple regression and structural equation modelling.

Findings – Traditional view that younger and female consumers are more fashion prone than older and male consumers is validated. However, demographics accounted for only 9 per cent of the variance in FSP while personality characteristics accounted for 46 per cent. Being agreeable, extroverted, open minded, and stable are all positively associated with fashion shopping.

Research limitations/implications – The study finds both personality dimensions and consumer demographics to influence FSP. As a limitation, the authors do not probe deep into the why and how of the mentioned relationships between personality and fashion buying.

Practical implications – With respect to demographics, managers could target young females as the primary segment for fashion clothing but cannot ignore young males and older females. With respect to personality, managers can appeal to agreeable, extroverted, open-minded personalities by linking novelty, fun, relaxation, and recreation with fashion buying.

Originality/value – This is one of the first attempts that simultaneously investigates the effects of demographic and personality characteristics on fashion shopping behaviour in India.

Keywords India, Personality, Consumer demographics, Fashion shopping, Fashion shopping proneness

Introduction

Fashion generally implies popular trend or current style. The terms fashion goods encompass a wide range of products such as clothing, food, perfume, music, automobiles, and beauty products. Fashion has become an integral part of global business. The global fashion industry was valued at USD1.7 trillion and employed 75 million people in 2012 (Fashionunited.com, 2012) with apparel and textiles being the major contributor to the fashion retail industry.

The relationship between risk aversion, brand trust, brand affect and loyalty

Evidence from the FMCG industry

Mukesh Kumar Mishra and Ankit Kesharwani
IBS Hyderabad, IFHE University, Hyderabad, India, and
Dolly Das
Nielsen India PVT LTD, Ranchi, India

Abstract

Purpose – The purpose of this paper is to explore the relationship among risk aversion, brand trust, brand affect, attitudinal loyalty and behavioral loyalty for low involvement day-to-day use of personal care products.

Design/methodology/approach – To achieve the above-stated objective, a theoretical model was tested using structural equation modeling. Before undertaking the analysis, preliminary analysis techniques such as the common method bias social desirability bias reliability and validity analysis were also assessed.

Findings – The results indicate that, for low involvement products, risk adverse consumers do not purchase a brand based only on trust. Risk aversion is also positively associated with attitudinal loyalty. When it comes to the relationship between brand trust and brand affect, it has been concluded that brand trust has had an important impact on brand affect. In this study, it has been found that attitudinal loyalty has a positive and strong impact on behavioral loyalty. This paper explains that due to the lack of trust, certain risk adverse customers are sticking with a particular brand.

Originality/value – Most of the brand loyalty research has been performed on high involvement products, whereas very limited research is available on low involvement day-to-day use products (i.e. personal care products), in particular where the consumption period of the product is less than a month. This kind of research is very rare, and this study has been done to fill this gap using rigorous data analysis.

Keywords Risk aversion, Brand trust, Brand loyalty, Brand affects, Low involvement products

Paper type Research paper

Introduction

These days how to make a consumer more loyal to a brand is one of the biggest challenges facing marketers. Customer loyalty is the next logical step in the process and involves a customer making repeat purchases and recommending a company or a brand to others. As Oliver (1999) explained, loyalty is a deeply held commitment to repurchase a preferred product consistently over time, despite situational influences and marketing efforts that might have the potential to cause switching behavior. According to him, the sequential process of loyalty integrates:

- brand performance aspects (cognitive);
- brand likeability (affective);
- wanting to repurchase the brand (conotive); and
- commitment to the action of repurchasing (action).

"TO FEEL A PLACE OF HEAVEN": EXAMINING THE ROLE OF SENSORY REFERENCE CUES AND CAPACITY FOR IMAGINATION IN DESTINATION MARKETING

Tathagata Ghosh
Abhigyan Sarkar

ABSTRACT. Emerging research in travel and tourism states that individuals can feel emotional connection towards a place or destination. This destination emotion is influenced by sensory reference cues appearing in destination advertisements. This research has empirically tested the influence of sensory reference cues on destination emotion and the extent to which that influence is moderated by an individual's capacity for imagination. The desirable marketing outcomes of destination emotion, namely spreading positive word-of-mouth and destination emotion have also been investigated. The study findings show that visual, haptic, and olfactory reference cues significantly influence destination emotion, and an individual's capacity for imagination moderates the influence. Destination emotion leads to repeat visit intention and word-of-mouth recommendation. The study results form the basis for a discussion of theoretical and managerial implications of the empirical model.

KEYWORDS. Sensory reference cues, destination emotion, individual capacity for imagination, word-of-mouth recommendation, visit intention

INTRODUCTION

The following scenario is not uncommon:

During a busy day at work, John decides to search for "exotic destinations" on Google because he intends to go on holiday with his family in the coming summer. He accesses several links with descriptions and photographs of holiday destinations. Perplexed by the sheer volume of search results, he initially finds it very difficult to choose from so many options. Finally, he comes across an advertisement featuring beautiful descriptions of Switzerland and conjuring up the prospect of a wonderful stay at a Swiss resort surrounded by mountains and beautiful scenery. The descriptions provided on the travel portal prompted him to act on his emotions and purchase the travel package.

TOWARDS AN INTEGRATED LOGISTICS CAPABILITIES MODEL OF SUPPLY CHAIN FLEXIBILITY: A SOCIAL EXCHANGE PERSPECTIVE

Santanu MANDAL*

Abstract:

Supply chain flexibility is a dominant capability in that it ensures sustenance of supply chain operations even in the face of growing uncertainties. However, the development of supply chain flexibility requires integration of logistics capabilities. As supply chains are network of inter-connected firms; the importance of relational attributes also cannot be undermined. The current study investigates the influence of various socio-exchange attributes viz. trust, commitment, power and reciprocity in the integration of logistics capabilities and consequently its impact on supply chain flexibility and supply chain performance. The collected data from 168 senior supply chain professionals using a cross-sectional survey was analyzed using Partial Least Squares. The analyzed data suggested trust, commitment, power and reciprocity to have a positive influence on integration of logistics capabilities. Further, integrated logistics capabilities were found to have a positive impact on supply chain flexibility which in turn exerts a positive influence on supply chain performance.

Keywords*:* supply chain flexibility, firm performance, social exchange theory, trust, commitment, integrated logistics capabilities.

JEL Classification: L10, M10.

1. Introduction

Increasing disruptions in recent times have led firms to devise on strategies that can enable them to have sufficient buffer in their planning and forecasting. This will enable the firms to respond better to environmental uncertainties (Wagner and Bode, 2008) and accordingly they can fight back disruptions effectively (Gligor et al., 2013). Strategically, this is as an essential supply chain capability termed as supply chain flexibility.

Recent supply chains disruptions are therefore are compelling factors for firms to devise risk mitigating capabilities. A supply chain disruption is an unexpected situation that can result in a negative outcome for a firm and its supply chain performance. Recent firms are facing an increase in the number of supply chain disruptions (Wagner and Bode, 2008; Gligor and Holcomb, 2012). This backdrop has compelled firms to devise adequate buffer in their routine to strategic operations so as to provide a proactive

Up, close and intimate: qualitative inquiry into brand proximity amongst young adult consumers in emerging market

Juhi Gahlot Sarkar and Abhigyan Sarkar

Juhi Gahlot Sarkar is Research Scholar at IBS Hyderabad, IFHE University, Hyderabad, India. Abhigyan Sarkar is Assistant Professor at the Department of Marketing, Institute of Management Technology Ghaziabad, New Delhi, India.

Abstract

Purpose – *The purpose of this study was to explore possible types of brand proximity based on respective psychological causal antecedents, and also to uncover possible marking outcomes of brand proximity.*

Design/methodology/approach – *Data were collected from young adult respondents through semi-structured depth interviewing. The data were coded using a grounded theory method to interpret causal relationships between concepts.*

Findings – *Data coding resulted in a causal process model showing various psychological factors that would predict various brand proximity types, and also various attitudinal outcomes of brand proximity. Important emerging market context-specific findings are that the majority of Asian consumers feel emotionally close to developed foreign country originated brands, and that they use brands as a means to escape from various stress factors present in their daily lives.*

Originality/value – *A value of the study lies in exploring the contemporary types of psychological brand proximity and associated factors in the domain of consumer-brand relationship for the first time among Asian young adults.*

Keywords *Brand proximity, Conscious cognitive proximity, Cultural proximity, Psychological brand proximity, Social proximity, Sub-conscious cognitive proximity*

Paper type *Research paper*

Introduction

There is an exhaustive literature on personifying brands, termed as brand anthropomorphism (Aggarwal and McGill, 2012; Brown, 2010; Hart *et al.*, 2013), the concept of which is borrowed by consumer researchers from the social anthropomorphism domain (Lloyd and Woodside, 2013). According to this approach, a brand image is created by marketers as having specific human personality traits, and individual consumers perceive brands as human. Some iconic brands, i.e. Harley Davidson (Schouten and McAlexander, 1995) and Marlboro (Sarkar, 2013), are, in fact, perceived as very human, and brand fans emotionally love such brands. It is also found that while forming relationships with brands, consumers use interpersonal relationship norms (Aggarwal, 2004). Prior research states that the brand relationship is largely analogous to Sternberg's (1986, 1997) multi-dimensional interpersonal love consisting of intimacy, passion and commitment (Shimp and Madden, 1988). This forms the basic premise of the research.

The brand love concept is related to hedonic consumption (Carroll and Ahuvia, 2006) representing emotive arousals, fun and fantasy while consuming (Holbrook and Hirschman, 1982). Though a large volume of research work has been done on brand love (Roy *et al.*, 2013; Carroll and Ahuvia, 2006; Thomson *et al.*, 2005; Shimp and Madden, 1988), marketing practitioners still often find consumers' brand-related behaviors to be highly confusing. Many customers switch brands due to various switching incentives (Oliver, 1999). This implies that there is something more to understand about the nature of

Validating a scale to measure consumer's luxury brand aspiration

Sreejesh S.
Department of Marketing and Strategy, IFHE University, Hyderabad, India
Abhigyan Sarkar
Department of Marketing, Institute of Management Technology (IMT), Ghaziabad, India, and
Subhadip Roy
Department of Marketing, IIM Udaipur, Udaipur, India

Abstract

Purpose – The purpose of this study was to conceptualize consumer's luxury brand aspiration and develop a psychometrically reliable scale to measure the construct. This study aims to extend the existing research in luxury branding domain through validating a scale to measure consumer's luxury brand aspiration.

Design/methodology/approach – Initially, the dimensions of consumer's luxury brand aspiration were identified through prior literature review and qualitative investigations. This was followed by a series of scale development studies suggested by Churchill (1979).

Findings – The results supported that the second-order measure of consumer's luxury brand aspiration consist of four related first-order dimensions, namely, identity signaling, social recognition, self-esteem and achievement signaling. Luxury brand aspiration was found to have direct positive influences on brand commitment and brand attachment. Brand commitment and attachment in turn significantly influence intention to pay price premium.

Originality/value – Value of this research article lies in validating a scale to measure individual's luxury brand aspiration for the first time in branding literature.

Keywords Brand globalness, Intention to pay price premium, Luxury brand aspiration, Luxury brand attachment, Luxury brand commitment

Paper type Research paper

Introduction

Vigneron and Johnson (1999) define luxury brand as an extreme level of prestige brand that is conspicuously consumed with a motive to display social status. The consumers' desire for luxury brands in emerging economies such as China, India, Brazil and Russia have increased significantly over the past few decades (Shukla, 2010; Tynan *et al.*, 2010). This is largely because consumers' brand choice decisions in these countries are getting increasingly influenced by non-utilitarian or symbolic brand attributes such as symbolic ownership and showcasing of social distinctions (Batra *et al.*, 2000; Akram *et al.*, 2011). In addition, rapid economic expansion in these emerging markets is continuously fueling consumers' craving for luxury brand consumption that is leading to substantial growth in the overall luxury consumption (Sukla and Purani, 2012). Recent reports states that about 85 per cent of the new luxury outlets opened globally are located in the emerging markets (Krauss, 2009). Overall, importance assigned to luxury consumption in emerging economies is prompted by increasing aspirational orientations of the consumers, as consumers' perceptions of luxury brand values significantly influence their buying behavior (Tynan *et al.*, 2010; Wiedmann *et al.*, 2007).

Okonkwo (2009) states:

> [. . .] in the last two decades, luxury brand management has generated much interest and discussions in both academic and business circles. Among business leaders, the debates have been related to the associated challenges and paradoxes that have emerged as a result of the evolution of luxury since it became a consolidated economic sector in the late 1990s, led by the vision of conglomerates, such as LVMH, Gucci Group and Richemont (p. 287).

Thus, in spite of the growth, a big challenge for luxury brands is to enhance and maintain the aspirational quotient of a luxury brand in the minds of target customers so that the consumers remain committed and motivated to pay a price premium.

Past research suggests that marketing of luxury brands requires a distinctive approach (Chadha and Husband, 2006; Thomas, 2007). This is primarily because of the showcasing of social distinctions that is a prime motive of luxury brand purchase (Douglas and Isherwood, 1979; Batra *et al.*, 2000; Akram *et al.*, 2011). In addition, the luxury consumption literature shows that consumers buy luxury products to reflect their self-concepts (Randhawa *et al.*, 2015). Predicting consumers' preferences for luxury brands is a critical task requiring a unique approach, as consumers often make purchase

ABSTRACT

Multimedia is any combination of content written in text, drawing, and sound, moving picture, delivered to you by computer or other electronic or digitally manipulated means. Through the rapid growth of multimedia technology, multimedia content can be created, shared and distributed easily. The amount of available digital resources is continuously increasing, promoted by a growing interest of users and by the development of new technology for the ubiquitous enjoyment of digital resources. The acquisition and storage of video data is an easy task but retrieval of information from video data is challenging .The general method of representing each video segment is shot that is a sequence of key frame(s) where those frames contained the 'meaningful' frames also the frame contained the important contents of the shot. The key frame(s) based shot method is specifically assisted for searching the video content as clients provided image query/search where an image will be matched with the indexed key frames with assist of resemblance distance. As a result, the key frames selection is most significant and several methods are used to automate the process. This paper proposes a new technique for key frame selection. The proposed method show significant ally good and the experiments prove the above statement.

Index Terms—Video data mining, Data mining, Key frame extraction, Knowledge Extraction, Multimedia Data's. Data extraction, Video dates, Frames.

I. INTRODUCTION

Data mining is a process of detecting knowledge from a given huge set of data. Of the available huge data set, multimedia is the one which contains diverse data such as audio, video, image, text and motion, and video data plays a vital role in the field of video data mining. In short, the application of video data is called video data mining. Data mining technique can be applied in various documents. Multimedia information has be-come increasingly prevalent and it constitutes a significant component of multimedia contents on the Internet [1]. Since multimedia information can be represented in various forms, formats, and dimensions, searching such information is far more challenging than text-based search [2]. While some basic forms of multimedia retrieval are available on the Internet, these tend to be inflexible and have significant limitations.

The key frame selection is having two main issues:

1. The number of key frame(s) utilized, (The first issue is tackled by where the amount of key frames for every shot will be decided arbitrarily using the shot length)
2. The significant representative frame(s) selection in a shot. (The second issue is generally complicated for choosing the frames automatically with maximum semantic value. This issue is handled through minimizing the redundant frames with the help of the methods, for example relevance ranking) existing methods for searching video to identify co derivatives have substantial limitations: they are sensitive to degradation of the video; they are expensive to compute; and many are limited to comparison of whole clips, making them unsuitable for applications such as monitoring of continuous streams. Most of the previously proposed match methods require direct comparison of video sequences between the query clip and the data being searched, which is computationally expensive.

II. EXISTING SYSTEM

A new approach is carried out for deep concept-based multimedia information retrieval, which focuses on high-level human knowledge, perception, incorporating subtle nuances and emotional impression on the multimedia resources.

It provides a critical evaluation of the most common current Multimedia Information Retrieval approaches and proposes an innovative adaptive method for multi-media information search that overcomes the current limitations.

The main focus of this approach is concerned with image discovery and recovery by collaborative semantic indexing and user relevance feedback analysis.

Through successive usage of our indexing model, novel image content indexing can be built from deep user knowledge incrementally and collectively by accumulating users' judgment and intelligence.

A. Drawback of Existing System: This approach does not consider about the false positives and false negatives in the given video.

The fault tolerance value is not reduced.

Incorporating genetic variations into the design will affects the accuracy of this work.

It considers only the action based video mining.

Human motion detection specifies only a particular region.

B. Advantage of Proposed System: The proposed method can find the best matching sequence in many messy match results, which effectively excludes false "high similarity" noise and compensate the limited description of image low-level visual features.

Compared to other search method, this method can also reduce the detection time.

It first pre-processes the query image and extracts the features of that image.

Trained videos are stored in the database and the features of the trained videos are clustered using the extracted features of the query input image.

Finally, features matching procedure is implemented to identify the similar feature and retrieves the relevant video. This method provides an efficient video retrieval using an image as input. Efficient clustering process is implemented. Features matching provide an efficient accurate similarity video retrieval

INTERNATIONAL LINKAGES OF THE INDIAN AGRICULTURE COMMODITY FUTURES MARKETS

B. Brahmaiah[*] and Srinivasan Palamalai[**]

Abstract: *The present paper attempts to examine the international linkage between the Indian and world futures markets with reference to five agriculture commodities, viz. Cotton, Crude Palm Oil, Refined Soya Oil, Soya Bean and Sugar, using Johansen Cointegration test and Vector Error Correction Model. The cointegration result confirms that there is a long-run relationship between the Indian futures and World futures prices of each commodity that belongs to Agricultural sector. Besides, the empirical evidence suggests that the World futures market prices leads to the Indian futures market prices for the case of Agriculture commodities such as Cotton, Crude Palm Oil, Refined Soya Oil, Soya Bean and Sugar, both in the long-run and short-run. It can be therefore, the present study concludes that the World agriculture futures markets plays a dominant role in influencing the price movement of Indian agriculture futures market prices of Cotton, Crude Palm Oil, Refined Soya Oil, Soya Bean and Sugar.*

1. INTRODUCTION

The futures markets mechanism was introduced in India started by Bombay cotton trade association in 1875. Primarily the market functions were materialized and the most of trading process were done by the manual works. In 1994, the Kapra committee had been recommended to Forward Market Commission (FMC) to create the electronic trading platform in India based on that online commodity trading operations has been begins on 2002-03 in India. The main legal framework governing Commodity Derivatives Market in India is the Forward Contracts Regulation Act 1952 (FCRA). The exchanges are regulated by the Forward Market Commission. The commodity market has been segmented into two types as forwards, and futures. Options contracts are not enforced in agricultural commodities in the market. The exchanges are offering online trading system to the investors. The online systems provide the transparency process of market

Oil price–inflation pass-through in Romania during the inflation targeting regime

Claudiu Tiberiu Albulescu [a], Cornel Oros [b] and Aviral Kumar Tiwari [c]

ABSTRACT

In the wake of the inflation-targeting strategy in Romania, we estimate the impact of international oil prices upon the consumer price index (CPI) and core inflation. The inflation target was systematically missed by the monetary authorities who explain this failure by exogenous factors. Using a frequency domain framework, we show that the oil price–inflation pass-through can be observed only for those components of inflation which include volatile prices and only in the medium run. Our results put forward that the constant missing of the target cannot be explained by the oil price–inflation pass-through and the credibility of the strategy is put into question.

KEYWORDS

Oil price–inflation pass-through; frequency domain; Granger causality; inflation targeting strategy; Romania

JEL CLASSIFICATION

I. Introduction

Romania adopted the inflation targeting regime in 2005 in order to reduce the persistent inflationary pressures recorded since the beginning of the 1990s. Even if the level of inflation decreased considerably afterwards, Romania has systematically missed its inflation target during the last years which the monetary authority has justified by blaming the international context, mainly the sharp rise in oil prices, as being responsible. Our article aims at analysing to what extent the international oil prices pass-through into inflation in Romania by making a distinction between consumer price index (CPI) inflation on the one hand and two different measures of core inflation (excluding the administrated prices, only or both the administrated and volatile prices) on the other hand. For this purpose, we resort to a frequency domain analysis which allows the identification of the pass-through at different frequencies.

Macroeconomists have viewed changes in the price of oil as an important source of economic fluctuations (Barsky and Kilian 2004; Blanchard and Gali 2007). A plethora of studies have addressed the oil price–inflation pass-through channels, among which Ferderer (1996), Barsky and Kilian (2004), LeBlanc and Chinn (2004), Cavallo (2008), Tang, Wu, and Zhang (2010), Álvarez et al. (2011), and Alba, Chia, and Su (2013). Even if the transmission mechanism linking international oil prices to consumer price inflation is quite complex, it is generally considered that the rise of the oil prices has both direct and indirect effects on the CPI inflation.

The direct effect reflects the fact that changes in oil prices are almost immediately passed-through to the prices of retail oil products which are consumed by households. In this situation, a spillover effect can appear. An increase in the oil price may affect energy costs through the prices of other items that are close substitutes, such as the natural gas, leading thus to an increase in their price also. In addition, the households have to pay higher energy prices themselves and they may bargain for compensating wage increases. These evidences recommend the standard use of the core inflation, which excludes volatile prices, in order to analyse the oil–inflation price-through. The indirect effect manifests through the change in the cost of production for goods and services. This transmission channel explains how an inflationary stimulus moves from upper-stream industries to end users. In addition, the indirect effects can generate revisions in inflation expectations which may entail price changes.

1. ABSTRACT

The manufacturing sector is the backbone of a country's economy and its people.The entire economic activity revolves around the investments & the number of people employed in the manufacturing sector, the value of products manufactured in the sector and the entire stream of revenues received by the government in the form of direct and indirect taxes.The manufacturing sector of a country also helps in the growth of other sectors like agriculture, science & technology, employment and the services sector.Indian Manufacturing Sector is one of the largest sectors of Indian economy and contributes substantial revenues to the Government thereby helping tremendously in the growth of the nation. According to the latest data of CII (Confederation of Indian Industry), the manufacturing sector contributes 15-16% to the GDP of India (2015). Besides, this important sector contributes to providing 12% employment of the entire work force in the country. The contribution of Indian industry to the global manufacturing output is 2.2% which is on par with the developed economies.Thus the manufacturing sector occupies prominent place in the national economic space.The manufacturing sector utilises an array of financial instruments in financing its manufacturing needs or requirements ---Working Term Loan, Letter of Credit, Commercial Paper, Debentures, Factoring, Trade Credit & Public Deposits; and there are different regulations governing the various instruments of finance utilised by the corporate sector.

PERFORMANCE OF AGRICULTURAL SECTOR IN ANDHRA PRADESH

P. Kothandarami Reddy & Koti Reddy Tamma

NTRODUCTION

Agriculture is considered as backbone of the Andhra Pradesh Economy. More than 50per cent of our total population earn their livelihood from agriculture and contributing a major portion to Gross State Domestic Product (GSDP). In order to make agriculture viable and profitable and to improve incomes in agriculture and allied sectors, the state has given top priority for agriculture. In 1993-94 agriculture and allied activities contributed about 39.5 per cent to GSDP of Andhra Region. Even though the crop sector witnessed high volatility during 1990s due to consecutive droughts and decelerating crop yields, the transformation continued towards high value commodities such as fruits, vegetables, milk, meat, poultry and fish. In terms of absorbing labour force and generating incomes, it has a strategic role even in 2010s. It contributes more to distribution of workforce (of workforce & GSDP) and less to the aggregate growth of the economy. The government is getting substantial income from raising land revenue. Agriculture and allied sector's contribution to Gross Value Added (GVA) at current prices for the year 2015-16 (AE) is about 29 percent. Agriculture and allied sector during 2015-16, is likely to record to a growth 11.77 percent at current prices (Socio Economic Survey- 2015-16, Govt of AP).The government has launched the Primary sector Mission to address the farm related issues like enhancing value addition from horticulture, livestock and fisheries and shortages in storage space including cold storages. The state is committed to transform the primary sector with an inspirational goal of making Andhra Pradesh as one of the three top leading states in India by 2029.

The area under food grains is estimated at 41.30 lakh hectares in 2015-16 as against 39.63 lakh hectares in 2014-15 showing an increase of 4.21 per cent. The total production of food grains in 2015-16 is estimated at 137.56 lakh tonnes while it was 160.03 lakh tonnes in 2014-15 showing a decrease of 14.04 per cent. Wide range of agro-climatic conditions of the state is conducive for growing a large variety of Horticultural crops, including root and tuber crops, ornamental crops, plantation crops like coconut, cashew and cocoa etc., it

India's Foreign Direct Investment and Economic Growth: Causality and Correlation

Tamma Koti Reddy and I.R.S. Sarma

Introduction

FDI inflows result in a direct increase in investment. Subsequently there is increase in the number of jobs with the development of new manufacturing facilities and creation of front end jobs, all of which create employment opportunities. There is also creation of indirect jobs in the economy in the form of suppliers and support services. FDI investments also results in upliftment of the area and the nation as a whole. Investment inflows and increased job opportunities together contribute to the increase in more disposable income in the economy. Thus the consumption component of the aggregate demand, which is a function of disposable income, increases correspondingly. FDI investment also brings with itself new technological advancements. This results in cost effective manufacturing, in turn resulting in increased supply. Cost effective manufacturing leads to rise in real income which results in overall economic growth through multiplier effect. Economists like Griffin, Singer and Weisskof found a negative effect of foreign capital inflow on the economic efficiency and growth towards the developing countries while, Chenery and Strout found favourable effect of foreign capital inflow on the economic efficiency and growth (Mathiyazhagan, 2005).

FDI is assumed to stimulate domestic savings and induce technological progress through innovation and incorporation of advanced technology in the production process (E.Mehic 2013). Indirectly, FDI contributes through technology diffusion and help improve the knowledge stock of the host country. Martin (2000) reveals in his study "FDI can result in gains in various forms to host countries including transfer of technology, manpower skill development and contribution to tax revenues."He also notes of "significant and robust impact of FDI when data on domestic investment is included." Similarly a substantial body of evidence including Borenzstein (1999), de Mello (1999), Johnson (2006), Chang (2010) etc suggests a positive impact of FDI on host country's economic growth.

Some studies reveal that FDI has no statistically significant effect or even has significantly negative impact on economic growth (Mencinger, 2003). FDI may harm GDI and the growth of the host economy if foreign firms will compete with local firms in the use of domestic resources and reduce investment opportunities for local investors (M.R. Agosin, 2000)

Indian Economy During The Post-Reform Period: Issues and Challenges

Madhubanti Dutta and T. Koti Reddy

Introduction

The Economic Reform did bring prosperity to the country, the benefits are not evenly distributed and some are even deprived of the benefits and they do not have the capacity to participate in the economic development process. The period of 1999-2000 to 2007-08 saw rapid economic growth in the country but it has not impacted on the unemployment problem of the country. There was a significant slowdown in the growth rate in the second half of 2008-09, following the financial crisis that began In the industrialized nations in 2007 and spread to the real economy across the world. The growth rate of the gross domestic product (GDP) in 2008-09 was 6.7 per cent.GDP growth rate of 7.4 per cent in 2009-10 has exceeded the government forecast of 7.2 per cent for the year. India's growth story has largely remained positive on the strength of domestic absorption, and the country has registered robust growth of 7.2 per cent in 2014-15 and 7.6 per cent in 2015-16(Economic Survey 2015-16).

The large agricultural workforce in rural areas is not sustainable with dwindling cultivable land and use of modern methods of cultivation. Besides the weather induced fluctuations, output of agricultural sector has been affected due to reduced capital investment and plateauing of yield levels in major crops. The current crisis in agriculture and the epidemic of farmer suicides tends to portray Indian farming as an unviable economic proposition and the Indian farmer as an object of pity who needs various crutches to keep him alive (Rajivlochan 2008). Politicians who oppose a cut in subsidies always argue that in a welfare state the maximization of aggregate consumer welfare is facilitated through the subsidization of goods and services which benefit the poor. But unfortunately, the majority of subsidy benefits go to the rich and non-deserving instead of the poor. In addition to this, subsidies in agriculture are also supported on the grounds that Indian products need to compete in the international market with the heavily subsidized products from USA and European Union. Public expenditure is an important source of employment generation and injection of purchasing power to rural India. It explains why despite normal rainfall in several years, fall in public expenditure has coincided with falling agricultural growth rates, productivity, private investment and therefore employment. The deceleration in the growth of agricultural sector is translated

Quikr's Diversification Strategy

"We are very happy to be launching our very first boat from the Quikrmother ship... QuikrCars launches as a unique and differentiated market leader which combines its immense car buyer demand and industry leading listings base with deep functionality and a monetization engine specific to the cars category."[1]

– Pranay Chulet, Founder and CEO of Quikr India Private Limited, in August 2015

Quikr India Private Limited (Quikr) , an e-commerce and services company, was declared as the 'Most Trusted Classifieds Brand' in India by The Economic Times and the '2nd Most Trusted e-ommerce Brand' in India by the Brand Equity Survey 2015. The Brand Equity Survey conducted by Nielsen[a] considered 373 brands and had a sample design of 7,200 distributed across socio economic classifications, geographies, ages, and incomes. All the brands under different categories were evaluated based on feedback given by consumers on several attributes such as Satisfaction, Value for Money, Quality, and Trustworthiness.[2]

On July 23, 2015, Quikr, which operated the leading online Consumer to Consumer (C2C) cross-category horizontal classified portal services,was valued at US$1 billion after receiving another round of fresh funding of US$150 million.[3] When the company, owned by Pranay Chulet (Chulet), started operations in the year 2008, the online classified market in India was mostly inefficient and ineffective in providing solutions that would ensure a fair price to individuals who wanted to resell or offer anything.[4] To provide a solution to the problem, Quikr was launched as a horizontal classifieds platform. It simplified user experience and offered the convenience of addressing multiple needs much faster at one place. Quikr replicated the business model of Craigslist[b], a dominating local e-commerce website in the US where consumers could buy and sell things online.[5] According to an industry observer, the model proved to be successful in the Indian market as Quikr, similar to the US-based Craigslist, allowed its users to post their ads for free and look through different products and services available on its portals such as apartments, pets, and even prospective spouses, before the deals were closed offline.[6] *"We Indians are very price conscious. And there are peculiarities, like we love to haggle. So I thought a platform like Craigslist for India would make sense,"*[7] said Chulet, Founder and CEO of Quikr. Over the years, the company expanded its services by launching new, unique, and innovative features to cater to different sections of society. It relied on making the best use of the latest technologies (internet, smartphones, etc.) to provide a good user experience to its customers.

After gaining a substantial market share, Quikr started expanding its business to include several categories such as services, cars, real estate, mobile phones, and jobs.[8] On August 10, 2015, the company entered a new vertical known as QuikrCars, which provided a platform for buying and selling commercial vehicles, cars, and bikes.[9] The following month, it entered into other verticals and announced that it would launch separate platforms which would address specific needs such as

Quikr's Diversification Strategy

"We are very happy to be launching our very first boat from the Quikrmother ship... QuikrCars launches as a unique and differentiated market leader which combines its immense car buyer demand and industry leading listings base with deep functionality and a monetization engine specific to the cars category."[1]

– Pranay Chulet, Founder and CEO of Quikr India Private Limited, in August 2015

Quikr India Private Limited (Quikr) , an e-commerce and services company, was declared as the 'Most Trusted Classifieds Brand' in India by The Economic Times and the '2nd Most Trusted e-ommerce Brand' in India by the Brand Equity Survey 2015. The Brand Equity Survey conducted by Nielsen[a] considered 373 brands and had a sample design of 7,200 distributed across socio economic classifications, geographies, ages, and incomes. All the brands under different categories were evaluated based on feedback given by consumers on several attributes such as Satisfaction, Value for Money, Quality, and Trustworthiness.[2]

On July 23, 2015, Quikr, which operated the leading online Consumer to Consumer (C2C) cross-category horizontal classified portal services,was valued at US$1 billion after receiving another round of fresh funding of US$150 million.[3] When the company, owned by Pranay Chulet (Chulet), started operations in the year 2008, the online classified market in India was mostly inefficient and ineffective in providing solutions that would ensure a fair price to individuals who wanted to resell or offer anything.[4] To provide a solution to the problem, Quikr was launched as a horizontal classifieds platform. It simplified user experience and offered the convenience of addressing multiple needs much faster at one place. Quikr replicated the business model of Craigslist[b], a dominating local e-commerce website in the US where consumers could buy and sell things online.[5] According to an industry observer, the model proved to be successful in the Indian market as Quikr, similar to the US-based Craigslist, allowed its users to post their ads for free and look through different products and services available on its portals such as apartments, pets, and even prospective spouses, before the deals were closed offline.[6] *"We Indians are very price conscious. And there are peculiarities, like we love to haggle. So I thought a platform like Craigslist for India would make sense,"*[7] said Chulet, Founder and CEO of Quikr. Over the years, the company expanded its services by launching new, unique, and innovative features to cater to different sections of society. It relied on making the best use of the latest technologies (internet, smartphones, etc.) to provide a good user experience to its customers.

After gaining a substantial market share, Quikr started expanding its business to include several categories such as services, cars, real estate, mobile phones, and jobs.[8] On August 10, 2015, the company entered a new vertical known as QuikrCars, which provided a platform for buying and selling commercial vehicles, cars, and bikes.[9] The following month, it entered into other verticals and announced that it would launch separate platforms which would address specific needs such as

[a] Nielsen Holdings Inc. is a global information and measurement company.

[b] Craigslist is a classified advertisements website in US with sections devoted to jobs, housing, personals, for sale, items wanted, services, community, gigs, résumés, and discussion forums.

Abstract: Corporate governance guidelines all over the globe are focusing on adding independent directors to the board to improve board effectiveness. Does the addition of more number of independent directors improve firm performance? The extant literature does not give a unanimous answer. In the given background, the present work explores the impact of board independence on firm performance for the emerging Indian market. The study examines Nifty firms over a period of six years from 2005–2010 using panel regression. The results show board independence to have positive impact on Tobin's Q, the proxy for firm value. The study found no direct impact of board independence on operating performance.

Keywords: agency conflict; board independence; corporate governance; firm value; Tobin's Q; panel regression.

Reference to this paper should be made as follows: Mohapatra, P. (2016) 'Board independence and firm performance in India', *Int. J. Management Practice*, Vol. 9, No. 3, pp.317–332.

Biographical notes: Pranati Mohapatra has teaching and research experience of almost 11 years in the area of Accounting and Finance. Her research interest includes corporate governance, sustainability and corporate finance. She has done PhD in the area of corporate governance. Presently she is working as Assistant Professor, Finance in ICFAI Business School, Hyderabad, India.

This paper is a revised and expanded version of a paper entitled 'Board independence and firm performance in India' presented at the '3rd IIMA International Conference on Advanced Data Analysis, Business Analytics and Intelligence', IIM Ahmedabad, India, 13–14 April 2013.

1 Introduction

Board Independence has been the centre of the corporate governance reform initiatives all over the globe. The corporate governance problem arises from the separation of Ownership and Control and the board of directors plays a major role in controlling the extraction of private benefits by the management or the dominant shareholder (Sarkar, 2009). A board consisting of outside independent directors is considered to be more effective in controlling the agency conflict than the executive directors (Weisbach, 1988; Fama, 1980). Apart from controlling agency conflict, independent directors can also

The Emergence of Rupee Bond

Dr. Vighneswara Swamy*

In his enthralling speech at the Wembley stadium in London, Prime Minister Modi said, "... after James Bond and Brooke Bond, we go to Rupee Bond." And for the first time, the Indian railways have launched a rupee bond in the London stock exchange. Also, International Finance Corporation has launched an INR 170 crore ($25-million) Masala bond issue, betting on the growing interest in India among international investors, and will help Indian companies issue rupee bonds abroad. Masala bonds (as they are colloquially called) are Rupee bonds issued in foreign markets. There has been a greater momentum following the Reserve Bank of India's recent approval for Indian corporations to issue Masala bond. According to Jingdong Hua, the Vice President of IFC, investors have shown strong demand for global rupee bonds despite the volatility in emerging market currencies. The appetite for rupee bond among international investors is a welcome development. And now, the Rupee bond is on the rise in the international market.

RBI in 2014 had permitted the International Financial Corporation (IFC) and the Asian Development Bank (ADB), to issue Rupee bonds in the overseas market that was met with a robust demand for such Rupee bonds in the international markets. It was in April 2015 that the RBI allowed the companies to sell rupee bonds overseas and pushed for increased retail participation in the domestic government bond market as well. These measures announced as part of the monetary policy statement were aimed at liberalizing and deepening the financial markets. At the same time, the Indian government has shown determination to fundamentally upgrade infrastructure to increase foreign investment in India. The RBI's move to allow the firms to sell rupee bonds overseas could open up another avenue for fund-raising without taking on the currency risk typically associated with borrowings abroad.

There has been an upsurge in the overseas borrowings by Indian companies to take advantage of the lower cost of capital in markets like the US and Europe. In 2014, Indian corporates have raised about $30.51 billion via External Commercial Borrowings (ECBs). The cost of hedging the currency risk involved in foreign currency borrowings takes away part of the advantage of lower borrowing costs. With the introduction of Rupee bond, the

Supervisory Colleges for SIFIs

Dr Vighneswara Swamy

Introduction

The global financial crisis has exposed numerous weaknesses in the supervision and regulation of multinational financial institutions and global banks generally *(Ben Bernanke, Chairman, Fed. Reserve, Financial Regulation and Supervision After the Crisis: The Role of the Federal Reserve (Oct. 23, 2009), available at reserve.gov/newsevents/speech/bernanke20091023a.htm.)*. National governments and international bodies too have acknowledged these weaknesses in the supervisory system of global financial institutions and have begun to take steps to improve their regulatory mechanisms with the hope of evading, or at least mitigating potential financial crises. Undoubtedly, one of such weaknesses has been the ineffective supervisory cooperation among national supervisors related to cross-border financial institutions.

Consequently, quite a few international governmental organisations, national governments, and commentators have appealed for the use of supervisory colleges to oversee global financial institutions, especially, those Systemically Important Financial Institutions (SIFIs) that have been the recipients of government financial support during the crisis.

The overarching objective of a supervisory college is to support its members develop a better understanding of the risk profile of the banking group. Moreover, information exchange and cooperation between supervisors can abet in strengthening the supervision of the individual components of a banking group. Besides, supervisory colleges can complement wider peer review processes by promoting a coherent approach across diverse jurisdictions to the consistent and effective implementation of macro and micro-prudential policy tools.

Supervisory colleges – The concept

The concept of supervisory co-operation on cross-border supervision finds its origin from the report of the Committee on Banking Regulations and Supervisory Practices in 1975 and the seminal idea of having a form of Memorandum of Understanding (MoU) was proposed in the Basel Commission for Banking Supervision (BCBS) report - The Supervision of Cross-Border Banking in 1996. These understandings between the supervisors might take the form of bilateral MoUs or exchange of letters, which could formulate what each party expects from the relationship. Again, in 2001, BCBS released a document – **'Essential Elements of a Statement of Co-operation between Banking Supervisors'**, listing the key elements that could form part of a statement of co-operation or MoU between 'Home' and 'Host' country supervisors.

The role of supervisory colleges for intents of institution-specific oversight varies depending on the size, and composition of the supervised group, which mostly fall into three categories:

(i) core colleges;

(ii) universal colleges; or

(iii) regional colleges.

Crisis management groups are closely aligned with supervisory colleges in that they build on the core colleges and include central banks, resolution authorities, and finance ministries.

Supervisory colleges are believed to be a vital tool and hence the BCBS and IAIS continue to scrutinise their

The Effect of Industrial Development on Economic Growth (An Empirical Evidence In India 1991-[illegible]15)

Harvinder Pal Singh and T. Koti Reddy

Introduction

Since Independence India is trying to build up a strong industrial base. But in spite of all its efforts India is considered as an industrially backward country. The importance of industrialization as a means for achieving rapid growth and prosperity has all along been recognized in the thinking on development strategy for development India(Isher J.Ahluwalia). The first industrial policy was declared by the government of free India on 6th April, 1948 stated that India had accepted Mixed Economy as its economic system for rapid industrial growth.1956 resolution about India's industrial policy was the government's acceptance of the socialistic pattern of society as the fundamental and basic goal of social and economic policy. More than 60 per cent of the licenses were issued to 5 industrially developed states during 1974-75;as a result the industrially backward areas were neglected. As a result of such liberalization, the objective of eliminating concentration of economic power, achieving regional imbalances, removing inequalities of income and wealth were relegated to the background, and the sole aim of the government appears to beraising the production at any cost.

The Government of India announced the New Industrial Policy on July 24; 1991.The policy statement is a great departure from the 1956 Industrial policy Resolution. The policy resembles that followed by China which gave up its equity objective in favour of growth;self reliance was replaced by open door policy. The Industrial policy initiatives undertaken by the government since July 1991 have been designed to build on the past industrial achievements and to accelerate the process of making Indian industry internationally competitive. It recognizes the strength and maturity of the industry and attempts to provide the competitive stimulus for higher growth. The thrust of these initiatives has been to increase the domestic and external competition through extensive application of market mechanisms and facilitating forging of dynamic relationships with foreign investors and suppliers of technology. Complementary to industrial policy changes, significant transformation has been brought about in monetary, fiscal and external sector policies. The changes include transition to market determined exchange rates and interest rates, removal of physical control on imports, rationalization and reduction of taxes and duties to enhance competitiveness of Indian Industries.

The effect of nature of online advergames on gamers' ad-persuasion: moderating roles of game-involvement and need for cognition

Devika Vashisht and S. Sreejesh

Published Online: November 12, 2016 · pp 171-185

Abstract

This experimental study examines the effects of nature of advergame, game-involvement and need for cognition on gamers' ad-persuasion from attention and elaboration perspectives. A 2 (nature of game) × 2 (game-involvement) × 2 (need for cognition) between-subject measures design is used. Results show that for a slow-paced advergame, low game-involvement results in higher ad-persuasion than high game-involvement, whereas for a fast-paced advergame, there is no difference in ad-persuasion between high and low game-involvements. Also, for a slow-paced advergame with low game-involvement, subjects with high need for cognition report higher ad-persuasion than subjects with low need for cognition. These findings suggest to game developers and advertisers who design advergames to consider a right mix of multiple game features (speed, game-involvement and need for cognition) within a single advergame so that the implementation has the strongest positive impact on gamers' ad-persuasion.

Green advertising receptivity: An initial scale development process

Ainsworth Anthony Bailey[a]*, Aditya Mishra[b] and Mojisola F. Tiamiyu[c]

[a]*College of Business and Innovation, University of Toledo, 2801 W. Bancroft St., Toledo, OH 43606, USA;* [b]*Department of Marketing and Strategy, IBS Hyderabad (IFHE), Donthanapally, Shankarapalli Road, Hyderabad 501203, India;* [c]*Department of Psychology, University of Toledo, 2801 W. Bancroft St, Toledo, OH 43606, USA*

The aim of this research is to develop and validate a scale to measure consumers' receptivity to green advertising (REGRAD), in light of the absence of such a scale from the green marketing research stream. REGRAD is posited as an individual difference factor, which can be measured, and consumers can be divided into segments based on this factor. The scale development process resulted in a nine-item scale, which shows a high degree of correlation with environmental behavior and a distinction from the environmental skepticism scale. REGRAD moderates attitudes and intentions toward a company and its *green* initiatives. Given the trend by marketers to target and market products as 'green', REGRAD can be used in identifying consumers who will be more receptive than others to these marketers' efforts. It can also guide the development of marketing communication messages. Research and managerial implications are explored, and the limitations of the research and directions for future research are presented.

Keywords: environmental behavior; green advertising; green marketing; scale development

Downloaded by [University of Otago] at 06:14 02 January 2015

Introduction

The current marketing environment in the USA has been marked by a resurgence in green advertising and marketing by various brands, as companies and the society in general focus more on such issues as 'carbon footprints', 'ecologically conscious consumption behavior', and 'eco-consciousness'. Various new green products have been launched, and consumer behavior has been impacted (Clifford and Martin 2011; Chang 2012). There has also been renewed interest in academic research on green advertising and marketing (see Table 1 for some examples of recent works). However, recent reports have indicated that current economic conditions have caused consumers to cut back on their purchase of products marketed as 'green' (Clifford and Martin 2011). Clifford and Martin (2011) detailed the seeming rise and fall in interest in green products in the USA and lamented the fickleness of *Americans' eco-consciousness* in the face of an economic recession. They opined that Americans' 'love affair' with green products and marketing was more like a 'bad infatuation'.

Green marketers have also suffered from the fact that many consumers tend to be ambivalent to *going green* (see, for example, Chang 2011), and consumers tend to be unwilling to pay the premium prices for green products (Neff 2012). Prior research has also shown the importance of adopting particular strategies when targeting consumers that might have low interest in certain kinds of goods (Davis 2013). This raises the question regarding whether some consumers may be more receptive to green communications than

Language Training for Business: To What Extent Should We Focus on Accent?

The IUP Journal of Soft Skills, Vol. X, No. 2, June 2016, pp. 44-55

Posted: 14 Feb 2017

Rita Rangnekar (https://papers.ssrn.com/sol3/cf_dev/AbsByAuth.cfm?per_id=824148)
The Icfai Business School

Date Written: 2016

Abstract

Job opportunities in the BPO and retail sector have scaled up English language training opportunities in India. The primary focus of these programs is accent training based on the justification of positive impact on economy. This paper aims to probe into the limited impact and superficiality of accent training and stress created as an outcome of language training. The paper also suggests ways to go beyond accent by focusing English language training on lasting absorption of a language which will able trainees to appreciate and speak the language in its totality.

Website content adaptation as a response to cultural differences: A study of US and Indian versions of US corporate websites

Notice

The full text article is not available for purchase.

The publisher only permits individual articles to be downloaded by subscribers.

Authors: Dwesar, Rishi; Kesharwani, Ankit

Source: Journal of Cultural Marketing Strategy, Volume 1 / Number 2 / 2015-16, pp. 207-218(12)
Publisher: Henry Stewart Publications

Abstract | References | Citations | Supplementary Data | Suggestions

Successful entry and the continuous growth of multinational firms in foreign markets mostly requires effective communication which is inclined toward the cultural dimensions of the host country. Also, communication attuned to the nation-specific culture is more effective and even necessary for the long-term success and profitability of multinational companies. Thus, multinational companies have recognised the impact of sociocultural values on local organisational behaviour and their communication with varied stakeholders in order to fruitfully run their operations. The objective of this paper is to categorise the content of various websites in such a way as it can be used to reflect Hofstede's four cultural dimensions: individualism, uncertainty avoidance, power distance and masculinity. Following the content analysis procedure, this study has made an attempt to find and establish differences between the content displayed on multinational companies' Indian versions of their websites and their home websites, in relation to Hofstede's four cultural dimensions. The results show that multinational companies' Indian versions of their websites reflect a higher

Modeling the Impact of New Capital Regulations on Bank Profitability

Vighneswara Swamy

Introduction

A growing strand of literature in favor of the Basel III framework for bank capital regulations, argues that there are significant macroeconomic benefits of raising bank equity. However, there have been debates about the desirability and the impact of new capital regulations on the profitability of banks. Higher capital requirements lower leverage and the risk of bank bankruptcies (Admati *et al.*, 2010). On the other hand, there is another strand of literature, which argues that there could be significant costs of implementing a regime with higher capital requirements (BIS, 2010, and Angelini *et al.*, 2011). The impact of Basel III regulations on the banks is extensive and affects the bank's day-to-day decision making in lending, funding, treasury, capital, liquidity, and operations. All these areas are closely interconnected, and directly affect the bank's profitability.

Though literature is rich with studies on bank regulation and its impact, very few studies are reported on the modeling of the impact of capital and liquidity requirements on bank profitability except the one by King (2010). There is a need to conduct country specific studies for estimate the impact of new capital regulations under Basel III proposals on the profitability of banks. This would provide the much-needed logic and rational approach towards ascertaining these impacts to policy makers as well as build a body of literature capturing the uniqueness of country specific features (particularly of emerging market economies such as that of India) in this direction.

The Basel III norms are bound to have a significant impact on the Indian financial sector. The Indian financial sector faces challenges in meeting some of the Basel III norms, more particularly the capital requirements. In this backdrop, it is required to assess the impact of Basel III proposals, particularly with regard to the impact on bank profitability, as this would have a direct effect on the capital adequacy and lending efficiency of the banking system. Further, the Basel III impact on bank profitability would significantly affect their capital generation capacity as well affect proliferation of their services. The increase in equity capital requirements is likely to increase the weighted average cost of capital and consequently banks would have to pass on the increase in the cost of capital to the borrowers as higher lending rates. However, the important question is how much would be an increase in interest income of the banks and how can these interrelations be mapped approximately

Soft Skills in Project Management: A Review

*Sindhu Ravindranath**

The present paper explores, through a review of related literature, the importance of soft skills in Business Administration and highlights the need for the inclusion of the same in BBA and MBA curriculum. The paper further recommends a quantitative study to better understand what skill sets would be of help to the students.

Introduction

What are soft skills and hard skills? Hard skills, often more in demand till now, is defined as a science (Belzer, 2004) which comprises processes, tools and techniques applied to projects. Soft skills, on the other hand, often described as an art (Belzer, 2004), is the process of managing and working with people, guaranteeing customer satisfaction with the purpose of retaining them, thereby forming a favorable atmosphere for the project team to deliver high quality products within budget, on time, consequently going beyond the expectations of the stakeholders. It was not much in demand till now, but is currently identified as critical for project success. Soft skills are normally acquired with experience (Belzer, 2004). Some organizations, like Mastek, Polaris and Sun Microsystems, aware of the significance of soft skills, have integrated soft skills into their training schema (Arora, 2003).

The CHAOS Chronicle (The Standish Group, 2001) reports the yearly failure rate of IT projects in the USA. Countries like the UK and USA which are developed have an advantage because of the use of well-tailored methodologies, tools and techniques which were launched as the effect of rigorous research and development initiatives from both the academia as well as professional bodies like the Project Management Institute (PMI) and Office of Government Commerce (OGC - UK). As per a survey conducted by Sonnekus and Labuschagne (2004), the IT projects in South Africa were found to fail at the rate of 22%, which is comparable to the rate released by the CHAOS Chronicle in 2000. Another survey carried out in Mauritius during 2003 (Sukhoo *et al.*, 2004) exposed that at least 50% of software projects suffered due to inability to match the agreed deadline for project completion or module completion, 50% in overshooting expenses and thus exceeding budget, and 30% due to issues with quality.

(Deemed-to-be-University Under Section 3 of the UGC Act, 1956)

It has been observed that apart from the hard skills that are needed, soft skills are a necessary requirement for IT organizations (Arora, 2003). When we closely analyze popular project management procedures such as the PMBOK® (Project Management Body of Knowledge) and PRINCE 2 (PRojects IN Controlled Environment), we find that they have not placed much emphasis on soft skills.

The University of Arkansas carried out a survey of soft skills which are required in IT organizations (Hathaway, 1999) and the results reveal that the highly needed skills were: (a) problem solving process; (b) listening skills; (c) teamwork; (d) adaptability to new technology and new languages; (e) transferring knowledge to application; (f) time management; (g) visualization; and (h) conceptualization skills and verbal communication. The desired skills were: (a) the ability to multitask; (b) dealing with business culture; (c) inter-team communication; (d) interpersonal skills; (e) constructive criticism; (f) organization skills; (g) stress management; and (h) general writing skills. According to this survey, less desired skills include leadership, technical writing, dealing with diversification (as in different cultures) and presentation skills.

Soft skills are expected to be attained with experience, even so sensitization of students is necessary during formal software project management courses. This is established by Cook (2004), who stated that project managers require a good understanding of social psychology so as to assure the maximum performance of project teams. According to Taylor (as cited in Heikkila, 2002), the project managers have to see beyond the technical competences and distinguish the value of business-focused skills in order to successfully oversee and manage an IT department.

A 2016 article in *The Economic Times* has reported the results of a survey conducted on 750 respondents where 60% of the respondents felt soft skills are very important while hiring employees and 70% of the same respondents found it difficult to find prospective employees with these skills. Against this backdrop, the present paper explores the soft skills requirement in a few avenues such as project management, marketing, etc., that are popular with students currently in job search, and tries to identify right kind of soft skills that shall form a part of the academic curriculum for BBA and MBA as is evident by the survey.

Dimensions of Soft Skills

A few sets of dimensions have been identified for soft skills for the management of projects (Belzer, 2004; and Moreira, 2004). They include: (a) communication skills, (b) teambuilding skills, (c) flexibility and creativity skills, (d) leadership skills, and (e) the ability to manage stress and conflict. There are a number of research initiatives to sensitize stakeholders and project managers about the importance of such skills to achieve successful implementation of projects. Accenture survey of the literature on middle skills and the research conducted by Accenture themselves showcase the importance soft skills that have been selected for organizational positions. The absence

Abstract

Attrition among the new hires has been a challenge faced by the managers in IT organizations. Many companies struggle to find the right fit, select a talented and motivated technical employee and then suffer a jolt when the person they hired quits before the completion of training. IT industry, which is already suffering from alarmingly high employee costs, incurs huge costs due to its inability to retain a new competent hire. The objective of the paper is to analyze the causes of premature exit of employees from their jobs to understand the role of soft skills in dealing with the situations arising in new work environment. The study attempts to investigate how an emphasis on soft skills and personality-related issues during hiring process, on boarding process and training can mitigate the rate of attrition among early hires.

Description

Attrition of new employees among IT industry has long been a concern for the HR and organizations. Many companies struggle to find the right fit, select a talented and motivated technical employee and then suffer jolt when the person they hired quits before the completion of training. IT industry, which is already suffering from alarmingly high employee costs, incurs huge costs due to its inability to retain a new competent hire. It is consistently reported that cost of new hires who jump the ship early has a drastic impact on organizational credibility and bottom line of an organization. The cost skyrockets when the employees leave the organization before a year. It not only questions the judgment of the hiring manager but also devastates the morale of the employees. Organizations make considerable investment in terms of training and developing the early hires to drive the performance. Hence, the pressure to reduce attrition among the new hires is of urgent concern. The present paper aims to analyze the causes of premature exit of employees from their jobs to understand the role of soft skills in dealing with the situations arising in new work environment.

An Analysis of Factors Contributing to the Performance of Employees in IT Industry: An Empirical Study.

- **Source:** IUP Journal of Computer Sciences . Jan-Apr2016, Vol. 10 Issue 1/2, p71-87. 17p.

- **Author(s):** Sastry Akella, S. S. K.; Venketeswara Rao, K.

- **Abstract:** The performance of an employee depends on different issues like ability, motivation, Perceived Organizational Support (POS) and job satisfaction. A lot of research has taken place on these factors in the general context of Human Resource (HR) development. But there is not much evidence on the relationship between the appraisal system and these factors. Due tofast changing technologies and demand for skills, the evaluation of performance of employees in Information Technology (IT) industry is becoming a challenging task for HR departments of the IT firms. In order to examine the factors contributing to the improvement of performance of employees in IT industry, this study conducted a survey among IT employees of various firms in Hyderabad. The responses of the employees were collected and analyzed. From the results, it is found that appreciation, feedback and follow-up action on the improvements required have a positive effect on employee motivation and POS. It is concluded that there is a need tofocus on appropriate follow-up mechanism so as to improve the performance of the employees.

ABSTRACT:

An Enhanced chaotic map lattice based algorithm for image encryption to improve the security of the algorithm suggested by Pisarchik. The basic idea behind the proposed algorithm is to alter the coupling direction used to update the map variables. The altered coupling direction results into a totally different set of initial conditions and map variables of three CML's. Based on experiments will show that the enhanced algorithm with chosen coupling direction can encrypt the color digital images. The image which given as input is retrieved as same as the original image while decrypting. Here many distortions take place when the image is converted pixel by pixel, this helps in high secrecy of the encrypted image

Key Words: Data Mining, Image Processing, Encryption, Decryption, Digital Images, Cryptography.

INTRODUCTION

The wide use of digital images across the world in internet, wireless networks, military image database, medical imaging system and various other applications, require reliable, fast and robust security system to store and transmit digital images. In order to fulfill the security requirements of digital images, many image encryption approaches have been used. One of the recently and widely used approaches is the chaos based cryptography. A lot of work is going on in developing the chaos based cryptosystems [3]. In cryptography, the strength lies in choosing the keys, which are secret parameters, used in encryption. It should not be possible to guess the key by an intruder. The chaotic systems are very sensitive to initial conditions and system parameters. For a given set of parameters in chaotic regime, two close initial conditions lead the system into divergent trajectories. Therefore, an encryption/decryption scheme can be developed if the secret parameters are chosen as keys [8]. Since the same parameters are used for encryption and decryption, the chaos scheme is symmetric. The parameters and the initial conditions form a key space thereby enhancing the security of the scheme. In recent years, the chaos based cryptographic algorithms have suggested some new and efficient ways to develop secure image encryption techniques in order to meet the demand for real-time image transmission over the communication channels. Chaos based image encryption methods are considered good for practical use because they have important characteristics like (i) they are very sensitive to initial conditions/system parameters, (ii) they have pseudo-random property and non-periodicity as the chaotic signals are usually noise-like, etc. Image encryption, two dimensional (2D) or higher dimensional chaotic maps are employed as the image can be considered as a 2D array of pixels [2, 6]. Recently, Pisarchik et al. have proposed a new practical algorithm based on a chaotic map lattice (CML) that allows direct encryption and decryption of color digital images [1]. The CML was introduced by Kaneko et al. as simple model to investigate the behavior of spatiotemporal chaos in many fields of nonlinear science [7]. In recent times, this kind of system has been utilized for secure communication in a number of encryption algorithms. In particular, the one way coupled CML is extensively used for self-synchronizing, chaos based cryptosystems [9]. Wang et al. have shown that the communication with CML is more secure than the communication with single map. In this paper, an enhanced algorithm for digital image encryption is proposed by altering the coupling direction to improve the level of security provided by the CML based algorithm recently suggested by Pisarchik.

EXISTING SYSTEM

In the past decade, a number of image encryption algorithms based on chaotic maps have been proposed. Some of them are based on a single map (0D system) or on one-dimensional chaotic maps and are appropriate for encryption of plaintext files or blocks of bits. However, they do not allow the direct encryption of images. For image encryption, two-dimensional (2D) or higher-dimensional chaotic maps are employed as the image can be considered as a 2D array of pixels. Recently, Pisarchik et al. have proposed a new practical algorithm based on a chaotic map lattice (CML) that allows direct encryption and decryption of color digital images. The CML was introduced by Kaneko et al. as simple model to investigate the behavior of spatiotemporal chaos in many fields of nonlinear science. In recent times, this kind of system has been utilized for secure communication in a number of encryption algorithms. In particular, the one way coupled CML is extensively used for self-synchronizing, chaos based cryptosystems. Wang et al. have shown that the communication with CML is more secure than the communication with single map.

Disadvantage of existing systes

The image has to be sent secured for can be taken by the intruders. In existing level hacker can easily hack the data's in data transaction. Hacker can easily know about the password. The information is not sent to the receiver securely by the sender due to the intruders.

PROPOSED SYSTEM

An enhanced chaotic map lattice based algorithm for image encryption to improve the security of the algorithm suggested by Pisarchik. The basic idea behind the proposed algorithm is to alter the coupling direction used to update the map variables. The altered coupling direction results into a totally different set of initial conditions and map variables of three CML's. Based on experiments will show that the enhanced algorithm with chosen coupling direction can encrypt the color digital images. The images encrypted by proposed algorithm are more indistinguishable and

Domestic Debt Market in India

Vighneswara Swamy PhD, PDF*

Abstract

As India is projected to be the world's most populous country by 2025, the growing needs of the economy, with expanding population, in the recent years have placed intense stress on physical infrastructure. In order to meet the deficit in the provision of infrastructure, mid-term appraisal of the twelfth plan suggests that to attain 9 percent real Gross Domestic Product (GDP) growth rate, infrastructure investment should be on average almost 10 percent of GDP during the Twelfth Plan which translates into INR 65795 billion (about One trillion dollar). Though there has been a progressive involvement of the private sector in infrastructure investments, the government has to play a proactive role in developing a well-structured platform for raising the required investments in Indian infrastructure. Given the huge demand of US$ 1 trillion for infrastructure investments during the 12th plan period, there is a greater emphasis on creating a domestic debt market with special focus on bond market as an alternate source of funding for bank finance, which is faced with myriad problems of stress assets, asset restructuring, etc.

Key words: domestic debt market; growth; financial development; savings; crowding out; corporate debt

Evaluating Recovery Routine Forecast in Network Environment

D.Saravanan[1] Dr. S. Vijaya Lakshmi[2]

[1]*Associate Professor* [2]*Dean(Academics),IFHE University, IBS Hyderabad, Telangana.*

Abstract-The problem of existing personalized search was that most proposed algorithms are uniformly applied to all users and queries. We argue that queries should not be handled in the same general manner: First, personalization may lack effectiveness on some queries, and thus, there is no need of it for these queries. Second, personalization algorithms have strengths and weaknesses for different queries. In such a case, simply leveraging pages visited by this user in the history may achieve better performance. Third, the effectiveness of personalization algorithms may vary due to various search contexts. For example, it might prove difficult to teach the interests of users who have done few searches. Even if search histories are enough to infer general user interests, users often search for short-term information needs that may be inconsistent with general user interest. In such cases, long-term user reports are useless or even harmful, whereas a short-term query context is more useful. Another problem is that many personalization algorithms are proposed by considering only positive aspects and are evaluated upon a small number of manually selected queries. Little investigation has been done on how personalization strategies perform under real-world search engine conditions faced by users. In this paper, we address these problems and make some contributions.

Key words: Personalization, Web Search, Query, Search Contexts, Effectiveness.

1. INTRODUCTION

Current web search engines are built to serve all users, independent of the special need of any individual user. Search engines are used more and more as referrals to web sites rather than direct navigation via hyperlinks. Personalization of web search is to carry out retrieval for each user incorporating his/her interests. We propose a personalized technique to learn user reports from users' search histories. The user reports are then used to improve retrieval effectiveness in web search. A user report and a general report are learned from the user's search history and a category hierarchy respectively. These two reports are combined to map a user query into a set of categories, which represent the user's search intention and serve as a context to disambiguate the words in the user's query. Web search is conducted based on both the user query and the set of categories. In most previous work on personalized Web search, all queries were usually personalized in the same manner. Personalized search is considered a solution to address this problem, since it can provide different search results based upon the preferences of users. However, they are far from optimal. One problem of current personalized search Personalization algorithms has strengths and weaknesses for different queries. We reveal that personalized Web search has different levels of effectiveness for different queries, users, and search contexts. Web search results can be improved using a personalization method based on a user's long-term interests. Here we developing an evaluation framework based on real query logs to enable large-scale evaluation of personalized search. [1] In a query logs is used to evaluate the personalized search. In our experiments, click-based personalization algorithms worked well. Although the algorithms work only for repeated queries, they are simple and stable. In this search engines take advantage of user histories in search if privacy issues do not prohibit it. Experimental results show that using the personalization algorithm for queries selected by our prediction model is better. In most previous work on personalized Web search, all queries were usually personalized in the same manner. That personalization does not work equally well under various situations. We defined the click entropy to measure variation in information needs of users under a query. Experimental results showed that personalized Web search yields significant improvements over generic Web search for queries with a click entropy. For the queries with click entropy, personalization methods performed similarly or even worse than generic search. As personalized search had different effectiveness for different kinds of queries, we argued that queries should not be handled in the same manner with regard to personalization. Our proposed click entropy can be used as a simple measurement on whether a query should be personalized.

1.1 Existing System

In most previous work on personalized Web search, all queries were usually personalized in the same manner.
We revealed in this paper is that personalization does not work equally well under various situations.
As personalized search had different effectiveness for different kinds of queries, we argued that queries should not be handled in the same manner with regard to personalization.

1.1.1 Advantages and Disadvantages

One problem of current personalized searchPersonalization algorithms has strengths and weaknesses for different queries. We reveal that personalized Web search has different levels of effectiveness for different queries, users, and search contexts. Web search results can be improved using a personalization method based on a user's long-term interests.

1.2 Proposed System

Our proposed click entropy can be used as a simple measurement on whether a query should be personalized.

Market Concentration and Firm Performance : Evidences from the Indian Life Insurance Industry

Joy Chakraborty *

Affiliations

Assistant Professor (Finance), Alliance School of Business, Alliance University, Bangalore, Karnataka, India

DOI: 10.17010/ijf/2016/v10i9/101477

Abstract

In the pre-reform era, Life Insurance Corporation of India (LICI) dominated the Indian life insurance sector with a market share of close to 100%. But the situation drastically changed since the beginning of the year 2000. With the development of the Insurance Regulatory and Development Authority of India (IRDAI) Act in 1999, private players started entering into the Indian life insurance market. At the end of the FY 2014-15, the market share of LICI stood at 73.48% with the number of private players having risen to 23 in the country's life insurance sector. One of the reasons for such a decline in the market share of LICI during the post-reform period could be attributed to the increasing competition from the private players in the country's life insurance sector. The present study attempted to evaluate the extent of concentration and competition prevailing in the Indian life insurance market over the study-period from 2008-09 to 2014-15, against the backdrop of the global financial crisis. In addition, an attempt was made to ascertain any significant differences in the performances of the 18 life insurance companies in India, inclusive of LICI, in terms of life insurance premium underwritten during the period under review. The present study revealed the pre-existing dominance of LICI in the Indian life insurance market, both in terms of market concentration and premiums underwritten, even after 15 years since the privatization of the country's insurance sector.

Motivation of teachers in higher education

Madasu Bhaskara Rao
ICFAI Business School, The ICFAI Foundation for Higher Education, Hyderabad, India

Received 26 August 2015
Revised 12 January 2016
Accepted 6 February 2016

Downloaded by Iowa State University At 01:21 19 January 2016 (PT)

Abstract

Purpose – Motivation is the process that accounts for an individual's intensity, direction and persistence of effort toward attaining a goal (Robbins and Judge, 2008). Teacher motivation is vital to the growing and evolving field of higher education, yet it is not investigated enough. Need for rapid growth of higher education, issues in compensation, developments in information technology and dearth for teaching and technical skills brought teacher motivation to the center stage. The purpose of this paper is to apply McGregor's Theory X and Theory Y to study teacher motivation in higher education.

Design/methodology/approach – An empirical study was conducted through survey method. A questionnaire was designed to elicit responses from randomly selected respondents.

Findings – Teachers in higher education were classified under Theory X and Theory Y styles. The relationship between teaching style and specific motivators in the class and on the job, preferred teaching methods and classroom management techniques were investigated.

Research limitations/implications – Application of McGregor's Theory X and Theory Y to understand teacher motivation in higher education provided interesting and new insights.

Social implications – This study would have implications for teacher-student fit and institution-teacher fit in learning environments.

Originality/value – The nature of a teacher's way-of-being matters to his/her motivation and performance in classroom. Implications exist for teacher recruitment and teacher training programs in relation to the profile of students and identifying and implementing right methodologies for classroom performance. This study has andragogical implications for classroom teaching, relationship with students and parents and interpersonal relationships among peers and education administrators.

Keywords Motivation, Higher education, Competitive advantage, Andragogy, Teaching methods, Theory X and Theory Y

Paper type Research paper

Teaching is the profession that teaches all of the other professions – Author unknown.

The world is getting smarter – with smart cities, smart technologies, smart devices and so on requiring smart human resources, in turn requiring smart teachers. Hence, teacher motivation, considered to be intrinsic for centuries, needs a re-look and understand it in the current context where a teacher dons multiple roles such as teacher, researcher, consultant and academic manager/administer. Teachers are the levers to transform the hope into reality in a knowledge society. Teacher motivation is of paramount importance today than ever before. Social science research needs to focus on teacher motivation keeping in view immense contribution made by them in creating valuable human capital for a better society.

Motivation is "the attribute that moves us to do or not to do something" (Broussard and Garrison, 2004). Motivation refers to "the reasons underlying behavior" (Guay *et al.*, 2010). Intrinsic motivation is motivation that is animated by personal enjoyment, interest or pleasure. Deci *et al.* (1999) observed "intrinsic motivation energizes and sustains activities through the spontaneous satisfactions inherent in effective volitional action. It is manifest in behaviors such as play, exploration and challenge seeking that

ABSTRACT

This article investigates the relationship between oil and gold price movements. We use the wavelet approach to analyze the time and frequency of this relationship. Results show that oil and gold markets have a high level of co-movement during periods of crisis. Furthermore, results suggest that directional causality is explained through the sources of oil shocks. Oil precautionary demand shocks drive fluctuations in the gold market for a short time, whereas the causality direction is reversed for a medium timeframe. However, in the case of oil aggregate demand-side shocks, we show that variables have anti-cyclical effects on each other.

1. Introduction

Gold and crude oil are considered the world's most strategic commodities and, therefore, their prices are strategically more important than those of other commodities. The technology revolution that has occurred since 2000, accompanied by the boom in international trade, leads to the characterization of oil as a global commodity with high volatility. Similarly, gold is known as the most strategic metal, as a movement in gold price generates a parallel movement in other metal prices. In the last decade, these commodity prices were not determined by basic market supply and demand. Indeed, the US crisis in 2002[1] generated a simultaneous expansion in both the oil and gold indices. The boom cycle of these indices continued until the first quarter of 2008. However, due to the subprime and economic crises in the second half of 2008, the expansion has been reversed. Further, the prices of crude oil and gold declined in the second half of 2008, from $147

Organized and Protected Communication in Mobile Group

D. Saravanan*

ABSTRACT

In this Paper, an Efficient and Secure User Revocation Scheme in Mobile Social Networks has been proposed where each user is connected extensively with his/her social friends or others users sharing similar interests. Scope of the Paper is that it describes a family of key management algorithms that reduce the cost due to multiple user revocation while keeping the storage cost manageable.

Key Terms: Data Communication, Encryption, Decryption, Secret Key, Group Key, Communication, Confidentiality.

1. INTRODUCTION

It is necessary to secure the group communication as the data are sensitive or it requires the users to pay for it. In the algorithms for secure group communication a group key is shared by all the users. The group key is used to encrypt data transmitted to the group. The group membership is dynamic. When group membership changes, to protect the confidentiality of the current users, a new group key needs to be shared by the users. When a user is admitted to the group, the group controller changes the group key and securely unit casts it to the joining user. To send the new group key to the current users, the group controller encrypts it with the old group key and multicasts it to them. Thus, the cost of rekeying for the group controller, due to a joining user is small.

However, when a user is revoked, i.e., the user leaves or is forcefully removed from the group, the group controller needs to securely uni cast the new group key to each of the remaining users. Toward this, the group controller encrypts the new group key with the personal keys of each of the remaining users and uni casts each message to the respective user. The cost of this process is symmetric key encryptions and messages. Thus, for a large group, revoking users from the secure group is an expensive operation. In these solutions, for a group of N users, the group controller distributes the new group key in encrypted messages. We note that in these solutions, the rekeying cost, i.e., number of encryptions performed and messages transmitted by the group controller, for a joining user is increased. However, techniques suggested in reduce the join cost to nearly constant and as such have been used by other approaches. On the other hand, the cost for revoking a user is reduced encrypted messages.

1.1. Existing System

- When a user is admitted to the group, the group controller changes the group key and securely uni casts it to the joining user.
- To send the new group key to the current users, the group controller encrypts it with the old group key and multicasts it to them. Thus, the cost of rekeying for the group controller, due to a joining user is small.
- However, when a user is revoked, i.e., the user leaves or is forcefully removed from the group, the group controller needs to securely unicast the new group key to each of the remaining users.

PERSIVE INITIATED PEER DISTTRIBUTION MULTIPLEXING

D.Saravanan

IFHE University, IBS Hyderabad, Telangana 501 203

ABSTRACT :

There is an emerging market for IPTV. Numerous commercial systems now offer services over the Internet that is similar to traditional over-the-air, cable, or satellite TV. Live television, time-shifted programming, and content-on-demand are all presently available over the Internet. Increased broadband speed, growth of broadband subscription base, and improved video compression technologies have contributed to the emergence of these IPTV services. This we proposed receiver based peer division multiplexing method. The experiments prove that the proposed method effective one.

Key worlds : Network, Receiver, Multiplexing, Data Transfer, Data Stream, Bandwidth.

INTRODUCTION

We draw a distinction between three uses of peer-to-peer (P2P) networks: delay-tolerant file download of archival material, delay-sensitive progressive download (or streaming) of archival material, and real-time live streaming. In the first case, the completion of download is elastic, depending on available Bandwidth in the P2P network. The application buffer receives data as it trickles in and informs the user upon the completion of download. The user can then start playing back the file for viewing in the case of a video file. Bit torrent and variants are examples of delay-tolerant file download systems.

In the second case, video playback starts as soon as the application assesses it has sufficient data buffered that, given the estimated download rate and the play back rate, it will not deplete the buffer before the end of file. If this assessment is wrong, the application would have to either pause playback and rebuffed or Slow down playback. While users would like playback to start as soon as possible, the application has some degree of freedom in trading off playback start time against estimated network capacity. Most video-on-demand systems are examples of delay-sensitive progressive-download application. The third case, real time live streaming has the most stringent delay requirement. While progressive download may tolerate initial Buffering of tens of seconds or even minutes, live streaming generally cannot tolerate more than a few seconds of buffering. Taking into account the delay introduced by signal ingest and encoding, and network transmission and propagation, the live streaming system can introduce only a few seconds of buffering time end-to-end and still be considered "live".

EXISTING SYSTEM

In the existing system, a number of commercial peer-to-peer (P2P) systems for live streaming have been introduced in recent years. But the behavior of these popular systems has been extensively studied in several measurement papers. Each peer downloads the data at the processing time maximum.

A.Issues in the existing work

The data transmission process not secure. Time consuming process is high.

B. Proposed System

In the proposed system, we are introducing a new technique for peer division multiplexing (PDM) to minimize per packet processing time of a stream. The PDM it mainly used for delivering the packet to receiver, each packet forward handshaking per packet between peers. It is broadcast server way delivering the packet to receiver. The broadcast server we can for total download and upload file store.

1. Advantages of proposed system

The secure data transmission between source and destination. Time consuming process is slow to compare the previous work.

Here we can implement new techniques is called IOB, and apply the cryptography mechanism.

EXPERIMENTAL SETUP

A. Constructing the p2p Network

The constructing peer to peer network with plotting the number of nodes to be there. Each peer different file downloads in the network, when the peer want some file from the network, in the P2P network for file distribute which ever system. The source and destination should be fount out the path. This path way sending data transfer from source to destination.

B. Usage of IOB and Repeater Node

In the proposed system we can introduce the new techniques for PDM.the data transfer from source to destination. That time data is spitted into number of packet. If the any one packet is loss those packets go to send the IOB.the IOB data deliver to receiver that time adding repeater node. Repeater node directly connected to the encoding server.

C. Processing of Broadcast Server

The Broadcast server using two types of process servers. 1. Encoding server and 2.receiver.the Encoding server download file and upload rate aggregates. The Packet is secure delivering to receiver

AES Algorithm

AES has a fixed block size of 128 bits and a key size of 128, 192 or 256 bits.

Time-frequency relationship between U.S. output with commodity and asset prices

Aviral K. Tiwari*, Claudiu T. Albulescu** and Rangan Gupta***

Abstract

Commodity and asset prices have a well-documented effect on economic growth, manifested through various channels. At the same time, the business cycle influences the commodity and asset prices. Whereas empirical evidence on the effect of commodity and asset prices on the long-run economic growth is ambiguous, most of the previous researches highlight a positive correlation in the short-run. The aim of this paper is to disentangle the short- and long-run co-movements between U.S. historical business cycles and commodity and asset prices, over the period 1859-2013. For this purpose we use a time-frequency approach and we test the historical influence of oil, gold, housing and stock prices, over the output growth. Different from other studies, we control for the effect of other prices and monetary conditions, using the wavelet partial coherency. In line with the previous works, we discover that co-movements between economic growth and commodity and assets prices manifest especially in the short-run. We also find that stock returns and housing prices have a more powerful effect on the U.S. economic growth rate than the oil and gold prices. The long-run co-movements are documented especially around the World War II. Finally, when controlling for the influence of the interest rate, inflation and other commodity and asset prices, co-movements become weaker in the short-run. In general the oil and housing prices lead the GDP growth, the U.S. output lead the gold prices, while there is no clear causality direction between business cycle and stock prices.

Keywords: Commodity and asset prices, economic growth, U.S. business cycle, historical co-movements, wavelets.
JEL codes: E32, C22, N11, N12.

1. Introduction

The impact of commodity prices, as well as the impact of real and financial asset prices on the economic growth is well-documented by the literature. The influence of different commodity prices, real estate prices and stock prices is heavily investigated. However, the empirical evidence on the short- and long-run effects of commodity and asset prices on the economic growth remains ambiguous. Therefore, given the strong fluctuation of these prices, a clear understanding of their correlation with the business cycle is crucial for anticipating the state of the economy.

The existing literature provides unambiguous link between economic growth, and commodity and asset prices. Several questions remain without a clear answer. Which are the similarities between the historical and the present co-movements of economic growth and commodity and asset prices? Is the influence of commodity and asset prices on the economic

ABSTRACT

This paper is an attempt to study the current status of skill up-gradation in Indian IT (Information Technology) industry. The objective of the study is to identify the level of penetration of skill up-gradation activities and their shortcomings. The paper will suggest suitable strategies and focus areas for IT managements to improve skill level of employees. The study is conducted by means of online survey. The study is conducted in three IT organisations operating in Hyderabad and Secunderabad. Some of the responses are collected through social networking sites from few other IT organisations. The analysis is done using statistical averages. It has been observed that IT industry is focusing on formal training as well as certifications of its employees. The average number of training programs attended and certifications obtained is fairly good. But, it appears that all the employees are not uniformly trained or certified. They are considerable number of employees with very little training/certifications where as some employees are having fairly large number of trainings/certifications. Also, employees are allocating fairly large percentage of time for on the job learning. However, the study has not collected data on number of days employee has attended training programs and the nature of training programs attended. The managements are advised to make it compulsory to participate in training programs for all employees every year. The managements are advised to provide financial and training assistance to all employees for certification on relevant skills. The project managers are advised to plan for on the job learning during the effort and schedule finalization of the projects.

1. INTRODUCTION

Information Technology (IT) industry is growing very fast in India. Computer science is still not a mature science and IT industry is evolving with time. This industry is dependent on highly skilled and motivated work force. There is a need to continuously train the work force to meet challenging customer requirements. Here is an attempt to study the focus on formal training by Indian IT industry. The paper will identify areas of improvement for skill building activity and suggest suitable strategy and policy changes.

The study is based on survey conducted in few IT organization employees. The focus is on formal training programs and certifications obtained. Also, the percentage of time for on the job training is collected. However, the survey does not cover nature of the topic and duration of formal training. The analysis is done using SOFA, a statistical tool. The statistical averages calculated are presented in Note 1 at the end of the paper.

The study clearly shows that IT industry has focus on formal training. There is evidence of formal training programs being organized by IT firms but there is no evidence that all the employees have time and opportunity to attend these training programs. Also employees need a good percentage of time for on the job training. It can be concluded that, there is focus on formal training, but special focus is required to cover all the employees. There is a need to study further whether on the job training is essential, if so is it planned by the project managers. The managements have to suitably modify Human Resource policies so that each employee will attend a certain minimum days of training and obtain certifications on regular basis on contemporary technologies.

2. REVIEW OF LITERATURE

Innovation and competitiveness are essential for growth of the enterprise. Skilled and capable employees are key for innovation. Enterprise competitiveness as well as regional competitiveness are impacted by enterprise training (Padilla Raman, 2007). Investments in human capital have positive impact on firm level productivity (Yang Chih-Hai, 2010). Local and small enterprises are more concerned about the need to acquire technology and be technologically updated (Ciravegna Luccano, 2001). The motivation levels of employees and employee retention are essential for any enterprise, more so in IT industry. It has been established that training investments improve motivation levels, increase employee retention and reduce attrition (Damaraju Sirisha, 2013, Katsimi Margarita, 2008).

Another important concern is even though qualified graduates are produced from the colleges, there is lack of requisite skill (Upadhya Carol 2007, Li Xiaoqing, 2011). Job obsolescence can be a major concern, if regular training is not provided to employees. Workers need to take more responsibility for management of

Web based information recovery- A survey

2016

D.Saravanan
IBS University, Hyderabad, Telangana 501 203

ABSTRACT

As increasing the demand on web search , internet user also increased. Because of the huge content available on web, it is difficult the user to identify the relevant information on web. For this user spend lot of time to identify their relevant information on web. There is no effective tool available to solve this browsing problem, this brings the challenging concern for the users. This paper brings the comparative study about the web search their merits and demerits.

Keywords : ***Text Ming, Data Mining, Information Extraction, Oncologists, Web browsers.***

1.INTRODUCTION

Analyzing the large unstructured data and getting the needed information is the really challenging task. This can achieve effectively with help of number of existing technique such as classification and clustering . This techniques are based on the similarities between the items or similarities between the item searched. Technology brings the browsing very easy, because of this web based content increased very rapidly. Information are gathered in variety of source on because of needed information retrieval is the one of the difficult process to the user. Number of various technique overcome this problem one of the model based on the creation of users browsing style, users information are stored based on the browsing style of the particular user. This model referred as impression model , this model stores all the details based on the user browsing style. When users try to search or user browse any information this model support the user nicely. The drawback of this model there is no proven concept of no practical implementation available. Model developed based on the users behaviour. Some more model to create a indexing based on the user browsing information. Some commonly used technique based on this are background representation , generic ontology.

2.LITERATURE REVIEW

1.Chris Buckley, Ellen M. Voorhees "Evaluating Evaluation Measure Stability".

1.1 Problem formulation

Information retrieval has a well-established tradition of performing laboratory experiments on test collections to compare the relative effectiveness of different retrieval approaches. The experimental design specifies the evaluation criterion to be used to determine if one approach is better than another. Because retrieval behavior is sufficiently complex to be difficult to summarize in one number and many different effectiveness measures have been proposed.

1.2 Research Design

The test collection must have a reasonable number of requests. Sparck Jones and van Rijsbergen suggested a minimum of 75 requests, while the TREC program committee has used 25 requests as a minimum and 50 requests as the norm. Five or ten requests is too few. The experiment must use a reasonable evaluation measure. Average Precision, R-Precision, and Precision at 20 (or 10 or 30) documents retrieved are the most commonly used measures. Measures such as Precision at one document retrieved (i.e., is the first retrieved document relevant?) or the rank of the first relevant document are not usually reasonable evaluation measures.

DATABASE SECURITY INCURSION RECOGNITION TECHNIQUE USING NEURAL NETWORK

D.Saravanan

Faculty of operations & IT, IFHE University, IBS Hyderabad

ABSTRACT

Database Intrusion Detection System (IDS) is an expert system looking for evidence of attacks on known vulnerabilities of the system. It holds a statistical model of the behaviour of a user on a system under surveillance. There are several techniques, protocols, and algorithms to increase the security level of database. In such works, there is a lack of time complexity analysis of the techniques. This time complexity has occurred due to the comparison process carried out at each time the user query is given i.e., comparing the profiles of online transactions and the stored authorized transactions each time when the query is received. This system time complexity also affects the system performance in terms of their precise security. It learns the habits a user working with the computer and to raise warnings when the current behaviour is not consistent with the previous learnt patterns, thus detecting whether the user is authentic or not. The system can be implemented using MATLAB. MATLAB is a numerical computing environment. It allows matrix manipulations, plotting of functions and data implementation of data. The learning process by neural network avoids the unauthorized transactions in the DBMS and reduces the time complexity the project improves the performance of the database system. The neural network implementation will show the effectiveness of the proposed IDS technique in securing the database from the intruders. The performance of the proposed technique is evaluated by utilizing different statistical performance measures.

Index Terms – Security systems, Data base security, Database applications, Overloads, Database Attacks.

I. INTRODUCTION

Database is an organized collection of data. The data is typically organized to model relevant aspects of reality in a way that supports processes requiring this information (for example, finding a hotel with vacancies). A general-purpose database management system (DBMS) is a software system designed to allow the definition, creation, querying, update, and administration of databases. Well-known DBMSs include MySQL, Postgre SQL, SQLite, Microsoft SQL Server, Microsoft Access, Oracle, Sybase, dBase, FoxPro and IBM DB2. The database is not generally portable across different DBMS, but different DBMSs can inter-operate by using standard such as SQLand ODBC or JDBC to allow a single application to work with more than one database. Database security concerns the use of a broad range of information security controls to protect databases (potentially including the data, the database applications or stored functions, the database systems, the database servers and the associated network links) against compromises of their confidentiality, integrity and availability. Security risks to database systems include:

- Unauthorized or unintended activity or misuse by authorized database users, database administrators, or network/systems managers, or by unauthorized users or hackers (e.g. inappropriate access to sensitive data, metadata or functions within databases, or inappropriate changes to the database programs, structures or security configu rations)
- Malware infections causing incidents such as unauthorized access, leakage or disclosure of personal or proprietary data, deletion of or damage to the data or programs, interruption or denial of authorized access to the database, attacks on other systems and the unanticipated failure of database services;
- Overloads, performance constraints and capacity issues resulting in the inability of authorized users to use databases as intended;
- Physical damage to database servers caused by computer room fires or floods, overheating, lightning, accidental liquid spills, static discharge, electronic breakdowns/equipment failures and obsolescence.

II. EXISTING SYSTEM

Detection System for Security in Database using COUNTER BLOOM FILTER (CBF). This approach is considered as transaction level approach and is used to detect the malicious transactions in the database. The protection of the database by the use of encryption techniques, where the database may be encrypted but this kind of system may lead to query degradation. The overall system architecture is divided into two parts

- Learning phase.
- Intrusion detection phase

The learning phase generates authorized transactions profile automatically and is used at detection phase to check the behavior of executable transactions. In a counter bloom filter it generalizes a bloom filter data structure by allowing the membership query and the CBF can be changed dramatically by insertions and deletion operations.

A. Problem in Existing system

- This technique fails against unknown database attacks.
- This approach is not effective because manual generating transaction profiles mechanism is more time consuming process maybe undetected.
- It does not detect transaction level dependency; hence some of them attack the database.
- It does not provide time efficiency. It is so because each time a transaction takes place the

Healthscape role towards customer satisfaction in private healthcare

Debajani Sahoo and Tathagata Ghosh
Department of Marketing and Strategy, ICFAI Business School, Hyderabad, India

Abstract

Purpose – The purpose of this paper is to identify the motives that enforce consumers to find out the major determinants that frame healthscape in private healthcare service that leads to their satisfaction in a developing country like India.

Design/methodology/approach – The generic motive dimensions are identified using an exploratory factor analysis. Next the reliability and validity of the factors are established followed by regression analysis using SPSS 20.0 s/w.

Findings – This paper identifies six healthscape motives in the private healthcare sector named as service personnel conduct and cleanliness, service delivery and facilities, ambience, location and look, appealing decoration, and upgraded safety service, out of which only service delivery, ambience, location, and decorations contribute the most to build customer satisfaction as per their significance value.

Research limitations/implications – The various dimensions of healthcare motives should be viewed as the levers of improving hospitals' service quality in the minds of its present and future customers. This finding can offer valuable insight to the forthcoming as well as existing developer who are planning to have their healthcare service presence in India.

Practical implications – This study suggests some important strategic guidelines for service positioning and market segmentation of healthcare services as per customer requirements. In the recent past, availing services from hospitals were purely utilitarian in nature. Customers were more inclined to get proper and timely services and cared more about the service quality of the healthcare service provider.

Originality/value – This paper is among the few works done on understanding private healthcare service delivery process in India and customer satisfaction level from those Hospitals. This study addresses the gap by identifying a set of dimensions that are relevant to customers for a unique healthcare experience.

Keywords Satisfaction, Patient satisfaction, Healthscape, Private healthcare, Servicescape, Healthcare services

Paper type Research paper

Introduction

The last decade witnessed a series of dramatic transformations in the scope of service delivery in the healthcare industry (Lee, 2011). Higher service expectations from patients, advancement in technology, greater access to health-related information through the digital media (internet), and a holistic approach to health and well-being concerns were few of those paradigm shifts that attributed the overall transformation (Francis, 2010). More specifically, a patient-centered healthcare service structure has emerged which seeks additional focus on designing the atmospherics of healthcare facility units. This is primarily because the technical aspects of a healthcare service are much more difficult to control as compared to its tangible elements (Hutton and Richardson, 1995a). These atmospheric cues, for example, sight, smell, taste, sound, and touch have a close resemblance with the concept of servicescape as developed by

Exploring the Emerging Role of Healthscape in Determining Patient Satisfaction: An Empirical Study in the Indian Private Healthcare Industry

Tathagata Ghosh & Debajani Sahoo

Purpose: This paper aims to identify the motives of patients to identify the major determinants framing the healthscape in private healthcare services that promotes patient satisfaction and loyalty in a developing country like India.

Design/Methodology/Approach: The dimensions of the generic motives are identified using an exploratory factor analysis (EFA). Next the reliability and validity of the factors are established followed by multiple linear regression analysis, using SPSS 20.0

Findings: This paper identifies six healthscape motives in the private healthcare sector. These are service personnel conduct and cleanliness, service delivery and facilities, ambience and facilities, location and look, appealing decoration, and upgraded safety services. It also identifies that these elements affect patients' satisfaction and loyalty positively.

Practical Implications: The healthscape motives should be viewed as the levers of improving hospitals' service quality in the minds of its present and future patients. This finding can offer valuable insight to newand existing developers who are planning to have a healthcare service presence in India. This study suggests some important strategic guidelines for service positioning and market segmentation of healthcare services. In the recent past, availing of services from hospitals was purely utilitarian in nature. Patients preferred to get proper and timely services and cared more about the service quality of the healthcare service provider. However, our study suggests that healthcare services could also be hedonic, that leads to pleasant experience. Overall the healthscape plays a major role in shaping patients' satisfaction and loyalty.

Originality/Value: This paper is unique on understanding private healthcare service delivery process in India and consumer satisfaction level from the healthscape standpoint of private hospitals. This study thus addresses the gap by identifying a set of dimensions that are relevant to consumers for a unique healthcare experience.

Keywords: Healthscape, Satisfaction, Loyalty, Healthcare services

Introduction

The last decade witnessed a series of dramatic transformations in the scope of service delivery in the healthcare industry (Lee, 2011). Higher service expectations from patients, advancement technology, greater access to health related information through digital media(Internet), and a holistic approach to health and well-being concerns are few of those paradigm shifts that attributed the overall transformation (Francis, 2010). More specifically, a patient-centered healthcare service structure has emerged which puts additional focus on designing the atmospherics of a healthcare facility unit. This is primarily because the technical components of healthcare services are much more difficult to control when compared to the tangible elements of a healthcare service encounter (Hutton and Richardson, 1995a). These atmospheric cues, for example, sight, smell, taste, sound, and touch have a close resemblance with the concept of servicescape as developed by Bitner (1992) and are considered as a crucial dimension for overall service experience. Extant research further suggests that the physical environment of a healthcare service provider might encourage or discourage certain behaviors and emotions of the patients (Carpman and Grant, 1993) and play a major role in their healing process (Fottler et al., 2000).

Healthcare service delivery is very different from other service encounter situations that are commonly found in banking, telecommunication, and airlines; patients find it difficult to determine, measure, and evaluate the technical nature of a typical healthcare service availed by them. As a result the tangible elements (physical settings, ambience, layout, facilities, infrastructure, etc) of a healthcare service encounter play a major role in judging the

ICFAI FOUNDATION FOR HIGHER EDUCATION HYD. ABAD

REGISTRAR
THE ICFAI FOUNDATION FOR HIGHER EDUCATION
(Deemed-to-be-University Under Section 3 of the UGC ... '91)

overall service quality (Bowers and Swan, 1992). It also influences the nature of relationship that is developed between the employees, i.e., physicians, nurses, administrative staffs, and patients (Crosby et al., 1990). Even further, patients' judgment about the technical competence of a physician is driven by cues taken from the healthcare atmospherics (Bowers and Swan, 1992).

All these studies substantiate the importance of investigating the concept of servicescape in more detail in the healthcare context considering its influence on patients' cognitive, affective, and conative reactions. Perhaps because of this realization, Hutton and Richardson (1995a) introduced the concept of Healthscape in order to capture the tangible aspects of healthcare service. This allows academics a plethora of opportunities to explore how healthscape affects patients' perception, attitude, satisfaction, and certain behavioral intentions like patronage, loyalty, and positive word of mouth. Despite this research potential, limited attention was paid in previous studies regarding the potential power of healthscape and its associated dimensions in generating optimum satisfaction among the patients. The present study hence aims to investigate whether and to what extent patients' satisfaction is affected by healthscape in a healthcare service environment. Patients' satisfaction is indeed worthy to be studied because it serves as an indicator of the quality of care provided to them (Cleary and McNeil, 1988). This in turn determines consumers' future priority towards that service provider and positive word of mouth that gives marketing and economic benefits (Boudreaux and O'hea, 2004). Our study fills this research void by empirically investigating both the tangible and intangible effects of healthscape cues on patients' satisfaction and loyalty.

Review of Literature and Hypothesis

Servicescape and Healthscape

The concept of servicescape is first provided by Bitner (1992) referring to the physical environment of a service platform where service transactions take place. It draws the origin from the term 'atmospherics' credited to Kotler (1973) who defines it as "the effort to design buying environments to produce buyer specific emotional effects that enhance his purchase probability." Servicescape is a multidimensional construct which encompasses the ambiance of a service setting composed of individual elements like color, music, scent, layout, and design (Bitner, 1992). Such an ambiance or environment is built around a place where market exchanges take place so that the physical surroundings exert an influence on the behavior of the consumers and employees participating in the exchange process (Bitner, 1992; Wakefield and Blodgett, 1994).

The environmental stimuli attributed to servicescape are captured using three dimensions namely- ambient conditions, spatial layout/functionality, and signs, symbols and artifacts. Ambient condition covers controllable and observable stimuli, for instance, temperature, air quality, noise, music, and visual factors like color, shape and cleanliness (Bitner, 1992). The second factor of spatial layout and functionality relates to layout, equipment and furnishings and their contribution to the consumption experience (Harris and Ezeh, 2008). The third dimension of signs, symbols and artifacts refer to physical signals which are communicated by way of general meanings and directions to consumers in that particular service center. (Bitner, 1992; Ardley et al., 2012). Bitner (1992) also focuses on the importance of servicescape as a surrogate indicator of intangible service performance which helps consumers develop cognitive and affective responses and behavioral intentions toward the stores' offerings (Baker et al., 1994).

Servicescape has been studied in various service sectors in order to explore its influential role on consumers' in-store behavior, such as money spent (Areni and Kim, 1993) or number of items purchased in a retail store (Spangenberg et al., 2006). Important servicescape dimensions introduced by Bitner et al. (1990) are later adopted by others to include facility aesthetics (color, music, and lighting), layout accessibility (spatial layout and furnishing to facilitate consumer enjoyment) and cleanliness (Miles et al., 2012; Wakefield and Blodgett, 1996). In the context of retail, studies have been conducted to examine how store environmental cues affect consumers' merchandise value perceptions which in turn determine their store patronage behavior (Baker et al., 2002).

Originating from the domain of servicescape, healthscape defines the servicescape specific to any healthcare service and refers to the tangibles captured through our senses of sight, smell, sound, taste, and touch (Hutton and Richardson, 1995a). The interior healthscape of a healthcare facility unit is more important than its exterior counterpart because of its potential to differentiate various

SECURED IMAGE TRANSFORMATION USING DISORGANIZED CHART PATTERN TECHNIQUE

D.Saravanan

Faculty of operations and IT, IFHE University, IBS Hyderabad

ABSTRACT

An Enhanced disorganized chart pattern based algorithm for image encryption to improve the security of the algorithm.. The basic idea behind the proposed algorithm is to alter the coupling direction used to update the map variables. The altered coupling direction results into a totally different set of initial conditions and map variables of three disorganized chart pattern Based on experiments will show that the enhanced algorithm with chosen coupling direction can encrypts the color digital images. The image which given as input is retrieved as same as the original image while decrypting. Here many distortions take place when the image is converted pixel by pixel, this helps in high secrecy of the encrypted image.

Index Terms —Image processing, Information hiding, Encryption, Multimedia information, Image hiding, Decryption.

I. INTRODUCTION

The wide use of digital images across the world in internet, wireless networks, military image database, medical imaging system and various other applications, require reliable, fast and robust security system to store and transmit digital images. In order to fulfill the security requirements of digital images, many image encryption approaches have been used. One of the recently and widely used approaches is the chaos based cryptography. A lot of work is going on in developing the chaos based cryptosystems. In cryptography, the strength lies in choosing the keys, which are secret parameters, used in encryption. It should not be possible to guess the key by an intruder. The chaotic systems are very sensitive to initial conditions and system parameters. For given set of parameters in chaotic regime, two close initial conditions lead the system into divergent trajectories. Therefore, an encryption/ decryption scheme can be developed if the secret parameters are chosen as keys [1]. Since the same parameters are used for encryption and decryption, the chaos scheme is symmetric. The parameters and the initial conditions form a key space thereby enhancing the security of the scheme. In recent years, the chaos based cryptographic algorithms have suggested some new and efficient ways to develop secure image encryption techniques to meet the demand for real-time image transmission over the communication channels. Chaos based image encryption methods are considered good for practical use because they have important characteristics like (i) they are very sensitive to initial conditions/system parameters, (ii) they have pseudo-random property and non-periodicity as the chaotic signals are usually noise-like, etc.

II. EXISTING SYSTEM

In the past decade, number of image encryption algorithms based on chaotic maps have been proposed. Some of them are based on a single map (0D system) or on one-dimensional chaotic maps and are appropriate for encryption of plaintext files or blocks of bits. However, they do not allow the direct encryption of images. For image encryption, two-dimensional (2D) or higher dimensional chaotic maps are employed as the image can be considered as a 2D array of pixels. Recently, Pisarchik *et al.*, [6] have proposed a new practical algorithm based on a chaotic map lattice (CML) that allows direct encryption and decryption of color digital images. The CML was introduced by Kaneko *et al.*, [7] as simple model to investigate the behavior of spatiotemporal chaos in many fields of nonlinear science. In recent times, this kind of system has been utilized for secure communication in number of encryption algorithms. One way coupled CML is extensively used for self-synchronizing, chaos based cryptosystems. Wang *et al.*, [8] have shown that the communication with CML is more secure than the communication with single map.

A. Disadvantage of existing system:

The image must be sent secured for can be taken by the intruders. In existing level hacker, can easily hack the data's in data transaction. Hacker can easily know about the password. The information is not sent to the receiver securely by the sender due to the intruders.

III. PROPOSED SYSTEM

Here in the present an enhanced chaotic map lattice based algorithm for image encryption to improve the security of the algorithm. The basic idea behind the proposed algorithm is to alter the coupling direction used to update the map variables. The altered coupling direction results into a totally different set of initial conditions and map variables of three disorganized chart pattern Based on experiments will show that the enhanced algorithm with chosen coupling direction can encrypts the color digital images. The images encrypted by proposed algorithm are more indistinguishable and have more distortion. It is also shown that the proposed algorithm is more sensitive to a small change in plain images, number of iterations and number of cycles. The pixel color is the combination of three components: red, green, and blue, each of which can take an integer value between 0 and 255. So, three parallel disorganized chart pattern s can be created by converting each of the three-color components to the corresponding values of map variable, for each pixel and these values are used as initial conditions. Each chaotic map in the Disorganized chart pattern, is iterated, this gives a very different value and the image becomes indistinguishable because of an exponential divergence of Chaotic trajectories.

A Study on Employability of Engineering Graduates by Considering the Present Job Opportunities with specific reference to Pune City in India

Prof. Bidhan Datta, Asst. Prof.,
MIT School of Business, Pune

Banantika Datta, (Applied Eco.)
Jawaharlal Nehru University

Abstract :

A Study on Employability of Engineering Graduates by Considering the Present Job Opportunities with specific reference to Pune City in India.

India is one of the fastest developing economy in the world. It has the resources to be the next super power, only if some proper guided steps are taken to use its resources wisely. Government of India recently has taken some initiatives like 'Make in India', 'Digital India', Pradhan Mantri Jan Dhan Yojana', 'Gold Monetization Scheme', implementation of 'Gram Sarak Yojana', 'Bullet train' etc. and also industrialization strategies which could able to create new jobs in Government, Public Sector Undertaking and Private Sectors as well. To create a potential workforce, it is crucial to educate the young citizens adequately which will enhance the employability. Pune city is one of the most popular city in India and educational hub also known as "Oxford of the East" (Pandit Jawaharlal Nehru), has continued to maintain a legacy in education (Chaterjee, 2013). Pune is the most preferred destination for Engineering students. According to a survey of 10,000 students conducted in June 2011 all over Maharashtra, 37% of the students gave their first preference as Pune (Kulkarni, 2011).

Higher education is very important in the progress of an individual and progress of any nation. Intellectual capital which is qualified and skilled workforces are the biggest strength of any nation in today's world. It makes an individual financially independent and benefits to the society as a whole. Regarding employment of engineering graduates, most companies hire from only the top tier colleges, this creates an artificial fall in the employable garduates. This shows the job opportunities for fresh engineering graduate is not smooth. The over emphasis on the number of Engineering colleges has led to a lower quality.

Engineering colleges grew like wild mushrooms. In India there were just 1,511 colleges in 2006-07, by 2014-15 it showed a figure of 3,345 and presently it is 4298. But this increase in number can't establish that it is really a good sign. 1.5 million engineering graduates pass outs in India every year, but only fewer getting hired (Mahajan, 2014). Mumbai-Pune in Maharashtra is having the highest no. 145 engineering colleges where as second highest is Hyderabad with 86 engineering colleges (National Employability Report of Engineering Graduates, 2011, Pg 24). Thus selecting Pune city as a research topic on 'Employability of Engineering Graduates' is stands appropriate.

Educated unemployment is the phenomenon where people with academic degrees are unable to find employment. Even if they manage to find a job they are underemployed. The underemployment is due to the mismatch between the graduate aspirations and the job opportunities available to them. Over 75 per cent of technical graduates are not ready for jobs (NASSCOM, 2011). The issue of educated unemployment has emerged as a major concern in India. It is a clear indication of the institutional ineffectiveness. As many as 82% of the total engineers are deemed to be unemployed (Chaturvedi, 2013).

There are large numbers of Engineering graduates passing every year and this number is increasing with each year. Only about one third of the graduates manage to get jobs through the campus placements. In some states up to 70% engineering graduates are unemployed (Mannan, 2014). Many Indian employers say that talent shortage, majorly lack of English knowledge and communication which prevent them from hiring the engineering graduates. The lower salaries offered and fewer placement opportunities become a rising trend of engineers transforming into self employment.

Thus there is a need to study the technical education at the graduate level and employability of the graduate engineers. The objectives of the Study is i) to study the possible employment opportunities available for the engineering graduates in the present market scenario and ii) to study the gap (if any) between the expectations of Engineering graduates and actual employment opportunities available to them.

Key words : Employability, Engineering Graduates, Job Opportunities, Pune, India.

1. Introduction to the Topic :

India is one of the fastest developing economy in the world. It has the resources to be the next super power,

A Study of Job Opportunities and Challenges of Retired Indian Air Force Personnel for their Resettlements

Prof. Bidhan Datta
Assistant Professor, MIT School of Business, Pune, India

Dr.Kuldip S. Charak
Director, Navsahyadri Group of Institutes, Pune, India

Abstract

The role of Indian Air Force is to safeguard the Indian Territory and to secure Indian air space. Indian Air Force which is responsible to secure the airspace presently has a strength of 127,000 active personnel. A major portion of this is Airmen (Combat armed force of Indian Air Force, below the officer rank). After joining Air Force they contributed their whole youth in the defence service. A large numbers of defence personnel are retiring every year after their initial term of engagement (bond). The average age of the retiring people is in between 40 to 46. They all have liabilities to their family. Almost everyone is married and their children are studying even for higher education. They are in search of Job soon after their retirement and also need support from the government for their re-settlement. Only few percentages out of them are placed for job in government sectors. But still many are jobless. In that case they are fully dependent on their pension. Some cases they are compromising themselves to do substandard job.

Price forecasting

ABSTRACT

In this study we investigate Spot electricity price forecasting performance of Autoregressive-GARCH models on Indian spot electricity price series. Hourly spot electricity price data for each of the five regions of Indian Electricity market from 1st of October 2010 to 15th November 2013 is used for the study to evaluate forecasting performance of the calibrated models. The conditional mean and conditional variance equations are estimated and one-step-ahead forecasts with a rolling window is performed. The fact that India being the only country in the world having power exchanges in-spite of demand outstripping supply and peak power shortage even to this day, further emphasizes the significance and criticality of spot electricity price forecasting from a power market participant's perspective and its practical relevance for Open access consumers in India.

© 2016 Elsevier Ltd. All rights reserved.

1. Introduction

The Indian Electricity Act[1] (IEA) 2003 has paved way for trading of electrical power and is now a separate and completely distinct activity with licensing from the Central Electricity Regulatory Commission (CERC) of India. Post the enactment of IEA 2003, private players and licensees have started their operations in Ahmedabad, Mumbai, Kolkata, Surat, Delhi and other major cities in India for Generation of electric power, Distribution of electricity and proper Operations in system. Electricity sector in India has been opened up for 100% Foreign Direct Investment (FDI) in power Generation, Distribution and power trading. In the last few decades, electricity markets world-wide are gradually transforming from being highly regulated by the Governments of the respective countries in-to deregulated and competitive markets and Indian Electricity market is the latest entrant to this list.[2] Electricity is a very distinctive commodity which cannot be cost-effectively stored and the end-user demand exhibits strong seasonality.[3] Earlier we had electric utilities which were vertically integrated and now we have deregulated competitive markets worldwide [3,35] with the sole objective of introducing competition in power industry, thereby, providing more options for power market participants to choose from [3]. With the deregulation and increased competition, today, participants of power markets are facing new challenges.

Short term, medium term or long term power trading is not a technical business any-more. It has transformed in to one in which, the product is treated similar to any other commodity [41]. Events such as non-availability of resources (e.g., variation or shortage of coal for thermal power stations), power plant outages, flawed transmission grid reliability or breakdown of electrical transformers tend to have tremendous effect on electricity spot prices. In a power market, for both spot markets and long-term contracts, price forecasts are essential input so that power market participants can devise effective bidding strategies or negotiation skills for maximizing future profits. An Independent power producer (IPP) or a Generator capable of predicting spot electricity prices accurately will be in a better position to adjust its own production schedule by buying/selling power from power exchange depending on when it is more profitable, ensuring power requirements are met and

E-mail address: gpgirish.ibs@gmail.com.

[1] The Indian Electricity Act was enacted by the Parliament of India on the 26th of May 2003 aimed at introducing competition and completely reorganizing the Indian power sector.

[2] Weron [47]; Girish, Panda and Rath [22] have reviewed the evolution of organized day-ahead spot electricity markets world-wide. Girish and Vijayalakshmi [24] have focused on role played by energy exchanges for facilitating electricity trading in India.

[3] Demand of electricity and electricity prices exhibit seasonality at annual level, monthly level, weekly level, daily level and intra-day level [1,17,23,28,29,47].

Women Directors in Corporate- A Kindling Move towards Women Empowerment

Dr.Manisha Singh
Faculty of Finance, IBS, Bangalore, Karnataka, Email: manisha@ibsindia.org

Akinchan Buddhodev Sinha
Assistant Director, ICSI-CCGRT, Navi-Mumbai & Research Scholar, ICFAI University Jharkhand
Email: akinchanbsinha@gmail.com

Abstract

In India, recognizing the significance of the role of woman in the growth and development of the corporate, The Securities and Exchange Board of India vide its circular date 17th of April, 2014 made it compulsory for all the listed companies to appoint at least one Woman Director on their Board by 31st of March, 2015 in alignment with the requirements of Section 149 of the Indian Companies Act, 2013, under corporate governance norms. Thus days are gone when women were ignored and their role was undermined. Today women are pillars of the business organization and making noteworthy contribution towards the success of business. In view of the burgeoning significance of women in corporate houses, this article makes an endeavor to delve deep into the need of women empowerment, how presence of women on corporate boards have enhanced the performance of the business organizations, the regulations governing the appointment of women directors on corporate boards and legal ramifications, takeaways from global practice and other important aspects.

Keywords: Women empowerment, start-ups, Corporate performance, Legal framework

Prologue- Women Empowerment

According to Nobel Laureate and Founder of UNDP's Human Development Index, Amartya Sen, once stated that empowering women and girls with more choices and more freedoms is vital to accomplish a better future for all. Women agency and freedom are among the significant catalyst for increasing development. It has been observed that countries which have expanded opportunities for women and girls in education and work in recent decades have largely attained prosperity and moderated population growth while restricting child mortality and accomplishing social progress for all.

Despite numerous initiatives taken both legal and political the condition of women is not so impressive, especially in corporate. In an article titled, *"What's Keeping Women From the Corporate Heights"?*, wherein there is a mention of existing discrimination in corporate boards. With reference to Europe the quotas to improve gender balance on corporate boards and threats to introduce them have gone some way to pushing Europe in terms of female representation in directorships. But the fact is on a global scale women are amazingly scarce in the higher spheres of corporate management.

In the U.S., gender-based discrimination is illegal, yet the June 2014 issue of Fortune magazine reported that the proportion of women CEOs had touched the historical level of 4.8 percent. What was striking that this development was described as "impressive progress", as in 1998 only one Fortune 500 company was led by a woman. Even in the gender and socially progressive Scandinavian countries female presence in executive management remains abysmal. One of survey revealed that merely 3 percent of the 145 biggest Scandinavian market capitalizations have a female leader. The same was found true with France.

Coming to India, according to a recent study on 'Women On Board 2016' by global recruitment tendering platform MyHiringClub.com and online job portal JobPortal.co.in presence of women members on boards of Indian companies is seen to be lower than the overall average for developing countries. In the mentioned study conducted online, a total of 38,313 listed corporate houses participated globally and in India 1,459 listed employees participated. The study revealed that overall percentage of women directors on board is 6.91% in these listed incorporations as against 6.69% in 2015. Norway once again led the table with a higher percentage of women on board at 40.12%, followed by Sweden (29.31%), Finland (25.89%), South Africa (18.31%) and the United States (17.37%). The report further noted that the average board life of male directors in India is 3 years more than their female counterparts while globally, the difference is merely about 2 years. Moreover, it was observed that women directors on an average are 5 years younger than males.

Title: Supply chain management and marketing integration: enhancing customer lifetime value

Authors: Pankaj M. Madhani

Addresses: ICFAI Business School (IBS), IBS House, Opp. AUDA Lake, Near Science City, Off. SG Road, Ahmedabad 380060, India

Abstract: The supply chain management (SCM) and marketing integration has a direct and significant impact on customers and the revenue-earning potential of the firm. Hence, it is vital for the firm to achieve better synergy between them. SCM and marketing integration is a complex and multi-faceted construct and hence requires strategic approach for its evaluation. This study aims to understand how to achieve SCM and marketing integration by focusing its facilitators and controlling distracters. This research develops various frameworks and models for better understanding of SCM and marketing integration. This research demonstrates the benefits of a close integration between SCM and marketing and evaluates its impact on customer lifetime value (CLV). The contribution of this article is both theoretical and practical. From a theoretical perspective, the frameworks developed for study of SCM and marketing integration are an important contribution to the existing knowledge. From a practical perspective, various models of this paper aim at providing guidelines for SCM and marketing managers for building competitive advantages by achieving SCM and marketing integration.

Complementary Relationship of Sales Organization Culture and Compensation System: Practical Implications

Pankaj M. Madhani

Introduction

The increasingly complex and competitive global business environment poses greater challenges than ever to organizations today. Because of a sluggish global economy, which could include any fallout from Brexit, the sole reliance on a compensation system as a performance driver to motivate and reward sales employees is not effective as sales organizations rely more on cost cutting measures. Therefore, sales organizations might want to consider other alternatives, such as revisiting organizational culture as a means to help employers achieve their goals and effectively implement their strategies. Organizational culture represents the shared values, beliefs, ideologies and norms held by organizational members that can influence their day to day behaviour within the organization and their expected code of conduct outside the organization.

A sales compensation system defines the relationship between the sales organization and the sales people by specifying the terms of exchange. When a sales compensation system is not aligned with a sales organization's culture, it can cause unintended consequences such as increased dissatisfaction of sales employees and low performance. Aligning organizational culture and compensation systems can provide harmony, balance and consistency in organizations.
This research identifies compensation strategies for various types of sales organization cultures and provides various frameworks and illustrations to achieve optimal or best performing results for a sales organization.

Key elements of An Organizational Culture

Organizational culture has two major attributes: content and strength. Content signifies the types of values and behaviors held by members of an organization while strength represents the depth and breadth of those behaviors embedded among the members. The strength of organizational culture is defined in terms of how widely and intensively organizational values are shared by its members. Both content and strength of culture are important for achieving a high level of organizational performance (Sorensen 2002). Culture strength needs to be examined to in relation to its content in order to understand organizational effectiveness. Organizational culture can be "positive" or "negative" based on nature of content. The content of culture investigates whether there are functional and dysfunctional dimensions of organizational culture.

Performance Management Practices in Times of Uncertainty: A Real Option Approach

Pankaj M. Madhani

INTRODUCTION

Organizations now operate in environments with unprecedented and unpredictable events. Such uncertainties put extra pressure on organizations. Uncertainty is caused by unexpected external events that put the organization in an unstable state. Such uncertainties are difficult to accurately predict and put the organization in a position where it must rapidly adjust to a changing environment or perish. Such heightened demands on organizations have subsequently called for corresponding human resources of flexible, versatile and capable individuals.

These circumstances have forced organizations to make paradigm shifts in managing human resources. Potential sources of competitive advantage in the context of human-resource management (HRM) practices are enhanced skill levels, greater workforce flexibility and productivity, and increased capacity to respond to the dynamics of a fast-changing business. In this context, performance management practices need to be re-evaluated to ensure that they are contributing to that competitive advantage. Effective performance management practices benefit both the organization and employees. During periods of uncertainty, it is challenging for an organization to enhance HR flexibility and at the same time keep employees motivated and their skills enhanced. This research studies that challenge and applies a real options approach to develop HR flexibilities and subsequently relevant performance management practices of the organizations.

STRATEGIC IMPORTANCE OF PERFORMANCE MANAGEMENT DURING UNCERTAIN TIMES

Measuring the performance of employees either as individuals or as part of teams has become an important tool to ensure good organizational performance. It is also critical in identifying possible gaps between job expectations and the organization's strategic intent. On average, organizations lose 40% of the potential financial value of their strategies due to poor performance and talent management of their employees (Mankins and Steele 2005). Maley and Kramer (2014) identified three chief purposes of performance management:

(1) The achievement of strategic goals of the organization
(2) Employee development
(3) Various administrative purposes such as compensation management.

An effective performance management process has many benefits such as organizations being able to effectively monitor performance of individual employees and link it to organizational goals and provide employees regular feedback and opportunities for development and rewards (Claus and Briscoe 2009).

Madhani, P. M. (2016). Performance Management Practices in Times of Uncertainty: A Real Option Approach, *World at Work Journal, Vol. 25, No. 1, pp. 25-39.*

Sales and Marketing Integration: Enhancing Competitive Advantages

Dr. Pankaj M. Madhani

Introduction

Significant research efforts have been devoted to considering co-operation and collaboration between functional departments in organizations, based on the premise that interdepartmental collaboration is linked to improving business performance. However, relatively little attention has been paid to the interdepartmental relationship between sales and marketing as compared to other functional relationships with marketing. Only recently, sales and marketing interaction has gained more conceptual attention. Sales and marketing interface exhibits one of the most contentious relationships within organizations and is one that is attracting increasing attention from both academicians and practitioners.

There is need to have collaboration between sales and marketing to alleviate their behavioural conflicts. The sales and marketing interface has a direct and significant impact on customers and the revenue-earning potential of the organization. Collaboration between sales and marketing may be important in reducing inter-functional conflict and creating high performance. Hence, every organization should improve the relationship between sales and marketing.

The major objectives of this paper are firstly, to introduce sales and marketing integration as a process which combines the strengths of sales and marketing by shifting the focus to the customer; secondly, to demonstrate how such integration can leverage the strengths of sales and marketing and meet the challenges of customer value creation in today's fast changing and highly competitive marketplace and thirdly; to suggest various research frameworks of sales and marketing integration for better understanding the interface of sales-marketing from inside–out. This study focuses on the how collaboration between sales and marketing, improves business performance rather than evaluating its consequences. Hence, this research focuses on drivers of sales and marketing integration for creating superior customer value.

Literature Review

Previously the academic focus was more on marketing's interaction with other functions such as R&D or finance, and researchers did not differ between the sales and marketing functions at all (Kahn and Mentzer, 1998). Many researchers found sales-marketing interface as a rather unexplored area with either limited research study (Dawes and Massey, 2005) or not researched systematically and deeply (Homburg et al., 2008).

Both sales and marketing may be following their own agendas, creating conflict, coordination problem, and ultimately great tension between the two groups. These issues can negatively characterize the interface between sales and marketing and may lead to conflict that is detrimental to collaboration (Dewsnap and Jobber, 2000). According to Corstjens and Corstjens (1999), a lack of cooperation between sales and marketing has the potential to damage the overall success of the organisation.

Intellectual Capital (IC) Intensity vs. Capital Intensity: Impact on Corporate Governance and Disclosure Practices of Firms

Dr. Pankaj M. Madhani

Abstract

This research focuses on industry characteristics and their impact on corporate governance and disclosure practices of firms. Nature of industry characteristics divides firms into two broad categories: intellectual capital (IC) intensive firms and capital intensive firms. Accordingly, this research studies the corporate governance and disclosure practices of firms listed in Indian stock market representing different sectors from both categories. The study has taken six sectors into consideration – Power, Oil & Gas, and Metal, along with Health Care, IT and FMCG. These sectors are segregated into high capital intensity (low IC intensity) and low capital intensity (high IC intensity) sectors depending on nature of industry. This study aims to establish a relationship, if any, between IC intensity of firms and their corporate governance practices in Indian context. Research concludes that there is no difference between IC intensive firms and capital intensive firms with respect to corporate governance and disclosure practices. After thorough empirical research, the paper explains why Indian scenario is different from developed nations such as USA.

Key Words: *Corporate Governance, Disclosure, Intellectual Capital Intensity, Intangible Assets, Capital Intensity, New Economy*

Dr. Pankaj M. Madhani

Corporate governance is the system of relations between the shareholders, board of directors and management of a firm as defined by the corporate charter, by-laws, formal policy and rule of law. Management recognizes that there are economic benefits to be gained from a well-managed disclosure policy. A system of corporate governance needs a good level of disclosure and an adequate information to eliminate (or at least reduce) information asymmetries between all parties, making corporate insiders accountable for their actions (Madhani, 2014a). Traditionally corporate governance and disclosure practices of firms are associated with variables such as board size, board independence, board committees, ownership concentration, cross-listing of firms, CEO duality, auditor selection, nature of industry and firm characteristics (size, age, leverage, origin and types of firms viz. public sector, private sector and foreign firms). However, the meaning and

Study of Corporate Governance and Disclosure Practices: Old Economy versus New Economy Firms

Pankaj M. Madhani

ICFAI Business School (IBS), Ahmedabad

Abstract : This research focuses on nature of industry and its impact on corporate governance and disclosure practices of firms. Nature of industry divides firms into two broad categories: old economy and new economy firms. Accordingly, this research studies the corporate governance and disclosure practices of firms listed in Indian stock market representing different sectors. The study has taken five sectors into consideration – Power, Oil & Gas, and Metal, along with Health Care and IT. These sectors are segregated into old economy (high capital intensity) and new economy (low capital intensity) sectors depending on nature of industry. This study aims to establish a relationship, if any, between capital intensity of firms and their corporate governance practices in Indian context. Research concludes that there is no difference between old economy firms and new economy firms with respect to corporate governance and disclosure practices. After thorough empirical research, the paper explains why Indian scenario is different from knowledge economy such as United States.

Key Words: Corporate Governance, Disclosure, Capital Intensity, Intangible Assets, Old Economy, New Economy

Introduction

The main objective of the corporate governance is to protect long-term shareholder value along with the other stakeholders. Corporate governance is a very wide term, which covers a wide range of activities that relate to the way business of firm is directed and governed. It deals with the policies and practices that directly impact on the firm's performance, stewardship and its capacity to be accountable to its various stakeholders. Corporate governance is the system of relations between the shareholders, board of directors and management of a firm as defined by the corporate charter, by-laws, formal policy and rule of law.

The corporate business is an increasingly important engine for wealth creation worldwide, and how companies are run will influence welfare in society as a whole. In order to serve this wealth creating function, firms must operate within a framework that keeps them focused on their objectives and accountable for their actions. That is to say, they need to establish adequate and credible corporate governance arrangements. Management recognizes that there are economic benefits to be gained from a well-managed disclosure policy. A system of corporate governance needs a good level of disclosure and an adequate information to eliminate (or at least reduce) information asymmetries between all parties, making corporate insiders accountable for their actions (Madhani, 2014a).

Benefits of Six Sigma in Supply Chain Management: Developing Various Frameworks

Pankaj M. Madhani

Introduction

In today's competitive business environments, firms are under intense pressure to systematically produce quality control and quality standards and generate positive bottom line results. Six sigma deployment by organizations reduces cost of poor quality. Cost of poor quality is the cost associated with poor quality of products and services and connects the improvement priorities of a firm with its strategic objectives of enhancing financial performance and greater customer satisfaction. Intensive competition in the market place has enforced organizations to focus on process performance for enhancing the customer value. In the pursuit of improved operational performance and higher customer satisfaction, Six Sigma has been recognized as a systematic and structured methodology that attempts to improve process capability through focusing on customer needs (Dasgupta, 2003). As per statistics, cost of poor quality is 10 percent of sales for companies who are at "Six Sigma" level, about 15 to 20 percent of sales for companies who are at "four sigma" level and about 20 to 30 percent of sales for companies who are at "three sigma" levels (Clark, 1999).

There are diverse application of Six Sigma such as in manufacturing processes, automobile industry, services such as healthcare and retail and supply chain management (SCM). Six Sigma can be a powerful toolbox for supply chain process in terms of continuous improvement and hence business performance. The Six Sigma can be used to develop a model for assessing, improving, and controlling quality in the supply chain network. Six Sigma deployment in SCM is important for overall performance and growth of business as it leads to improved productivity, competitiveness, superior value creation, and market performance. However, there has been little theoretical analysis and conceptual development of underlying Six Sigma deployment in supply chain. It is mainly because practitioner oriented nature of Six Sigma. Hence, this paper works in this direction, and provides insights of SCM process improvement in terms of efficiency and effectiveness and resultant business value created by proposing various frameworks.

Literature Review

Six sigma is described as a business excellence strategy (Antony et al., 2007) and as being a customer-driven (Nakhai and Neves, 2009), a project-driven (Assarlind et al., 2012) or a business-driven (Savolainen and Haikonen, 2007) methodology, which focuses on decision making based on statistical and non-statistical tools (Manville et al., 2012), to lead towards improving the organization's product, process and service (Savolainen and Haikonen, 2007) or financial performance (Nakhai and Neves, 2009).

Kumar et al. (2008) studied a case of implementation of the Six Sigma approach for improvement in service system by a major consumer electronics and appliance retailing company in the USA. Kumar and Sosnoski (2009) highlighted the potential of Six Sigma inrealizing the cost savings and improved quality by using the case study of a leading manufacturer of tooling.

Ownership Concentration, Corporate Governance and Disclosure Practices: Study of Firms Listed in Bombay Stock Exchange

Dr. Pankaj M Madhani

Introduction

Corporate governance and disclosure practices of firms are influenced by various variables such as board size, board independence, board committees, cross-listing of firms, CEO duality, auditor selection, nature of industry (manufacturing versus service firms; traditional versus knowledge intensive firms; and tangible assets versus intangible assets dominated firms), and firm characteristics (size, age, leverage, origin and types of firms viz. public sector, private sector and foreign firms). This study aims to contribute to the understanding of corporate governance and disclosure issue by analyzing the specific governance variable such as ownership concentration of the firm. The ownership concentration of the firm and its impact on corporate governance and disclosure practices is the core theme of this research and accordingly this research identify and test the empirical evidence for such relationship for samples firms comprising of selected BSE listed firms.

Typically, corporate governance is viewed from the perspectives that publicly traded firms have dispersed shareholders who demand better governance and disclosure to protect their residual claims. In concentrated ownership environment, controlling owners are likely to be less dependent on transparency and information disclosure as they can obtain information directly from informal channels. Hence, such firms will be reluctant to disclose additional information. Therefore, it is expected that there is a negative relationship between ownership concentration and corporate governance and disclosure practices of firms. This study focuses on the extent of corporate governance and disclosure practices and examines it from the perspectives of the ownership concentration.

Literature Review

Corporate governance structures and systems vary greatly across countries. The corporate governance system across the world, can be classified based on the degree of ownership and control and the identity of controlling shareholders, into two broad categories—the outsider systems (notably the US and the UK) characterized by widely dispersed ownership and the insider systems (notably continental Europe and Japan) characterized by concentrated ownership or control (Maher and Andersson, 1999). Firm ownership is an increasingly influential form of corporate governance (Connelly et al., 2010).

When ownership is dispersed, shareholding control tends to be weak because of poor shareholder monitoring. Small shareholders are unlikely to be interested in monitoring because they would bear all the costs of monitoring hence share a small proportion of the benefits. Hence, no monitoring of managerial efforts would take place.

Marketing Ethics: Enhancing Firm Valuation and Building Competitive Advantages

Dr. Pankaj M. Madhani

Abstract

Marketing ethics plays a critical role in forming, maintaining and sustaining long-term customer relationships. An ethical marketing practice is a key factor of organization's success because it affects the organizations' capability to build strong relationships with customers, and accordingly, it is one of the organizational drivers enhancing Customer Lifetime Value (CLV). The CLV of a customer represents the amount the customer will contribute to the bottom line of the firm over the span of the business relationship with them. Ethical marketing are practices that emphasize transparent, trustworthy, and responsible personal and organizational marketing policies and actions that exhibit integrity as well as fairness to consumers and other stakeholders. The ethical reputation of the organization results in customer trust which in turn leads to satisfaction and commitment to the organization and hence builds competitive advantages. Research provides various marketing ethics frameworks and valuation matrix along with numerical illustrations to understand how marketing ethics help organizations in improving overall performance and ultimately firm valuation.

Ethics is a collection of principles of right conduct that shape the decisions people or organizations make. Ethics studies morality through the critical examination of right and wrong in human action. Morality refers to the customs, principles of conduct and moral codes of an individual, group or society. One way in which an organization influence ethics is by formally and explicitly defining *right* from *wrong*. Practicing ethics in marketing means applying standards of fairness, or moral rights and wrongs, to marketing decision making, behavior, and practice in the organization. The purpose of marketing ethics is to create a long term sustainable competitive advantage. Those organizations that develop this advantage are able to satisfy the needs of both customers and the organization. This focus has come about for two reasons. First, when an organization behaves ethically, customers develop more positive attitudes about the firm, its products, and its services. Second, when marketing practices depart from

Date Written: 2016

Abstract

Firms have to analyze, monitor and make improvements of their existing Supply Chain Management (SCM) processes in order to beat market competition and stay competitive. In this regard, the Six Sigma is a methodology that enables the firms to renew their existing SCM practices and guide them in making improvements. Six Sigma focuses on reducing variation, measuring defects and improving the quality of products, processes and services. Six Sigma-based SCM effectively manages typical disruption issues in supply chain as it ensures the delivery of the most appropriate product, in right time, in right place with the least cost to the customer. This paper develops an integrative framework and the business value-added framework and financial matrix to measure and evaluate the impact of Six Sigma on SCM. As identified and emphasized in this paper, efficiency and effectiveness drivers of SCM and accompanying business values generated by Six Sigma deployment in SCM positively influence an organization's overall business performance.

Application of Six Sigma in Supply Chain Management: Evaluation and Measurement Approach

Dr. Pankaj M. Madhani

1 Introduction

Six-Sigma is a logical, systematic and process focused approach to achieving continuous process improvements. This process improvement methodology for enhancing quality levels was developed by Motorola in 1986 for its high volume manufacturing environment in order to increase its competitiveness against Japanese companies. Six Sigma is a well-structured knowledge management approach that focuses on reducing variation, measuring defects, and improving the quality of products, processes and services. It is a highly disciplined process that helps organizations to calculate how well a process is performing and focus on developing and delivering near-perfect products and services.

The supply chain represents a process of delivering value to customers by creating and delivering products. Supply chains span from raw materials to manufacturing, distribution, transportation, warehousing, and product sales. Supply chain is the network of entities through which material and information flows. Those entities include suppliers, manufacturers, wholesaler, retailers and customers. In today's highly competitive environment, supply chain performance is very vital for the survival of firms because customers judge the performance of firms based on their supply chain performance.

Competition is no longer between firms but between entire supply chains. So, supply chain has become an important dimension for firms to give maximum attention in order to excel in a competitive environment. Hence, the importance of supply chain management (SCM), that is, the set of synchronized decisions and activities that effectively integrate suppliers, manufacturers, transporters, warehouses, retailers, and customers. It is a good idea to use Six Sigma in supply chain projects in order to improve supply chain measurement metrics as it helps organizations to capitalize on the potential synergy between Six Sigma and SCM. This paper works in this direction and provides various frameworks for Six Sigma deployment in supply chain along with a financial matrix.

2 Literature Review

There are diverse application of Six Sigma such as in manufacturing processes, automobile industry and services such as healthcare and retail. Kumar et al. (2007) presented a case on application of Six Sigma problem-solving methodology in manufacturing process to identify the parameters causing casting defects and to control these parameters. Krishna et al. (2008) presented a case study illustrating how a multinational Indian corporation was able to successfully implement Six Sigma principles to improve its manufacturing operations. Kumar et al. (2008) studied a case of implementation of the

Firm Size, Corporate Governance and Disclosure Practices: Inter-relations

Pankaj M. Madhani

Abstract

Corporate governance and disclosure practices of firms are influenced by various internal and external variables. Among these, firm characteristics such as size, age, leverage, origin and types of firms viz. public sector, private sector and foreign firms. also have major impact on disclosure practices of firms. As there is no much research from Indian context regarding impact of specific firm characteristics such as firm size on corporate governance and disclosure practices of firms, this study aims to contribute to the understanding of this relationship. This study focuses on corporate governance practices of sample firms listed in Bombay Stock Exchange (BSE). The sample comprises 9 sectors selected from S&P BSE sectoral indices to study impact of firm size (both in terms of fixed assets as well as gross sales) on corporate governance practices of firms. By analyzing the impact of firm size on corporate governance and disclosure practices of firms, this research identifies and tests the empirical evidence for such relationship.

The Impact of Legal and Regulatory Environment: A Study of Corporate Governance and Disclosure Practices of Firms Listed on Bombay Stock Exchange

The IUP Journal of Corporate Governance, Vol. XV, No. 2, April 2016, pp. 7-36

Posted: 18 Oct 2016

Pankaj Madhani (https://papers.ssrn.com/sol3/cf_dev/AbsByAuth.cfm?per_id=1906277)
The Icfai Business School (IBS), Ahmedabad

Date Written: October 7, 2016

Abstract

Governance depends on both country-level as well as firm-level mechanisms. The country-level governance mechanisms include a country's laws, its culture and norms, and the institutions that enforce the laws. Firm level or internal governance mechanisms are those that operate within the firm. Apart from firm-level governance mechanism, it is also important to study whether the institutional, legal and regulatory environments for shareholder protection rights and the corporate governance structure are complementary or substitute of each other. This research looks into the institutional, legal and regulatory environments of the US, UK, Luxembourg and India from the perspective of corporate governance and disclosure practices by studying a sample of 54 firms across various sectors listed on the Bombay Stock Exchange, India. The research seeks to empirically investigate whether they are significantly different for firms cross-listed in those countries. The research suggests that legal and regulatory environments for corporate governance and internal corporate governance are not substitutes. On the contrary, they are complementary because strong corporate governance at the country level reinforces the effectiveness of internal governance at the firm level, increasing the effect of internal corporate governance.

SIX SIGMA DEPLOYMENT IN SUPPLY CHAIN MANAGEMENT: ENHANCING COMPETITIVENESS

DR. PANKAJ M. MADHANI, Associate Dean and Professor (Finance & Strategy), ICFAI Business School (IBS), AHMEDABAD pmadhani@iit.edu

Introduction

Six-Sigma as a process improvement methodology for enhancing quality levels was developed by Motorola in 1986 for its high volume manufacturing environment in order to increase its competitiveness against Japanese companies. Six Sigma is a well structured knowledge management approach that focuses on reducing variation, measuring defects, and improving the quality of products, processes and services. It is a highly disciplined process that helps organizations to calculate how well a process is performing and focus on developing and delivering near-perfect products and services.

The supply chain represents a process of delivering value to customers by creating and delivering products. Supply chains span from raw materials to manufacturing, distribution, transportation, warehousing, and product sales. Supply chain is the network of entities through which material and information flows. Those entities include suppliers, manufacturers, wholesaler, retailers and customers. In today's highly competitive environment, supply chain performance is very vital for the survival of firms because customers judge the performance of firms based on their supply chain performance. So, supply chain has become an important dimension for firms to give maximum attention in order to excel in a competitive environment. Hence, the importance of supply chain management (SCM), that is, the set of synchronized decisions and activities that effectively integrate suppliers, manufacturers, transporters, warehouses, retailers, and customers. It is a good idea to use Six Sigma in supply chain projects in order to improve supply chain performance.

Six Sigma Concept and Its Applications : Sigma is a statistical term that measures how far a given process deviates from perfection. The name of the Six Sigma methodology is derived from the Greek alphabet symbol sigma (ó) utilized in statistics for standard deviation; a measure of the variability within a population around the mean, a measurement to quantify variation and process inconsistency (Pande et al., 2000). The central idea behind Six Sigma is that if organizations can measure how many "defects" they have in a process, they can systematically figure out how to eliminate them and get as close to "zero defects" as possible. The Six-Sigma quality level is equal to 3.4 defects per million opportunities (DPMO) and can be shown as 3.4 DPMO.

An "opportunity" is defined as any chance for nonconformance or not meeting the required specifications. This reduces waste and hence saves money whilst improving customer satisfaction.

The six-sigma method allows firms to reduce things to a common denominator - defects per unit and sigma and hence provides a common language and the ability to benchmark themselves against like products, processes and practices' (Harry, 1997). Most organizations produce at a level of two to three Sigma, meaning that between 66,807 and 308,537 defects occur with every one million opportunities; this means between 6.7% and 30.9% of everything produced contains a defect. A Sigma quality level offers an indicator of how often defects are likely to occur, whereby higher sigma quality levels indicate a process that is less likely to create defects as the quality level also increases accordingly (Table 1).

Table 1: Sigma Level: Defects Per Million Opportunities

Sr. No.	Sigma Level (Capability of Process)	Defects Per Million Opportunities (DPMO)	Yield (Error Free)
1	1	690,000	31%
2	1.5	500,000	50%
3	2	308,537	69.1%
4	3	66,807	93.3%
5	3.5	22,750	97.725%
6	4	6,210	99.38%
7	4.5	1,350	99.87%
8	5	230	99.977%
9	5.5	32	99.997%
10	6	3.4	99.9997%

In one Six Sigma project, Ford analysts measured inventory levels at one of their plants during production hours and found that levels varied by 20% over a month. They found that one of the major causes of inventory fluctuation was inefficient and inconsistent unloading of parts at the plant docks. Taking actions to improve

Competitiveness and Sustaining Performance: Integrating Sales and Marketing

Pankaj M. Madhani

Abstract

Sales and marketing integration is important in reducing inter-functional conflict, creating customer trust, satisfaction and improving overall performance of organization. Hence, there is need to integrate sales and marketing by enhancing collaboration between them. A lack of cooperation between sales and marketing has the potential to damage the overall success of the organization. Sales and marketing research should not only focus on analyzing factors that detract sales and marketing integration, but also to establish symbiotic relationship between sales and marketing and identify facilitators of such integration in terms of necessary resources and capabilities required by the organization.This research works in this direction, and provides in-depth insights for enhancing sales and marketing integration by identifying major issues in sales and marketing relationship; studying various facilitators of sales and marketing integration and then suggesting two-stage research framework of sales and marketing integration.

Keywords: *Sales; marketing; collaboration; integration; efficiency; effectiveness.*

Sales and marketing integration may be important in reducing inter-functional conflict, creating customer trust, satisfaction and improving overall performance. Hence, there is need to integrate sales and marketing by enhancing collaboration between them. Accordingly, every organization should improve the relationship between sales and marketing as their integration helps organizations to outperform competition; create added value as well as customer satisfaction.

The major objectives of this paper are firstly; to identify major issues in sales and marketing relationship; secondly; to study various drivers of sales and marketing integration, and thirdly; to suggest two-stage research framework of sales and marketing integration. First stage of framework introduces sales and marketing as a symbiotic and complementary process which combines the strengths of sales and marketing by shifting the focus to the customer; and second stage of framework demonstrates how such

Relationship between Ownership Types and Corporate Governance and Disclosure Practices of Firms Listed in Indian Stock Exchange

Pankaj M Madhani

Introduction

Corporate governance is the system by which firms are directed and controlled. The corporate governance structure specifies the distribution of rights and responsibilities among different stakeholders in the system, such as, the board, managers, shareholders and spells out the rules and procedures for making decisions on corporate affairs. Thus, corporate governance provides an ethical process as well as well defined structure through which the objectives of the firm, the means of attaining such objectives, and systems of monitoring performance are also set.

As such corporate governance is an institutional arrangement that not only addresses the agency problem between shareholders and managers of the firm, but also provides the context for the decisions taken by the top management of the firm. In this context, the fundamental objective of a corporate governance framework is to identify a basis for strategic co-operation between shareholders and managers of the firm such that the agency problem is reduced and a basis for decisions that promote the competitiveness of the firm is provided.

The corporate governance covers a wide range of measures. Researchers classify these measures into internal and external corporate governance mechanism. Corporate governance mechanisms can be considered as key factors explaining the level of disclosure by various firms. With internal corporate governance mechanisms, the types of ownership and structure of the firm, the board characteristics such as size and composition, the auditor and the major committees of the board acquire special significance. Within external corporate governance mechanisms, the external market and market competition play a significant role in improving corporate governance. The internal and external corporate governance mechanisms in turn are shaped by the overall legal and institutional environments of the country. This research emphasizes on study of corporate governance and disclosure practices of firms segregated according to types of ownership (private as well as public sector and foreign firms). Private sector and public sector firms are constituents of domestic firms while foreign firms are subsidiaries of Multinational Corporations (MNCs).

Private sector as well as public sector and foreign firms are diverse entities with different management philosophy, responsibility and structure. In relation to corporate governance and disclosure practices, in spite of the differences, there are corporate governance principles, such as accountability, transparency, and ethical business conduct, are equally applicable for these diverse entities. This research works in this direction and focuses on private as well as public sector and foreign firms across various sectors listed in Bombay Stock Exchange (BSE), to study their corporate governance and disclosure practices.

Madhani, P. M. (2016). "Relationship between Ownership Types and Corporate Governance and Disclosure Practices of Firms Listed in Indian Stock Exchange", *The IUP Journal of Corporate Governance, Vol. 15, No. 1, pp. 7- 29.*

Enhancing Competitiveness: Moving from Supply Chain to Demand Chain Management

Dr. Pankaj M. Madhani

Introduction

Supply chain involves all activities associated with the flow and transformation of goods as well as the related information flows from the raw material stage, through to the end user. Supply chain is defined as the integration of key business processes from customers through original suppliers that provide products, services, and information that adds value for end users and other stakeholders. Here, a supply chain includes all the value chain processes from suppliers to end customers. As such supply chain comprises all the supply processes necessary to fulfill customer demand and is managed within supply chain management (SCM). SCM can be defined as "the management of upstream and downstream relationships with suppliers and customers in order to create enhanced value in the final market place at less cost to the supply chain as a whole" (Christopher, 1998). Hence, SCM refers to all of the processes, technologies, and strategies that together form the basis for working with internal as well as external sources of supply.

As SCM focuses on the efficient matching of supply with demand it does not help the firm to find out what the customer perceives as valuable, and how this customer-perceived value can be translated into customer value propositions. Hence, supply chain efficiency by itself will not increase customer value and satisfaction as firms also require market orientation to enhance their market responsiveness capabilities. This research works in this direction and explains how firms build competitive advantages by moving from supply chain to demand chain management approach.

Moving from Supply Chain to Demand Chain Management

Globalization has resulted in greater competition, and implies that markets are becoming volatile and more fragmented, thereby generating further management challenges in supply chain. Even high-speed, low-cost supply chains are unable to respond to unexpected changes in demand or supply. It is imperative that each supply chain participant adds value from the perspective of the end customer in the supply chain. This assumes integration of both supply and demand side activities in the value chain (Jeong and Hong, 2007). SCM requires integration and coordination of business processes throughout the supply chain for the purpose of satisfying and responding to changes in the demands of ultimate customers.

In current era of intense rivalry, it is not enough to have efficient supply chains as they often become uncompetitive because they do not adapt to changes in the structures of markets. Supply chain efficiency is necessary, but it is not enough to ensure that firms will do better than their rivals (Lee, 2004). SCM focuses on the efficient matching of supply with demand but does not help the firm to find out what the customer perceives as valuable, and how this customer-perceived value can be translated into customer value propositions. Hence, SCM efficiency by itself will not increase customer value and satisfaction (Madhani, 2013a).

MP Taps and Fittings Enterprise*

CASELET, FINANCIAL MANAGEMENT

ET CASES - FLAME, 7 PAGES

AUTHOR(S) : DR. MANISHA SINGH, FACULTY MEMBER, IBS, BANGALORE

Case Preview Teaching Note Preview

Rs.200.00

Product code: FIN-2-0037, FIN-2-0037A

ABSTRACT

The caselet highlights the importance of applying the accounting concepts and conventions mandated by Institute of Chartered Accountants of India (ICAI) for preparation of final accounts by the business enterprises. It begins with a brief history about the formation of sole proprietorship business entity 'MP Taps and Fittings Enterprise' and then talks about various business activities and transactions during the year. Through this, the case tries to bring to the light the importance of recording the business transactions and treatment of the adjustment entries while preparing the financial statements. It also describes the various situations where the recording of business transaction would be done using different accounting concepts and conventions practiced by accountants in India as well as abroad.

Pedagogical Objectives

- To understand the application of accounting principles in recording of financial transactions
- To analyze the treatment of adjustment entries in the preparation of final accounts
- To understand the concept of Return On Investment (ROI) and its importance
- To discuss the concept of providing for future losses or cash requirements

Case Positioning and Setting

MBA program – Financial Accounting course – To discuss various issues pertaining to the treatment of business transactions, understand the applicability of accounting principles and preparation of final accounts

* FLAME INTERNATIONAL CASE CONFERENCE 2016

This Case Pack Includes:

- Abstract
- Caselet
*- Teaching Note (**ONLY for Academicians)*

Abstract

In this study, we investigate the impact of Odd-Even rationing of vehicles plying on the roads of the National Capital city of Delhi, India on air pollution levels by considering both residential and industrial areas of Punajbi Bagh, R.K. Puram, Anand Vihar, Mandir Marg, NSIT Dwarka and Shadipur of the city and have analyzed its impact by employing event study technique and by utilizing daily data of NO_2, SO_2, O_3, PM_{10} and $PM_{2.5}$. A ±15 day window has been considered for our analysis to assess the impact on air pollution levels pre-odd even rationing and post-odd even rationing and has statistically investigated whether this bold move by the State Government of Delhi has helped in the reduction of air pollution levels in the city or not. With the State Government considering implementing Odd-Even rationing permanently, the present study is intended to provide insights to policy makers to take an informed decision and also facilitate in implementing future policies for controlling air pollution levels in the city.

1. Introduction

Delhi, the National capital territory of India, has always been known world-wide for its rich historical sculptures, monuments and is now infamously known for its Air Pollution levels. World Health Organization [1] in their study in December 2014 found that 13 of the 20 most polluted cities of the world are from India and Delhi tops this infamous list by having six times more airborne particulate matter that are considered to be safe compared to normal level which is shocking, alarming and something which needs to be addressed immediately. The average $PM_{2.5}$ levels in Delhi for Dec-Jan 2015 was 226 which was recorded by the US embassy compared to Beijing's 95 for the same period implying that New Delhi's air quality is almost twice as bad as that of Beijing's air quality. According to WHO's air quality guidelines the safe levels for PM is 20 μg/m^3 (annual mean) for PM_{10} and that of $PM_{2.5}$ is 10 μg/m^3 (annual mean).

Consumers' Deal Proneness: A Demographic Approach

-- Surajit Ghosh Dastidar

Sales promotion (deal) is increasingly becoming a powerful tool for marketers at all stages of the product life cycle, from encouraging trial to inducing brand switching to maintain loyalty. However, for effective sales promotional campaigns, a company needs to understand why consumers respond to deals. The deals must appeal directly to the target audience and be perceived by them to add value. Demographic influences on consumer responses to products promoted through deals have been the focus of many early studies. However, results have been mixed and inconclusive. Moreover, no study is known in the Indian context. This study was carried out in terms of eight deal types across FMCG and durables, pertaining to four demographic characteristics, e.g., gender, age, income and education. Significant influence of demographics, though modest, has been found in many cases. The profiling of promotion-prone consumers is expected to enable marketers to design better promotional campaigns.

Understanding the Repatronage Intentions of Supermarket Customers: A Cluster Analysis

-- Grishma Padhye and B V Sangvikar

In the competitive retail scenario in India, supermarkets need to develop strategies for sustaining customer relationships. Retail literature has highlighted different attributes for store choice, which are determinants of store patronage. The attributes of supermarkets have been broadly categorized into product-related (variety, store brands, product quality), and market-related (shopping experience, fast checkout, reliability, helpful salespeople, and service). This study uses 18 attributes and derives three cluster solution of enthralled, casual, and apathetic supermarket customers using hierarchical and non-hierarchical cluster analysis. A chi-square test of independence reveals that the three clusters differ significantly with respect to age, working status, education, income, and distance traveled to the store. The enthralled customers comprise younger, working consumers with higher educational qualifications and higher incomes and traveling shorter distances to the supermarket. One-way ANOVA test shows that the three clusters vary significantly with respect to repatronage intentions. Enthralled customers show higher repatronage intentions than the casual customers, who in turn show higher repatronage intentions than apathetic customers. The findings offer crucial

Automated Teller Machines (ATMs): The Changing Face of Banking in India

Bank Management

Information and communication technology has changed the way in which banks provide services to its customers. These days the customers are able to perform their routine banking transactions without even entering the bank premises. ATM is one such development in recent years, which provides remote banking services all over the world, including India. This paper analyzes the development of this self-service banking in India based on the secondary data.

The Information and Communication Technology (ICT) is playing a very important role in the progress and advancement in almost all walks of life. The deregulated environment has provided an opportunity to restructure the means and methods of delivery of services in many areas, including the banking sector. The ICT has been a focused issue in the past two decades in Indian banking. In fact, ICTs are enabling the banks to change the way in which they are functioning. Improved customer service has become very important for the very survival and growth of banking sector in the reforms era. The technological advancements, deregulations, and intense competition due to the entry of private sector and foreign banks have altered the face of banking from one of mere intermediation to one of provider of quick, efficient and customer-friendly services. With the introduction and adoption of ICT in the banking sector, the customers are fast moving away from the traditional branch banking system to the convenient and comfort of virtual banking. The most important virtual banking services are phone banking, mobile banking, Internet banking and ATM banking. These electronic channels have enhanced the delivery of banking services accurately

managerial implications for designing and developing differentiated marketing strategies to enhance better ratings of attributes from customers and hence repatronage intentions.

Segmentation of Young Consumers of North-East India Based on Their Decision-Making Styles

-- Pradeep K Deka

The consumer decision-making process is a complex phenomenon. The decision to purchase goods and services is influenced by a number of factors, a few of which are internal to the customer, while a few others are external environmental factors. Depending on these factors, customers exhibit some unique characteristics in their decision-making styles. This study is an attempt to understand the decision-making style of young Indian consumers (specifically of North-East India) and then to identify segments of consumers based on their decision-making behaviors. The study is based on the well-accepted model of profiling consumer decision-making styles by Sproles and Kendall (1986), but also takes into consideration various other studies undertaken related to Indian consumers. This study checks the validity of the said model over a sample of 119 college-going youth from North-East India. The consumer decision-making styles were identified with the help of a structured questionnaire as suggested by consumer decision-making style inventory by Sproles and Kendall (1986). Eleven consumer decision-making styles were identified instead of the eight styles envisioned by the original model. A simple comparison is also done of the outcomes of various studies related to the said model.

End of the Road for Maruti 800: A Case Study

-- B Shafiulla

Maruti 800 has revolutionized Indian auto industry in the last 30 years. Maruti 800 is widely regarded as the most influential automobile in India; about 2.87 million Maruti 800 were manufactured during its course, of which 2.66 million were sold in India. The name "Maruti" was synonymous with Maruti 800 during the 1980s and the 1990s. It remained the bestselling car in India until 2004 when Maruti Alto took the coveted title. In April 2010, Maruti halted the sales of the car in 13 major cities —the four metros and nine other cities including Kanpur, Bengaluru, Hyderabad, Pune, Ahmedabad, Agra and Surat, where the law made it mandatory for the vehicles sold to be Euro IV-compliant. According to the Executive Director MSIL, the car production stopped in January 18, 2014, but spare parts would be available for customers for the next 8-10 years as per company policy.

and efficiently to the customers. The ATMs are an important part of a bank's alternative channel to reach the customers, to showcase products and services and to create brand awareness. This is reflected in the increase in the number of ATMs all over the world. ATM is one of the most widely used remote banking services all over the world, including India. This paper analyzes the growth of ATMs of different bank groups in India.

International Scenario

If ATMs are largely available over geographically dispersed areas, the benefit from using an ATM will increase as customers will be able to access their bank accounts from any geographic location. This would imply that the value of an ATM network increases with the number of available ATM locations, and the value of a bank network to a customer will be determined in part by the final network size of the banking system. The statistical information on the growth of branches and ATM network in select countries.

Indian Scenario

The financial services industry in India has witnessed a phenomenal growth, diversification and specialization since the initiation of financial sector reforms in 1991. Greater customer orientation is the only way to retain customer loyalty and withstand competition in the liberalized world. In a market-driven strategy of development, customer preference is of paramount importance in any economy. Gone are the days when customers used to come to the doorsteps of banks. Now the banks are required to chase the customers; only those banks which are customercentric and extremely focused on the needs of their clients can succeed in their business today.

Optimal Mix of Financial and Nonfinancial Rewards: Enhancing Sales Performance

Pankaj M. Madhani , Associate Dean and Professor,
ICFAI Business School

INTRODUCTION

A salesforce represents a significant investment because it is a large percentage of total costs for most sales organizations. As boundary spanners, salespeople link the organization to its customers and generate revenue. Given the important role salespeople play in building competitive advantages for an organization, motivation of the salesforce is widely recognized as an essential component of a rewards strategy. An effective rewards strategy has the goal of attracting, motivating and retaining qualified sales employees as well as enhancing their performance.

An organization needs to determine what its salesforce wants and provide it through proper design of rewards plans in a way that is proactive and specific as well as economic and effective.

Rewards optimization not only reduces employee turnover but also enhances performance of retained employees as it takes into consideration the needs of the sales employees, the characteristics of their territories and the requirements of the organization. This research provides an approach to a salesperson's profitability index (SPI) that can predict future sales performance and link that performance to the rewards practices of sales organizations. After determining the future value of various groups, a sales organization may correlate data on each segment's prior rewards structure with the SPI to develop a picture of how such factors influence performance of sales employees. Because of this, SPI can be used across various segments and can be correlated with types of rewards practices. Based on this relationship, sales organizations can identify specific rewards needs to enhance sales performance.

Financial Versus Nonfinancial Rewards: Key Features

An effective rewards design influences the behavior of sales employees and leads to a positive sales outcome. Financial rewards are associated with a lower level of internalization and thus undermine intrinsic motivation and clearly influence extrinsic motivation. Motivation is not constant as it varies with age, education, experience, aspirations, background and position in an organization. Thus, organizations try to cater to individual preferences to align employees' efforts with the business objectives and enhance motivation level of their employees. Hence, sales organizations incorporate non-financial rewards in rewards design to motivate salespeople to perform better as not every employee is motivated by financial rewards. Such designs are customized to fit individual selling roles, different selling strategies and unique requirement of different sales territories.

A Salesperson's Future Value- and Training Needs: A Model-Driven Approach

Pankaj M. Madhani, Ph.D.
ICFAI Business School

Businesses spend a massive amount on salesforce training. The American Society for Training and Development (ASTD) estimates that businesses in the United States spend $15 billion annually on sales and sales management training, which amounts to about $2,000 per salesperson (Salopek 2009). In technical markets, the costs associated with the development of a single salesperson can exceed $100,000 (Johnston and Marshall 2006). The large amounts spent on training reinforces the idea that it remains critically important for organizations to enhance the performance of sales employees.

However, in the current environment of tough competition and economic uncertainty, there is a growing recognition that enhancing salesforce productivity is not simply a matter of hiring, firing and deploying the right number and types of individuals. Success is also dependent on finding ways to help existing salespeople sell more. Narrowing the gap between the top 15% or 20% and the rest of the salesforce can lead to productivity jumps of more than 200% (Ledingham, Kovac, and Simon 2006).

Customer-focused Supply Chain Strategy: Developing Business Value Added Framework

Pankaj M. Madhani
pmadhani@iit.edu

Associate Dean & Professor
ICFAI Business School (IBS)

Introduction

In the context of globalization, shortening product lifecycles, and changing customer preferences, the management of supply chains has become increasingly complex. Supply chain covers all movement and storage of materials and goods including inventory of raw materials as well as work-in-process, and finished goods from point of origin to point of consumption. Any initiatives to improve supply chain performance attempt to match supply and demand, thus simultaneously driving down costs and improving customer satisfaction. Customers are crucial to any business as without customers, there is no sales; without sales, there is no revenue and profits. Hence, there is lot of attention on 'customer-focus'.

With competition now at the supply chain level (Craighead *et al.,* 2007), competitive advantage comes from the ability of supply chain partners to co-ordinate and integrate strategies aimed at satisfying the ultimate customers of the supply chain at a relatively low total cost (Cohen and Roussel, 2005). Customer-focused supply chain strategy provides an approach to respond to these challenges and hence they are most likely to prosper within today's competitive global landscape. Customer-focused supply chain strategy strives to match supply and demand, thereby driving down costs simultaneously with improving customer satisfaction. In short, customer-focused supply chain strategy maximizes value to the ultimate customers of the supply chain in terms of both satisfaction with the product and/or services and a relatively low total cost of the product and/or service.

This research works in this direction to underscore significance of customer-focused supply chain strategy. It also provides supporting matrix to emphasize its various attributes; develops 4Rs framework for building customer-focused supply chain strategy and formulate business value added framework to emphasize benefits in terms of improved firm performance.

Literature Review

A supply chain is an interconnected set of relationships from customer to supplier, through a number of intermediate stages such as sourcing, manufacturing, and warehousing and distribution and it is a network of companies which influence each other (Agarwal and Shankar 2002). The 'supply chain' is a process that describes the flow of goods from the production of a product right through to the final sale to the end consumer (Bruce *et al.,* 2004).

Madhani, P. M. (2017). "Customer-Focused Supply Chain Strategy: Developing Business Value-Added Framework", *The ICFAI Journal of Supply Chain Management*, Vol. 14, No. 4, pp. 7-22.

Available at https://ssrn.com/abstract=3107755

LEVERAGING IT: BUILDING A CUSTOMER -FOCUSED SUPPLY CHAIN STRATEGY

DR. PANKAJ M. MADHANI, ASSOCIATE DEAN AND PROFESSOR
ICFAI BUSINESS SCHOOL (IBS)
pmadhani@hawk.iit.edu, pmadhani@iit.edu

Introduction : A supply chain is an interconnected set of relationships from customer to supplier, through a number of intermediate stages such as sourcing, manufacturing, and warehousing and distribution and it is a network of companies which influence each other. The 'supply chain' is a process that describes the flow of goods from the production of a product right through to the final sale to the end consumer (Bruce et al., 2004). Supply chain management (SCM) can be used to describe various concepts – the processes within a manufacturing firm; purchasing and supply management relationships; the total chain; as well as a total network.

Supply chain strategy of the firm refers to the strategic goals and objectives of its supply chain and requires an end-to-end focus on integration of business processes throughout the value chain for the purpose of providing optimum value to the end-customer (Green et al., 2008). As supply chain strategy is part of the overall business strategy, organizations should understand customers' needs, and to choose and implement the appropriate supply chain strategy to satisfy customer demands (Dubey et al., 2017).

Implementing an effective supply chain strategy is an important issue in enhancing customer satisfaction. Various actors in supply chains need to be able to recognize changes in the environment and utilize opportunities that evolve to meet changing customer demands. Proper implementation of supply chain strategy improves the performance of the supply chain. Information Technology (IT) in SCM provides a reduction in cycle time, a reduction of inventory, a minimization of the bullwhip effect, improvement in the effectiveness of distribution channels and ultimately helps in building responsiveness, resilience, reliability, and realignment required for building customer-focused supply chain strategy.

Customer-focused Supply Chain Strategy : In today's competitive business environment, customer satisfaction is an increasingly important component of an effective organization and hence every organization aims to become more sensitive and responsive to the changing needs of customers, i.e. "customer focused". Customer-focused supply chain strategy strives to match supply and demand, thereby driving costs down simultaneously with improving customer satisfaction. In short, customer-focused supply chain strategy maximizes value to the ultimate customers of the supply chain in terms of both satisfaction with the product and/or services and a relatively low total cost of the product and/or service. Table 1, below shows major differences between traditional supply chains and customer-focused supply chains according to competitive priorities.

Table 1: Traditional Supply Chains versus Customer-focused Supply Chains

Sr. No.	Competitive Priorities	Traditional Supply Chains	Customer-focused Supply Chains
1	*Responsive*	Modest ability to respond to changes	Strong ability to be proactive as well as responsive to changes
2	*Resilient*	Often limited to single chains or a large number of chains	Maintain a limited set of multiple chains to ensure distribution
3	*Reliable*	Focus on cost-efficiency	Focus on reliable and cost efficient supply chains
4	*Realigned*	Participants forced to choose between own and chain's interests	Interests of participants coincide (or is developed to be synergistic)

(Source: Madhani, 2017)

Competitive Priorities: Responsiveness, Reliability, Resiliency and Realignment : The competitive priorities of responsiveness, reliability, resiliency and realignment for a typical supply chain are explained below:

Responsiveness : Responsiveness in supply chain is the equivalent of agile and agile means capable of coping with wide changes in demand. Agility is the ability to respond to short-term changes in demand or supply quickly and handle unexpected external disruptions smoothly and cost-efficiently. Agility in a supply chain is the ability of the supply chain as a whole, and its members, to rapidly align the network and its operations to dynamic and turbulent requirements of the customers. Supply chain agility is the capability of the supply chain to respond quickly and effectively to market changes and accordingly adjust tactics and operations within its supply chain to respond to environmental changes, opportunities, and threats. Supply chain agility can also positively affect operational performance as it enables firms to meet delivery deadlines and to ensure dependability and accuracy of a service.

Resilience : Resilient supply chains are more capable of coping with the uncertain external environment i.e. they are more adaptable. Resilience means the capacity to anticipate unsafe and unexpected events for organizational survival in the face of threats, including the prevention or mitigation of failures in the systems. Adaptive supply chains or supply networks are those that are flexible enough to meet the uncertainty of changing customer demands and accordingly restructure the supply chain in response to changing markets and economic environments.

Reliability : Today's business scenario is characterized by higher levels of turbulence, volatility, unexpected shocks and discontinuities and reflects many uncertainties causing risks. Consequently, supply chains are vulnerable to disruption and, in consequence, the risk to business is increased. Hence, increasing reliability

Salesperson's True Potential vs. Salespersons Profitability Index

Pankaj M. Madhani

Abstract

Typically sales organizations measure only past sales performance and hence rely on historical metric. Sales people who brought in the most sales were considered 'stars'. However, such direct measure was neither an accurate gauge of a sales person's present worth nor a good indicator of his or her potential. By developing a forward looking approach to forecast a salesperson's future value and linking sales performance with the types of training and incentives each salesperson has received, it is possible to optimize salesforce investments, boost revenue and profit and derive greater business value. Salesperson's profitability index (SPI) developed in this paper provides basis for internal benchmarking and helps sales organizations in measuring future value of salesperson. SPI is dependent on future value of sales people and salesforce investment. This research provides insights on how sales organization can incorporate SPI metric in salesforce investment and performance management to boost salesforce productivity and enhance competitive advantages.

The salesforce represents a significant investment as it is a large percentage of total costs for most sales organizations. Each year businesses across the globe spend a massive amount on salesforce investment. U.S. businesses spend a whopping $800 billion annually on salesforce compensation and another $15 billion on sales training (Kumar *et al.*, 2015). Nevertheless sales organizations currently rely on backward-looking metrics to gauge the impact of these spendings.

Sales organizations have used many subjective and objective measures to gauge sales performance. In subjective measures, sales organizations focus on how hard sales people have worked in terms of the overall amount of efforts or time that sales people devote trying to achieve sales goals. While in objective measures, sales organizations monitor and reward their sales people with sales revenue or output measure. Such output based measures of performance are simple and easy to implement, but ad-hoc rather than

Logistics and Marketing Integration: Enhancing Competitive Advantages

Pankaj M. Madhani

Introduction

Success of a business as well as delivery of higher customer service is largely dependent on achieving an effective coordination and integration among individual units of the organization. Researchers have long recognized the importance of customer service in achieving customer satisfaction. The interface between logistics and marketing is critical to the delivery of customer service. However, achieving outstanding customer service levels is complex and challenging because it involves inter functional co-ordination, especially between the logistics and marketing functions. Without the successful link of logistics and marketing, the firm may be unable to provide good customer services and meet customer expectations, resulting in a dissatisfied customer or a lost sale. In fact, organizations often succeed or fail depending on their levels of customer service.

Logistics and marketing are usually concerned with satisfying the customers' needs and wants, respectively through their supply and demand functions in a marketing channel. The logistics activity may be dependent on a marketing activity in a marketing channel, and vice versa. The malfunctioning of one activity may severely impact the functioning of other activities. Therefore, the satisfaction of supply and the satisfaction of demand of customers' needs and wants have to be coordinated and synchronized in order to achieve customer value proposition. This research works in this direction and provides various frameworks for integrating logistics and marketing.

Literature Review

Logistics operations are responsible for the efficient and effective handling of a firm's goods and services with the ultimate aim to minimize costs, to improve customer service and to create a competitive advantage (Christopher, 2006).The efficient and effective logistics management is major component for organizational success. An important functional area in logistics is warehousing management. Warehousing can be a highly costly and labor-intensive function (Murphy and Poist, 1993).

Logistics interacts with a number of different areas within an organization, such as operations (production), marketing, procurement, and human resource management (Coyle et al., 1992) with the most common interface being with marketing (Schary, 1984).Although marketing was originally considered as including activities related to demand creation (personal selling, advertising, sales promotion) and demand supply (physical distribution), it has evolved to focus primarily on demand creation. Hence, logistics has emerged as a discipline to address the demand supply activities inherent in the physical distribution functions to fulfill the demand (Lambert and Cook, 1990).Warehousing and distribution are critical to the successful marketing of products: if the product is not where customers want it, when they want it, it is unlikely to sell (Lawrence, 1998).The typical interface between the logistics and marketing is in the area of customer service (Sharma et al., 1995).

Leagile Supply Chain Strategy: Benefits of Both Lean and Agile Approach

Materials Management Review, Vol. 13, No. 9, pp. 9-11, (2017)

7 Pages

IBS Hyderabad, ICFAI Foundation for Higher Education (IFHE) University, Hyderabad

Abstract

Supply chain strategies with traditional strategies do worse compared to those having a strategy focused on either lean, agile or a combination of lean/agile strategies. Though lean and agile strategies are often pitted as opposing paradigms, they share a common objective; meeting customer demands at the least total cost. As time has now become a vital factor in competitiveness due to customers becoming increasingly reluctant to accept long lead-times for products and services, the significance of speed and responsiveness in today's industry settings have blurred the boundaries of related concepts, such as agility and lean thinking and evolved concepts of legality. Leagile is a better supply chain strategy than lean or agile alone. Leagile supply chain strategies have led to a revolution in the way the firms manage their supplies as these concepts, have made business competitive and more profitable.

Leagile Supply Chain Strategy: Benefits of both Lean and Agile Approach

Dr. Pankaj M. Madhani
Associate Dean and Professor
ICFAI Business School (IBS)

Introduction

Supply chain strategy is a tool to control the supply, transportation, production and distribution of products to the end customers. Lean supply chain strategy is suited for competitive markets within sufficient assets while agile strategy, on the other hand, is a response to volatile markets. Lean supply chains are synonymous with commodity-type products aiming to reduce waste, maximize utilization and driving continuous improvement. In contrast, agile principles are applied when the supply chain needs to respond rapidly to fluctuating demands, ensure premium quality and/or deal with products that have short life spans (Madhani, 2017b). There are some instances where there is an economic justification for designing a `Leagile' supply chain (hybrids of the lean and agile approaches), thereby getting the best of both worlds. This research works in this direction and identifies various configurations of leagile strategies to extract benefits of both lean and agile supply chain strategies.

Leagile Supply Chain Strategy: Mix of the Lean and Agile Approaches

Supply chain strategies can be classified as the ones that emphasize cost reduction (i.e. lean strategy), quick response (i.e. agile strategy) or a mix of both of them (leagile strategy) (Sharma and Kulkarni, 2016). In a leagile supply chain, lean material flow is upstream of agile material flow. It is called leagile approach as agile process is fully documented and understood by initially engineering a lean process and then adapting it by removing specific constraints and capacity limitations, thus enabling agility (Mason-Jones *et al.,* 2000a). It is possible to reap the benefits of both lean and agile concepts and they both can co-exist. According to study of Naylor *et al.,* (1999), lean and agile, supply chain strategies are not mutually exclusive. There are several examples that show the need to develop hybrid strategies comprising benefits of both lean and agile supply chain strategies (Christopher and Towill, 2000).

Illustration

Toyota – the very company regarded as the pioneer of 'lean concept' also demonstrated fruitful example of leagility. Scion, a splinter division of Toyota, is dedicated to serving a distinct segment of today's automotive market: the 18-25 year-old 'Generation Y' segment. The base vehicles are produced in a lean manner in Japan and shipped to the U.S. Toyota caters to this market through marketing mechanisms that avoid the mainstream media, choosing instead to sponsor local sporting events, concerts, and enthusiast clubs (Oser, 2004). Here major emphasis is on individuality when selecting and owning a car. After logging on to Scion's website, Toyota encourages visitors to modify one of the three base Scion models (the xA, xB, and tC), saying, "Build your Scion: We relinquish the power to you."

Six Sigma Deployment in HR: Enhancing Competitiveness

Pankaj M. Madhani

Abstract

Six Sigma is a disciplined, quality approach and philosophy for eliminating defects in any process – from manufacturing to transactional and from product to service. Six Sigma is flexible enough to be applied to different challenges throughout business and organizations can use it in diverse areas such as HR. Six Sigma deployment in HR helps in its reengineering by increasing the speed, quality and efficiency of HR services. Six Sigma deployment in HR is important for overall performance and growth of business. This research provides HR process improvement steps in terms of efficiency and effectiveness, develops various frameworks for its successful implementation and document benefits of Six Sigma deployment in HR with various case studies.

Key words : *HR, Six Sigma, TQM, HRM practices, DMAIC, Competitive advantages*

Dr. Pankaj M. Madhani

IBS House, Opp. AUDA Lake
Science City Road, Off. S.G. Road,
Ahmedabad – 380 060, India,
pmadhani@iit.edu

In this highly competitive environment every functional areas of an organization needs to perform better, faster and cheaper, to keep the company ahead of the competition. In this context, human resource (HR) function is no exception as more cost effective and streamlined HR processes will create value for the organization, instead of just being a support function for the management. By aligning HR processes and scientifically building human capital, HR can contribute significantly to the organization's effectiveness and competitiveness (Becker and Huselid, 1998). Effective and efficient HR practices will streamline efforts of various functional departments in the organizations and thus increase the overall customer value. Six Sigma is well suited to contribute to and support these efforts of the organizations due to its focus on problem identification, process improvement, and its emphasis on the customer. Six Sigma aims to reduce variation in manufacturing and business processes and was adopted by a large number of companies in the 'Fortune 500' list with a view to make measurable improvements and savings based on evidence.

Six Sigma is a data-driven improvement methodology that emphasizes defect prevention over defect detection by

Supply Chain Strategy Selection: A Multi-Criteria Decision-Making Approach

Dr. Pankaj M. Madhani
Associate Dean and Professor
ICFAI Business School (IBS)

Introduction

Supply chain covers all movement and storage of materials and goods including inventory of raw materials as well as work-in-process, and finished goods from point of origin to point of consumption. Any initiatives to improve supply chain performance attempt to match supply and demand, thus simultaneously driving down costs and improving customer satisfaction. However, such initiatives require uncertainty within the supply chain to be reduced as much as feasible so as to facilitate a more predictable upstream demand. At times it is not possible to remove uncertainty from the supply chain due to the nature of product involved. If a product is innovative and having very short product life cycle (PLC), then by its very nature, its demand will be unpredictable. Hence, specific supply chains are faced with the situation where they have to accept uncertainty but need to develop a strategy that enables them still to match supply and demand. Hence, this research works in this direction and identifies various strategies to match demand and supply efficiently and effectively.

Supply Chain and Management and Strategy: Key Concepts

The 'supply chain' is a process that describes the flow of goods from the production of a product right through to the final sale to the end consumer (Bruce *et al.*, 2004). According to Harland (1997) the term supply chain management (SCM) can be used to describe a number of concepts – the processes inside a manufacturing organization; purchasing and supply management occurring within dyadic relationships; the total chain; and finally a total firm network.

SCM is defined as plans to be conducted repeatedly to satisfy the necessities of the final customer (Seferlis and Giannelos, 2004). SCM is an integration of all activities associated with the flow of goods, starting from raw material to the final product reaching the customer. SCM can improve the performance of the firm by integrating key business processes from end users through suppliers and vendors by providing products, services and information that add value to customers (Othman and Ghani, 2008). The basic premise of SCM is that the performance of a firm depends more and more on its ability to maintain effective and efficient relationships with its suppliers and customers (Chen and Paulraj, 2004). SCM emphasizes how to maximize the overall value of the firm by better deploying and using of resources across the whole of the firm (Sukati *et al.*, 2012). Today, firms view SCM as a strategic tool to increase their competitive advantage. This strategic view is encapsulated in the concept of the "supply chain strategy" (Qrunfleh and Tarafdar, 2013).

Madhani, P. M. (2017), "Supply Chain Strategy Selection: A Multi-Criteria Decision-Making Approach", *The IUP Journal of Supply Chain Management*, Vol. 14, No. 2, pp. 38-56.

Six Sigma Deployment in Sales and Marketing: Enhancing Competitive Advantages

Pankaj M Madhani
Associate Dean and Professor
ICFAI Business School (IBS)

1.0 Introduction

Organizations face constant competition to attract and retain customers, hence, revenue and profitability of some of the organizations' are at risk. One method of reducing this risk is to increase the customer satisfaction and overall customer value by streamlining sales and marketing efforts. Six Sigma is well suited to contribute to and support these efforts of sales and marketing due to its focus on problem identification, process improvement, and its emphasis on the customer. Organizations can use Six Sigma in the reengineering of sales and marketing operations to increase customer satisfaction by increasing the speed, quality and efficiency of its services.

Six Sigma deployment in sales and marketing will depend on its ability to change and adapt to the organizational needs as sales and marketing require a disciplined and strategic approach for value creation and market-share growth. Six Sigma approach helps sales and marketing in increasing market share and top line revenue in targeted product/markets by providing superior value. These are external objectives as opposed to the internal objectives of defect reduction and cost cutting for Six Sigma deployment in production and operation. In short, Six Sigma is a disciplined, data-driven approach and methodology for eliminating defects in any process – from manufacturing to transactional and from product to service.

2.0 Literature Review

Six Sigma is a business improvement program that targets process variation. Traditionally Six-Sigma has been used in the manufacturing for reducing defects. Krishna et al., (2008) studied a case study illustrating how a multinational Indian corporation was able to successfully implement Six Sigma principles to improve its manufacturing operations. Six Sigma problem-solving methodologies in manufacturing process was studied by Kumar et al., (2007) to identify the parameters causing casting defects and to control these parameters.

Six Sigma is not only for manufacturing, but any process where an opportunity exists for error and hence can be used in diverse business areas to improve on time delivery; reduce cycle time for hiring and training new employees; improve sales forecasting ability; and improve quality of customer service (Mehrjerdi, 2013). Kumar et al. (2008b) presented a case of implementation of the Six Sigma approach for improvement in service system by a major consumer electronics and appliance retailing company in the USA.

Diverse Roles of Corporate Board: A Review of Various Corporate Governance Theories

*Pankaj M Madhani**

The board of directors (i.e., board) has generally been perceived as the backbone of corporate governance. Board is one of the most important internal corporate governance mechanisms used by the shareholders to monitor management. Board has diverse functions and roles such as control role, strategic role, service or resource provision role and advice and counsel role. There are many theories of corporate governance to explain such diverse roles of corporate boards. Any single corporate governance theory cannot fully explain the complexity and heterogeneity of the board functions in a corporate business. Hence, this research study reviews some of the corporate governance theories with a view to understanding how board functions and how board compositions are related to firm performance. This study looks at four main theories, namely, agency theory, stewardship theory, resource dependency theory, and resource-based view theory, that have influenced corporate governance development related to board functions.

Introduction

Corporate governance has predominantly focused on the relationship between the management of firm and the board of directors (board), particularly on separating these two functions for effective professional management. It is mainly because, the board members usually may not get enough time and the management of the firm has to manage the day-to-day affairs. So, the role of board as a driver of corporate governance becomes even more pertinent. Corporate governance is constantly changing and evolving and changes are driven by both internal as well as external environmental dynamics. There are many theories of corporate governance to explain the diverse roles of corporate boards. Effective and good corporate governance cannot be explained by one theory. Hence, it is best to use multiple corporate governance theories. Any single corporate governance theory cannot fully explain the complexity and heterogeneity of the board functions in a corporate business. So, it is important to re-visit various corporate governance approaches in the light of the diverse nature of these theories with a fresh angle. This research describes the various roles of corporate board from agency theory, stewardship theory, resource dependency theory and Resource-Based View (RBV) perspectives.

Literature Review

Corporate governance is defined as the organizational controls that govern the behavior of managers and define their discretionary powers (Charreaux, 1997). Corporate governance can also be more narrowly defined as the instruments that are in place to guarantee the maximum rate of return on investment to the shareholders and creditors of the company (Shleifer and Vishny, 1997). The broader objectives of corporate governance are: to protect the interests of shareholders and various other stakeholders including customers, suppliers, employees and society at large, to ensure full transparency and integrity in communication and to make available complete, accurate and clear disclosure to all concerned.

A good system of corporate governance will facilitate the resolution of corporate conflicts between minority and controlling shareholders, executives and shareholders, and between shareholders and stakeholders. Corporate governance typically protects investor from managers who instigate self-deal, theft of corporate assets as well as corruption (Dalton and Daily, 1999). Corporate governance stands for responsible business management geared towards long-term value creation. Good corporate governance is a key driver of sustainable corporate growth and long-term competitive advantage (Madhani, 2007). Good governance means little expropriation of corporate resources, which contributes to better allocation of resources and better performance (Madhani, 2014).

The outcome of a good corporate governance practice is an accountable board of directors who ensures that the investors' interests are not jeopardized. Board of directors is one of the most important internal corporate governance mechanisms used by the shareholders to monitor management. Perry and Shivdasani (2005) state that, "charged with hiring, evaluating, compensating and ongoing monitoring of the management, the board of directors is the shareholder's primary mechanism for oversight of managers". The board of directors has generally been perceived as the backbone of corporate governance as board contributes to alleviating agency costs to the firm by monitoring and rewarding top executives to ensure wealth maximization for the shareholders. McNulty and Pettigrew (1996) identified the various roles of board directors in terms of three main perspectives: a governance perspective (the monitoring function of the board), a strategic perspective (decisions enabling the firm to change), and the resource perspective (how the board links the firm to its external environment and enables it to acquire critical resources). Any board effect on firm performance will be highly dependent on context-specific situations such as stage of organizational life cycle (Johnson, 1997), industry homogeneity and regulation (Palia, 2000), competitive conditions (Carpenter and Westphal, 2001), technology changes (Castanias and Helfat, 2001) and general industry conditions (Finkelstein and Hambrick, 1996).

Boards have an oversight role and as such it oversees strategy and monitors the managerial decisions of the top management team (Harrison, 1987; Johnson *et al.*, 1993 and1996; and Withers and Hillman, 2008). Research also states that boards serve critical functions in firms, such as monitoring management on behalf of shareholders and providing valuable resources to firms, including advice, expertise, connections to environmental contingencies, and legitimacy (Hillman and Dalziel, 2003). Board (board of directors) members may have

Lean versus Agile Supply Chain Strategy: Key Decision Criteria

Dr. Pankaj M. Madhani
Associate Dean and Professor
ICFAI Business School (IBS)

Introduction

Supply chain management (SCM) can be used to describe a number of concepts – the processes inside a manufacturing organization; purchasing and supply management occurring within dyadic relationships; the total chain; and finally a total firm network. Hence, it is an integration of all activities associated with the flow of goods, starting from raw material to the final product reaching the customer. Supply chain performance improvement initiatives strive to match supply and demand, thereby driving down costs simultaneously with improving customer satisfaction. This invariably requires uncertainty within the supply chain to be reduced as much as practicable so as to facilitate a more predictable upstream demand. Sometimes, however, uncertainty is impossible to remove from the supply chain due to the type of product involved. Thus, specific supply chains are faced with the situation where they have to accept uncertainty but need to develop a strategy that enables them still to match supply and demand. This research works in this direction and identifies various strategies to match demand and supply efficiently and effectively.

Supply Chain Management and Strategy: Key Concepts

SCM can improve the performance of the firm by integrating key business processes from end users through suppliers and vendors by providing products, services and information that add value to customers (Othman and Ghani, 2008). SCM emphasizes how to maximize the overall value of the firm by better deploying and using of resources across the whole of the firm. Today, firms view SCM as a strategic tool to increase their competitive advantage. This strategic view is encapsulated in the concept of the "supply chain strategy" (Qrunfleh and Tarafdar, 2013).

Supply chain strategy is defined as a set of approaches utilized to integrate suppliers, manufacturing, warehouses, and stores so that merchandise is produced and distributed at the right quantities, to the right location, at the right time, in order to minimize system-wide costs while satisfying service level requirements (Simchi-Levi *et al.,* 2008). Therefore, supply chain strategy of the firm refers to the strategic goals and objectives of its supply chain and requires an end-to-end focus on integration of business processes throughout the value chain for the purpose of providing optimum value to the end-customer (Green *et al.,* 2008).

As the modern business environment becomes almost borderless, there is advent of cutting-edge supply chain strategies. When developing a supply chain strategy that will facilitate matching supply and demand, the relationship between product type, supply chain and sales predictability is pivotal to ensuring that the optimal approach is adopted. Implementing an effective supply chain strategy is an important issue in today's competitive markets. Proper implementation of supply chain strategy improves the performance of the supply chain (Gunasekaran *et al.,* 2004).

This study investigates the factors influencing the Chinese manufacturing industry's innovation and industrial performance utilizing a panel data approach on a sample of Chinese manufacturing enterprises over the period of 2008–2013. The industries were grouped according to related sectors into five groups, a general group was also created which included the whole data sample. The study found that research and development (R&D) expenditure positively influenced the growth of product innovation and industrial performance, but not necessarily knowledge innovation and export performance. Also, expenditure on new product development had a positive impact on both innovation and industrial performance. The growth of patent application was discovered to be influenced by an R&D project and foreign patent license. Finally, the number of enterprises and firm size (i.e. number of employees) contributed positively to the industrial output performance. The findings suggest that industrial R&D and new product development influences the success of product innovation and sales performance. The study recommends that the government should set up policies that will stimulate industrial R&D, while supporting technology transfers from foreign partners. Most importantly, government policies on the development of the industry should be addressed on a sectorial level and not a "one-size-fit-all" type of policy.

Keywords: China manufacturing industry; innovation; industrial performance; R&D; patent.

AGILE, ADAPTABLE, AND ALIGNED SUPPLY CHAIN: ENHANCING COMPETITIVE ADVANTAGES

DR. PANKAJ M. MADHANI
ASSOCIATE DEAN AND PROFESSOR, ICFAI BUSINESS SCHOOL (IBS)
pmadhani@iit.edu

Introduction : In the twenty-first-century as strategies and structures of the organizations are changing to cope up with increased competitive pressure and fast changing customer demand, it is imperative to study how those changes are manifest in their supply chains. Based on extensive study of more than 60 leading companies that focused on building and rebuilding supply chains, Lee (2004) found top-performing companies have the ability to develop supply chains that are agile, adaptable, and aligned (Triple-A). To achieve sustainable competitive advantage, organizations need supply chain having all three of these qualities. Wal-Mart, Amazon and Dell Computer have their supply chains not just fast and cost-effective but they are also agile, adaptable and aligned. Such Triple-A supply chains should generate superior supply chain performance which, in turn, leads to better organizational performance. The most successful companies work within supply chains that rapidly respond to short-term changes in immediate and ultimate customer' demands (agility), adjust to long-term changes in economies and markets by restructuring the supply chain (adaptability), and integrating business processes resulting in an equitable sharing of risks, costs, and rewards with all supply chain partners (alignment).

Triple-A Supply Chain: Enhancing Competitive Advantages : Great supply chains possess three very different qualities. First, top-performing supply chains are agile. They react speedily to sudden changes in demand or supply. Second, they adapt over time as market structures and strategies evolve. Third, they align the interests of all the partners in the supply network so that companies optimize the chain's overall performance when they maximize their interests. These organizational capabilities of agility, adaptability, and alignment are dynamic capabilities that result in competitive advantage as these capabilities are developed and renewed in response to changes in customer demand and changes in the structure of markets and economies. As these organizational abilities are integrated and coordinated with in supply chain networks, it ultimately develops competitive advantage related to the ability to satisfy the ultimate customers of the supply chain. It is necessary to decipher the needs of ultimate consumers - not just immediate customers. Otherwise, organization may fall victim to the "bull whip effect" which amplifies and distorts demand fluctuations. Only supply chains that are agile, adaptable, and aligned provide companies with sustainable competitive advantage (Lee, 2004). Key attributes of agile, adaptable, and aligned supply chain (SC) are given in Figure 1.

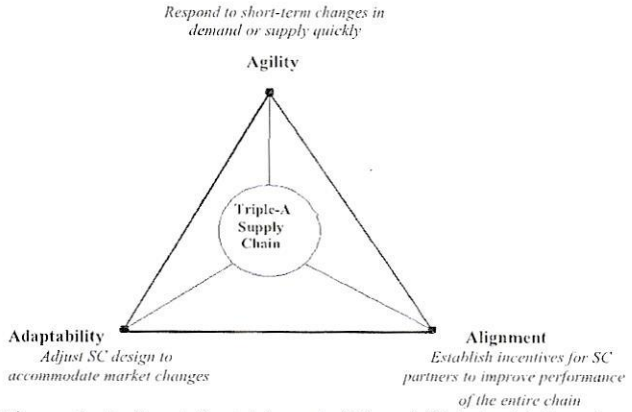

Figure 1: Agile, Adaptable and Aligned (Triple-A) Supply Chain: Key Attributes
(Source: Framework developed by author)

Key attributes of high performance supply chain are explained below in terms of agility, adaptability and alignment.

Agility : Agility of a supply chain is critical for the success of supply chain members (Van Hoek, 2006; Forsberg and Towers, 2007). Agility is the ability to respond to short-term changes in demand or supply quickly and handle unexpected external disruptions smoothly and cost-efficiently. Aligned supply chain aligns the interests of all participating firms in the supply chain with their own. As each player maximizes its own interests, it optimizes the chain's performance as well.

Agility provides the ability of supply chain partners to work together to rapidly react to changes in customer demand (Baker, 2008; Swafford et al., 2008). This ability to rapidly react to changes in demand depends on the degree to which the supply chain partners integrate and coordinate information flow throughout the supply chain (Swafford et al., 2008; Green et al., 2007). The ability to provide required information allows supply chain partners to share knowledge about plans, requirements, and status resulting in improved supply chain performance (Zhang et al.,2006). Such sharing of information strengthens collaboration among the supply Chain partners as collaboration is also key to the supply chain's ability to respond (Thomas,2008; Lee et al., 2008).

Successful companies foster supply chain agility by following various steps given below:

1. Promoting the synchronous flow of real-time information among supply chain partners by continuously providing data on changes in supply and demand so they can respond promptly.

Abstract

Asset prices in the markets are influenced by changes in economic environment and also reflect the intrinsic value of an individual stock in a particular industry. Various asset pricing models have been developed to predict asset returns as accurately as possible. CAPM is one of the most used models to understand the risk and return relationship. The Arbitrage Pricing Theory, a multi-factor model, assumes that asset returns are dependent on multiple risk factors including macroeconomic indicators such as inflation, changes in interest rates, growth in gross domestic product (GDP), or political and economic events which generally impact the returns of all assets. The objective of this paper is to examine the various macroeconomic factors that influence asset prices on the Indian bourses and use the APT (multi factor model) to explain asset returns on the thirty scrips included in the BSE SENSEX for the period April 2011 to March 2017. The statistical techniques used are exploratory factor analysis, multiple regression analysis and cross sectional regression analysis.

Key Words: **CAPM, Cross-Sectional regression, Factor analysis, Multi-factor model, Multiple regression.**

Introduction

Asset prices in the markets are responsive to the changes in economic environment besides obviously reflecting the intrinsic value of an individual stock in a particular industry. The economic environment representing the systemic milieu generally reflects the macroeconomic environment, the financial environment, the degree of market integration, the volatility in oil prices, and the level of political certainty amongst others in an economy. At the individual stock level, factors

Identifying the factors causing changes in optimum portfolio mix using Sharpe optimisation model

Dimple Pandey and Davinder Suri

Abstract
The performance of the SENSEX is a function of the performance of the individual stocks comprising the index. The individual stock performance is influenced by a complex interplay of factors related to the specific company, the factors related to the industry to which the company belongs and macroeconomic factors at large. The objective of this study is to investigate the impact of macroeconomic factors on the companies comprising the SENSEX. This paper would focus on active portfolio management of companies comprising Sensex using Sharpe Optimization Model. The model decides an optimum portfolio composition as well as proportion of each stock from the set of companies being examined. The study has been conducted for two time periods- April 2012 to March 2014 when the macroeconomic indicators in India were relatively weaker as compared to second period from April 2014 to March 2016 when the macroeconomic indicators were stronger. The paper has used daily SENSEX data for the model. The results of comparison from the Sharpe Optimization Model have been examined to justify the performance of individual companies based on macroeconomic factors.

Keywords: Macroeconomic factors, SENSEX, Sharpe optimization model

Introduction
The equity markets play a very important role in channelization of savings in an economy. There are myriad of factors impacting stock market prices and there have been studies examining factors influencing the stock market prices. These factors could emanate from the system such as macroeconomic variables, financial liberalization, market integration, oil price fluctuation, and the political certainty. Unsystemic factors such as company performance including liquidity, leverage, profitability, and growth, size of the firm and dividend rate impact the equity market price. Beyond the company itself, sector and industry performance also impact market price of a company. In the recent past in India, there were two distinct time periods where the macroeconomic factors were largely contrasting. In the period of 2012 to 2014, India was facing difficult times in terms of weak economic growth, high persistent inflation and headwinds from external sector while in the period 2014 to 2016, the Indian economy appeared to have weathered the storm. The performance of the stock markets faces pressure of these negative and positive shocks. Within the stock market, there may be some stocks that appear not to be affected by shocks and then some that are highly responsive to the systemic factors. We aim to understand the behaviour of stocks that comprise the S&P BSE SENSEX under the two distinct time periods when they faced the systemic headwinds and tailwinds respectively.
In the following sections, the underlying macroeconomic environment has been delineated comprehensively, followed by the earlier research work in this area followed by the explanation of the objective and methodology used and the conclusions and recommendations comprise the last segment.

Economic Parameters in India – 2012 to 2016
The year 2012-14 witnessed weakening economic growth in the economy along with inflationary trends, the pressure of twin deficits in terms of fiscal and current deficits and the Federal Bank of the U.S. indication of tapering of expansionary monetary policy.

2017

Towards a Holistic Model of Management Education

*Rajini Anand**

This paper discusses the linkages between spirituality and management education. Traditional education is not enough to develop well-rounded individuals capable of handling a volatile, complex and dynamic business world. It requires the addition of spiritual intelligence to make the change from self-consciousness to the consciousness of the self. It is this spiritual intelligence that aids the manager to awaken the firm to its true potential and greater role in terms of corporate social responsibility.

Introduction

Spirituality refers to the age-old values that have always sustained our society and life on planet Earth. These values serve as the very basis of a harmonious existence amid humans and all of nature.

Spirituality needs to be an important part of education. The goal of education is not to generate a generation only capable of understanding the language of machines. The real objective of learning is not just exposure to existing knowledge but also to critical skills like team building, leadership, creativity and a good mindset. Any education system which cannot address the above-mentioned scopes of personality is not comprehensive in itself. While they strive to acquire education, a degree and the qualifications to earn a good living, we should help our students understand that education for life is an entirely different thing. Education for life is spirituality, practicing values such as love, compassion, patience, forgiveness, etc. This alone will create a deep sense of responsibility towards our fellow human beings, nature and the world as a whole. Today, science and technology has reached the pinnacle of glory, yet widening the gap between poverty and affluence, leading to a state of despair and cynicism in the mass psyche.

The very purpose of education is to improve the quality of life, not based on knowledge alone but the value-based education and spirituality with a sense of purity and purpose. This doctrine surely helps the students to mold their attitudes—humane in temperament, refined in approach and divine in spirit. It would provide opportunities

The Mediating Role of Customer Relationship on the Social Media Marketing and Purchase Intention Relationship with Special Reference to Luxury Fashion Brands

Vikas Gautam [a] and Vikram Sharma[b]

[a]IBS Business School Gurgaon, IDPL Complex, Dundahera, Gurgaon, India; [b]IBS Business School Gurgaon, Marketing, IDPL Complex, Dundahera, Gurgaon, India

ABSTRACT

The reach of internet technology and social media has opened abundance of opportunities for marketers as well as for consumers across the globe. To anticipate future purchase behavior of consumers, marketers are not leaving any stone unturned. The main objective of this study is to investigate the direct and indirect impacts of social media marketing activities (entertainment, customization, interaction, word of mouth, and trend) on consumers' purchase intentions in luxury fashion brands. This study employed higher order Structural Equation Modeling to test the study model with ($n = 243$) sample data. We found positive significant impacts of social media marketing and customer relationships on consumers' purchase intentions. In addition, our study model confirmed full mediation of customer relationships in the relationship between social media marketing and consumers' purchase intentions. Based on our research findings, we strongly recommend that marketers of luxury fashion brands engage in social media marketing activities to provide value to customers.

KEYWORDS

confirmatory factor analysis, intimacy, luxury fashion brands, purchase intentions, social media marketing, structural equation modeling, trust

Introduction

The growth of internet technology has transformed the communication mode that affects billions of people across the globe. Popularity of social media has its roots in the early nineties and it is some sort of online community built on internet technology that aimed at facilitating more interactions among businesses and its customers without any physical boundaries (Campbell, Anitsal, & Anitsal, 2013). According to Zhou and Wang (2014), a large number of companies are making social media as an important part of marketing strategy on the basis of highly promising features such as; large and swift expansion of internet users, ease of use, speed of internet, etc. Marketers are motivated to engage in social media marketing due to high growth of internet and registered social media users (Carim & Warwick, 2013).

Ahmedabad, 380-060, India
Email: pmadhani@iit.edu

Abstract: The banking, financial services and insurance (BFSI) sector has faced fierce competition and such competitive pressure forces BFSI sector firms to improve their business processes for better performances. It is against this backdrop that Lean Six Sigma (LSS) has emerged as a vital tool as it helps firms in building and strengthening customer relationships by delivering improved customer service at the lowest cost. LSS deployment in BFSI sector firms increases service efficiency and effectiveness which in turn enhances overall customer value provided by firms. This research focuses on LSS deployment in BFSI sector and provides various frameworks and models for synthesising and determining value creation for both customers and organisations.

Keywords: lean; Six Sigma; Lean Six Sigma; LSS, banking; financial services; insurance; BFSI; customer value creation.

Enhancing HR Competitiveness: A Six Sigma Approach

Pankaj M. Madhani , Associate Dean and Professor,
ICFAI Business School

INTRODUCTION

Six Sigma has been extensively used by organizations as a strategic management tool. Statistically, Six Sigma means 3.4 defects per million opportunities (DPMO) whereas in management terms, it is an improvement methodology that aims to reduce the cost of poor quality by focusing on process effectiveness and efficiency. Six Sigma is designed primarily to improve performance and enhance process capability. Six Sigma deployment can help in the reengineering of human resources by increasing the speed, quality and efficiency of its services. There are a myriad of examples of Six Sigma's effectiveness. The combination of Six Sigma and Human Resource Management (HRM) was first applied at General Electric (GE), where Six Sigma deployment helped improve the overall quality of HRM. U.S. defense contractor Raytheon has also employed Six Sigma in HRM as a broad tool for creating customer value and changing culture to make HRM processes more efficient, cost-effective and user-friendly. In 2006, Hewitt Associates (now part of Aon) introduced Six Sigma process improvement methods and reported remarkable results in retaining employees. Company officials said that Six Sigma allowed HR specialists to think differently about business issues and solve the fundamental problems (Leatherbury 2008).

SIX SIGMA-BASED HR PRACTICES: ENHANCING PERFORMANCE

Human resources is a service department with internal customers to satisfy, government rules and regulations to comply with, HR budgets to meet and a bottom line to improve. The Six Sigma approach adds more science to the art of human resources. Six Sigma is a set of structured tools designed to reduce cycle time, eliminate product or service defects and increase customer service. The focus is on working smarter and doing things right the first time. The statistical orientation of Six Sigma can be an effective tool for analyzing HR issues and improving performance of the HR department. With Six Sigma's focus on the entire process, its methods would be more appropriate for a complete overhaul, rather than refinement, of HR processes. The outcomes of these HR improvements can be better, faster and more cost-effective services in the organization, improved internal customer satisfaction and greater motivation and job satisfaction of HR employees. Differences between traditional HR practices and Six Sigma-based HR practices are shown in Table 1.

Abstract

Return on human resources (HR) investment may not remain stable over time for organizations, due to changes in business conditions. The "real options" approach enables organizations to evaluate investment opportunities of HR in uncertain environments and highlights how these investments create value through future choices (i.e., HR options). HR options are "investments in the human capital pool of an organization that provides the capability to respond to future contingent events." This research applies this logic to analyze the uncertainties associated with HR in organizations and discuss how organizations manage these uncertainties through HR "options" that are capabilities generated by various HR management practices. With appropriate HR capabilities, organizations are able to manage uncertainties proactively. Research emphasizes that certain HR management practices create HR options in terms of reducing uncertainties of return, volume and costs. Research also underscores that effective compensation and benefits practices reduce uncertainties of costs significantly.

Keywords

human resources, real options, uncertainty, flexibility, HR options

Introduction

With the increasing focus on identifying and evaluating risks in organizations, risk management has become a key strategic priority. Risk management is considered to involve the identification, analysis, evaluation, control and monitoring of risk. In a current scenario of increased complexity and rapidly changing environment, effective risk management may be a source of competitive advantage for organizations. Businesses adopt and integrate risk management practices into their operations, and accordingly various standards such as the International Organization for Standardization, ISO 31000: 2009 (*Risk Management Principles and Guidelines*) along with a multitude of tools and frameworks emerge.

However, this focus on risks has primarily focused on financial and physical assets, largely neglecting the area of human resource management (HRM). For any organization, human resources (HR) are assets that can provide value and competitive advantage; however, such assets have associated uncertainties and risks. There is growing recognition that one of the key risks in a business is related to

Building a Customer-focused Culture in Organizations: Developing 7Cs Model

Pankaj M. Madhani

1 Introduction

Customers are crucial to any business as without customers, there is no sales; without sales, there is no revenue and profits. In the current scenario of highly competitive market, developing a strong relationship with customers is vital in achieving the goals of both the customers and the organization.

"There is only one boss, the customer. And he can fire everybody in the company from the chairman on down, simply by spending his money somewhere else" – Sam Walton.

Slogans such as "The customer comes first" or "The customer is king" are quite common in business world. These slogans are used to emphasize the role of the customer to the stakeholders such as owners and employees of a service firm (Olsen *et al.,* 2014). To be successfully focused on customers, organizations must ensure a high level of consensus and cohesiveness around the belief that its existence relies on being responsive to the needs of its customers. For true success, the organization has to ensure superior customer experiences which add continuous value for customers. Instead of a goal of maximizing performance measured in terms of financial metrics, the goal of the organization should be to add value to and delight the customer, as financial success follows continuous innovation to provide unique value to customers (Denning, 2016). Customer focus has a positive impact on new product performance and the firms' performance (Nickell *et al.*, 2013). Sun and Kim (2013) also reported that customer focus can significantly influence the firms' financial performance.

The practice of customer focus has been identified as pivotal for any organization seeking to reach a level of sustainable performance (Mokhtar, 2013). Sustainable performance refers to an expectation that an organization is able to react rapidly and efficiently when faced with emerging customer-related issues. This is an important factor, given the dynamic nature of customer expectations (Mukerjee, 2013). Hence, there is lot of attention on 'customer-focus'. Customer focus is described as: "... the set of beliefs that put the customers' interest first, while not excluding those of all other stakeholders such as owners, managers, and employees, in order to develop a long-term profitable enterprise" (Deshpande *et al.,*1993). Customer-focus is also defined as organizations' concerns with their customers' needs, wants, and expectations (past, present, and future); and their strong commitment to understand and satisfy them in a proactive manner for long-term growth (Bartley *et al.,* 2007).

Madhani, P. M. (2018). "Building a Customer-focused Culture in Organizations: Developing 7Cs Model", *International Journal of Business Excellence*, Vol. 16, No. 2, pp. 199-232.

Executive Summary

Viewing Salespeople as Real Options

Extending the concept of real options, this research considers a salesforce as a strategic asset and subsequently emphasizes creation of salesforce options to reduce uncertainties of return, volume and costs. The underlying logic of real options provides an extension of how practitioners can approach the management of salesforce uncertainty to reduce business risk and enhance organizational value.

Viewing Salespeople as Real Options

By Pankaj M. Madhani, Ph.D., ICFAI Business School

INTRODUCTION

Salesforces can provide value and competitive advantages, but such assets have associated uncertainties and risks. The salesforce represents the single largest marketing investment for most business-to-business (B2B) companies. U.S. companies alone spend more than $800 billion on their sales staffs each year —three times more than they spend on advertising (Steenburgh and Ahearne 2012). Salesforces generally fluctuate due to changes in business conditions. The "real options" approach enables organizations to evaluate the investment opportunities of salesforces in uncertain environments and highlights how these investments create value through future choices. Research applies this logic to analyze the uncertainties associated with human assets in sales organizations and discusses how sales organizations can proactively manage these uncertainties through the real options approach.

REAL OPTIONS AND ENVIRONMENTAL UNCERTAINTY

Real Options Approach

The real options theory explicitly addresses the issue of investment choices for future resources and capabilities. Real options are investments that are discretionary in that they provide organizations with the right, but not the obligation, to undertake some future action. The theory assumes that an organization develops a level of foresight sufficient to invest in resources with options characteristics that provide flexibility for future investments and imply that there are ways to hedge against risk and reduce uncertainty.Based on capabilities provided by real options, the organization may choose to adjust, reduce, increase or abandon the investment in the future, thereby helping stabilize returns from such assets. Thus, real options help organizations adjust to future shocks and business risks.

Environmental Uncertainty and Salesforce Options

Environmental uncertainty is caused by unexpected events that put the sales organization in an unstable state. Such environmental uncertainty is difficult to accurately predict as is its impact on an organization's ability to meet financial-performance indicators. In this scenario, a sales organization must rapidly adjust to a changing environment or perish. Such heightened demands on sales organizations have subsequently called for a salesforces of flexible, versatile and capable individuals. These circumstances have forced sales organizations to make paradigm shifts in managing their salesforces. Salesforce attributes such as enhanced skill levels, greater work-related flexibility and productivity, and increased capacity to respond to fast-changing business dynamics can provide competitive advantages.

Enhancing Return on Salesforce Investment: Reallocating Incentives and Training Resources With Intrinsic Valuation Approach

Pankaj M. Madhani, Associate Dean and Professor, ICFAI Business School

Abstract

In most sales organizations, salesforce performance evaluation has mostly relied on reflective metrics such as sales volume, revenue, and manager's evaluations of salesforce, and hence they have limited insight into how a salesperson will do going forward and what types of training and incentives will be most effective. Sales organizations should emphasize sustaining and improving their salesforce performance by proactively reallocating investment in incentives and training resources. The main question is what type of incentives and training will bring out the best in a high performer or help a promising sales employee improve? Salesperson's intrinsic value measurement and analysis provides directions for finding an answer. With this approach, sales organizations can then make strategic decisions about rewards and training optimization. These findings will help organizations reallocate their expenditure levels (i.e., training and incentive investments) to maximize salesperson's intrinsic value, enhance salesperson's future performance and ultimately boost revenue and profitability.

Keywords

salesforce performance, sales training, sales incentives, intrinsic value, salesperson's value investment ratio, salesperson's intrinsic value

Introduction

This research studies the impact of salesforce investment on training (directed toward improving the salesperson's knowledge, skills and abilities [KSAs]) and reward (used to encourage the salesperson to perform better) on salesperson's future performance. It is imperative that managers have the ability not only to measure a salesperson's current performance but also to predict the salesperson's performance in the future for better reallocation of incentives and training resources. In most organizations, sales employees are usually made up of mainly solid performers (60%), with smaller but roughly equal proportions of laggards and rainmakers (20% each).[1] Though most incentives and training programs approach these three groups as if they were the same, each group has different incentives

Six Sigma in Sales and Marketing: Enhancing Competitiveness

Pankaj M Madhani
Associate Dean and Professor
ICFAI Business School (IBS)

Introduction

The Greek letter sigma (σ) is used in mathematics to represent standard deviation (i.e., how much a process varies from its average value). A sigma quality level offers an indicator of how often defects are likely to occur, whereby higher sigma quality levels indicate a process that is less likely to create defects as the quality level also increases accordingly. Under the Six Sigma methodology, deficiencies are described in terms of 'defects' per million opportunities, with the score of Six-Sigma quality level equal to 3.4 defects per million opportunities (DPMO). Here, an 'opportunity' is defined as any chance for non- conformance or not meeting the required specifications. Six Sigma is a disciplined, data-driven approach and methodology for eliminating defects in any process – from manufacturing to trading, and from product to service. It was originally developed at Motorola in the 1980s for production processes characterized by high volume and the high degree of standardization with goal of eliminating waste by achieving near-perfect results.

In a current business environment characterised by changing buyer preferences, channel leverage, shorter product life cycles and increase financial pressure on sales growth, profits, and shareholder value, there is a lot of interest in deploying Six Sigma to sales and marketing to reduce the uncertainty inherent in it. Six Sigma has been applied by various organizations in their sales and marketing processes with the ultimate goal of increasing customer satisfaction, sales revenue, market growth and profitability. Organizations such as 3M, Allied Signal, Dell, HSBC, Johnson & Johnson, LSI Logic, Owens Corning, Service Master, Standard Register (Taylor Communications) etc. have deployed Six Sigma in sales and marketing and achieved significant growth in top line and bottom line performance.

Six Sigma Evolution: Various Generations

The initial focus of Six Sigma was the rigorous process of defect reduction in manufacturing operations and was termed as Generation I of Six Sigma.

Enhancing Customer Value Creation with Market Culture: Developing 7Cs Framework

*Pankaj M Madhani**

Market culture is a corporate business philosophy that puts the customer's satisfaction first, while taking into account the role played by the other market factors. Market culture addresses the degree to which the customer's values and beliefs are embedded within the organization and in its activities. Market culture consists of some combination of artifacts, values and norms, and underlying assumptions that organizational members share about their customer-centric behavior. This study focuses on market culture and identifies various elements in terms of 7Cs framework for building market culture. These 7Cs of market culture are: customer insight, competitor awareness, collaborative approach, CEO leadership, criteria for decision making, compensation strategy, and customer value. Significant steps can be taken in each of the 7Cs to strengthen an organization's market culture. The study develops various frameworks to establish a relationship between market culture and firm valuation and also provides supporting illustrations.

Introduction

There are many sought-after market factors of external environment that obviously should enhance the financial performance of an organization in terms of sustained profitability and above-normal financial returns. Some of the market factors are high barriers to entry, non-substitutable products, a large market share, low bargaining power of buyers and suppliers or rivalry among competitors. Still, there are many organizations exhibiting financial success even in the absence of such desirable market factors. In reality, for some organizations, the key ingredient of success is something less tangible but more powerful than the market factors listed above. The major distinguishing feature in highly successful organizations and their most important competitive advantage is their organizational culture. Organization culture is a key driver in enhancing the performance of the organization and is an explanatory variable that distinguishes one organization from another.

Effective Salesforce Management Practices: A Real Option Approach

Pankaj M Madhani

ABSTRACT

Salesforce are strategic assets to the sales organization, but their returns may not remain stable over time due to changes in business conditions. Salesforce investments are similar to investments in other types of real assets and thus carry uncertainties. Research identifies the uncertainties of return, volume and costs associated with salesforce and discusses various salesforce 'options' which are capabilities generated by some salesforce management (SFM) practices and their combinations. The 'real options' approach enables organizations to evaluate investment opportunities of salesforce in uncertain environments and underscores how these investments create value through future choices. Research also develops various frameworks for managing different types of salesforce uncertainties through better management practices.

BUILDING CUSTOMER-FOCUSED SUPPLY CHAIN STRATEGY WITH 4R MODEL

Dr. Pankaj M. Madhani*

*) Associate Dean & Professor, ICFAI Business School, Ahmedabad, India
E-mail: pmadhani@iit.edu

ABSTRACT

Purpose

With competition now at the supply chain level, competitive advantage comes from the ability of supply chain partners to satisfy the ultimate customers of the supply chain. In this context, customer-focused supply chain strategy strives to match supply and demand, thereby driving down costs simultaneously with improving customer satisfaction.

Design/methodology/approach

This research underlines significance of customer-focused supply chain strategy and underscores various attributes of customer-focused supply chain strategy. It also develops 4Rs (responsiveness, resilience, reliability and realignment) framework for building customer-focused supply chain strategy and formulate value creation framework to emphasize overall benefits in terms of increased competitive advantages. The research reviews cases from the real-life world to develop the framework.

Findings

Customer-focused supply chain strategy helps organizations to sense consumer demand and respond to it in real-time, provides a superior consumer experience at every opportunity while also decrease time to market, trim overall costs and optimize productivity and thus achieve customer-focus objectives.

Research limitations/implications

Customer-focused supply chain strives to achieve the ideals of fully integrated efficient and effective supply chains and hence increase customer value proposition. Such supply chains are capable of creating and sustaining competitive advantage by balancing downward cost pressures and the need for efficiency, with effective means to manage the demands as well as the known risks of routine supply chain failures.

Originality/value

Research underlines significance of customer-focused supply chain strategy and provides supporting matrix to underscore various attributes of customer- focused supply chain strategy. Research also emphasizes overall benefits in terms of improved firm performance by providing various case studies.

Pankaj M. Madhani, PhD, Associate Dean and Professor, ICFAI Business School

Abstract

Salesforce constitutes one of an organization's most productive and most expensive assets and has a major impact on overall performance of the sales organization. Salesforce sizing affects profitably of a sales organization by affecting both revenues and costs. The salesforce size affects customers, salespeople and the overall sales organization. A salesforce that is of the right size is challenged and motivated, but not overworked, connects with customers effectively, sales compensation costs are reasonable and sales as well as profitability of the organization is strong. The organization that is more effective than others (e.g., sales growth, profit contribution, market position and customer satisfaction) has a more optimal salesforce size. There are many internal and external factors affecting salesforce sizing decisions such as strategic objectives, product maturity, competitive environment, market trends and financial goals. All these factors together determine optimal return of investment for salesforce investment. This research provides a mathematical model for practicing managers to determine the optimal size of a salesforce.

Keywords

salesforce size, sales compensation, ROI, breakeven ratio, sales productivity, salesforce sizing errors

Introduction

Each year businesses across the globe spend huge amounts on salesforce investment. The salesforce is the engine that drives revenue of organizations and also represents a significant investment for most organizations; for example, each year the U.S. economy alone spends conservatively $800 billion on salesforce compensation and hires at least 22 million people to carry out their sales function.[1] The salesforce represents a large percentage of the total costs for sales organizations. Most companies spend 10% of sales on cost of salesforce, and some spends as much as 22%.[2] The salesforce plays a major role in driving a firm's revenue generation compared with any other marketing resources, as research suggests that spending on the salesforce has a greater impact on revenues than spending on advertising.[3] Hence, the strategic value of the salesforce is at an all-time high as it has a major impact on overall organizational performance.

About

Abstract

As with any other insurance companies, the role of IFFCO Tokio was working the non-life risks. The major issue which IFFCO Tokio was coping with, just like other insurers, was managing the liability payments which at times could be highly variable due to completely unknown business risks as well as contractual nature of obligations. Being a non-life insurance company, the investment policy of IFFCO Tokio could not be the same as any other life insurance company. So what was the best investment policy and the best way to manage the interest rate risk?

About

Abstract

On December 3, 2016, Venezuela, once Latin America's richest country, entered the record book of historical events to become the 57th country in the economic history of the world to have experienced hyper-inflation. Its central bank reported the highest-on-record inflation of 180 per cent and 240 per cent in 2015 and 2016 respectively. The country was facing the world's worst ever economic disaster. The citizens were suffering from food shortages, hunger, death due to lack of medicines, and escalating homicide rates, which were turning the nation into the second most violent country in the world outside of open war. There was no sign of improvement in the year 2017 either; in fact, it was worse than 2016. The opposition party (Congress) in Venezuela claimed that the inflation level had risen further to almost 800% between the end of 2016 and the beginning of the year 2017. According to IMF projections, inflation was expected to reach 13000% by the end of the year 2018, which would reduce the size of the economy by 15%. Economists claimed that too much dependency on oil and not having made policy changes to adapt to the low petroleum price were the major reasons for the plight in which the country found itself. None of the steps taken by the government headed by President Nicolas Maduro to control inflation, like implementing price control or fixing currency exchange rates, were effective in improving the situation. It remained to be seen how Venezuela would come out of this economic crisis.

Data Analytics in HR Effectiveness

Dr. Bidhan Datta[1], Ms. Vaishnavi Gadwe[2], Ms. Rajeshreeba Gohil[3]

[1]Faculty of Management, ICFAI Business School, Pune, (India)
[2,3]Student, ICFAI Business School, Pune, (India)

ABSTRACT

HR analytics is the process of data mining and business analytics techniques in human resource management tomanage and utilized data in effective manner to excel HR effectiveness. The Business objectives and HR objectives should go hand in hand for maximizing revenue of anybusiness. One of the most important functions of HR practices is to focus in managing human capital through proper HR planning. Talent management and retention of skilled employee is a challenging job in any organization. Usage of data analytics will help the organization to effectively manage employees' information and to take relevant decision time to time.

Key Words: Data Analytics, HR effectiveness, Human Capital, Skills, Talent Management

I. INTRODUCTION

The aim of data analytics is to analyze the insight of information about human capital and then using those on decision making process to improve the HR excellence. The challenges in-front of human resource analytics is to identify the organizational needs in short term and long term basis and accordingly use of data to optimize return on investment on human capital. PTA (Predictive Talent Analytics) will help to improve strategic workforce planning and create talent-ready for organizations. Thus, any company wants to hire an employee these available resources of data will help to can make quick decision. As a rise in prominence of 'big data' came into picture, HR Analytics got more exposure. It is helping to manage and analyze the smartness of data behavior and predict outcomes. Data analytics when combined with HR, it can bring various transformations and can help in all major roles of HR. While few are with disagreement with analytics, many are adapting it (Kylie, 2016).

II. LITERATURE REVIEW

Aligning HR activities in line of organizational strategies for has become a necessity to get a sustainable competitive advantage. Strategic human resource management can be regarded as a necessary approach to identify the process that need to be undertaken for the maximum productivity (Muscalu & Anca, 2014). Here it is also necessary that HR professionals and management must develop a strategic of how human capital contributes to organizational success prior to incorporating HR analytics (Kylie, 2016). PTA (Predictive Talent Analytics) provides the turnover rate of the employees. So by analyzing the data of those employees who left the job, analyst can get a rough idea about reason/ any problem they were facing. If in most of the cases it is observed same kind of issues like attitude, personality or any other, then company can get to know that people with such personality won't be suitable for that type of job or position after a particular point. In India, in HR companies uses PTA to analyze the performance of the candidate. A survey from Timesjob.com reveals that, "though 90% of the companies were impressed with PTA but only 7% adopted it and 55% of the organizations don't use PTA for future requirement". So, the reason can be that still at some point HR believes in traditional way of hiring employees. It helps to analyze the risk of hiring a candidate too (TimesJobs, 2015).

III. APPLICATIONS OF DATA ANALYTICS IN HR

- Providing information to CEO/ Organizational head by HR analyst, which shows the reviewed data on attrition, hiringemployee cost, talent acquisition, workforce management and many other factors related toHR functions.
- Improving operational activities such as analyzing video interviews, catching fraud, work pattern to improve payroll leakage etc.
- Providing a platform to analyze productivity, talent acquisition, cost effectivenessthrough data analytics.

Commodities Derivative Price Behavior in Emerging Market

Sharon K Jose, Prashoban Palakkeel

Abstract

Economic studies on the Commodity price behaviour in the developed markets has addressed a lot of issues in the commodity price dynamics. This can be attributed to the existence of uninterrupted trade and the data can be traced to almost 100 years, for example, Chicago Mercantile Exchange, Chicago Board of Trade or London Metal exchange. The commodities futures trade started in the same time period in India but the banning of futures trade resulted in lack of availability of data which has kept Indian research at a nascent stage. This paper tries to explore various developments with the commodities prices in the emerging commodity market. Commodity prices have been modelled using state-space specification. The forecasts are most efficient for most of the commodities considered under the study. It shows that state-space specification and Kalman filter algorithm is an ideal method for modelling and forecasting commodity prices in the emerging market. Forecasting the right prices in such economies will help the framer to make better storage decisions.

Strategic Supply Chain Management (SSCM): Developing Conceptual Framework and Research Propositions

Pankaj M. Madhani

ABSTRACT

In current era of highly comptitive and fast pace business environment organization are struggling to survive as product lifecycles (PLCs) have become shorter, clock-speed has become faster, and the consequences of disenchanting a customer have become more severe. Thus, organization are looking for ways to be more productive, creative and competitiveas these factors affect their performance. Strategic supply chain management (SSCM) enable firms to create value in multiple ways and shows how the role of supply chain is being redefined, from an operational tool to a bonafide competitive strategic weapon. The strategic supply chain management not only focuses on use of a supply chain as a means to deliver products to right place, but also as an enabler to enhance strategic outcomes that drive overall performance of the organization. Strategic supply chain management drives an organization to deliver what its customers want, when its customers want it and streamlining operations to provide great service at lower cost.

Value-creation aspects of the strategic supply chain management have become a new competitive ground to which most organizations can aspire. Strategic supply chain management needs four key components in order to be as customer-centric as possible: Responsiveness, Resiliency, Reliability and Realignment (4Rs). Strategic supply chain management enhances customer value proposition through competitive priorities of 4Rs and hence they need to be integrated in order to create the most value within an organization's operations as well as for the customers. Strategic supply chain management mitigates the challenges of customer value creation in today's highly complex and competitive business environment. This research has developed a research framework for better understanding of customer interface and organizations from inside-out. The research has formulated various propositions and emphasized that 4Rs are important drivers of strategic supply chain management in improving business performance.

Key words:
Strategic supply chain management, SCM, SSCM, Responsiveness, Resiliency, Reliability, Realignment, Customer-centric, Customer-focus, Competitive Advantages

A Study on Gender & Educational association with the perception of crowd funding as a viable option to raise pre-seed capital.

Ms. Seeboli Ghosh Kundu[1], Dr. R. Venkataraman[2]
[1] Asst. Professor- ITM Business School & Research scholar, Bharathiar University
[2] Professor, Centre for Management Studies, Presidency College

Abstract- *The role of Crowd funding is become significant after the Start up revolution and has the potential to solve this problem to rais capital at pre-seed stage for Startups. In the last three years the startup fever has gripped this country and have the potential to catapult i into the planned path for economic supremacy. In this backdrop of startup revolution, pre-seed capital is become one of the most talked abou topic. Raising capital is not easy for Startups in nascent stage. Though different modes of raising capital like angel investors, ventur capitalists, bank loans are available in the market still these options are not effective enough always to raise pre-seed capital. Howeve Crowd Funding, which is already a well known option to raise pre-seed in developed country, has the potential to bridge this gap. Thi paper has tried to identify the Gender & Educational association with the perception of crowd funding as a viable option to raise pre-see capital.*

y Words: IT Startups, Crowd funding, Pre-seed Capital, Equity based crowd funding.

INTRODUCTION

Raising capital has become a key problem for all kind of startups in today's world. Many entrepreneurs are facing challenges and landing i failure while raising the capital for their projects. External support is not always easily available while starting a new venture. The traditiona modes of raising funds have their own limitations. For example while issuing loan, banks generally ask for collateral of the organizations whic results in failure in many cases as the start-ups are not able to fulfil the requirement of getting loan. Another problem of raising capital is lack o historical data that includes asymmetric information for investors. One famous mode of finance is to identify venture capitalist where they als prefer to invest relatively large amounts and only if the project has potential and significant return propositions. Adding on to this, ventur capitalists are generally not interested in pre-seed capital and prefer to fund on later stage companies because of the safe return on investment an a more precise valuation process (EY, 2012). All these issues have made the crowd funding as one of the most popular tool to raise fund. Eve Governments has recognized the importance of this mode and the potential of crowd to raise capital for startups (Collins, 2012). Compared t the traditional mode of raising capital, crowd funding is recognized as one of most important and talked about alternative avenue for raisin capital in pre-seed stage.

OBJECTIVES:

1. This study helps to understand in detail the various funding options available to start -ups in general.
2. To explore the relationship between Gender & the perception of various options to raise pre seed capital.
3. To explore the relationship between Educational Qualification & the perception of various options to raise pre seed capital

YPOTHESIS TESTING

Hypothesis 1:

H0: There is no difference in the score between the two genders in terms of their perception of the feasibility of the different options of raisin pre seed capital.

H1: There is a significant difference in the score between the two genders in terms of their perception of the feasibility of the different options c raising pre seed capital.

Hypothesis 2:

H0: There is no difference in the score between the different levels of highest education received in terms of their perception of crowd funding a a feasible option of raising pre seed capital.

H1: There is a significant difference in the score between different levels of highest education received in terms of their perception of crow funding as a feasible option of raising pre seed capital.

METHODOLOGY

This paper revolves around the responses circulated through a questionnaire. The number of samples collected is 500. The questionnaire ha questions both in terms of continuous variables and categorical variables including 5 point Likert Scale.

Abstract

Revolution of Startups have played very pivot role in the growth of Indian economy. The huge growth in Indian economy for the next decade is expected to be taken by the startup revolution, driven by private enterprises. This revolution has largly contributed in the incremental development of our country and as result service and manufacturing sectors has witnessed doubled digit GDP growth that achieved during 2003-2007. In the recent three years the startup fever has gripped this country and have the potential to catapult it into the planned path for economic supremacy. In this backrop rasing pre-seed capital is become a significat and burning topic. Researches have indicated that raising capital was always a challenge for the startup. Though different modes of raising capital like angel investors, venture capitalists, bank loans are available in the market still these options are not effective enough always to raise pre-seed capital. The role of Crowd funding is become significant here and has the potential to solve this problem to raise capital at pre-seed stage for Startups. However the awarness of crowd funding is still in the nasent stage.There exist a big Gap between the demand and supply in terms of fund availability and that gap can be easily bridged with the help of popularly emerging option known as crowd funding. This paper is the indicative of different trypes of crowd funding and their acceptability in the area of startups.

Key Words: IT Startups, Crowd funding, Pre-seed Capital, Crowd Funding.

Introduction

Raising capital has become a key problem for all kind of startups in today's world. Many entrepreneurs are facing challenges and landing in failure while raising the capital for their projects. Title: Strategic supply chain management for enhancing competitive advantages: developing business value added framework

Authors: Pankaj M. Madhani

Addresses: ICFAI Business School (IBS), Opp. Annapurna Dham, Por, Adalaj Koba Highway, Ahmedabad, 382421, India

Abstract: With strategic supply chain management (SSCM) approach, supply chains develop capabilities to prosper within today's competitive global landscape. SSCM helps organisations to anticipate demand of consumers precisely; cater such demand reliably and swiftly and enhance supply chain efficiency and effectiveness. Greater insight into demand and delivery schedule provided by SSCM will improve operational performance and help organisations in creating the business value they seek. Research develops appropriate competitive priorities of SSCM in terms of responsiveness, resilience, reliability and realignment to enhance SCM efficiency, effectiveness and competitive advantages. Research underscores the dynamic capabilities of responsiveness, resiliency, reliability and realignment as important drivers of SSCM and develops relevant research propositions. The main purpose of the research is to emphasise how strategic supply chain approach improves business performance and accordingly formulates an integrated SSCM framework for business value added.

Keywords: strategic supply chain management; supply chain; business value added; competitive priorities; organisation performance; dynamic capabilities; responsiveness; resiliency; reliability; realignment.

How Compensation and Benefits Build and Sustain a Customer-Focused Culture

Pankaj M. Madhani , Associate Dean and Professor,
ICFAI Business School

INTRODUCTION

Customer-focused culture is based on the concept that what's best for the customer is best for the business. Organizational culture affects employee perceptions, as well as workplace behaviors that contribute to the success or failure of an organization. Properly designed compensation and rewards systems keep employees focused on what's important from an organization's perspective, reinforce desired employee behavior, and eventually lead to alignment of organizational and individual goals. Therefore, a systematic way to build a customer-focused culture is to value, recognize and reward behaviors that support the desired culture. A customer-focused culture requires seven building blocks (7Cs): customer insight, competitor awareness, a collaborative approach, CEO leadership, criteria for decision making, customer value creation and a compensation system (Madhani 2018). A compensation and rewards system is one of the powerful levers in building a customer-focused culture.

Compensation and rewards practices define the relationship between the organization and the individual member by specifying the terms of exchange. Organizational culture expresses values and norms to which employees must conform and specifies the contributions expected from them as well as the rewards individuals can expect to receive as a result of their performance. Three key elements of organizational culture — values, norms and beliefs — influence the behavior of employees. Values are the qualities an organization considers most significant to its business operations, employees and customers. Norms are unwritten rules of behavior in the organization that help "operationalize" actions that are consistent with values and beliefs, such as behavioral expectations of how employees interact with customers. For example, a common norm within customer-focused organizations is that employees are customer advocates. Beliefs are opinions individuals hold about their organization and themselves. Values and beliefs of customer-focused culture include customer-centric goals and values.

An organization should use its values and beliefs as the foundation for hiring, managing, rewarding and shaping the behavior of the employees. Once the desired organizational culture is defined, compensation and rewards systems should be tailored to support and reinforce that culture (see Figure 1). Compensation and rewards plans linked with customer metrics provide employees with an opportunity to focus and share in the success (or challenges) of the customer experience. Thus, compensation and reward systems affect and influence the organization's values and beliefs and ultimately organization culture.

Building a Customer-Centric Supply Chain Strategy: Enhancing Competitive Advantages

*Pankaj M Madhani**

Customers are crucial to any business, as without customers, there will be no sales; and without sales, there will be no revenue and profits. Hence, there is a lot of attention on 'customer-centricity'. With competition now at the supply chain level, competitive advantage comes from the ability of supply chain partners to co-ordinate and integrate strategies aimed at satisfying the ultimate customers of the supply chain at a relatively low total cost. Customer-centric supply chain strategy provides an approach to respond to these challenges as it strives to match supply and demand, thereby driving down costs and simultaneously improving customer satisfaction. This study works in this direction to underline the significance of customer-centric supply chain strategy. The study also provides supporting matrix to underscore the various attributes of customer-focused supply chain strategy; develops 4Rs (responsiveness, resilience, reliability and realignment) framework for building customer-centric supply chain strategy; and formulates a value creation framework to emphasize the overall benefits in terms of improved firm performance.

Introduction

In today's highly competitive business environment, organizations are struggling to survive as Product Lifecycles (PLCs) have become shorter, clock-speed has become faster, and the consequences of disenchanting a customer have become more severe. Thus, organizations are looking for ways to be more creative, competitive and innovative as these factors affect their performance. There are various drivers influencing the performance of the organizations. One of them, customer-centric performance, is the organization's performance as perceived by its customers. Accordingly, dependability, responsiveness, delivery speed, customization, and customer satisfaction are manifests of customer-centric performance (Evans and Lindsay, 2005). Slogans such as "The Customer Comes First" or "The Customer Is the King" are quite common in the business world. These slogans are used to emphasize the role of a customer to the stakeholders such as owners and employees of a service firm (Olsen *et al.*, 2014).

In the current era of competitive global scenario, developing a successful supply chain strategy is critical to an organization's long-term success. The management of supply chains has become increasingly important as well as complex in the context of globalization, new product development, diffusion of innovation and changing customer preferences. Thus, organizations are looking for ways to be more creative, competitive and innovative as these factors affect the performance of the organizations. Supply chain covers all movement and

Online published on 3 September, 2019.

Abstract

The performance of the SENSEX and individual sector indices is a function of interplay of various macroeconomic factors impac the economy at large. The objective of this study is to identify the relationship between various macroeconomic factors and SEN and the sector-specific indices and also examine the magnitude of impact. The sector-specific indices selected for study contrib more than ten percent to the SENSEX. The study has been conducted using vector autoregression after examining the stationa the selected variables for the period April 2010 to March 2018 using monthly data series. This will help the investors to understa the extent of the variability in the indices explained by the macroeconomic factors over time. The present study peered beneath SENSEX to examine the effect of various macroeconomic on the index and on individual indices. The result of the analysis wou help the investors to optimise returns based on understanding of the relation between macroeconomic factors and a specific inc

The New Monetary Policy Index : Case Study of the RBI's Monetary Policy

PRAKASH ANANT SALVI*
DAVINDER KAUR SURI**

Abstract

This study attempts to design monetary policy index to capture the stance as well as tools used by the RBI at various points in time in the backdrop of it operating frameworks. The New Monetary Policy Index (NMPI) is primarily based on methodology used by Samantaraya (2009), using both qualitative data as well as quantitative data. Qualitative data is collected through various circulars issued by the RBI from time to time and quantitative data is collected from the RBI's Handbook of Statistics on Indian economy. The choice of monetary policy tools to be included in the index and the weights assigned to the index variables are selected through Principal Component Analysis. To examine the alignment of the NMPI with the actual monetary policy stance, sharp contractions in the index are corroborated with actual data published by the RBI for the periods and compared with inflation, industrial output and bank credit at the time. This gives us positive results for the index designed.

I. Introduction

THE CENTRAL BANK has three main tools of monetary control. They are (a) changing the discount rate (the rate the central bank charges on its loans to banks and other financial institutions), (b) changing reserve ratios (percentage of commercial banks' total deposits liabilities required to be kept in cash with the Central Bank and in liquid assets kept with themselves) and (c) conducting open market operations (buying and selling government bonds to banks and public). Each tool works by changing the excess reserves in the banking system (McConnell and Brue, 2005). When the Central bank takes monetary policy actions, it sets in motion a series of actions in financial markets, which, in turn, lead to changes in spending, production and

ABSTRACT

Import and export plays a vital role in an economy. It is an important factor for the GDP growth of any country. People's Republic of China and India are the most populous and the largest Asian countries experiencing rapid economic growth over the last two decades. The aim of this paper is to compare the past, study the present to predict the future economic scenario by consideringvariousindicators, mainlyimports-exports of minerals, fuels, chemicals and metals.The comparison is done on the basis of secondary datafrom reliable sources.India started its financial reforms since the economic liberalisation in July 24, 1991. Thus, data from the year 1991 to 2018 is considered for this paper. China grabs the largest market share of Asian, as well as western countriesby providing cheap manufacturing goods and known as manufacturing hub of the world. On the other hand, India has made its footprint in the service sectors. Indiaand China have been growing at increasing rate since 1980s and the growth accelerates after 1991.This research tries to find out whether India will be able to competewith China in thelong run, despite a large gap in their present economic scenario.

Keywords: *China, EconomicGrowth, Export-Import, GDP, India*

I. INTRODUCTION

India and China (People's Republic of China) are the two most fast-growing and powerful countries in Asia as well as in the world. Although the US economy is the largest, but China is the second largest economy, far ahead of France, United Kingdom, Germany and Japan. Similarly, Indian economy is growing at faster rate and in near future it can become the 3rd largest economy after the US & China, and may cross France, United Kingdom, Germany and Japan as well.Indian and Chinese economies are growing rapidly among the Asian countries due to economic reforms UNTACT Stat and Morgan Stanley Research from the period of 1980 to 2009 (Rezwanul Hasan, 2013). This study aims to compare the economy of these two fastest growing countries.Since the structural reforms in China in1978, its GDP has grown at an average rate of about 9 percent per annum (Narendra Jadhav and Janak Raj, 2005). In 1978 China was ranked 9thin nominal GDP with 214 USD billion. Presently, it stands2nd13.45 trillion USD andis the world's largest manufacturing hub.

A Comparative Study of Demographic and Risk Tolerance Profile of Conventional and Socially Responsible Investors in India†

Vineeta Mishra* and Ajit Mittal**

This paper is an attempt to examine whether demographic factors like age, gender, income, occupation, marital status and education, and a risk tolerance score calculated through a structured questionnaire could be used individually or in combination to differentiate between investors keen to invest in socially responsible investment avenues and conventional investors whose investment decision is mainly based on risk and return. A single cross-sectional survey was conducted among 236 investors of different age groups and investment experience. The respondents included individuals who have at least two years of investment experience. Age, marital status, occupation and socially responsible investment behavior show strong association with Financial Risk Tolerance (FRT) of Indian investors.

Introduction

Sustainable, Responsible and Impact Investing (SRI), also known as socially responsible investing, is an investment ideology that focuses on Environmental, Social and Corporate Governance (ESG) criteria in order to generate financially competitive returns in long term, which also impacts the society positively. It is said that social responsibility screening process is more likely to have a positive impact on the investment portfolio by selecting financially stronger, more stable and profitable companies.

Investor's behavior is influenced by many factors during investment decision making. Whether to invest in conventional stocks and products or to invest in

† This paper was presented at the International Conference on 'Management Imperatives for Sustainable Growth' held at ICFAI Business School (IBS) Gurgaon on August 24, 2018.

have suggested that a person's knowledge of personal finance and economic expectations may play a role in shaping risk preferences.

As far as Indian studies are concerned, Kannadhasan's (2015) study on 778 retail investors has reported that men, younger individuals, single individuals, professionally qualified people and self-employed people have higher level of FRT than others. However, the level of risk tolerance does not change with income. He has also studied the financial risk behavior and concluded similar results as FRT.

Sulaiman (2012) in his study on Indian investors observed that most of the anticipated relationship between financial risk tolerance and each of the demographic features from the literature were found to be relevant. However, his study does not support the view that FRT decreases with age.

There are many studies which have examined the demographics of socially responsible investors. Most of these studies have been done on countries where there is a well-established market for socially responsible investments or social screening is an established norm like the US, UK and Australia.

In a study conducted on 4,000 socially responsible investors, Rosen *et al.* (1991) found that these socially responsible investors were mostly highly educated. Around 60% had a graduate degree. As far as occupation is concerned, 81% of the respondents were in white-collar jobs. The result of this study was compared to that of a study done in 1986 by the same researcher but on conventional investors. The study concluded that socially responsible investors were younger, better educated but not as rich as conventional investors. However, wealth could be a function of the number of active years of investment and hence nothing conclusively can be said on the same line.

Junkus and Berry (2010) studied the well-informed individual investors of the US (who were members of American Association of Individual Investors) and concluded that females are more likely to be socially responsible investors. They also reported that single individuals, younger individuals, better educated individuals and comparatively less wealthy individuals are more likely to opt for socially responsible investment.

Woodward (2000), analyzing the socially responsible investors, identified that a typical socially responsible investor is likely to be middle-aged, highly qualified and in a managerial profession. However, their income is relatively low as compared to conventional investors.

Lewis and Mackenzie (2000) did a similar study by administering a questionnaire to 1,146 socially responsible investors of UK. The summary indicated that socially responsible investors are frequently middle-aged and are middle-income and professional investors.

Nilsson (2008) conducted a study on Swedish investors using a questionnaire. The questionnaire was answered by 439 socially responsible investors and 89

"Sound and Fury, Signifying Nothing": What Makes Men and Women Experience and React to Destructive Emotions at Work?

Rita Rangnekar and Sumeet Manerikar***

Destructive emotions and their propensity to distort mental equilibrium have been well-researched in Buddhist philosophy, especially, the works and teachings of the Dalai Lama, who has extensively written about various ways in which strong feelings and emotions create 'havoc' in the minds and hearts of people. This study examines the differences in the experience of and reactions to destructive emotions in men and women. The study looks into an association between the experience of destructive emotions and the intensity of the experience, reactions and triggers at work with respect to gender. The study is based on empirical research conducted through a quantitative analysis of data collected from 110 employees or working professionals. The findings show that all factors trigger destructive emotions at work and that different genders react differently to destructive emotions at work. There is a difference in the way men and women are provoked by destructive emotional state and how they react.

The infernal serpent; he it was, whose guile, Stirr'd up with envy and revenge, deceiv'd the mother of mankind.

– **John Milton**

Introduction

Destructive emotions and their propensity to distort mental equilibrium have been well-researched through studies in Buddhist philosophy especially, the works and teachings of the Dalai Lama, who has identified various ways in which strong feelings and emotions create 'havoc' in the minds and hearts of people (which have been termed as "destructive emotions"). The Dalai Lama's Discourses with Daniel Goleman in the

Pull-A-Vehicle Approach for Transport with Internet of Things (IoT) based Fleet Management System (FMS)

[1]Sudarshan Kumar Baurai, [2]V. N. Bajpai, [3]Vipin Khurana
[1]Research Scholar, Dr. APJ Abdul Kalam Technical University, Lucknow, UP, India
[2] Chairperson-PGDM Programme, Institute of Technology & Science (ITS), Mohan Nagar, Ghaziabad, UP, India.
[3] Dean & Area Chair (Quantitative Techniques & Analytics), ICFAI Business School, Gurugram, Haryana, India

Abstract: Logistics and Transportation processes have got a positive impact and a paradigm shift in its operations out of use of technology solutions. Emerging Internet of Things (IoT) provide solutions for the Logistics & Transportation processes. This article explains an IoT based FMS for people and goods transport service provider by integrating passenger in decision-making process and balancing the trade-off of Vehicle Capacity & Wait Time. For this Pull-A-Vehicle Approach has been conceptualized. This paper carries a good study of research literature for gap analysis and concept building. This also provide overview of vehicular communication that creates the basis for research objectives and concept approach of Pull-A-Vehicle.

Key words: Logistics, Transportation, FMS, IoT, IoLT, IoV, Mobility Communication, VANET, ITS

1. INTRODUCTION:

Logistics & Transportation is key to economic development of a society. A good transport system in logistics activities, provide better logistics efficiency, reduce operation cost, and promote service quality (Tseng, 2005). Transportation need for people and goods, result high motorisation, urbanisation and population density, which is resulting in traffic congestion, increasing travel time, fuel consumption and air-pollution (Cowell, 2010). Passenger and freight transport have different challenges. Passenger journeys are decided in terms of origin and destination, mode, timing and frequency of travel by individuals while freight journeys have a single purpose of transporting goods from one point in the supply chain to another (Allen, Browne, & Cherrett, 2012).
A fleet of vehicles is used either for transporting human passengers or containers of goods. However the two have different complexities and challenges. The presence of customer during the passenger journey process itself presents a challenge. To reduce the wait-time for passenger in one hand and at the same time the optimized capacity utilization of vehicles to keep operations viable are trade-offs to be balanced. Therefore a solutions based on Internet of Things (IoT) for good fleet management to realize optimum returns from limited resources is an emerging business opportunity.

1.1 FLEET MANAGEMENT SYSTEMS:

Fleet is a collection of vehicles used in any transport through land, water or air though in this paper it refer to a fleet of vehicles for road transport. Fleet operator is the owner of these vehicles used in any type transport and based on the number of vehicles a fleet operator can be small, mid, large or very large fleet operator. A Fleet Management System (FMS) is an information system to help the fleet operator which is a logistics organizations to operate in efficient & effective manner and realize maximum returns on their investment (Kolaric, 2008). In a competitive environment, technology intervention is a necessity for managing smooth transportation modes and services (Blythe, Rackliff, Holland, & Mageean, 2000). Fleet management include every aspect of the life cycle of a vehicle therefore it is important for companies to employ efficient fleet management systems to reduce risks and increase quality of service in addition to operational efficiency of a fleet at minimal cost (Malekian, Moloisane, Nair, Maharaj, & Chude-Okonkwo, 2017).

1.2 INTERNET OF THINGS (IOT):

The term Internet of Things (IoT) was first used by Kelvin Ashton in 1999 and it has been conceived in parallel to Wireless Sensor Networks (WSNs) (Gawade & Meeankshi, 2017). Through IoT, any physical object referred as thing can be paired with another object, that will enable transmit, receive and process data to and from one object to another (Roberto Minerva, Abyi Biru, 2015) (Li, Xu, & Zhao, 2015). With a smart sensor attached to the object, it get a tiny computer features. And when they do so, they are often called smart things, because they can act smarter than things that have not been tagged (FLEISCH ElgarFleisch, 2010). The new realized capabilities in smart things are of immense value in managing processes. Any process having smart things transmit process status transparently to improve efficiency, performance & effectiveness so that the entire system would become intelligent. In near time the dominance of people-to-people communications will soon be overcome by device-to-device D2D communications (Aloi et al., 2016).

1.3 INTERNET OF LOGISTICS THINGS (IOLT):

The scope for technology is growing in providing innovative solutions for various improvement dimensions of logistics and transportation. Satellite based positioning, ever increasing reach of fast telecommunication and IoT provide more and more technology based solutions. Therefore Barcodes and RFID Tags, which provide control on the basic functionality is now have IoT based solutions covering almost the entire Supply Chain. (Decker et al., 2008). Real-time monitoring and control through smart devices is becoming a necessity in highly competitive environment (Luo et al., 2016).

Abstract

Background and Objective: Leadership research has come a long way from trait theory, through human relations school of thought, to contingency and/or situational model. It is critically important to consolidate the leadership research so as to set-up the agenda for future. This paper aimed to summarize the research published in the integrated field of leadership and organizational research. **Materials and Methods:** This paper systematically reviewed the research papers about leadership and organization published between 2010 and 2017. The approach of the paper was in line with single-journal systematic review methodology, which reviewed publication of a single important journal. Out of 208 papers published in this period, 119 papers related to leadership studies were reviewed. **Results:** The paper brought out seven important research gaps for the future researchers to fill, which indicated that the research arena was wide open for the future research in the area of leadership and related areas that could be explored by novel research particularly with a focus on developing markets as none of the reviewed papers focus on developing markets. **Conclusion:** The paper concluded that Future research could also focused on meta-analysis and explored the significance of case study/literature review or comparative analysis in addressing leadership problems in organizations.

IMPACT OF THE AMBIANCE OF A SHOPPING MALL ON CONSUMERS' PERCEPTIONS AND PREFERENCES: AN EMPIRICAL STUDY IN THE INDIAN CONTEXT

Seeboli Ghosh Kundu, Subhankar Baishya

ABSTRACT

Atmospheric branding is becoming one of the most important marketing communication points to create positive consumers' perception. It has been identified that consumers' preferences are highly influenced by the atmosphere of the shopping mall. There is a positive association between consumers' emotions, preferences, and store atmosphere. Very limited studies have been conducted on atmospheric branding of a shopping mall, in the Indian context. This present study aims to identify the factors of the ambiance of shopping malls that influence the consumers and classify them broadly. Furthermore, the study also tries to identify the extent to which the impact is created by the factors. Lastly, the present study is being conducted to rank the factors based on their importance and find the variable that influences the most. The results statistically support that a) all the variables can be broadly classified into six categories namely: Basic Benefits, Sensitivity and Care for Customers, Brand Reputation, Exclusive benefits , Layout and Nature of the crowd, b) The result also indicates that Behaviour of the staffs, Exclusive Brands, Fire Exit, Degree of Brightness in the mall, Nature of the crowd impact the minds of the customers the most followed by the behaviour of the staffs and the Presence of exclusive brands.

Simulation of Technical Indicators for Better Profits in the Indian Stock Market

Krishna Murthy Inumula, Anupama Tadamarla, K.Deeppa

ABSTRACT: This article designs models and uses simulation to examine optimization of technical indicators in stock market: the Moving Average Convergence Divergence (MACD) and the Relative Strength Index (RSI). Based on sector-wise Nifty 50 group of companies' daily closing price of the stocks from the year January 2013 to September 2018. This study is to demonstrate how the simulation of technical indicators MACD and RSI helps investor in reducing the trading cycles of investment with better profits in the long run. Results concluded that the experimentation of optimization of technical indicators is one-step forward in making profitable trades as it is evident from the nifty50 stocks. Furthermore, it also proves that both the optimized MACD and RSI outperformed the standard MACD, standard RSI and Buy& Hold strategy.

Key words- Simulation, Technical indicators, Buy and Hold Strategy, Indian Equity Market JEL Classifications- G11, G12, G17

I. INTRODUCTION

A large number of participants come together in the composite system called stock markets , interrelating one another with the objective of profit maximization through trading stocks [Johnson (2003) and Kendall (2003)]. Testing of past data is done by traders to institute specific rules for buying and selling of the securities in order to maximize profit and minimize the risk of loss. Traders undertake their analysis on the principle that the market prices follow a pattern of recurring in the future and hence becoming a base for future prediction. In spite of the fact that the principle seems to be simple, it is complex to take a decision of when and how much to buy and sell. To manage this situation there are a few techniques emerged with technical indicators that helps in the study of the market information that predicts the rise and fall trends. Many technical indicators have been found in literature to experiment over the stock returns. Compared to conventional buy and sell strategy the signals generated by technical indicators proved to be more efficient and give good returns over the investment both short term and long term. In this research study two momentum indicators MACD and RSI were considered for simulation to determine the profitable trading strategies. This research is supportive to regulate the pertinent use of indicators like MACD and RSI in the decision making of attaining a profitable investment in the Indian Financial Market. Investors in stock market always find ways to beat the market and expect higher returns in short run and long run investments.

Revised Manuscript Received on September 20, 2019.

Krishna Murthy Inumula, Associate Professor, Symbiosis Institute of International Business (SIIB), Symbiosis International University, Pune, E-mail: dr.krishna@siib.ac.in

Anupama Tadamarla, Faculty Member, IBS, `Pune and Research Scholar, Symbiosis International University, Pune, E-mail: anu1078@gmail.com

K.Deeppa, Faculty Member, IBS, Pune,E-mail: k.deeppa@gmail.com

As per the EMH (Efficient Market Hypothesis) there is no profitable trading rule available for the investors to make abnormal profits as it says that all the information for decision making in buying and selling stocks is contained in the market that drives the business.

II. REVIEW OF LITERATURE:

The definition of indicators is perfectly done mathematically which leads to the usage of these technical indicators mechanically by certain investors. It is imperative to understand that the best practice to use the indicators is with its combination with other tools of technical analysis. However, return predictability might not infer higher returns after considering transaction costs as the strategy of technical trading involve many transactions. (Bassembinder and Chan, 1998:2).

Gencay (1998) examined through nonparametric models the profitability of simple technical trading rules as the strategy would capitalize on the investment with total returns. The investment strategies for profitability was assessed against the simple strategy of buy & hold on the security and its expanse from the ideal net profit. The indicated results showed that the technical strategy with nonparametric models provided substantial profits when tested against the strategy of buy-and-hold.

Brock et al. (1992) showed improved profits from 1897 to 1986 in the companies of Dow–Jones Index (DJI) with the usage of moving averages and trading tools like the supports and resistances for technical analysis than the strategy of buy-and-hold in the same index. Mills (1997) elucidated a related outcome to the one reflected in the stated article, but for FT30 index of London stock exchange where assessing the significance of the rules statistically through the technique of bootstrap and AR±ARCH models ,which resulted with greater returns been produced by the trading rules than the strategy of buy-and-hold.

Stephanos, P. and T. Stavros (2001) has appraised earlier research on forecasting exchange rate and recognized few issues in problems in constructing a predictive model and examined the usage of different technical rules for profitability in the USD/DM and USD/BP foreign exchange markets. The data for 1989-1996 were taken, separated into two sub-periods with altered macroeconomic features; and results compared with detailed technical rules and the strategy of buy and hold. Kwon and Kish (2002) acknowledged that in New York Stock Exchange (NYSE) the technical rules attained an enhanced profitability than strategy of buy-and-hold.

Effective Rewards and Recognition Strategy: Enhancing Employee Engagement, Customer Retention and Company Performance

Pankaj M. Madhani , Associate Dean and Professor,
ICFAI Business School

Introduction

Organizations across the world seek to retain their talent. The loss of an employee has been proven to incur exorbitant costs in the recruitment, selection, and training of a replacement, costs amounting to a full year's compensation or more. Moreover, an organization's human resources are among its most precious; skilled and competent employees - and thus their retention - are acknowledged as being imperative for business success. Rewards and recognition are important resources offered by the organization that motivate employees to accomplish organizational goal and hence play a key role in increasing employee retention within organizations. When employees are satisfied with the rewards and recognition plan offered by their organization, this leads to employee retention. An individual's motivation to remain with an organization is greatly determined by the rewards and recognition strategy. To guarantee not only the retention of but also optimum performance from its employees an organization must offer a range of diverse means of rewarding its employees. With up to 80% of a company's expenses coming from human resources, it is vital that the workforce be engaged. Employee engagement promote retention of talent, enhances customer satisfaction, foster customer loyalty, company reputation and overall stakeholder value. Engagement is found to correlate with positive organizational outcomes like lower absenteeism, lower turnover intention, lesser costs and higher growth. Effective reward and recognition systems influence employee engagement and enhance work performance. Rewards and recognition have already been established as an antecedent of employee engagement (Fairlie 2011).

Employee Engagement

Rewards and recognition have major potential to positively affect employee engagement levels and corporate performance, in a world in which 4 out of every 10 employees are not engaged (Brown and Reilly 2013). According to Gallup's annual engagement survey conducted in 2018, only 34% of the U.S. workforce is engaged, with 53% not engaged and 13% actively disengaged. Employee engagement is about the emotional connection employees have with the organization they work for. High levels of employee engagement enable an organization to attain better performance, competitive advantage, higher productivity and lower employee turnover. Aktar and Pangil (2018) empirically found that effective rewards and recognition positively influence employee engagement.

Employee Turnover Cost

The direct economic costs associated with losing talented employees includes: the costs of replacing an employee; the separation of the employee; downtime; recruiting; interviewing; on-boarding; and training and development of the new hire. The costs associated with losing employees and recruiting, selecting and training new employees often exceed 100% of the annual compensation for the position and vary between 1.5and 2.5 times the annual salary paid for a job (Cascio 2006).

Madhani, P. M. (2020). "Effective Rewards and Recognition Strategy: Enhancing Employee Engagement, Customer Retention and Firm Performance", *The Journal of Total Rewards*, Vol. 29, No. 2, pp. 39-48.

Title: Customer-focused supply chain strategy: developing 4Rs framework for enhancing competitive advantages

Authors: Pankaj M. Madhani

Addresses: ICFAI Business School (IBS), IBS House, Opp. AUDA Lake, Science City Road, Off. S.G. Road, Ahmedabad, 380-060, India

Abstract: Customer-focused supply chain strategy helps firms to respond consumer demand in real-time; provides a superior customer experience; trims overall costs and optimises productivity. Firms that effectively implement customer-focused supply chain strategy are much more likely to achieve better corporate performance in terms of sales, profitability, market share and even customer satisfaction. Customer-focused supply chain also enhances capabilities of the firm to adapt to the rapidly changing business environment. In customer-focused supply chain strategy, supply chains are much more customer focused - they deliver great service at lower cost and a key ingredient of their success is strong emphasis on responsiveness, resiliency, reliability and realignment (4Rs) among supply chain partners, where all are focusing on customer value proposition. This research has developed various frameworks and presented various case studies to emphasise 4Rs as important drivers of customer-focused supply chain strategy.

Keywords: customer-focus; supply chain strategy; responsiveness; resiliency; reliability; realignment; competitive advantage; customer value proposition; 4Rs.

Enhancing Supply Chain Efficiency and Effectiveness With Lean Six Sigma Approach

Pankaj M. Madhani, ICFAI Business School, Ahmedabad, India
https://orcid.org/0000-0002-8810-3201

ABSTRACT

Lean Six Sigma (LSS) enables supply chains to become more efficient and effective in sustaining continuous improvement. The speed, service quality, and the cost of operations impact the supply chain performance. One most popular approach for providing faster responses, improving quality and reducing cost in SCM, is LSS as it combines strengths of both Lean and Six Sigma. LSS is not just about doing things better, it is a way of doing better things. Research establishes complementary relationship of Lean and Six Sigma; summarizes benefits of LSS in SCM and develops various frameworks such as S-V framework and O-T-S framework to emphasize the role of LSS in enhancing efficiency and effectiveness of SCM processes. As a strategic management tool, LSS deployment in SCM is considered to be an important management philosophy, supporting organizations in their efforts to enhance efficiency and effectiveness of operations, satisfy customers and enhance competitive advantages.

INTRODUCTION

There is a huge opportunity cost to any organization that continues to support inefficient and ineffective business processes in a highly competitive world. To combat these inefficiencies, organizations have begun to make investments in process improvement methodologies such as Total Quality Management (TQM), reengineering, benchmarking, Lean, Six Sigma and Lean Six Sigma etc., to enhance service quality. Competitive pressure forces companies to improve their core as well as support functions for better performances. Supply chain as an integrated function is the lifeline of an organization as a streamlined supply chain management (SCM) can enhance business performance by providing better value to customers. SCM helps increasing organizational effectiveness and profitability by promoting the integration between firms and their suppliers through the development of supplier partnerships and strategic alliances. In present day business environment, supply chains that compete with each other, not companies (Christopher & Towill, 2001), and the success or failure of supply chains is ultimately determined in the marketplace by the consumer.

An effective SCM is crucial to business continuity (Cabral et al., 2012) as well as survival in a market that is increasingly volatile, turbulent and competitive. SCM enhances competitiveness of a firm if appropriate supply chain strategy is chosen (Soni & Kodali, 2012). In a globally competitive

Abstract

The research deploys service–profit chain model to underscore the impact of effective rewards strategy on contribution and performance of employees in enhancing customer service and, thus, business performance. The service–profit chain postulates that higher employee satisfaction levels lead to high customer satisfaction and ultimately affect consumer loyalty and profitability. Therefore, human resource managers should implement better internal service quality practices, such as effective rewards strategy that focus on employee satisfaction, operational excellence and service orientation, to enhance firm performance. The research emphasizes that the service–profit chain begins with internal service quality triggered by financial and nonfinancial rewards and ends with business performance in terms of revenue growth and profitability. The research highlights that with effective rewards strategy, companies should take care of their employees first, because doing so will result in employees delivering a better customer experience and creating loyal customers who generate greater profits.

recognition, service–profit chain, financial reward, nonfinancial reward, internal service quality, employee satisfaction, employee loyalty, customer satisfaction, customer retention, business performance

Introduction

The service industry is one of the fastest growing sectors in developed and developing countries, experiencing increased competition and more demanding customers in recent years. Such an intense environment puts pressure on service providers to set themselves apart from their competitors, including by providing higher quality service to retain customers and drive profitability.[1] As service industries are heavily dependent on their employees for achieving and sustaining a competitive advantage, it is important for organizations to take those actions and making those investments that best enable their employees to successfully coproduce quality service experiences. Companies are forced to focus greater attention on the quality of the service provided to customers, making frontline employees of central importance for the better customer experience. It is imperative for organizations to improve the internal customer (i.e., employee) service quality, with satisfying human resource management (HRM) policies

ENHANCING RETAILERS' OPERATIONS PERFORMANCE WITH LEAN SIX SIGMA APPROACH

Dr. Pankaj M. Madhani*

*) Associate Dean & Professor, ICFAI Business School, Ahmedabad, India
E-mail: pmadhani@iit.edu

ABSTRACT

Purpose
Retailers face many challenges due to uncertain business environment negatively influencing their performance. In this context, Lean Six Sigma (LSS) deployment in the retail industry provides various benefits in terms of higher efficiency and effectiveness. LSS is robust and flexible in nature and hence fits well into the fast-paced and competitive retail environment.

Design/methodology/approach
LSS transforms the various retail operations and creates competitive advantages by building new operational capabilities for the retailers. To highlight this transformation, the research provides a clear roadmap for LSS deployment in the retail industry. Research develops retail LSS synergy framework as well as financial evaluation metric and underscores that LSS deployment positively affect retailers' business performance. By using these frameworks, research also discusses various illustrations to highlight successful deployment of LSS by retailers.

Findings
LSS deployment immensely benefits the retail industry as it mitigates many challenges faced by retailers. With LSS initiatives, traditional retail operations are transformed to represent higher cost efficiency and customer effectiveness in operations and thus helps in building sustainable competitive advantages.

Research Implications
Research emphasizes the critical issue of measurement and evaluation of the financial contribution that the LSS practices make on various retail operations. There are various format of retail: discount, specialty, apparel, grocery, convenience stores, and quick-service restaurants. Hence, there is a need to compare LSS deployment performance among various types or formats of retail sector. An empirical investigation that quantifies the overall benefits of retail LSS is necessary and hence future research may focus on it.

Originality/Value
The research emphasizes the significance of LSS deployment in retail and underscores how synergy of Lean and Six Sigma enhances cost efficiency and customer effectiveness for a retailer. Research also provides illustrations of successful LSS deployment in retail industry.

Ethics in Sales and Marketing: Key Advantages

Pankaj M. Madhani

Associate Dean & Professor
ICFAI Business School (IBS)

Introduction

The ethics in sales and marketing is especially important in today's environment of increased customer awareness; demanding customers; shorten product life cycle (PLC) and stiff competition. Many organizations are using sales and marketing ethics as a key selling point, because more customers consider an organization's ethical reputation when making purchasing decisions. Lack of ethical practices in sales and marketing may lead to dissatisfied customers, bad publicity, a lack of trust, lost business, or, sometimes, legal action. Sales and marketing ethics plays a critical role in forming, maintaining and sustaining long-term customer relationships. An ethical sales and marketing practices is a key factor of organization's success because it affects the organizations' capability to build strong relationships with customers.

Customers perceive behavior of organizations as ethical or unethical by analyzing and distinguishing such behavior as right or wrong, fair or unfair, just or unjust. Sales and marketing are frequent targets of ethical issues. Ethical issues in sales and marketing such as misleading advertising, unsafe and harmful products, abuse of distribution channel power, promotion of materialism, and product adulteration are still major concerns. Unethical sales and marketing activity causes various problems for organizations such as lack of customer trust, spoiled customer relationships, declined customer retention, and reduced sales

Need for Sales and Marketing Ethics

Today it is not enough to have satisfied customers; firms should also target and try to retain their most valuable customers by building customer trust and loyalty. Ethical sales and marketing facilitates organizations to foster long-term relationships with customers based on customer satisfaction, trust and loyalty. Organizations that maintain relationships with customers on the premises of trust, ethics, and integrity will have a competitive advantage over those that do not. Ethical sales and marketing practices may avoid short-term decisions that hamper long-term benefits. In contrast, unethical sales practices may focus on short-term gain by misleading customer to gain immediate sale, but such deception will likely jeopardize future sales.

Although, unethical sales and marketing practices can have immediate negative impact on the customers, the organization ultimately loses in long-term as customers lose faith and trust in such brands. In such scenario, customers were the first victims of unethical sales and marketing practices but the reputation of the organization will be irreparably damaged.

DEPLOYING A CUSTOMER-FOCUSED SUPPLY CHAIN STRATEGY WITH 4RS (RESPONSIVENESS, RESILIENCY, RELIABILITY AND REALIGNMENT) MODEL

DR. PANKAJ M. MADHANI, ASSOCIATE DEAN AND PROFESSOR
ICFAI BUSINESS SCHOOL (IBS), AHMEDABAD, pmadhani@iit.edu

Introduction

In today's world of complex and extremely competitive business milieu, firms are struggling to survive as product lifecycles (PLCs) have become shorter, clock-speed has become faster, and the consequences of disenchanting a customer have become more severe. In today's competitive business environments, firms are under intense pressure to systematically produce quality control and quality standards and generate positive bottom line results. That's why many firms are looking for ways to be more productive, creative and competitive as these factors affect their performance. To improve business performance in rapidly changing environments, supply chain performance can be a crucial prerequisite. The supply chain is one of the key lifelines of an organization hence, it has to transit from being simply a supporting activity to becoming an integral part of business strategy. Differentiation through customer service is the most effective way to improve business performance, and customer-focused supply chain strategy can help to achieve high-level customer service.

Traditional Supply Chains versus Customer-focused Supply Chains

The traditional supply chain in which the end point of networks are represented by final users, is no more relevant today, as such cost-focused supply chains driven by efficiency criteria are more susceptible to unforeseen swings in demand. In the traditional supply chain function, the major focus is on demand forecasting function while synchronizing distribution function. However, only a customer order drives real demand in the process and fills the supply chain. Hence, each supply chain member overestimates the customer demand to avoid stock-out situations. Usually, each supply chain entity "over-plan" stocks and keep safety margin to assure better customer service without supply disruption. This phenomenon is known as the "bullwhip effect" where a small variation in demand downstream generates increasingly larger demands as it progresses up-stream. Traditional, supply chain aims to reduce operating costs for firms by enhancing supply chain efficiency across its various processes. However, focusing only on cost-driven efficiency based strategy provides temporary competitiveness; it will not offer sustainable competitive advantages as products and services are not differentiated from competitors (Madhani, 2020a).

As an extension of the cost-focused (i.e. efficiency driven) supply chain, customer-focused supply chain provides better solution to cater changing customer needs. Table I, below shows major differences between traditional supply chains and customer-focused supply chains according to competitive priorities. Supply chain capabilities of responsiveness, resilience, reliability and realignment can be categorized as dynamic capabilities. Dynamic capability is the organization's capacity to create, extend, or modify competences (internal and external) to respond volatile and uncertain business environment. Such dynamic capabilities refers to the ability of an organization to meaningfully manage (i.e. integrate, build and reconfigure) its resource and hence can be differentiated from operational capabilities, which relates to existing processes of the organization. Thus dynamic capabilities of responsiveness, resilience, reliability and realignment provide competitive advantage for supply chain. It is mainly because these capabilities are built and revised according to market potential, structural changes in market as well as business conditions (Madhani, 2017).

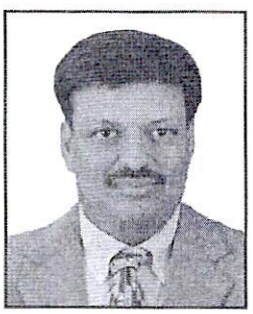
Table I: Traditional Supply Chains versus Customer-focused Supply Chains

Sr. No.	Competitive Priorities	Traditional Supply Chains	Customer-focused Supply Chains
1	*Responsive*	Modest ability to respond to changes	Quick ability to respond to changes by taking proactive actions
2	*Resilient*	Usually restricted to an individual supply chain / or a bunch of supply chains and hence provides limited flexibility	Develop a specified cluster of several supply chains for enhancing flexibility
3	*Reliable*	Focus on cost-efficiency	Focus on reliable and cost efficient supply chains
4	*Realigned*	Often supply chain participants are asked to make selection between self-interest and interest of supply chain partners	Usually interests of supply chain partners converge to develop better synergy

(Source: Tabulated by author)

Strategic Supply Chain Management : The supply chain management (SCM) operates at three levels: strategic, tactical and operational and the highest level of SCM decisions is the strategic - also referred as strategic supply chain management (SSCM) which is relevant to the entire organization. The main theme of SSCM is not limited to the use of a supply chain as a process to deliver goods and materials to right place, as its scope is extended to elevate strategic position of an organization by strengthening its overall business performance. SSCM is about strategic thinking on supply chain management to enhance the firm's performance (Madhani, 2020b).

Building a Customer Focused Strategy: Conceptual Frameworks and Research Propositions



Dr. Pankaj M Madhani
Associate Dean
ICFAI Business School (IBS)
Ahmedabad.
Email : pmadhani@iit.edu

Abstract

In today's highly competitive business environments, organizations tend to become more sensitive and responsive to the changing needs of customers. Inculcating and continually strengthening 'customer focus' is essential for achieving and sustaining competitive advantages for the organizations. The seven Cs framework and research propositions developed in this research is an actionable model for building a customer focused strategy in organizations. With this framework significant steps can be taken to strengthen an organization's customer focus. A strong customer focused strategy exhibits high ratings on all seven Cs: *CEO leadership*, *collaborative approach*, *compensation system*, *customer insight*, *criteria for decisions*, *competitor awareness* and a deep organizational commitment and contribution of all functions to creation of superior *customer value*, profitably. Research discusses customer focused strategy at Zappos and also provides numerical illustrations to calculate increase in firm valuation for a customer focused organization.

Lean Six Sigma Deployment in Retail Industry: Enhancing Competitive Advantages

The IUP Journal of Business Strategy, Vol. XVII, No. 3, September 2020, pp. 25-45

Posted: 27 Mar 2021

Pankaj Madhani (https://papers.ssrn.com/sol3/cf_dev/AbsByAuth.cfm?per_id=1906277)
The Icfai Business School (IBS), Ahmedabad

Date Written: March 25, 2020

Abstract

In today's competitive business environment, retail industries are under intense pressure to produce quality standards, enhance customer satisfaction, and generate positive bottom-line results. Hence, there is a great need for the deployment of Continuous Improvement (CI) methodologies such as Lean, Six Sigma, and Lean Six Sigma (LSS) in the retail environment. LSS deployment can give retailers the ability to create competitive advantages based on fulfilling customer needs with enhanced effectiveness and efficiency. The LSS Efficiency-Effectiveness (E-E) framework, developed in this study, sets a succinct research agenda on how efficiency and effectiveness drivers of retail operations induced by LSS deployment may affect a retailer's overall business performance. LSS transforms the retailers' overall business strategy from vision to reality by the execution of appropriate projects in retail operations. To highlight this transformation, the study provides several case studies of LSS deployment in the retail industry.

Abstract
Digital visibility through social media marketing has played a colossal role in the realm of entrepreneurship and fund raising. Strong positive dynamics between social media marketing and crowd-funding has the impending to decipher demand-supply gap of fundraising at the pre-seed stage. In this study, we explore the relationship between usage of social media and awareness of crowd-funding as a viable option for raising pre-seed capital in an emerging market of India which has witnessed the exponential growth of start-up companies and entrepreneurship in the past few years. The results of the study suggest that awareness of different options of crowdfunding for raising pre-seed capital is strongly correlated with the effective usage of social media platforms by the organizations. From an organization"s perspective, it has been found that effective use of Social Media platforms increases with the duration involved in social media platforms. The results of the study give a perspective for all entrepreneurs, fundraisers, and start-up companies that how digital visibility through social media marketing can unravel the problem of crowd-funding. With a growing trend of today"s youth using social media marketing worldwide, the strong dynamics between crowd-funding and social media marketing is expected to breed exponentially in terms of their contribution to the economy, wealth generation, and job creation.

Keywords: Social Media Marketing, Digital Visibility, Crowdfunding, Fundraising, Entrepreneurship, India.

1. Introduction

Start-up culture in India has been a significant contributor in terms of wealth generation, job creation and has made a significant contribution to India"s GDP in the last few years. India ranks 3rd in the global start up ecosystem (Economic Survey, 2019) with an awe-inspiring fact that start-ups have raised about $7.5 billion in funding in 2018 as against $4.3 billion in 2017. The role played by digital and social media marketing in the evolution of the start-up ecosystem has been imperative. Though the social media revolution has ensured relatively easy access to get funds, however, there still exists a

gap between demand and supply to raise capital at the pre-seed (Mollick, 2013). For a start-up revolution to continue progressing and thriving, pre-seed capital becomes an important dimension to consider. It"s a well-known fact that raising capital is not easy for Start-ups which are in their nascent stage. At this juncture, companies can consider crowd-funding which has already proved its importance in the context of developed nations and the social media revolution is making it even more significant from the perspective of a developing country like India.

Crowd-funding may be outlined as "the effort" undertaken "by entrepreneurial people and groups – cultural, social and for-profit – to fund their ventures by drawing on comparatively small" financial "contributions from a comparatively sizable number of individuals, without using standard monetary intermediaries"(Allison, Davis, Short, & Webb, 2014). It has also been witnessed that India has a significantly high exit for a large number of start-up organizations example: In Bangalore city which is

Panic During COVID-19 Pandemic! A Qualitative Investigation Into the Psychosocial Experiences of a Sample of Indian People

Gagan Deep Sharma[1], Amarpreet Singh Ghura[2], Mandeep Mahendru[3,4], Burak Erkut[5,6], Tavleen Kaur[7] and Deepali Bedi[8]*

[1] University School of Management Studies, Guru Gobind Singh Indraprastha University, New Delhi, India, [2] FLAME University, Pune, India, [3] State Bank Institute of Leadership, Kolkata, India, [4] State Bank Institute of Credit and Risk Management, Gurugram, India, [5] Department of Business, Faculty of Economics, Administrative and Social Sciences, Bahçeşehir Cyprus University, Nicosia, Cyprus, [6] Institute for Research in Economic and Fiscal Issues (IREF), Paris, France, [7] Department of Human Resource Management, ICFAI Business School, Gurugram, India, [8] Sukoon Psychotherapy Center, Gurugram, India

The outbreak of COVID-19 has spread to the entire world and is severely affecting social psychology. We conducted semi-structured interviews on 59 subjects from India to investigate the impact of information, misinfodemics (spread of wrong information), and isolation on their psychology. We perform qualitative analysis on the data. Our findings reveal that flow of information leads to anxiety, caution, and knowledge; while misinfodemics cause panic, distrust, and confusion; and isolation creates cognitive dissonance (the state of having inconsistent thoughts, beliefs, or attitudes) and adaptability among masses. The encouraging part of our findings is that, as of now, the situation is far from the state of depression. Practically, our research calls upon the government to support the masses in fighting through the crisis by focusing on pointed psychological counseling. We contribute theoretically to the body of knowledge in the field of social psychology, which is studying the psychological interventions to avoid panic amid pandemic. Future researchers in the area would do well by detailing the psychological interventions required to contain the negative impacts of the pandemic on social psychology.

INTRODUCTION

The coronavirus disease (COVID-19), which emerged in Wuhan (China) in December 2019, has spread throughout the world, infecting 2.5 million people and causing 179,000 deaths (as on 21 April 2020) (Worldometers, 2020).[1] COVID-19, declared a pandemic by the World Health Organization in March 2020, is generating stress among masses across the world (World Health Organization, 2020). As it is a new virus, the mechanism of action of severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) is relatively novel and no cure is currently available.

Abstract

Persuasive research shows that more credible sources of information are more influential in changing the attitude and gaining behavioral compliance. In this article, the authors examine whether perceptions regarding source credibility, realistic information and specific information in the web recruitment context differs on three different recruitment media. The three different recruitment media taken in this study are employee review website (www.glassdoor.com), professional networking website (www.linkedin.com) and the company's own webpages. The employee review website and professional networking website belong to the company independent website category since they are not controlled by a particular organization. The company's own webpages belong to a company dependent website category as every organization has its own website. This study compares and investigates company independent websites versus company dependent websites as a tool for providing recruitment communication on three different parameters, namely source credibility, realistic information, and specific information. The study is conducted in India and the results are based on responses obtained from 283 students actively looking for jobs. The results suggest that job seekers perceive company independent websites (employee review website and networking website) to be more credible. These websites provide more realistic and specific information than the company dependent website. The authors also examine the role of realistic information, source credibility and specific information as antecedents to organizational attractiveness. How social media can be instrumental in employee engagement is also discussed.

Online Young Consumer Shopping Self-Efficacy: An Indian Exploration

Vikas Gautam[a,*], Vikram Sharma[b]

[a] *Associate Professor, ICFAI Business School Hyderabad, India*
[b] *Faculty Member, ICFAI Business School Gurgaon, India*

ABSTRACT

The current study examined the Indian young consumer online shopping self-efficacy in an integrated model. Authors tested the study model (antecedents and consequences of online shopping involvement) with the help of 225 sample data by using first order structural equation modeling. Online shopping enjoyment was found most important predictor of online shopping involvement followed by online accessibility. Further, the impact of online shopping involvement on online shopping self-efficacy was quite high in comparison to online technical self-efficacy. We strongly recommend that the marketers must use internet strategically in establishing dialogue between seller and online shoppers.

Keywords: Online Shopping Enjoyment, Online Shopping Value, Online Accessibility, Online Parental Attitude, Online Shopping Involvement, Online Shopping Self-Efficacy, Online Technical Self-Efficacy

Ⅰ. Introduction

The entire world has witnessed rapid growth in commerce by internet mostly in last two decades. The internet has paved numerous opportunities to marketers across the globe. Online Shopping has become a trend in all age groups of consumers. E-retail revenues are projected to grow to 6.54 Trillion US dollars in 2022 (Statista, 2020). According to a joint ASSOCHAM -Forrester study paper, Indian electronic commerce revenue will reach USD 120 Billion by 2020 with annual growth rate of 51% (The Economic Times, 2016) The contributing factors for this mammoth growth will be high internet penetration, good economic growth and demographic dividend specific to India.

In this 21st century world, young generation is flooded with information at very high speed. Same is the case with Indian young generation. They are well versed with usage of internet. It has become very easy for marketers to target young consumers towards online shopping. Young consumers prefer

DOI: https://doi.org/10.46281/ijafr.v5i2.771

Keywords: Commodity Market, India, Spot Price, Futures prices, Seasonality, State Space Model, Kalman Filter.

Abstract

Futures trading is one of the oldest methods of trading and investing in commodities. History of commodities futures trading in India is interrupted, flabbergasted and disrupted unlike commodities future trading in Chicago Mercantile Exchange (CME), Chicago Board of Trade (CBOT), or London Metal Exchange (LME) where futures trading has been taking place uninterrupted for over a century. Prohibiting of futures trading in India in a large part of the last few decades has ensured research on commodities trading in India is still at an embryonic stage. In this study, we model Commodity prices of select Agriculture (Barley, Jeera, Sugar, and Pepper), Metal (Aluminium, Copper, Lead, and Gold), and Energy commodities (Crude Oil) in Indian Commodity Markets. Data during the Super-cycle period of commodities in India from 2003 to 2013 is used for the study and modeled using the state-space specification. The results of the study suggest that state-space specification and Kalman filter provides preeminent estimates for modeling and forecasting Indian commodity prices during the Super-cycle period. The results of the study provide crucial insights for pension funds, alternate investment funds, hedge funds and sovereign wealth funds worldwide to strategize better in

STRATEGIC SUPPLY CHAIN MANAGEMENT: A STRATEGIC APPROACH FOR ENHANCING BUSINESS PERFORMANCE

DR. PANKAJ M. MADHANI, ASSOCIATE DEAN AND PROFESSOR
ICFAI BUSINESS SCHOOL (IBS), AHMEDABAD, pmadhani@iit.edu

Introduction : There are various drivers influencing performanceof the firms. One of them, strategic supply chain approach, is about strategic thinking on supply chain management (SCM) to enhance the firm's performance.SCM is "the management of upstream and downstream relationships with suppliers and customers in order to create enhanced value in the final marketplace at low cost to the supply chain as a whole" (Christopher, 2011).SCM is a critical success factor for today's organizations.

Firms can experience improved performance through SCM by aligning various processes from customer and its upstream, and sharing relevant data for enhancing customer value proposition. SCM operates at three levels:strategic, tactical and operational (Cooperet al., 1997). The highest level of SCM decisions isthe strategic -also referred as strategic supply chain management (SSCM) which is relevant to the entire organization.

Any action plan to enhance supply chain (SC) performance makes efforts to align supply and demand, reduce overall costs and enhancecustomer satisfaction (Madhani, 2018).Bruceet al., (2004) defined a supply chain as "a process that describes the flow of goods from the production of a product right through to the final sale to the end consumer". According to Poluha (2006): "A supply chain is a coordinated system oforganizations, people, activities,information and resources involved inmoving a product or service in physical orvirtual manner from supplier tocustomer".

Conventionally, the focus of supply chainhas been on moving materials in the whole delivery process and hence it has been labeled as 'support' function in the value chain as support functions help firms in achieving their goals. The traditional supply chains have aimed to become leaner with shorter lead times and more cost efficient to lower costs (Christopher, 2005). However, with focus of only cost efficiency they are more vulnerable to unexpected events and as a result, they faced major problems such as stock outs and disruption of activities (Lee, 2004). In this context, strategic supply chains take a crucial role in enhancing efficiency and effectiveness of operations.Strategic supply chainsare capable of building competitive advantage by balancinghigher efficiencyrequirements along with better demand management while managing supply chain risks.

Strategic Supply Chain Management (SSCM): Key Dimensions : The main theme of SSCM is not limited to theuse of a supply chain as a process to delivergoods and materials to right place, asits scope is extended to elevate strategic position of a firm by strengthening its overall business performance.In this way, strategicsupply chainapproachtransforms traditional supply chain from a functional role that guides operational strategy as a supporting function to a central theme of the business strategy.SSCM can enable firms to create value in multiple ways and shows how the role of supply chain is being redefined, from an operational tool to a bonafide competitive strategic weapon.

The value of SSCM is reflected in how firms such as Wal-Mart, Zara, Toyota, and Dell have used their supply chains as competitive weapons to gain advantages over peers (Hultet al.,2007). These firms have created competitive advantage by balancing downward cost pressures and the need for efficiency, with effective means to manage the demands of market-driven service requirements and the known risks of routine supply chain failures.

In order to be competitive, firms have to design and manage a supply chain that is agile, adaptive, assured and aligned, i.e. develop the strategic supply chain.The most successful companies work within strategic supply chains that rapidlyrespond to short-term changes in immediate and ultimate customer' demands (i.e. agility),adjust to long-term changes in economies and markets by restructuring the supply chain(i.e. adaptability), offer robustness and reliability of supply chain network (i.e. assurance) and integrating and coordinating business processes resulting in anequitable sharing of risks, costs, and benefits with all participating partners (i.e. alignment).

The focus of SSCM is to identify thecritical combination of competitive priorities (quick response, higher flexibility, higher reliabilityandlow cost) in supply chains that can help organizations to succeed.Strategic supply chains do not aim to improve only one operational dimensionof supply chain but aim to maximize the total value added to the customer and to use supply chain as a means to create a competitive advantage and enhance firm performance. Therefore, strategic supply chains excel in their performance in relation to a set of competitive priorities and at the same time, they achieve sustainable competitive advantage (Figure 1).

Lean Six Sigma Deployment in Finance and Financial Services: Enhancing Competitive Advantages

Pankaj M Madhani*

Finance and Financial Services organizations are faced with the challenges of today's increasingly competitive and complex business environment. Finance and Financial Services have to enhance their efficiency and effectiveness and pro-actively manage their capability to ensure they meet the organization's objectives. In this context, it is necessary to find a method to improve the operational performance of Finance and Financial Services. The Six Sigma, Lean and synergies of both (i.e. Lean Six Sigma or LSS) are a key business strategy to enhance the quality and productivity of these organizations. With LSS initiatives, traditional Finance and Financial Services operations are transformed to represent the various competitive capabilities. LSS deployment helps Finance and Financial Services to transform and move from operational to tactical and finally to strategic role. This study explores diverse performance enhancement options and provides various frameworks to identify the various benefits as well as challenges of Lean Six Sigma deployment in Finance and Financial Services. The study also provides various illustrations of successful LSS deployment in Finance and Financial Services.

Introduction

Constant change in the external environment driven by heightened competition, more demanding consumers and a relatively unstable economic climate are just some of the challenges that organizations face in their day-to-day operations. Such changes call for enhanced firm capability in identifying new opportunities and sustaining superior performance. In present business scenarios, the competitions are growing at a very fast rate, due to which it has become tougher to control cost, quality, productivity and customer satisfaction. Competitive pressure forces companies to improve their support

Performance Optimisation of Retail Industry: Lean Six Sigma Approach

Pankaj M. Madhani, Ph.D.[1]

Abstract

Study of available literature indicates that Lean Six Sigma (LSS), because of its robust and flexible nature, fits into the fast-paced and dynamic competitive environment of the retail industry. Its deployment enables the retailers to review their existing operations and practices and guides them in making sustainable improvements. With LSS initiatives, traditional retail operations are transformed to represent various competitive capabilities. LSS also transforms the retailers' overall business strategy from vision to reality by execution of appropriate projects and creates new operational capabilities for the retailers. The present study focuses on development of a Retailers' Integrative Framework and a Financial Evaluation Matrix, which together set an agenda on how efficiency and effectiveness drivers of retail operations induced by LSS deployment may affect a retailer's business performance.

About

Abstract

This is part of a case series. Warehouse receipt financing (pledge financing) is a relatively new concept in India. Although it has been growing steadily, its outreach is still not significant enough to impact the lives of farmers in India. This case attempts to highlight the importance and benefits of warehouse receipt financing for farmers through the story of its protagonist Manjeet Singh, a small farmer from Govindpur village in Punjab, India. It compares all the agri-financing options available to him. After studying those options, the students can discuss their relative merits and demerits. It also brings to light the plight of farmers in India who in spite of having bumper crops, do not have storage options easily accessible, leading to crop damage and wastage and subsequently to income not commensurate with crop production.

About

Abstract

This is part of a case series. This case discusses the journey of a Trader from a Middleman to a Service Provider and how he did this by tapping the Commodity Derivative Market in India. Through protagonist Kundan Shah (Kundan), a trader from Punjab, India, the case draws attention to the importance of Warehouse Receipts under the inventory financing system. It also brings to light the different players of the collateral management system, their roles and responsibilities, and their importance in the entire inventory financing scheme. The case begins by highlighting the reducing profit margin for Kundan, a trader/middleman who is a part of the Agriculture Produce Marketing Committee (APMC) community, and purchases agri-produce from the farmers in mandis for reselling in the retail market at a better price and with a good profit margin. However, margins have decreased because fewer farmers are willing to sell their produce to these traders in light of various government initiatives and the improved financing options available to them. An example of such a government initiative is the National Agriculture Market (eNAM), which is a pan-India electronic trading portal that networks the existing APMC mandis to create a unified national market for agricultural commodities in India. So, small and fragmented farmers can get their agricultural produce price information and decide to store their produce in warehouses or to sell in mandis (market). Further, the case showcases how the margins have been going down year by year with lower procurements from the farmers. Faced with uncertainty over the sustainability of his business, Kundan is thinking of changing his trade from being an intermediary to becoming a warehouse service provider. The case also emphasizes the importance of warehouses and the role of the warehouseman in preparing Warehouse Receipts for agri-credit.

Abstract: New product development (NPD) is one of the most critical issues for the survival of knowledge-based companies in today's changing world. The purpose of the present study is to investigate the effect of high-performance work systems (HPWS) on new product development in knowledge-based companies through the mediating role of marketing capabilities. The statistical population consists of managers and staff of Iranian knowledge-based companies in Isfahan province. The results show that staff independence, training and development, participation in decision making, selective recruitment, job security, and performance management significantly affect NPD. In addition, that the job transparency variable does not have a significant impact on the development of new products in knowledge-based companies. The results of the mediation analysis hypothesis also show that HPWS have a positive significant effect on NPD through the mediating variable of marketing capabilities.

***Keywords**: high performance work systems; new product development; NPD; marketing capabilities; knowledge-based companies.*

- **Gender and Green IT practice- Implications from the ABC model of Attitude**

by Vinod Sharma, Manohar Kapse, Aruna Bala

Abstract: Society is increasingly changing and modernising. Traditional gender roles are no longer valid as world moves toward a gender equal society. This paper aims to examine the significance of gender difference in the attitude formation that would eventually result in green IT practice. The study is based on the fundamental affect-behaviour-cognition (ABC) model and it investigates the relationship between the beliefs of an individual and green IT practice with respect to the mediator green IT concern. The data was collected from 246 young respondents via purposive sampling technique and was analysed through regression analysis and average causal mediation effect (ACME). Green IT concern has been identified as a mediator and results also confirmed that females have a different ways of attitude formation compared to its male counterparts. Hence, to ensure employee engagement, it is very important to consider the factor of gender.

***Keywords**: green IT belief; green IT concern; green IT practices; ABC model; gender difference; average causal mediation effect; ACME.*

- **Preparing for Takeoff: Set up Social Media for Travel Planning**

by Sakshi Kathuria, RAISWA SAHA, J. Ramesh Kumar, Harbhajan Bansal

Abstract: This study witnesses the effects of perceived risk (PR), trust and subjective norm (SN) on attitude and behavioural intention (BI) of Indian travellers using social media for their travel planning. A survey was carried out with 288 respondents who used marketer's social media page for their decision-making in the past 12 months. A conceptual model was created after a careful review of literature and partial least square regression modelling was applied. The study focused on the under focused area, that is the influence of hotelier's social media activities on the travel planning. Most of the researches investigated the impact of online travel agents or the impact of user generated content (UGC), but, however the focus on the hoteliers' social media presence is seldom researched. This research is very useful for academicians, researchers and policy makers working with the social media market. Academicians may further explore the role of social media to have a better understanding of their impact on the theory of planned behaviour and its components.

***Keywords**: social media; tourism; risk; trust; subjective norm; theory of planned behaviour.*

- **Value relevance of financial reports and macroeconomic factors in defining stock price: Evidence from Indian stock markets**

by Ravi Kumar Jain, K. P. Venugopala Rao

Abstract: The aim of this study is to investigate the causality of the accounting information reported as per Indian Accounting Standards (Ind AS) adopted by the Indian companies from the accounting year 20162017 and the other nonaccounting information. This paper examines the value relevance of accounting information for companies listed on NSE using the vector auto regression model on the panel data for 20172019. The study suggests that the earnings per share, gross domestic product and the industrial index of production have significant explanatory power and had a causation effect on the market price of the shares of the companies. Whereas, the accounting information of book value per share and the net cash flow from investing

Seasonality in Indian Commodities Market: Insights for modeling from preceding commodity cycle

Sharon K Jose[1] **and Girish G P**[2]

Abstract

In this study we analyze seasonal behavior of Indian agriculture, energy and metal commodities through the ten years of preceding Super-cycle (2003-13) by considering monthly data for near month futures prices to remove basis variance. The thrust of the paper is to investigate seasonal behavior of selected commodities in India using monthly seasonal dummies. We found seasonal variation in four commodities namely gold, barley, guar and Jeera. In a declining interest-rate scenario and Post-Covid world, there is elevated likelihood that we are going to witness the next commodities super-cycle. It is imperative for hedge fund managers, global investors, commodities traders, high net-worth individuals, market participants and spread-traders to know what to expect based on the preceding super-cycle to strategize better and address seasonality.

JEL classification numbers: L61, L94, L95
Keywords: Commodity, Spot, Future, Hedging, Seasonality, India

1 Introduction

Seasonal variation in commodity prices and its impact on the relationship between spot and future prices are pertinent and are associated to investing in commodity markets. Commonly, it is believed that commodities spot prices are prejudiced by effects of seasonality which is defined as periodic, inveterate and predictable pattern in demand and supply of commodities. Gorton and Rouwenhorst (2006) claimed that seasonality in commodity spot prices will not impact futures returns since seasonal variation is predictable, and thus should already be rooted in the futures prices. Conversely Fama and French (1987) observed that the seasonal nature in the supply and demand of some commodities suggests they will contain seasonality in the basis and thus the term structure. Carter et. al (1999) found substantiation of seasonality in risk premiums and Grauer (1977) found confirmation of seasonality in commodity betas. Fama and French (1987) investigated the seasonal hypothesis for agricultural, wood, livestock, and metal futures. They did not find indication of seasonality in the basis for metals. Nonetheless, they did find strong seasonality for many agricultural commodities including corn, soybeans, and wheat.

In Indian context, Jose and Girish (2020) in their study modeled and forecasted Indian commodities market using state-space specification and Kalman filter providing preeminent estimates for Super-cycle

Abstract. World is witnessing a trend of countries adopting renewable energy sources viz.a.viz. Fossil fuels dominated energy sources. International Energy Agency believes that by 2025 energy produced from Renewable energy sources will most likely surpass electricity generated by coal. India being one of the largest producer and consumer of electricity in the world is already one of the largest producers of energy from renewable sources in the world with 38%+ of India's total installed capacity from renewable energy sources. In this study we analyze and review the role that Renewable Energy is going to play in India's Energy basket. With growing dependence on non-fossil fuels, it's imperative for industry participants, policy makers, governments and researchers to decipher what is the role that is going to be played by energy produced from renewable energy sources in India's energy basket from a strategic as well as policy making perspective.

1. Introcuction

International Energy Agency (IEA)'s 2020 report indicates that by 2025 energy produced from Renewable energy sources will most likely surpass electricity generated by coal [1]. India is already one of the large producers of energy from renewable sources [2]. As on November 2020, more than 38%+ of India's electricity generation installed capacity is contributed by electricity generated from renewable energy sources [3] [8]. World is witnessing a trend of countries adopting renewable energy sources viz.a.viz. Fossil fuels dominated energy sources.

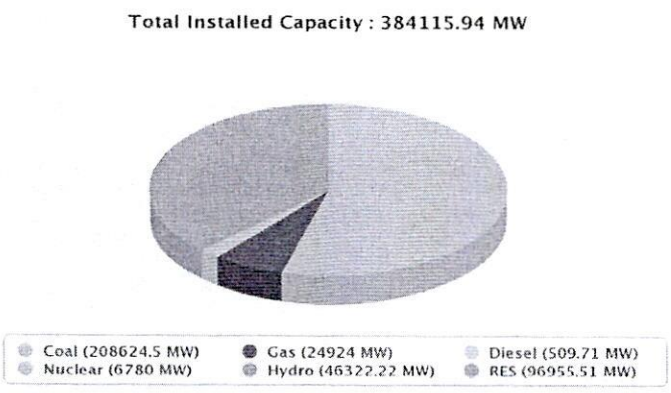

Figure 1. Total Installed Generation Capacity in India (as on June 2021) [3]

Six Sigma Deployment in HR: Enhancing Competitiveness

Pankaj M. Madhani

Abstract

Six Sigma is a disciplined, quality approach and philosophy for eliminating defects in any process – from manufacturing to transactional and from product to service. Six Sigma is flexible enough to be applied to different challenges throughout business and organizations can use it in diverse areas such as HR. Six Sigma deployment in HR helps in its reengineering by increasing the speed, quality and efficiency of HR services. Six Sigma deployment in HR is important for overall performance and growth of business. This research provides HR process improvement steps in terms of efficiency and effectiveness, develops various frameworks for its successful implementation and document benefits of Six Sigma deployment in HR with various case studies.

Key words : *HR, Six Sigma, TQM, HRM practices, DMAIC, Competitive advantages*

pmadhani@iit.edu

In this highly competitive environment every functional areas of an organization needs to perform better, faster and cheaper, to keep the company ahead of the competition. In this context, human resource (HR) function is no exception as more cost effective and streamlined HR processes will create value for the organization, instead of just being a support function for the management. By aligning HR processes and scientifically building human capital, HR can contribute significantly to the organization's effectiveness and competitiveness (Becker and Huselid, 1998). Effective and efficient HR practices will streamline efforts of various functional departments in the organizations and thus increase the overall customer value. Six Sigma is well suited to contribute to and support these efforts of the organizations due to its focus on problem identification, process improvement, and its emphasis on the customer. Six Sigma aims to reduce variation in manufacturing and business processes and was adopted by a large number of companies in the 'Fortune 500' list with a view to make measurable improvements and savings based on evidence.

Six Sigma is a data-driven improvement methodology that emphasizes defect prevention over defect detection by

Abstract

High-road approach organizations deploy commitment-based / high performance working HRM systems and see employees as a sales driver rather than a cost driver They have a long-term perspective and make more investment in their HR by paying them above the industry average and implement policies and practices that focus on employee engagement, satisfaction, and service orientation to enhance organizational performance. This research views compensation and benefits practices through the lens of a high-road approach and provides various frameworks to emphasize the role of the high-road approach in enhancing employee commitment, engagement, loyalty, productivity, and retention thus, leading to healthier organizational growth. The research provides various illustrations to explain how companies have initiated a high-road approach to compensation and benefits practices and improved their overall performance. Research also discusses the barriers to high-road approach adoption and identifies prerequisites for its successful implementation.

ENHANCING RETAIL WORKFORCE PERFORMANCE WITH A REAL-OPTIONS APPROACH

The traditional retail industry carries a long overall impact in the global economy, occupying a vital position in the supply chain and serving as a major employer. The brick-and-mortar retail has been facing very challenging times in recent years due to extremely high competitiveness, soaring customer expectations, and the increasing proliferation of online retailers. Those challenges have been exacerbated by COVID-19 as mostphysical stores closed with lockdowns, forcing shoppers to stay away, and millions of retail workers were unable to do their jobs from home. The retail sector is very labor-intensive, so any disruptions have disproportionate employment consequences. The retail sector also relies on low-wage and part-time, on-call and gig workers who are not well covered by traditional social protection measures, which further strengthens the social consequences of the crisis in this sector.

Pankaj M. Madhani, Ph.D.
ICFAI Business School

The COVID-19 pandemic has caused a sudden and severe impact on retailers as they experienced a significant shock to both supply and demand on an unprecedented scale, compounded by statutory measures that restricted the movement of people and goods. COVID-19 has been

Abstract

The evolution of Lean Six Sigma includes both the speed of Lean and the robustness of Six Sigma. Lean Six Sigma leads to greater efficiency and better quality in the finance and accounting process. Lean Six Sigma helps in solving various issues faced by finance and accounting processes. Applying the principles and discipline of Lean Six Sigma in finance and accounting provides the tools and discipline to strengthen the internal control environment while at the same time ensuring that the information flows are efficient. Lean Six Sigma is the predominant process management methodology for finance and accounting services as it is rapidly transforming how finance and accounting functions are managed. Research provides a set of guidelines in the form of the smooth deployment of Lean Six Sigma in finance and accounting services and develops various frameworks for emphasizing its operational, tactical, and strategic benefits. Research also provides various illustrations of successful Lean Six Sigma deployment in finance and accounting.

Retail Workforce Sizing Strategy for Enhancing Service Delivery and Store Performance

Pankaj M. Madhani, ICFAI Business School, India
https://orcid.org/0000-0002-8810-3201

ABSTRACT

The retail workforce is a strategic lever of the retailer for improving sales growth, market share, and profitability. With optimal retail workforce sizing and structure, customers would get prompt sales assistance and service, shelves should be replenished in a timely manner, store employees should be neither idle nor overstretched, and compensation costs should be managed effectively. Undersizing may hurt retailers in the long run as it affects merchandising capability and customer services, which ultimately hurt store sales and profits. Retail workforce optimization keeps store employees happy, improves customer service, and reduces opportunity costs of lost sales. The research provides various frameworks that outline the impact of undersizing in retail stores on sales and profitability and provides a methodology to determine the optimal workforce size. The research also provides an illustration with various scenarios to investigate whether a retail store is understaffed and calculates the financial impact of undersizing on revenue and profitability.

Building a customer-focused culture with rewards alignment: a cross-sectional analysis

by Pankaj M. Madhani

International Journal of Electronic Customer Relationship Management (IJECRM), Vol. 13, No. 1, 2021

Abstract: In today's highly competitive business environments, organisations tend to become more customer-focused, and accordingly, they recognise the need to build customer-focused culture and relevant strategies to gain a competitive advantage. Organisation culture determines the norms in the organisations that dictate how members of organisations should think and behave. This research develops various frameworks for building customer-focused culture and provides illustrations of convergence as well as divergence of organisational culture and compensation/rewards strategy. Research emphasises mutual interdependence of organisation culture and compensation and rewards strategy and explains the role of financial and non-financial rewards in building customer-focused culture.

Abstract

Human resource (HR) is the backbone of an organization and hence, there is need to build its underlying capabilities for effective service delivery. Six Sigma aims at improving the effectiveness of processes by collecting data and then using advanced statistical analysis tools to solve the problems. Six Sigma deployment in HR provides consistency in operations and leads to quality excellence by providing better services at lower costs. Six Sigma approach adds more science to the art of HR, which is used to measuring outcomes it can control, rather than those it can influence. Six Sigma deployment in HR transforms typical HR practices with a proactive approach and leads to better, faster and more cost-effective services; improve internal customer satisfaction and greater motivation and job satisfaction of employees. The research develops various framework for Six Sigma deployment in HR and provides case studies of successful Six Sigma deployment in various areas of HR.

THE REWARDS VALUE CHAIN: OPTIMAL MIX OF TANGIBLE AND INTANGIBLE REWARDS FOR ENHANCING BUSINESS PERFORMANCE

Pankaj M. Madhani, Ph.D.
ICFAI Business School

An organization's performance depends on its rewards management system. Effective rewards systems are designed to attract and retain suitable employees, motivate employees in terms of higher engagement and commitment levels, minimize conflict, and boost organization productivity (Armstrong 2010). Such rewards systems, through the optimal mix of tangible and intangible rewards, successfully balance competing objectives to simultaneously meet the needs of employees, customers and the organization, and maximize value of the organization.

Effective rewards systems deliver tangible rewards great enough to attract talented employees and intangible rewards sufficient to motivate them. According to Herzberg's motivation and hygiene theory, salary and other financial rewards (i.e., tangible rewards) only help prevent employees' dissatisfaction, but intangible rewards, such as recognition, can contribute to long-term positive effects on employees' job satisfaction (Herzberg, Mausner, and Snyderman 1959). Accordingly, tangible rewards (i.e., pay) are not a motivator of performance for employees, but play a maintenance role in keeping

Deploying a "Good Jobs" Strategy in Service Sectors for Enhancing Competitive Advantage

Pankaj M. Madhani, ICFAI Business School, India
https://orcid.org/0000-0002-8810-3201

ABSTRACT

Many service companies believe that there is a trade-off between investing in employees and offering the lowest prices. They offer few benefits, no career paths, and, hence, are considered as bad jobs. Conventional wisdom holds that bad jobs are the unavoidable price of low-cost service. However, this research emphasizes that investing in people and processes actually can boost customer experience and decrease costs. The good jobs strategy is a model for investing and empowering front-line employees in service industries and revamping operations to support those employees. The good jobs strategy is an approach to improving productivity and customer satisfaction in service industries. This research works in this direction and develops various frameworks for smooth deployment of the good jobs strategy. The research also formulates financial measurement and evaluation models for calculating benefits of the good jobs strategy and provides diverse illustrations of its successful deployment.

KEYWORDS

Bad Jobs, Cross-Training, Employee Turnover, Good Jobs, Human Resources, Operations, Retail, Service Industry, Simplification, Slack, Standardization

1. INTRODUCTION

There has been a lot of discussion over the last few years about the growth of the services sector - in terms of nations' GDP and people's occupations - compared to the manufacturing sector, which had dominated the business scenario earlier. Service-related jobs and activities have grown to encompass a much larger share of the global economy and job market. The service sector grew significantly in the late twentieth century, to the extent that 80 percent of jobs in the USA were offered by service companies (Heineke and Davis, 2007). More than 80 percent of all jobs in the USA are in the service sector (Bureau of Labor Statistics, 2015) which is 11 percent higher than service-related employment in 1990. Similarly, significant proportions of the gross domestic product generated in emerging economies can be attributed to services (Loungani and Mishra, 2014). As of June 2020, 117.36 million people in USA (85% of all nonfarm payroll employees) worked in private service-providing industries. Among the major service-industry sectors, the biggest was trade, transportation and utilities (Bureau of Labor Statistics, 2020).

Service jobs are also undergoing significant changes as a result of technological innovations; check-in kiosks; robo-advisors, and self-checkouts - all of which suggesta trend toward the automation of many standard customer-facing tasks (e.g. retail, banking, insurance and financial services) (Singh *et al.*, 2017). These trends suggest a need to essentially redesign frontline employee roles to integrate

Marketing and Supply Chain Management Integration: Enhancing Customer Trust, Loyalty, and Retention

Pankaj M. Madhani
Dean & Professor
ICFAI Business School

Introduction

Marketing and supply chain management (SCM) are highly related. Marketing is of crucial importance to the creation of value in supply chains. Marketing and supply chain professionals need to have a strong understanding of how the two functions harmonize. The marketing and SCM fields are so broad, interconnected, and overlapped that it can be harder to think of how they differ, than how they relate. When resources, decisions, and efforts from both functions synergically unify together, organizations can get a more powerful impact on the results they pursue. They can satisfy customer demand triggered by the company's advertisements, and by making their products and services consistent, companies can build long-term trust. When the two functions perform disjointedly, the organization starts pursuing different internal goals, which frequently leads to dysfunction or even disaster. Enhancing cross-functional integration of marketing and SCM aligns demand and supply management processes, reduces stock-out situation, and enhances customer satisfaction, trust, loyalty, and ultimately customer retention.

Marketing and SCM: Definitions and Key Features

The influence of marketing activities on the supply chain, and vice versa, have to be understood and coordinated, for example, pricing, promotion, as well as product mix efforts influence delivery times and supply chain costs. Similarly, supply chain costs strongly impact the marketing success of the product and ultimately the organization's profitability. Thus, these two business functions viz. marketing and SCM have a strong complementary relationship. The definitions of marketing and SCM identify a common thread between them. Hence, it is important to define these functions.

Marketing

In 2017, American Marketing Association (AMA) approved and defined Marketing as: "Marketing is the activity, set of institutions, and processes for creating, communicating, delivering, and exchanging offerings that have value for customers, clients, partners, and society at large." (https://www.ama.org/the-definition-of-marketing-what-is-marketing/).

SCM

The Council of Supply Chain Management Professionals (CSCMP) defined SCM as: "Supply chain management encompasses the planning and management of all activities involved in sourcing and procurement, conversion, and all logistics management activities. Importantly, it also includes coordination and collaboration with channel partners, which can be suppliers, intermediaries, third-party service providers, and customers. In essence, supply chain management integrates supply and demand management within and across companies." (https://cscmp.org/CSCMP/Educate/SCM_Definitions_and_Glossary_of_Terms.aspx).

Madhani, Pankaj M. (2021). Marketing and Supply Chain Management Integration: Enhancing Customer Trust, Loyalty, and Retention. *Marketing Mastermind*, Vol. 18, No. 5, pp. 49-58.

ENHANCING EFFICIENCY AND EFFECTIVENESS IN RETAIL SUPPLY CHAIN MANAGEMENT: DEVELOPING A CUSTOMER-FOCUSED APPROACH

PANKAJ M. MADHANI
ASSOCIATE DEAN & PROFESSOR, ICFAI BUSINESS SCHOOL (IBS)
pmadhani@hawk.iit.edu

Introduction : Retailers offer a very wide range of goods, staple and changing fashion goods, from clothing to homeware, from accessories to furniture or white goods, often also food including fresh food. There are various retail formats (stores), such as grocery stores; specialty, apparel, and convenience stores; discount, entertainment, and quick-service restaurants. Major retailers closer to the consumer (e.g. Wal-Mart, Target, Best Buy, etc.) are now taking the lead where manufacturers once dominated supply chain issues (e.g. Proctor & Gamble, Unilever, etc.). Today, retailers are the controllers of product supply while still meeting real-time customer demand. Fierce competition in today's retail space with e-retailing and augmented expectations of customers has required retailers to invest in their supply chains for better performance. In the retail environment, market competition today takes place between supply chains rather than between individual retailers.Retailers' performance is affected by supply chain practices such as the use of technology, supply chain speed, customer satisfaction, supply chain integration, and inventory management.

Retailers are an essential part of the supply chain because of their proximity to customers. The retail supply chain's key aim is to bridge the gap between the point of production and the point of sale. Retailers now have various options to meet the needs of their customers (e.g. from stores, from warehouses, or directly from the suppliers, etc.). With the introduction of store brands or private labels, more retailers are developing deeper integration with manufacturers and even raw material suppliers. Supplier relationships in the upstream and customer relationships in the downstream are also important facets of retail supply chain management.

Retailers, usually face significantly more partners in the supply chain as a major retailer could have hundreds or thousands of vendors to supply its products compared to a much more controllable number for the manufactures. A large-scale retailer uses several brands and suppliers for the same product category while it sources inventories from many suppliers. Thus, the retail supply chain management needs to have more ability to scale more effectively and efficiently for better supply chain coordination. As shown in Figure 1, wholesalers (vendors), warehouses (distribution centers), retailers (stores), and customers are the four main components of a typical retail supply chain management network as they have direct linkages. The manufacturers and suppliers represent indirect linkages for the retail supply chain.

Retailers now control, organize, and manage the supply chain from production to consumption and thus contribute to the transformation of the retail supply chain.It has become important to understand supply chain management (SCM) from a retail perspective as with the evolution of power on the demand side, SCM is considered as the source of competitive advantage for retailers.Research works in this direction and discusses the contribution of retail supply chain management in enhancing customer value and service delivery as well as the profitability of retailers.

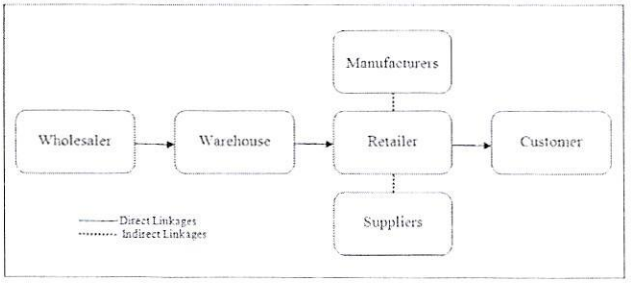

Figure 1: Retail Supply Chain Management Network: Direct and Indirect Linkages

(Source: Framework Developed by Author)

Customer-focused SCM: A Key Driver of Retail Success

The COVID-19 pandemic has caused a sudden andsevere impact on retailers as they experienced a significantshock to both supply and demand on an unprecedentedscale, compounded by statutory measures that restrictedthe movement of people and goods.During the COVID-19 pandemic, many retailers experienced stock shortages and unprecedented demand spikes (Madhani, 2021a).It has never been more important to manage supply and demand fluctuations in retail supply chains. With the increased demand and supply uncertainty, retail businesses have become extremely complex. Because of the shorter product life cycle (PLC) and the need to reduce the time to market, it is becoming increasingly necessary for retailers to deliver value to the customers. Increased competition from online shopping threatens the very existence of

Retail Supply Chain Management: Building a Customer-Focused Approach with Competitive Priorities

*Pankaj M Madhani**

Retailing is immensely important to the global economy as it represents a substantial part of the economic activities of both developed and developing nations. Retailers are the terminal points of a supply chain, where products and customers meet, and sales revenue is generated for the entire supply chain, necessitating effective retail Supply Chain Management (SCM). Today's retail supply chains are dealing with a business environment that is becoming increasingly complex, competitive, and uncertain due to changing and unpredictable customer demand. As a result, there is a requirement to build customer focus in retail SCM. Customer-focused retail SCM enhances customer value proposition as it helps retailers to sense customer demand, respond in real-time, and deliver a superior consumer experience every time, while minimizing time to market, lowering overall costs, and increasing productivity. It also improves a retailer's top and bottom lines by enhancing the retailer's ability to become more agile, assured, adaptive, and aligned to the dynamically changing environment, with a greater emphasis on the customer. In this study, a business value-added framework is developed, with the emphasis on various competitive priorities (i.e., responsiveness, reliability, resiliency, and realignment) as important drivers of customer-focused retail SCM for enhancing customer value propositions.

Introduction

Fierce competition in today's retail space with e-retailing and augmented expectations of customers has required retailers to invest in their supply chains for better performance. It has become important to understand Supply Chain Management (SCM) from a retail perspective as with the evolution of power on the demand side, SCM is considered as the source of competitive advantage for retailers (Davies, 2009). SCM is an integration of all activities associated with the flow of goods, starting from raw material to the final product reaching the customer. SCM emphasizes how to maximize the overall value of the firm by better deploying and using the resources across the whole of the firm. Hence, SCM can improve the performance by integrating key business processes from end users through suppliers and customers by providing products, services and information that add value to customers (Afshan, 2013; and Afshan and Motwani, 2021). In recent years, retail SCM, in which the retailer assumes leadership of the entire channel, has become a hot topic in modern SCM (Agrawal and Smith, 2015). Lambert and Cooper (2000) emphasized that

HR Options: Enhancing Human Resources Flexibility with Real Options Approach

Pankaj M. Madhani
pmadhani@iit.edu

Associate Dean & Professor
ICFAI Business School (IBS)

Introduction

Directly or indirectly environmental uncertainty hurts an organization's ability to meet financial performance indicators. During the period of environmental fluctuations, sales revenue and volume remain stagnant or turns down, profitability also declines. Hence, there will be upward pressure on revenue growth and a downward squeeze on costs. The reduction in spending inevitably means that there will be a tightening of expenditure budgets. Organizations emphasize do more with less during the period of environmental uncertainty and hence take every opportunity to cut costs and arrest declining revenues and margins. In this scenario, organizations need the flexibility to cope up with environmental uncertainty. Flexibility becomes essential especially in the present dynamic environment, which is marked by faster technological changes, competition extending beyond domestic players, continuous change in consumer needs and preferences, the pandemic situation caused by Covid-19, and subsequent economic downturn creating uncertainty in the external environment and subsequently impacting the internal environment of the organization. Flexibility is the ability of an organization to respond or adapt to various demands from its dynamic competitive environment faster or bring a change in the environment itself and thus manage uncertainties proactively to achieve a competitive advantage over its rivals.

Organizational flexibility is the main capability that enables organizations to face environmental uncertainty, as it makes them more responsive to change. If the external environment is highly dynamic, volatile, and in a constant state of flux, an organization can't afford to exist in a stationary state. Organizations have to continuously renew itself if it wants to survive and prosper in such unstable and unpredictable environments. With organizational flexibility, the organization responds or adapts to dynamic environmental situations to achieve a competitive advantage over its competitors. Flexibility is valuable to organizations as it provides them with the ability to adapt when faced with uncertainty and ensures that an organization continues to achieve a fit with its constantly changing external environment over time.

Organizations achieve flexibility through the combination of resource and coordination flexibility. Resource flexibility is achieved by the utilization of a resource for varied purposes. The larger is the number of alternative uses for a given resource, the lesser is the cost and difficulty of switching across different uses and lower is the time needed to change from one use to another and the higher is the resource flexibility. Resources can be effectively deployed through various organizational processes.

DEPLOYING A CUSTOMER-FOCUSED SUPPLY CHAIN STRATEGY WITH 4RS (RESPONSIVENESS, RESILIENCY, RELIABILITY AND REALIGNMENT) MODEL

PANKAJ M. MADHANI, ASSOCIATE DEAN & PROFESSOR
ICFAI BUSINESS SCHOOL

Introduction : In today's world of complex and extremelycompetitive business milieu,firms are struggling to survive as product lifecycles (PLCs) have become shorter, clock-speed has become faster, and the consequences of disenchanting a customer have become more severe. In today's competitive business environments, firms are under intense pressure to systematically produce quality control and quality standards and generate positive bottom line results. That's why many firms are looking for ways to be more productive, creative and competitive as these factors affect their performance.

To improve business performance in rapidly changing environments, supply chain performance can be a crucial prerequisite.The supply chain is one of the key lifelines of an organization hence, it has to transit from being simply a supporting activity to becoming an integral part of business strategy. Differentiation through customer service is the most effective way to improve business performance, and customer-focused supply chain strategy can help to achieve high-level customer service.

Traditional Supply Chains versus Customer-focused Supply Chains : The traditional supply chainin which the end point of networks are represented by final users,is no more relevant today, as such cost-focused supply chains driven by efficiency criteria are more susceptible to unforeseen swings in demand.In the traditional supply chainfunction, the major focus is on demand forecasting function while synchronizing distribution function.

However, onlya customer order drives real demand in the process and fills the supply chain. Hence, each supply chain member overestimates the customer demand to avoid stock-out situations. Usually, each supply chainentity "over-plan" stocksand keep safety margin to assure better customer service without supply disruption. This phenomenon is known as the "bullwhip effect"where a small variation in demand downstream generates increasingly larger demands as it progresses up-stream.

Traditional, supply chain aims to reduce operating costs for firms by enhancingsupply chain efficiency across its various processes. However, focusing only on cost-driven efficiency based strategy provides temporary competitiveness; it will not offer sustainable competitive advantages as products and services are not differentiated from competitors (Madhani, 2020a).

As an extension of the cost-focused (i.e. efficiency driven) supply chain, customer-focused supply chainprovides better solution to cater changing customer needs. Table I, below shows major differences between traditional supply chains and customer-focused supply chains according to competitive priorities. Supply chain capabilities of responsiveness, resilience, reliability and realignmentcan becategorized as dynamic capabilities.

Dynamic capabilityisthe organization's capacity to create, extend, or modify competences (internal and external) to respond volatile and uncertain business environment.Such dynamic capabilities refers to the abilityof an organization to meaningfully manage (i.e. integrate, build and reconfigure) its resource and hence can be differentiated from operational capabilities, which relates to existing processes of the organization. Thus dynamic capabilities of responsiveness, resilience, reliability and realignment provide competitive advantage for supply chain. It is mainly because these capabilities are built and revised according to market potential, structural changes in market as well as business conditions (Madhani, 2017).

Table 1: Traditional Supply Chains versus Customer-focusedSupply Chains

Sr. No.	Competitive Priorities	Traditional Supply Chains	Customer-focused Supply Chains
1	*Responsive*	Modest ability to respond to changes	Quick ability to respond to changes by taking proactive actions
2	*Resilient*	Usuallyrestricted to an individual supply chain / or a bunch of supply chains and hence provides limited flexibility	Develop a specified cluster of severalsupply chains for enhancing flexibility
3	*Reliable*	Focus on cost-efficiency	Focus on reliable and cost efficient supply chains
4	*Realigned*	Often supply chain participants are asked to make selection between self-interest and interest of supply chain partners	Usuallyinterests of supply chain partners converge to develop better synergy

(Source:Tabulated by author)

Strategic Supply Chain Management : The supply chain management (SCM) operates at three levels: strategic, tactical and operational and the highest level of SCM decisions is the strategic - also referred as strategic supply chain management (SSCM) which is relevant to

Six Sigma in Marketing: A Key Differentiator

Pankaj M. Madhani
pmadhani@iit.edu

Associate Dean & Professor
ICFAI Business School (IBS)

ABSTRACT

Six Sigma provides a quantitative, statistical notion of quality useful in understanding, measuring, and reducing variation. Six Sigma deployment in the marketing process focuses on an evidence-based approach (management by fact) to make better decisions for making significant process improvement. With a proactive approach, the Six Sigma deployment adds more 'science' to the art of marketing. Six Sigma can be used in diverse areas of marketing e.g. improve on-time delivery; improve sales forecasting ability; improve quality of customer service, etc. Six Sigma implementation in marketing is highly beneficial for the company's overall growth, success and development, as it contributes to increased market performance, competitiveness, and superior value creation. The research also explains the DMAIC methodology for Six Sigma deployment in marketing. Various companies have incorporated Six Sigma in their marketing processes with the goal of enhancing customer satisfaction, sales income, business growth, and profitability.

Introduction

In today's fast-changing global market scenario and highly competitive business environment, organizations are struggling to survive and hence, are in dire need of managing their different organizational functions most effective and cost-effective way. In this situation, a customer-focused function such as marketing and sales has come under intense pressure to perform. As customers are becoming more demanding, customer preferences are changing very fast, Product Life cycles (PLCs) becoming shorter, new products are introduced frequently and quickly, the consequences of disenchanting a customer have become more severe and hence marketing needs to enhance its efficiency and effectiveness. Six Sigma implementation, as a fact-based, data-driven, and disciplined approach, aids marketing in increasing market share by offering superior value to targeted products/markets.

Statistically, Six Sigma means 3.4 defects per million opportunities (DPMO) while in management terms, it is an improvement methodology that aims to reduce the cost of poor quality by focusing on process effectiveness and efficiency. By improving the speed, quality, consistency, and productivity of its services, Six Sigma implementation will assist in the reengineering of marketing processes. Six Sigma deployment in the marketing process focuses on an evidence-based approach (management by fact) to make better decisions for making significant process improvement. While Six Sigma is not commonly used in marketing and sales, it has the great potential to provide huge benefits.

Abstract -
India is the fifth largest economy in the world, with the second largest population and currently enjoys a favourable demographic dividend. HR managers play a major role in implementing technological advancement which has a significant impact in sustainable business and economic development. HR functions help organisations to improve its functionalities such as flow of information, labour productivity, core competencies, employee performance that improve the business sustainability as a whole. This paper tries to understand the effectiveness of recent technological changes in an organisation and its implications on performance and labour productivity by conducting in-depth interviews with senior HR managers of various companies. Artificial intelligence, robotic, IoT, business process automation reduce human errors, bring strategic changes and radical transformation in organisation which will help to align different HR functions to achieve organisational excellence.

Keywords - Artificial Intelligence, Human Resource, Labour Productivity, Organisational Excellence, Robotics, Sustainability

I. INTRODUCTION

Sustainable business has better chances of being more successful tomorrow than it already is today. The role of HR is imperative in achieving sustainability in this ever-changing era flooding with new technologies each day. The major challenge for the HR professionals is to ensure higher labour productivity but in a sustainable manner. This paper focuses on the need for technological upgradation and integrating HR practices to increase labour productivity for business sustainability. The sustainability and hindrance of any organisation is significantly affected by the human resource strategy of the organisation. Improvising technological upgradation leads to more cost to the organisation. The implication of the process and through training and development by the HR department will enhance the skills of the labour forces. The crucial processes of talent management, retention of skilled, experienced and productive employees are also driven by the human resource functions and that leads to sustainability in business environment.

This research paper focuses on the need of implementation of upgraded technology such as Artificial Intelligence (AI), robotics, internet of things (IoT) etc, in an organisation to sustain in the competitive business. Implementation of changes followed by adequate training is a major challenge and the HR functions play a vital contributions to the sustainability programs for skill development that enhance labour productivity. In the era of modernisation the AI, big data, analytics, robotics become important in an organisation for sustainability. The effectiveness of sustainability in business, depends on fast adaptability in effective change management, the creation of organization structures, and upgradation in business strategy that allow employees to perform well. Quickly adapting new technological upgradation in an organisation makes their performance, labour productivity higher.

ABSTRACT

Year 2020 brought a huge challenge in business environment all over the world due to COVID-19. India is not an exception and faced similar challenges which impacted heavily on the economy. India has a huge retail market being the second largest populous country in the world with huge potential and young workforce. It is an important factor for the GDP growth of any country. The aim of this paper is to compare the past, present and predict the future economic scenario by considering various factors which majorly impacted the retail market due to COVID-19. A huge transformation observed in the retail business. Buyers' choices shifted away from local retail purchases to online. Buying behaviour and consumer spending have shifted towards online purchases and also card transactions. This research also aims to study the impact of COVID-19 on Indian economy and way out of the downfall.

Customers Perceptions of Online Retailing Service Quality and Their Loyalty

Vikas Gautam, Department of Marketing & Business Strategy, ICFAI Business School

Vikram Sharma, Department of Marketing, ICFAI Business School

Abstract

Computer-assisted services have developed in abundance and contributing substantially towards swift progression of Internet espousal. The main objective of the current study was to examine the effects of E-Service Quality (website design, reliability, privacy/security, and customer service), Customer Perceived Value, Corporate Image, Customer Satisfaction, Trust, and Commitment, on customer Loyalty. After theoretical considerations, a research model was developed and empirically tested. 243 eligible responses were collected via an offline questionnaire survey. Higher order Structural Equation Modeling results confirmed significant effects of customer satisfaction, corporate image, and commitment on customer loyalty by explaining 79.70 % of variance. Whereas, trust proved to be insignificant predictor of customer loyalty. Commitment was not found having significant mediating effect in the relationship between customer satisfaction and loyalty. On the other hand, corporate image has an indirect positive effect on customer loyalty through customer satisfaction. Moreover, electronic service quality has a direct and indirect positive effect on customer satisfaction through customer perceived value. Drawing from the results, this research provides empirical support that customer loyalty can be influenced by e-service quality, customer perceived value, customer satisfaction, commitment, and corporate image in online retail context.

Keywords

E-Service Quality, Customer Perceived Value, Customer Satisfaction, Commitment, Corporate Image, Trust, Customer Loyalty.

Introduction

Past few decades have witnessed a rapid growth in Electronic-commerce market. This growth has resulted in drawing attention of social science researchers across the globe towards electronic marketing activities. Every organization dreamt of having large loyal customer base, thus all global e-commerce companies are developing strategies to achieve customer loyalty. According to Parasuraman & Grewal (2000), inducing loyalty among customers demand ingredients like; superior quality products, superior value and flawless after-sales service. As well, customer delight is as indispensable key to achieve customer loyalty (Oliver, 1999). The service quality provides significant information and feeling to prospects and customers in virtual shopping context, as it does in case of brick and mortar retail store. Several management scholars have confirmed tangible and intangible benefits for the companies resulting from customer's loyal behavior. Reichheld (1996) identified positive word of mouth and product recommendations as intangible benefits, whereas repeat purchases as tangible benefits. In addition, loyal customer saves money for the company and maintains long term relationships. Customer satisfaction is very important to ensure loyalty (Anderson & Srinivasan, 2003; Oliver, 1999), whereas customer perceived value is considered a critical component of customer satisfaction (Cronin et al., 2000). Perceived customer value is understood as what benefits a customer receive in relation to the costs incurred in the transaction.

Parasuraman & Grewal (2000) found evidence for strong relationship between customers' perceived value and purchase/repurchase intentions. In virtual retail context, customers continue to put their regular and continued efforts to find better value for their money across other websites, because it is not guaranteed that satisfied customers will always be loyal (Anderson and Srinivasan, 2003). Customer perceived value has been playing a vital role in predicting buying behavior and achieving sustainable competitive advantage (Parasuraman, 1997).

In offline retail context, service quality is vital for ensuring customer satisfaction (Cronin et al., 2000). This relationship between service quality and customer satisfaction stood valid in virtual retail settings also (Hsu, 2006). In online retail settings, marketers need to focus on few important factors such as website design, reliability, security, and customer value to satisfy customers and achieve organizational success (Aladwani & Palvia, 2002). Hence, the investigation of the relationships of these factors and customer satisfaction will yield useful insights. Electronic service quality is at the core for predicting customer satisfaction and loyalty (Zhou et al., 2019). Moreover, customer perceived value moderates the relationship between customer satisfaction and loyalty in e-commerce contex et al., 2009). Authors validated the significant influence of electronic service quality on customer satisfaction and loyalty. Service quality along with corporate affects satisfaction strongly and further enhances the loyalty (Kuo & Ye, 2009).

Get the App

Extending the reach of customer loyalty, Yieh et al., (2007) identified determinants of customer loyalty like; perceived price fairness, perceived product qualit customer satisfaction, trust. Earlier, Yu et al., (2005) applied Customer Satisfaction Index Model suggested by Fornell et al., (1996) among Lexus automobile users in Taiwan and listed the predictors of customer loyalty namely; customer expectation, perceived quality, perceived value, overall customer satisfaction, and customer complaints. Customer loyalty has been studied extensively across globe and listed a number of determinants such as; good management, image and customer services, trust in a store, trust in a salesperson, brand reputation, customer satisfaction etc. (Al-Awadi, 2002; Macintosh & Lockshin, 1997; Selnes, 1993). In services sector, trust is considered an important factor as customers need to believe the sellers about the promise they made with them. It is a well-known fact that intangible nature of services poses a challenge for marketers to fulfill the promises made by service organizations.

The future of buyer–seller relationships depends on the commitment made by the allies. According to Masud & Daud (2019), commitment positively strengthens customer satisfaction and augments customer loyalty. Therefore, these constructs are in limelight for better understanding by the researchers. It becomes a very challenging task for researchers to conclude the complete set of antecedents of customer loyalty in different contexts. This gives further scope to dig more about customer loyalty and its antecedents. Therefore, the current study intended to explore the customer loyalty construct in electronic-commerce sector of India.

The online retail context is quite challenging for marketers while ascertaining customer loyalty because of absence of touch and feel. The online service environment is not direct when compared with a physical service environment (Cox and Dale, 2001). This poses a challenge in identifying a best combination of e-service quality attributes. Technology is boon or bane at the same time. Therefore, online retail context becomes an important area for research to increase customer loyalty for capturing changes due to inbuilt dynamism of it.

The main objective of this study was to test the impacts of e-service quality, customer satisfaction, customer value, corporate image, trust and commitment on customer loyalty. Moreover, this study had other objectives as under

1. To study the mediating effect of Customer Perceived Value in the relationship between E-Service Quality and Customer Satisfaction.

- **Moderating and Mediating Impact of Compassion and Trauma Fatigue on Burnout Satisfaction Relationship: A case study of Indian Nurses**
  by Jolly Joseph, Richa Misra, Shalini Srivastava
  Abstract: Nursing services are an important part of the health care system. Nursing statistics show that India has been struggling with a shortage of nurses since independence. Due to the scarcity of human resources, most nurses are at the risk of high levels of stress, burnout, and fatigue. In the Pandemic the situation of health care staff has further worsened, as the hospital is overwhelmed with patients of highly infectious disease The objective of the present study is to examine the relationship between burn out, trauma fatigue, compassion, and job satisfaction among nurses in Delhi-NCR, one of the worst pandemic affected region of India. A sample of 233 structured questionnaires was collected after direct interviews with staff nurses from private and

- **Measuring the performance of a private higher education institution in South Africa**

by Christo Bisschoff, Ridwaan Asvat, Christoff Botha

Abstract: This article postulates a model to measure the business performance of a private higher education institution in South Africa. The broad theoretical framework identified 15 antecedents and their respective measuring criteria to measure business performance. Statistical scrutiny ensured that these criteria are actual measures of the respective business performance antecedents, which culminated in a theoretical model to measure the business performance of private higher education in South Africa. The 15 business performance antecedents are sales, growth, profitability, technology, customer, innovation, service, leadership, return on investment, stakeholders, society, quality, marketing, communication, legality, and general measures of business performance. The results showed that all the antecedents are reliable indicators of business performance. The performance of a private higher education institution can be successfully measured and it is possible to determine whether the demographic variables influence the business performance antecedents. Besides, the model seeks to determine whether any significant correlations exist between the business performance antecedents. The measurement of business performance is valuable to business school directors, managers and investors in private higher education. Researchers and scholars who intend to explore this avenue of business performance models further could also benefit from this article.

Keywords: *business performance; private higher education; measurement; success; model.*

- **Do celebrities influence Urban and Rural Bottom of the Pyramid consumers?-A comparative study-based approach.**

by Debadrita Panda, Tanmoy Dasgupta

Abstract: Celebrity endorsement is a very popular way to influence the purchase behaviour of consumers. It is used frequently as a part of marketing strategy and promotion. Several studies have provided evidence about its significant effect on various types of consumer segments. Different types of consumers have shown different types of responsive behaviour for celebrity endorsements. Being a developing country, India has a huge amount of Bottom of the Pyramid (BoP) living with an income of less than two dollars per day. Broadly dividing them into urban and rural BoPs, this current study tries to determine the effect of celebrity endorsements behind purchase intention for both Urban and Rural BoPs. Paschim Medinipur, one of the largest districts of West Bengal state, India has been selected for this study. This district also has high Human Poverty Index. A sample size of 500 consisting of both urban and rural BoPs are showing a significant difference towards the effect of celebrity endorsement for purchase intention as well as attitude towards advertisements and brand preference.

Keywords: *BoPs; Celebrity Endorsement; Multivariate statistical analysis; West Bengal; India.*

- **Exploring the consequences of ethical leadership on CSR: A study on Indian Manufacturing industry.**

by Santosh Basavaraj, Aruna B

Abstract: Human beings react to their perception, often thinking it is reality. The present study examines perceptions of employees on ethical leadership and its consequences on CSR effectiveness. This study showcases a few ethical behaviours of the leaders that positively persuade their employees to see organizational CSR effectiveness. The study is conducted in Indian manufacturing sector by capturing the data of 61 companies from 285 employees. The study comes with significant practical and research implications. The analysis used statistical methods such as exploratory factor analysis and structural equation model (SEM) to test the hypothesis. The study showed that it is highly essential to hold a positive employer branding via CSR as it is proved that if the employee sees their leader as ethical, it creates a positive image about organizational CSR among employees. Practically, this study informs you of the need of the leader to maintain a positive perception among the employees. Research-wise, the study extends the literature on CSR by linking it with employees' ethical leadership perception.

Keywords: *Ethical leadership behavior; empowerment; envision; ethical approach; management approach; perceived CSR outcome.*

Art Creation and the Mental Health: A Qualitative Study among Artists

Aruna Balammal*

Abstract

The article aims to examine the effectiveness of art therapy to maintain mental health. It is popularly believed that emotional catharsis in the form of art enhances positive mood, brings clarity to one's cognition, and so on. The study uses qualitative data obtained from open-ended and moderately structured interviews conducted among artists. The artists whose arts reflected originality rather than an imitation of a visible target such as portrait drawing are chosen for the study.. The group is a mix of professional artists and self-taught artists. The study finds that the art therapy technique helps artists to communicate their thoughts, desires, and contentious emotions in a manner which is socially acceptable. The study says art helps people build self-esteem, bring positivity and self-confidence. Self-esteem, self-confidence and authentic identity are prerequisites for not only healthy performance and high productivity in organisations but also for becoming a fully functioning individual.

Keywords: Art therapy, Non-verbal Communication, Self-esteem, Well-being, Mental health

1. Introduction

The paper is developed with the goal of exploring the effectiveness of art as a vehicle for mental health development. Art is viewed by the majority, as a medium of expression. When the word 'therapy'

An investigation to identify the association between the effective usage of social media platform and the awareness of crowdfunding to raise pre -seed

Abstract:

Crowdfunding is become one of the most talked about avenue to raise pre-seed capital. Many of the Indian start ups have actually started using crowdfunding as a tool to raise their capital. Digital and social media marketing has also contributed in a large way in the revolution of Start-ups. In this backdrop of start-up revolution and evolution in digital and social media marketing, pre-seed is become one of the most talked about topic over the last few years. After the social media revolution, though it is become relatively easy to get funds, however there is always a gap between demand and supply to raise the pre-seed. Crowdfunding has already proved its' significance for the developing country like India. This research paper aims to seek the relationship between the social media usage and the awareness of crowd funding.

Key Words: IT Start ups, Crowd funding, Pre-seed Capital, Social media marketing

Introduction:

Raising capital has become a key problem for all kind of start-ups in today's world. Many entrepreneurs are facing challenges and landing in failure while raising the capital for their projects. External support is not always easily available while starting a new venture. The traditional modes of raising funds have their own limitations. For example while issuing loan, banks generally ask for collateral of the organizations which

Women Directors in Corporate- A Kindling Move towards Women Empowerment

Abstract

In India, recognizing the significance of the role of woman in the growth and development of the corporate, The Securities and Exchange Board of India vide its circular date 17th of April, 2014 made it compulsory for all the listed companies to appoint at least one Woman Director on their Board by 31st of March, 2015 in alignment with the requirements of Section 149 of the Indian Companies Act, 2013, under corporate governance norms. Thus days are gone when women were ignored and their role was undermined. Today women are pillars of the business organization and making noteworthy contribution towards the success of business. In view of the burgeoning significance of women in corporate houses, this article makes an endeavor to delve deep into the need of women empowerment, how presence of women on corporate boards have enhanced the performance of the business organizations, the regulations governing the appointment of women directors on corporate boards and legal ramifications, takeaways from global practice and other important aspects.

Keywords: Women empowerment, start-ups, Corporate performance, Legal framework

Prologue- Women Empowerment

According to Nobel Laureate and Founder of UNDP's Human Development Index, Amartya Sen, once stated that empowering women and girls with more choices and more freedoms is vital to accomplish a better future for all. Women agency and freedom are among the significant catalyst for increasing development. It has been observed that countries which have expanded opportunities for women and girls in education and work in recent decades have largely attained prosperity and moderated population growth while restricting child mortality and accomplishing social progress for all.

Despite numerous initiatives taken both legal and political the condition of women is not so impressive, especially in corporate. In an article titled, *"What's Keeping Women From the Corporate Heights"?*, wherein there is a mention of existing discrimination in corporate boards. With reference to Europe the quotas to improve gender balance on corporate boards and threats to introduce them have gone some way to pushing Europe in terms of female representation in directorships. But the fact is on a global scale women are amazingly scarce in the higher spheres of corporate management.

In the U.S., gender-based discrimination is illegal, yet the June 2014 issue of Fortune magazine reported that the proportion of women CEOs had touched the historical level of 4.8 percent. What was striking that this development was described as "impressive progress", as in 1998 only one Fortune 500 company was led by a woman. Even in the gender and socially progressive Scandinavian countries female presence in executive management remains abysmal. One of survey revealed that merely 3 percent of the 145 biggest Scandinavian market capitalizations have a female leader. The same was found true with France.

Coming to India, according to a recent study on 'Women On Board 2016' by global recruitment tendering platform MyHiringClub.com and online job portal JobPortal.co.in presence of women members on boards of Indian companies is seen to be lower than the overall average for developing countries. In the mentioned study conducted online, a total of 38,313 listed corporate houses participated globally and in India 1,459 listed employees participated. The study revealed that overall percentage of women directors on board is 6.91% in these listed incorporations as against 6.69% in 2015. Norway once again led the table with a higher percentage of women on board at 40.12%, followed by Sweden (29.31%), Finland (25.89%), South Africa (18.31%) and the United States (17.37%). The report further noted that the average board life of male directors in India is 3 years more than their female counterparts while globally, the difference is merely about 2 years. Moreover, it was observed that women directors on an average are 5 years younger than males.

Title: Supply chain management and marketing integration: enhancing customer lifetime value

Authors: Pankaj M. Madhani

Addresses: ICFAI Business School (IBS), IBS House, Opp. AUDA Lake, Near Science City, Off. SG Road, Ahmedabad 380060, India

Abstract: The supply chain management (SCM) and marketing integration has a direct and significant impact on customers and the revenue-earning potential of the firm. Hence, it is vital for the firm to achieve better synergy between them. SCM and marketing integration is a complex and multi-faceted construct and hence requires strategic approach for its evaluation. This study aims to understand how to achieve SCM and marketing integration by focusing its facilitators and controlling distracters. This research develops various frameworks and models for better understanding of SCM and marketing integration. This research demonstrates the benefits of a close integration between SCM and marketing and evaluates its impact on customer lifetime value (CLV). The contribution of this article is both theoretical and practical. From a theoretical perspective, the frameworks developed for study of SCM and marketing integration are an important contribution to the existing knowledge. From a practical perspective, various models of this paper aim at providing guidelines for SCM and marketing managers for building competitive advantages by achieving SCM and marketing integration.

Keywords: supply chain management; SCM; marketing; interaction; collaboration; integration; customer lifetime value.

Complementary Relationship of Sales Organization Culture and Compensation System: Practical Implications

Pankaj M. Madhani

Introduction

The increasingly complex and competitive global business environment poses greater challenges than ever to organizations today. Because of a sluggish global economy, which could include any fallout from Brexit, the sole reliance on a compensation system as a performance driver to motivate and reward sales employees is not effective as sales organizations rely more on cost cutting measures. Therefore, sales organizations might want to consider other alternatives, such as revisiting organizational culture as a means to help employers achieve their goals and effectively implement their strategies. Organizational culture represents the shared values, beliefs, ideologies and norms held by organizational members that can influence their day to day behaviour within the organization and their expected code of conduct outside the organization.

A sales compensation system defines the relationship between the sales organization and the sales people by specifying the terms of exchange. When a sales compensation system is not aligned with a sales organization's culture, it can cause unintended consequences such as increased dissatisfaction of sales employees and low performance. Aligning organizational culture and compensation systems can provide harmony, balance and consistency in organizations.
This research identifies compensation strategies for various types of sales organization cultures and provides various frameworks and illustrations to achieve optimal or best performing results for a sales organization.

Key elements of An Organizational Culture

Organizational culture has two major attributes: content and strength. Content signifies the types of values and behaviors held by members of an organization while strength represents the depth and breadth of those behaviors embedded among the members. The strength of organizational culture is defined in terms of how widely and intensively organizational values are shared by its members. Both content and strength of culture are important for achieving a high level of organizational performance (Sorensen 2002). Culture strength needs to be examined to in relation to its content in order to understand organizational effectiveness. Organizational culture can be "positive" or "negative" based on nature of content. The content of culture investigates whether there are functional and dysfunctional dimensions of organizational culture.

Performance Management Practices in Times of Uncertainty: A Real Option Approach

Pankaj M. Madhani

INTRODUCTION

Organizations now operate in environments with unprecedented and unpredictable events. Such uncertainties put extra pressure on organizations. Uncertainty is caused by unexpected external events that put the organization in an unstable state. Such uncertainties are difficult to accurately predict and put the organization in a position where it must rapidly adjust to a changing environment or perish. Such heightened demands on organizations have subsequently called for corresponding human resources of flexible, versatile and capable individuals.

These circumstances have forced organizations to make paradigm shifts in managing human resources. Potential sources of competitive advantage in the context of human-resource management (HRM) practices are enhanced skill levels, greater workforce flexibility and productivity, and increased capacity to respond to the dynamics of a fast-changing business. In this context, performance management practices need to be re-evaluated to ensure that they are contributing to that competitive advantage. Effective performance management practices benefit both the organization and employees. During periods of uncertainty, it is challenging for an organization to enhance HR flexibility and at the same time keep employees motivated and their skills enhanced. This research studies that challenge and applies a real options approach to develop HR flexibilities and subsequently relevant performance management practices of the organizations.

STRATEGIC IMPORTANCE OF PERFORMANCE MANAGEMENT DURING UNCERTAIN TIMES

Measuring the performance of employees either as individuals or as part of teams has become an important tool to ensure good organizational performance. It is also critical in identifying possible gaps between job expectations and the organization's strategic intent. On average, organizations lose 40% of the potential financial value of their strategies due to poor performance and talent management of their employees (Mankins and Steele 2005). Maley and Kramer (2014) identified three chief purposes of performance management:

(1) The achievement of strategic goals of the organization
(2) Employee development
(3) Various administrative purposes such as compensation management.

An effective performance management process has many benefits such as organizations being able to effectively monitor performance of individual employees and link it to organizational goals and provide employees regular feedback and opportunities for development and rewards (Claus and Briscoe 2009).

Madhani, P. M. (2016). Performance Management Practices in Times of Uncertainty: A Real Option Approach, *World at Work Journal, Vol. 25, No. 1, pp. 25-39.*

Sales and Marketing Integration: Enhancing Competitive Advantages

Dr. Pankaj M. Madhani

Introduction

Significant research efforts have been devoted to considering co-operation and collaboration between functional departments in organizations, based on the premise that interdepartmental collaboration is linked to improving business performance. However, relatively little attention has been paid to the interdepartmental relationship between sales and marketing as compared to other functional relationships with marketing. Only recently, sales and marketing interaction has gained more conceptual attention. Sales and marketing interface exhibits one of the most contentious relationships within organizations and is one that is attracting increasing attention from both academicians and practitioners.

There is need to have collaboration between sales and marketing to alleviate their behavioural conflicts. The sales and marketing interface has a direct and significant impact on customers and the revenue-earning potential of the organization. Collaboration between sales and marketing may be important in reducing inter-functional conflict and creating high performance. Hence, every organization should improve the relationship between sales and marketing.

The major objectives of this paper are firstly, to introduce sales and marketing integration as a process which combines the strengths of sales and marketing by shifting the focus to the customer; secondly, to demonstrate how such integration can leverage the strengths of sales and marketing and meet the challenges of customer value creation in today's fast changing and highly competitive marketplace and thirdly; to suggest various research frameworks of sales and marketing integration for better understanding the interface of sales-marketing from inside–out. This study focuses on the how collaboration between sales and marketing, improves business performance rather than evaluating its consequences. Hence, this research focuses on drivers of sales and marketing integration for creating superior customer value.

Literature Review

Previously the academic focus was more on marketing's interaction with other functions such as R&D or finance, and researchers did not differ between the sales and marketing functions at all (Kahn and Mentzer, 1998). Many researchers found sales-marketing interface as a rather unexplored area with either limited research study (Dawes and Massey, 2005) or not researched systematically and deeply (Homburg et al., 2008).

Both sales and marketing may be following their own agendas, creating conflict, coordination problem, and ultimately great tension between the two groups. These issues can negatively characterize the interface between sales and marketing and may lead to conflict that is detrimental to collaboration (Dewsnap and Jobber, 2000). According to Corstjens and Corstjens (1999), a lack of cooperation between sales and marketing has the potential to damage the overall success of the organisation.

Intellectual Capital (IC) Intensity vs. Capital Intensity: Impact on Corporate Governance and Disclosure Practices of Firms

Dr. Pankaj M. Madhani

Abstract

This research focuses on industry characteristics and their impact on corporate governance and disclosure practices of firms. Nature of industry characteristics divides firms into two broad categories: intellectual capital (IC) intensive firms and capital intensive firms. Accordingly, this research studies the corporate governance and disclosure practices of firms listed in Indian stock market representing different sectors from both categories. The study has taken six sectors into consideration – Power, Oil & Gas, and Metal, along with Health Care, IT and FMCG. These sectors are segregated into high capital intensity (low IC intensity) and low capital intensity (high IC intensity) sectors depending on nature of industry. This study aims to establish a relationship, if any, between IC intensity of firms and their corporate governance practices in Indian context. Research concludes that there is no difference between IC intensive firms and capital intensive firms with respect to corporate governance and disclosure practices. After thorough empirical research, the paper explains why Indian scenario is different from developed nations such as USA.

Key Words: *Corporate Governance, Disclosure, Intellectual Capital Intensity, Intangible Assets, Capital Intensity, New Economy*

Dr. Pankaj M. Madhani
Professor,
ICFAI Business School (IBS)
IBS House, Opp. AUDA Lake
Science City Road, Off. S.G. Road,
Ahmedabad – 380 060, India

Corporate governance is the system of relations between the shareholders, board of directors and management of a firm as defined by the corporate charter, by-laws, formal policy and rule of law. Management recognizes that there are economic benefits to be gained from a well-managed disclosure policy. A system of corporate governance needs a good level of disclosure and an adequate information to eliminate (or at least reduce) information asymmetries between all parties, making corporate insiders accountable for their actions (Madhani, 2014a). Traditionally corporate governance and disclosure practices of firms are associated with variables such as board size, board independence, board committees, ownership concentration, cross-listing of firms, CEO duality, auditor selection, nature of industry and firm characteristics (size, age, leverage, origin and types of firms viz. public sector, private sector and foreign firms). However, the meaning and

Study of Corporate Governance and Disclosure Practices: Old Economy versus New Economy Firms

Pankaj M. Madhani

ICFAI Business School (IBS), Ahmedabad

Abstract : This research focuses on nature of industry and its impact on corporate governance and disclosure practices of firms. Nature of industry divides firms into two broad categories: old economy and new economy firms. Accordingly, this research studies the corporate governance and disclosure practices of firms listed in Indian stock market representing different sectors. The study has taken five sectors into consideration – Power, Oil & Gas, and Metal, along with Health Care and IT. These sectors are segregated into old economy (high capital intensity) and new economy (low capital intensity) sectors depending on nature of industry. This study aims to establish a relationship, if any, between capital intensity of firms and their corporate governance practices in Indian context. Research concludes that there is no difference between old economy firms and new economy firms with respect to corporate governance and disclosure practices. After thorough empirical research, the paper explains why Indian scenario is different from knowledge economy such as United States.

Key Words: Corporate Governance, Disclosure, Capital Intensity, Intangible Assets, Old Economy, New Economy

Introduction

The main objective of the corporate governance is to protect long-term shareholder value along with the other stakeholders. Corporate governance is a very wide term, which covers a wide range of activities that relate to the way business of firm is directed and governed. It deals with the policies and practices that directly impact on the firm's performance, stewardship and its capacity to be accountable to its various stakeholders. Corporate governance is the system of relations between the shareholders, board of directors and management of a firm as defined by the corporate charter, by-laws, formal policy and rule of law.

The corporate business is an increasingly important engine for wealth creation worldwide, and how companies are run will influence welfare in society as a whole. In order to serve this wealth creating function, firms must operate within a framework that keeps them focused on their objectives and accountable for their actions. That is to say, they need to establish adequate and credible corporate governance arrangements. Management recognizes that there are economic benefits to be gained from a well-managed disclosure policy. A system of corporate governance needs a good level of disclosure and an adequate information to eliminate (or at least reduce) information asymmetries between all parties, making corporate insiders accountable for their actions (Madhani, 2014a).

Benefits of Six Sigma in Supply Chain Management: Developing Various Frameworks

Pankaj M. Madhani

Introduction

In today's competitive business environments, firms are under intense pressure to systematically produce quality control and quality standards and generate positive bottom line results. Six sigma deployment by organizations reduces cost of poor quality. Cost of poor quality is the cost associated with poor quality of products and services and connects the improvement priorities of a firm with its strategic objectives of enhancing financial performance and greater customer satisfaction. Intensive competition in the market place has enforced organizations to focus on process performance for enhancing the customer value. In the pursuit of improved operational performance and higher customer satisfaction, Six Sigma has been recognized as a systematic and structured methodology that attempts to improve process capability through focusing on customer needs (Dasgupta, 2003). As per statistics, cost of poor quality is 10 percent of sales for companies who are at "Six Sigma" level, about 15 to 20 percent of sales for companies who are at "four sigma" level and about 20 to 30 percent of sales for companies who are at "three sigma" levels (Clark, 1999).

There are diverse application of Six Sigma such as in manufacturing processes, automobile industry, services such as healthcare and retail and supply chain management (SCM). Six Sigma can be a powerful toolbox for supply chain process in terms of continuous improvement and hence business performance. The Six Sigma can be used to develop a model for assessing, improving, and controlling quality in the supply chain network. Six Sigma deployment in SCM is important for overall performance and growth of business as it leads to improved productivity, competitiveness, superior value creation, and market performance. However, there has been little theoretical analysis and conceptual development of underlying Six Sigma deployment in supply chain. It is mainly because practitioner oriented nature of Six Sigma. Hence, this paper works in this direction, and provides insights of SCM process improvement in terms of efficiency and effectiveness and resultant business value created by proposing various frameworks.

Literature Review

Six sigma is described as a business excellence strategy (Antony et al., 2007) and as being a customer-driven (Nakhai and Neves, 2009), a project-driven (Assarlind et al., 2012) or a business-driven (Savolainen and Haikonen, 2007) methodology, which focuses on decision making based on statistical and non-statistical tools (Manville et al., 2012), to lead towards improving the organization's product, process and service (Savolainen and Haikonen, 2007) or financial performance (Nakhai and Neves, 2009).

Kumar et al. (2008) studied a case of implementation of the Six Sigma approach for improvement in service system by a major consumer electronics and appliance retailing company in the USA. Kumar and Sosnoski (2009) highlighted the potential of Six Sigma inrealizing the cost savings and improved quality by using the case study of a leading manufacturer of tooling.

Ownership Concentration, Corporate Governance and Disclosure Practices: Study of Firms Listed in Bombay Stock Exchange

Dr. Pankaj M Madhani

Introduction

Corporate governance and disclosure practices of firms are influenced by various variables such as board size, board independence, board committees, cross-listing of firms, CEO duality, auditor selection, nature of industry (manufacturing versus service firms; traditional versus knowledge intensive firms; and tangible assets versus intangible assets dominated firms), and firm characteristics (size, age, leverage, origin and types of firms viz. public sector, private sector and foreign firms). This study aims to contribute to the understanding of corporate governance and disclosure issue by analyzing the specific governance variable such as ownership concentration of the firm. The ownership concentration of the firm and its impact on corporate governance and disclosure practices is the core theme of this research and accordingly this research identify and test the empirical evidence for such relationship for samples firms comprising of selected BSE listed firms.

Typically, corporate governance is viewed from the perspectives that publicly traded firms have dispersed shareholders who demand better governance and disclosure to protect their residual claims. In concentrated ownership environment, controlling owners are likely to be less dependent on transparency and information disclosure as they can obtain information directly from informal channels. Hence, such firms will be reluctant to disclose additional information. Therefore, it is expected that there is a negative relationship between ownership concentration and corporate governance and disclosure practices of firms. This study focuses on the extent of corporate governance and disclosure practices and examines it from the perspectives of the ownership concentration.

Literature Review

Corporate governance structures and systems vary greatly across countries. The corporate governance system across the world, can be classified based on the degree of ownership and control and the identity of controlling shareholders, into two broad categories—the outsider systems (notably the US and the UK) characterized by widely dispersed ownership and the insider systems (notably continental Europe and Japan) characterized by concentrated ownership or control (Maher and Andersson, 1999). Firm ownership is an increasingly influential form of corporate governance (Connelly et al., 2010).

When ownership is dispersed, shareholding control tends to be weak because of poor shareholder monitoring. Small shareholders are unlikely to be interested in monitoring because they would bear all the costs of monitoring hence share a small proportion of the benefits. Hence, no monitoring of managerial efforts would take place.

Marketing Ethics: Enhancing Firm Valuation and Building Competitive Advantages

Dr. Pankaj M. Madhani

Abstract

Marketing ethics plays a critical role in forming, maintaining and sustaining long-term customer relationships. An ethical marketing practice is a key factor of organization's success because it affects the organizations' capability to build strong relationships with customers, and accordingly, it is one of the organizational drivers enhancing Customer Lifetime Value (CLV). The CLV of a customer represents the amount the customer will contribute to the bottom line of the firm over the span of the business relationship with them. Ethical marketing are practices that emphasize transparent, trustworthy, and responsible personal and organizational marketing policies and actions that exhibit integrity as well as fairness to consumers and other stakeholders. The ethical reputation of the organization results in customer trust which in turn leads to satisfaction and commitment to the organization and hence builds competitive advantages. Research provides various marketing ethics frameworks and valuation matrix along with numerical illustrations to understand how marketing ethics help organizations in improving overall performance and ultimately firm valuation.

Ethics is a collection of principles of right conduct that shape the decisions people or organizations make. Ethics studies morality through the critical examination of right and wrong in human action. Morality refers to the customs, principles of conduct and moral codes of an individual, group or society. One way in which an organization influence ethics is by formally and explicitly defining *right* from *wrong*. Practicing ethics in marketing means applying standards of fairness, or moral rights and wrongs, to marketing decision making, behavior, and practice in the organization. The purpose of marketing ethics is to create a long term sustainable competitive advantage. Those organizations that develop this advantage are able to satisfy the needs of both customers and the organization. This focus has come about for two reasons. First, when an organization behaves ethically, customers develop more positive attitudes about the firm, its products, and its services. Second, when marketing practices depart from

Application of Six Sigma in Supply Chain Management: Evaluation and Measurement Approach

The IUP Journal of Supply Chain Management, Vol. 13, No. 3, pp. 34-53

Date Written: 2016

Abstract

Firms have to analyze, monitor and make improvements of their existing Supply Chain Management (SCM) processes in order to beat market competition and stay competitive. In this regard, the Six Sigma is a methodology that enables the firms to review their existing SCM practices and guide them in making improvements. Six Sigma focuses on reducing variation, measuring defects and improving the quality of products, processes and services. Six Sigma-based SCM effectively manages typical disruption issues in supply chain as it ensures the delivery of the most appropriate product, in right time, in right place with the least cost to the customer. This paper develops an integrative framework and the business value-added framework and financial metrics to measure and evaluate the impact of Six Sigma on SCM. As identified and emphasized in this paper, efficiency and effectiveness drivers of SCM and accompanying business values generated by Six Sigma deployment in SCM positively influence an organization's overall business performance.

Application of Six Sigma in Supply Chain Management: Evaluation and Measurement Approach

Dr. Pankaj M. Madhani

1 Introduction

Six-Sigma is a logical, systematic and process focused approach to achieving continuous process improvements. This process improvement methodology for enhancing quality levels was developed by Motorola in 1986 for its high volume manufacturing environment in order to increase its competitiveness against Japanese companies. Six Sigma is a well-structured knowledge management approach that focuses on reducing variation, measuring defects, and improving the quality of products, processes and services. It is a highly disciplined process that helps organizations to calculate how well a process is performing and focus on developing and delivering near-perfect products and services.

The supply chain represents a process of delivering value to customers by creating and delivering products. Supply chains span from raw materials to manufacturing, distribution, transportation, warehousing, and product sales. Supply chain is the network of entities through which material and information flows. Those entities include suppliers, manufacturers, wholesaler, retailers and customers. In today's highly competitive environment, supply chain performance is very vital for the survival of firms because customers judge the performance of firms based on their supply chain performance.

Competition is no longer between firms but between entire supply chains. So, supply chain has become an important dimension for firms to give maximum attention in order to excel in a competitive environment. Hence, the importance of supply chain management (SCM), that is, the set of synchronized decisions and activities that effectively integrate suppliers, manufacturers, transporters, warehouses, retailers, and customers. It is a good idea to use Six Sigma in supply chain projects in order to improve supply chain measurement metrics as it helps organizations to capitalize on the potential synergy between Six Sigma and SCM. This paper works in this direction and provides various frameworks for Six Sigma deployment in supply chain along with a financial matrix.

2 Literature Review

There are diverse application of Six Sigma such as in manufacturing processes, automobile industry and services such as healthcare and retail. Kumar et al. (2007) presented a case on application of Six Sigma problem-solving methodology in manufacturing process to identify the parameters causing casting defects and to control these parameters. Krishna et al. (2008) presented a case study illustrating how a multinational Indian corporation was able to successfully implement Six Sigma principles to improve its manufacturing operations. Kumar et al. (2008) studied a case of implementation of the

Firm Size, Corporate Governance and Disclosure Practices: Inter-relations

Pankaj M. Madhani

Abstract

Corporate governance and disclosure practices of firms are influenced by various internal and external variables. Among these, firm characteristics such as size, age, leverage, origin and types of firms viz. public sector, private sector and foreign firms. also have major impact on disclosure practices of firms. As there is no much research from Indian context regarding impact of specific firm characteristics such as firm size on corporate governance and disclosure practices of firms, this study aims to contribute to the understanding of this relationship. This study focuses on corporate governance practices of sample firms listed in Bombay Stock Exchange (BSE). The sample comprises 9 sectors selected from S&P BSE sectoral indices to study impact of firm size (both in terms of fixed assets as well as gross sales) on corporate governance practices of firms. By analyzing the impact of firm size on corporate governance and disclosure practices of firms, this research identifies and tests the empirical evidence for such relationship.

The main objective of the corporate governance is to protect long-term shareholder value along with the other stakeholders. Corporate governance is a very wide term, which covers a wide range of activities that relate to the way business organization is directed and governed. It deals with the policies and practices that directly impact on the organization's performance, stewardship and its capacity to be accountable to its various stakeholders. Corporate governance is the system of relations between the shareholders, board of directors and management of a company as defined by the corporate charter, by-laws, formal policy and rule of law.

The corporate business is an increasingly important engine for wealth creation worldwide, and how companies are run will influence welfare in society as a whole. In order to serve this wealth creating function, companies must operate within a framework that keeps them focused on their objectives and accountable for their actions. That is to say, they need

The Impact of Legal and Regulatory Environment: A Study of Corporate Governance and Disclosure Practices of Firms Listed on Bombay Stock Exchange

The IUP Journal of Corporate Governance, Vol. XV, No. 2, April 2016, pp. 7-36

Posted: 18 Oct 2016

Pankaj Madhani (https://papers.ssrn.com/sol3/cf_dev/AbsByAuth.cfm?per_id=1906277)

Date Written: October 7, 2016

Abstract

Governance depends on both country-level as well as firm-level mechanisms. The country-level governance mechanisms include a country's laws, its culture and norms, and the institutions that enforce the laws. Firm level or internal governance mechanisms are those that operate within the firm. Apart from firm-level governance mechanism, it is also important to study whether the institutional, legal and regulatory environments for shareholder protection rights and the corporate governance structure are complementary or substitute of each other. This research looks into the institutional, legal and regulatory environments of the US, UK, Luxembourg and India from the perspective of corporate governance and disclosure practices by studying a sample of 54 firms across various sectors listed on the Bombay Stock Exchange, India. The research seeks to empirically investigate whether they are significantly different for firms cross-listed in those countries. The research suggests that legal and regulatory environments for corporate governance and internal corporate governance are not substitutes. On the contrary, they are complementary because strong corporate governance at the country level reinforces the effectiveness of internal governance at the firm level, increasing the effect of internal corporate governance.

SIX SIGMA DEPLOYMENT IN SUPPLY CHAIN MANAGEMENT: ENHANCING COMPETITIVENESS

DR. PANKAJ M. MADHANI, Associate Dean and Professor (Finance & Strategy),
ICFAI Business School (IBS),
AHMEDABAD pmadhani@iit.edu

Introduction

Six-Sigma as a process improvement methodology for enhancing quality levels was developed by Motorola in 1986 for its high volume manufacturing environment in order to increase its competitiveness against Japanese companies. Six Sigma is a well structured knowledge management approach that focuses on reducing variation, measuring defects, and improving the quality of products, processes and services. It is a highly disciplined process that helps organizations to calculate how well a process is performing and focus on developing and delivering near-perfect products and services.

The supply chain represents a process of delivering value to customers by creating and delivering products. Supply chains span from raw materials to manufacturing, distribution, transportation, warehousing, and product sales. Supply chain is the network of entities through which material and information flows. Those entities include suppliers, manufacturers, wholesaler, retailers and customers. In today's highly competitive environment, supply chain performance is very vital for the survival of firms because customers judge the performance of firms based on their supply chain performance. So, supply chain has become an important dimension for firms to give maximum attention in order to excel in a competitive environment. Hence, the importance of supply chain management (SCM), that is, the set of synchronized decisions and activities that effectively integrate suppliers, manufacturers, transporters, warehouses, retailers, and customers. It is a good idea to use Six Sigma in supply chain projects in order to improve supply chain performance.

Six Sigma Concept and Its Applications : Sigma is a statistical term that measures how far a given process deviates from perfection. The name of the Six Sigma methodology is derived from the Greek alphabet symbol sigma (ó) utilized in statistics for standard deviation; a measure of the variability within a population around the mean, a measurement to quantify variation and process inconsistency (Pande et al., 2000). The central idea behind Six Sigma is that if organizations can measure how many "defects" they have in a process, they can systematically figure out how to eliminate them and get as close to "zero defects" as possible. The Six-Sigma quality level is equal to 3.4 defects per million opportunities (DPMO) and can be shown as 3.4 DPMO.

An "opportunity" is defined as any chance for nonconformance or not meeting the required specifications. This reduces waste and hence saves money whilst improving customer satisfaction.

The six-sigma method allows firms to reduce things to a common denominator - defects per unit and sigma and hence provides a common language and the ability to benchmark themselves against like products, processes and practices' (Harry, 1997). Most organizations produce at a level of two to three Sigma, meaning that between 66,807 and 308,537 defects occur with every one million opportunities; this means between 6.7% and 30.9% of everything produced contains a defect. A Sigma quality level offers an indicator of how often defects are likely to occur, whereby higher sigma quality levels indicate a process that is less likely to create defects as the quality level also increases accordingly (Table 1).

Table 1: Sigma Level: Defects Per Million Opportunities

Sr. No.	Sigma Level (Capability of Process)	Defects Per Million Opportunities (DPMO)	Yield (Error Free)
1	1	690,000	31%
2	1.5	500,000	50%
3	2	308,537	69.1%
4	3	66,807	93.3%
5	3.5	22,750	97.725%
6	4	6,210	99.38%
7	4.5	1,350	99.87%
8	5	230	99.977%
9	5.5	32	99.997%
10	6	3.4	99.9997%

(Source: Table Developed by Author)

In one Six Sigma project, Ford analysts measured inventory levels at one of their plants during production hours and found that levels varied by 20% over a month. They found that one of the major causes of inventory fluctuation was inefficient and inconsistent unloading of parts at the plant docks. Taking actions to improve

Competitiveness and Sustaining Performance: Integrating Sales and Marketing

Pankaj M. Madhani

Abstract

Sales and marketing integration is important in reducing inter-functional conflict, creating customer trust, satisfaction and improving overall performance of organization. Hence, there is need to integrate sales and marketing by enhancing collaboration between them. A lack of cooperation between sales and marketing has the potential to damage the overall success of the organization. Sales and marketing research should not only focus on analyzing factors that detract sales and marketing integration, but also to establish symbiotic relationship between sales and marketing and identify facilitators of such integration in terms of necessary resources and capabilities required by the organization.This research works in this direction, and provides in-depth insights for enhancing sales and marketing integration by identifying major issues in sales and marketing relationship; studying various facilitators of sales and marketing integration and then suggesting two-stage research framework of sales and marketing integration.

Keywords: *Sales; marketing; collaboration; integration; efficiency; effectiveness.*

Sales and marketing integration may be important in reducing inter-functional conflict, creating customer trust, satisfaction and improving overall performance. Hence, there is need to integrate sales and marketing by enhancing collaboration between them. Accordingly, every organization should improve the relationship between sales and marketing as their integration helps organizations to outperform competition; create added value as well as customer satisfaction.

The major objectives of this paper are firstly; to identify major issues in sales and marketing relationship; secondly; to study various drivers of sales and marketing integration, and thirdly; to suggest two-stage research framework of sales and marketing integration. First stage of framework introduces sales and marketing as a symbiotic and complementary process which combines the strengths of sales and marketing by shifting the focus to the customer; and second stage of framework demonstrates how such

Relationship between Ownership Types and Corporate Governance and Disclosure Practices of Firms Listed in Indian Stock Exchange

Pankaj M Madhani

Introduction

Corporate governance is the system by which firms are directed and controlled. The corporate governance structure specifies the distribution of rights and responsibilities among different stakeholders in the system, such as, the board, managers, shareholders and spells out the rules and procedures for making decisions on corporate affairs. Thus, corporate governance provides an ethical process as well as well defined structure through which the objectives of the firm, the means of attaining such objectives, and systems of monitoring performance are also set.

As such corporate governance is an institutional arrangement that not only addresses the agency problem between shareholders and managers of the firm, but also provides the context for the decisions taken by the top management of the firm. In this context, the fundamental objective of a corporate governance framework is to identify a basis for strategic co-operation between shareholders and managers of the firm such that the agency problem is reduced and a basis for decisions that promote the competitiveness of the firm is provided.

The corporate governance covers a wide range of measures. Researchers classify these measures into internal and external corporate governance mechanism. Corporate governance mechanisms can be considered as key factors explaining the level of disclosure by various firms. With internal corporate governance mechanisms, the types of ownership and structure of the firm, the board characteristics such as size and composition, the auditor and the major committees of the board acquire special significance. Within external corporate governance mechanisms, the external market and market competition play a significant role in improving corporate governance. The internal and external corporate governance mechanisms in turn are shaped by the overall legal and institutional environments of the country. This research emphasizes on study of corporate governance and disclosure practices of firms segregated according to types of ownership (private as well as public sector and foreign firms). Private sector and public sector firms are constituents of domestic firms while foreign firms are subsidiaries of Multinational Corporations (MNCs).

Private sector as well as public sector and foreign firms are diverse entities with different management philosophy, responsibility and structure. In relation to corporate governance and disclosure practices, in spite of the differences, there are corporate governance principles, such as accountability, transparency, and ethical business conduct, are equally applicable for these diverse entities. This research works in this direction and focuses on private as well as public sector and foreign firms across various sectors listed in Bombay Stock Exchange (BSE), to study their corporate governance and disclosure practices.

Enhancing Competitiveness: Moving from Supply Chain to Demand Chain Management

Dr. Pankaj M. Madhani

Introduction

Supply chain involves all activities associated with the flow and transformation of goods as well as the related information flows from the raw material stage, through to the end user. Supply chain is defined as the integration of key business processes from customers through original suppliers that provide products, services, and information that adds value for end users and other stakeholders. Here, a supply chain includes all the value chain processes from suppliers to end customers. As such supply chain comprises all the supply processes necessary to fulfill customer demand and is managed within supply chain management (SCM). SCM can be defined as "the management of upstream and downstream relationships with suppliers and customers in order to create enhanced value in the final market place at less cost to the supply chain as a whole" (Christopher, 1998). Hence, SCM refers to all of the processes, technologies, and strategies that together form the basis for working with internal as well as external sources of supply.

As SCM focuses on the efficient matching of supply with demand it does not help the firm to find out what the customer perceives as valuable, and how this customer-perceived value can be translated into customer value propositions. Hence, supply chain efficiency by itself will not increase customer value and satisfaction as firms also require market orientation to enhance their market responsiveness capabilities. This research works in this direction and explains how firms build competitive advantages by moving from supply chain to demand chain management approach.

Moving from Supply Chain to Demand Chain Management

Globalization has resulted in greater competition, and implies that markets are becoming volatile and more fragmented, thereby generating further management challenges in supply chain. Even high-speed, low-cost supply chains are unable to respond to unexpected changes in demand or supply. It is imperative that each supply chain participant adds value from the perspective of the end customer in the supply chain. This assumes integration of both supply and demand side activities in the value chain (Jeong and Hong, 2007). SCM requires integration and coordination of business processes throughout the supply chain for the purpose of satisfying and responding to changes in the demands of ultimate customers.

In current era of intense rivalry, it is not enough to have efficient supply chains as they often become uncompetitive because they do not adapt to changes in the structures of markets. Supply chain efficiency is necessary, but it is not enough to ensure that firms will do better than their rivals (Lee, 2004). SCM focuses on the efficient matching of supply with demand but does not help the firm to find out what the customer perceives as valuable, and how this customer-perceived value can be translated into customer value propositions. Hence, SCM efficiency by itself will not increase customer value and satisfaction (Madhani, 2013a).

Price forecasting

ABSTRACT

In this study we investigate Spot electricity price forecasting performance of Autoregressive-GARCH models on Indian spot electricity price series. Hourly spot electricity price data for each of the five regions of Indian Electricity market from 1st of October 2010 to 15th November 2013 is used for the study to evaluate forecasting performance of the calibrated models. The conditional mean and conditional variance equations are estimated and one-step-ahead forecasts with a rolling window is performed. The fact that India being the only country in the world having power exchanges in-spite of demand outstripping supply and peak power shortage even to this day, further emphasizes the significance and criticality of spot electricity price forecasting from a power market participant's perspective and its practical relevance for Open access consumers in India.

© 2016 Elsevier Ltd. All rights reserved.

1. Introduction

The Indian Electricity Act[1] (IEA) 2003 has paved way for trading of electrical power and is now a separate and completely distinct activity with licensing from the Central Electricity Regulatory Commission (CERC) of India. Post the enactment of IEA 2003, private players and licensees have started their operations in Ahmedabad, Mumbai, Kolkata, Surat, Delhi and other major cities in India for Generation of electric power, Distribution of electricity and proper Operations in system. Electricity sector in India has been opened up for 100% Foreign Direct Investment (FDI) in power Generation, Distribution and power trading. In the last few decades, electricity markets world-wide are gradually transforming from being highly regulated by the Governments of the respective countries in-to deregulated and competitive markets and Indian Electricity market is the latest entrant to this list.[2] Electricity is a very distinctive commodity which cannot be cost-effectively stored and the end-user demand exhibits strong seasonality.[3] Earlier we had electric utilities which were vertically integrated and now we have deregulated competitive markets worldwide [3,35] with the sole objective of introducing competition in power industry, thereby, providing more options for power market participants to choose from [3]. With the deregulation and increased competition, today, participants of power markets are facing new challenges.

Short term, medium term or long term power trading is not a technical business any-more. It has transformed in to one in which, the product is treated similar to any other commodity [41]. Events such as non-availability of resources (e.g., variation or shortage of coal for thermal power stations), power plant outages, flawed transmission grid reliability or breakdown of electrical transformers tend to have tremendous effect on electricity spot prices. In a power market, for both spot markets and long-term contracts, price forecasts are essential input so that power market participants can devise effective bidding strategies or negotiation skills for maximizing future profits. An Independent power producer (IPP) or a Generator capable of predicting spot electricity prices accurately will be in a better position to adjust its own production schedule by buying/selling power from power exchange depending on when it is more profitable, ensuring power requirements are met and

E-mail address: gpgirish.ibs@gmail.com.

[1] The Indian Electricity Act was enacted by the Parliament of India on the 26th of May 2003 aimed at introducing competition and completely reorganizing the Indian power sector.

[2] Weron [47]; Girish, Panda and Rath [22] have reviewed the evolution of organized day-ahead spot electricity markets world-wide. Girish and Vijayalakshmi [24] have focused on role played by energy exchanges for facilitating electricity trading in India.

[3] Demand of electricity and electricity prices exhibit seasonality at annual level, monthly level, weekly level, daily level and intra-day level [1,17,23,28,29,47].

Product code: FIN-2-0037, FIN-2-0037A

ABSTRACT

The caselet highlights the importance of applying the accounting concepts and conventions mandated by Institute of Chartered Accountants of India (ICAI) for preparation of final accounts by the business enterprises. It begins with a brief history about the formation of sole proprietorship business entity 'MP Taps and Fittings Enterprise' and then talks about various business activities and transactions during the year. Through this, the case tries to bring to the light the importance of recording the business transactions and treatment of the adjustment entries while preparing the financial statements. It also describes the various situations where the recording of business transaction would be done using different accounting concepts and conventions practiced by accountants in India as well as abroad.

Pedagogical Objectives

- To understand the application of accounting principles in recording of financial transactions
- To analyze the treatment of adjustment entries in the preparation of final accounts
- To understand the concept of Return On Investment (ROI) and its importance
- To discuss the concept of providing for future losses or cash requirements

Case Positioning and Setting
MBA program – Financial Accounting course – To discuss various issues pertaining to the treatment of business transactions, understand the applicability of accounting principles and preparation of final accounts

Abstract

In this study, we investigate the impact of Odd-Even rationing of vehicles plying on the roads of the National Capital city of Delhi, India on air pollution levels by considering both residential and industrial areas of Punajbi Bagh, R.K. Puram, Anand Vihar, Mandir Marg, NSIT Dwarka and Shadipur of the city and have analyzed its impact by employing event study technique and by utilizing daily data of NO_2, SO_2, O_3, PM_{10} and $PM_{2.5}$. A ±15 day window has been considered for our analysis to assess the impact on air pollution levels pre-odd even rationing and post-odd even rationing and has statistically investigated whether this bold move by the State Government of Delhi has helped in the reduction of air pollution levels in the city or not. With the State Government considering implementing Odd-Even rationing permanently, the present study is intended to provide insights to policy makers to take an informed decision and also facilitate in implementing future policies for controlling air pollution levels in the city.

1. Introduction

Delhi, the National capital territory of India, has always been known world-wide for its rich historical sculptures, monuments and is now infamously known for its Air Pollution levels. World Health Organization [1] in their study in December 2014 found that 13 of the 20 most polluted cities of the world are from India and Delhi tops this infamous list by having six times more air borne particulate matter that are considered to be safe compared to normal level which is shocking, alarming and something which needs to be addressed immediately. The average $PM_{2.5}$ levels in Delhi for Dec-Jan 2015 was 226 which was recorded by the US embassy compared to Beijing's 95 for the same period implying that New Delhi's air quality is almost twice as bad as that of Beijing's air quality. According to WHO's air quality guidelines the safe levels for PM is 20 μg/m^3 (annual mean) for PM_{10} and that of $PM_{2.5}$ is 10 μg/m^3 (annual mean).

Consumers' Deal Proneness: A Demographic Approach

-- Surajit Ghosh Dastidar

Sales promotion (deal) is increasingly becoming a powerful tool for marketers at all stages of the product life cycle, from encouraging trial to inducing brand switching to maintain loyalty. However, for effective sales promotional campaigns, a company needs to understand why consumers respond to deals. The deals must appeal directly to the target audience and be perceived by them to add value. Demographic influences on consumer responses to products promoted through deals have been the focus of many early studies. However, results have been mixed and inconclusive. Moreover, no study is known in the Indian context. This study was carried out in terms of eight deal types across FMCG and durables, pertaining to four demographic characteristics, e.g., gender, age, income and education. Significant influence of demographics, though modest, has been found in many cases. The profiling of promotion-prone consumers is expected to enable marketers to design better promotional campaigns.

Understanding the Repatronage Intentions of Supermarket Customers: A Cluster Analysis

-- Grishma Padhye and B V Sangvikar

In the competitive retail scenario in India, supermarkets need to develop strategies for sustaining customer relationships. Retail literature has highlighted different attributes for store choice, which are determinants of store patronage. The attributes of supermarkets have been broadly categorized into product-related (variety, store brands, product quality), and market-related (shopping experience, fast checkout, reliability, helpful salespeople, and service). This study uses 18 attributes and derives three cluster solution of enthralled, casual, and apathetic supermarket customers using hierarchical and non-hierarchical cluster analysis. A chi-square test of independence reveals that the three clusters differ significantly with respect to age, working status, education, income, and distance traveled to the store. The enthralled customers comprise younger, working consumers with higher educational qualifications and higher incomes and traveling shorter distances to the supermarket. One-way ANOVA test shows that the three clusters vary significantly with respect to repatronage intentions. Enthralled customers show higher repatronage intentions than the casual customers, who in turn show higher repatronage intentions than apathetic customers. The findings offer crucial

Automated Teller Machines (ATMs): The Changing Face of Banking in India

Bank Management

Information and communication technology has changed the way in which banks provide services to its customers. These days the customers are able to perform their routine banking transactions without even entering the bank premises. ATM is one such development in recent years, which provides remote banking services all over the world, including India. This paper analyzes the development of this self-service banking in India based on the secondary data.

The Information and Communication Technology (ICT) is playing a very important role in the progress and advancement in almost all walks of life. The deregulated environment has provided an opportunity to restructure the means and methods of delivery of services in many areas, including the banking sector. The ICT has been a focused issue in the past two decades in Indian banking. In fact, ICTs are enabling the banks to change the way in which they are functioning. Improved customer service has become very important for the very survival and growth of banking sector in the reforms era. The technological advancements, deregulations, and intense competition due to the entry of private sector and foreign banks have altered the face of banking from one of mere intermediation to one of provider of quick, efficient and customer-friendly services. With the introduction and adoption of ICT in the banking sector, the customers are fast moving away from the traditional branch banking system to the convenient and comfort of virtual banking. The most important virtual banking services are phone banking, mobile banking, Internet banking and ATM banking. These electronic channels have enhanced the delivery of banking services accurately

managerial implications for designing and developing differentiated marketing strategies to enhance better ratings of attributes from customers and hence repatronage intentions.

Segmentation of Young Consumers of North-East India Based on Their Decision-Making Styles

-- Pradeep K Deka

The consumer decision-making process is a complex phenomenon. The decision to purchase goods and services is influenced by a number of factors, a few of which are internal to the customer, while a few others are external environmental factors. Depending on these factors, customers exhibit some unique characteristics in their decision-making styles. This study is an attempt to understand the decision-making style of young Indian consumers (specifically of North-East India) and then to identify segments of consumers based on their decision-making behaviors. The study is based on the well-accepted model of profiling consumer decision-making styles by Sproles and Kendall (1986), but also takes into consideration various other studies undertaken related to Indian consumers. This study checks the validity of the said model over a sample of 119 college-going youth from North-East India. The consumer decision-making styles were identified with the help of a structured questionnaire as suggested by consumer decision-making style inventory by Sproles and Kendall (1986). Eleven consumer decision-making styles were identified instead of the eight styles envisioned by the original model. A simple comparison is also done of the outcomes of various studies related to the said model.

End of the Road for Maruti 800: A Case Study

-- B Shafiulla

Maruti 800 has revolutionized Indian auto industry in the last 30 years. Maruti 800 is widely regarded as the most influential automobile in India; about 2.87 million Maruti 800 were manufactured during its course, of which 2.66 million were sold in India. The name "Maruti" was synonymous with Maruti 800 during the 1980s and the 1990s. It remained the bestselling car in India until 2004 when Maruti Alto took the coveted title. In April 2010, Maruti halted the sales of the car in 13 major cities —the four metros and nine other cities including Kanpur, Bengaluru, Hyderabad, Pune, Ahmedabad, Agra and Surat, where the law made it mandatory for the vehicles sold to be Euro IV-compliant. According to the Executive Director MSIL, the car production stopped in January 18, 2014, but spare parts would be available for customers for the next 8-10 years as per company policy.

and efficiently to the customers. The ATMs are an important part of a bank's alternative channel to reach the customers, to showcase products and services and to create brand awareness. This is reflected in the increase in the number of ATMs all over the world. ATM is one of the most widely used remote banking services all over the world, including India. This paper analyzes the growth of ATMs of different bank groups in India.

International Scenario

If ATMs are largely available over geographically dispersed areas, the benefit from using an ATM will increase as customers will be able to access their bank accounts from any geographic location. This would imply that the value of an ATM network increases with the number of available ATM locations, and the value of a bank network to a customer will be determined in part by the final network size of the banking system. The statistical information on the growth of branches and ATM network in select countries.

Indian Scenario

The financial services industry in India has witnessed a phenomenal growth, diversification and specialization since the initiation of financial sector reforms in 1991. Greater customer orientation is the only way to retain customer loyalty and withstand competition in the liberalized world. In a market-driven strategy of development, customer preference is of paramount importance in any economy. Gone are the days when customers used to come to the doorsteps of banks. Now the banks are required to chase the customers; only those banks which are customercentric and extremely focused on the needs of their clients can succeed in their business today.

Optimal Mix of Financial and Nonfinancial Rewards: Enhancing Sales Performance

Pankaj M. Madhani , Associate Dean and Professor,
ICFAI Business School

INTRODUCTION

A salesforce represents a significant investment because it is a large percentage of total costs for most sales organizations. As boundary spanners, salespeople link the organization to its customers and generate revenue. Given the important role salespeople play in building competitive advantages for an organization, motivation of the salesforce is widely recognized as an essential component of a rewards strategy. An effective rewards strategy has the goal of attracting, motivating and retaining qualified sales employees as well as enhancing their performance.

An organization needs to determine what its salesforce wants and provide it through proper design of rewards plans in a way that is proactive and specific as well as economic and effective.

Rewards optimization not only reduces employee turnover but also enhances performance of retained employees as it takes into consideration the needs of the sales employees, the characteristics of their territories and the requirements of the organization. This research provides an approach to a salesperson's profitability index (SPI) that can predict future sales performance and link that performance to the rewards practices of sales organizations. After determining the future value of various groups, a sales organization may correlate data on each segment's prior rewards structure with the SPI to develop a picture of how such factors influence performance of sales employees. Because of this, SPI can be used across various segments and can be correlated with types of rewards practices. Based on this relationship, sales organizations can identify specific rewards needs to enhance sales performance.

Financial Versus Nonfinancial Rewards: Key Features

An effective rewards design influences the behavior of sales employees and leads to a positive sales outcome. Financial rewards are associated with a lower level of internalization and thus undermine intrinsic motivation and clearly influence extrinsic motivation. Motivation is not constant as it varies with age, education, experience, aspirations, background and position in an organization. Thus, organizations try to cater to individual preferences to align employees' efforts with the business objectives and enhance motivation level of their employees. Hence, sales organizations incorporate non-financial rewards in rewards design to motivate salespeople to perform better as not every employee is motivated by financial rewards. Such designs are customized to fit individual selling roles, different selling strategies and unique requirement of different sales territories.

A Salesperson's Future Value- and Training Needs: A Model-Driven Approach

Pankaj M. Madhani, Ph.D.,
ICFAI Business School

Businesses spend a massive amount on salesforce training. The American Society for Training and Development (ASTD) estimates that businesses in the United States spend $15 billion annually on sales and sales management training, which amounts to about $2,000 per salesperson (Salopek 2009). In technical markets, the costs associated with the development of a single salesperson can exceed $100,000 (Johnston and Marshall 2006). The large amounts spent on training reinforces the idea that it remains critically important for organizations to enhance the performance of sales employees.

However, in the current environment of tough competition and economic uncertainty, there is a growing recognition that enhancing salesforce productivity is not simply a matter of hiring, firing and deploying the right number and types of individuals. Success is also dependent on finding ways to help existing salespeople sell more. Narrowing the gap between the top 15% or 20% and the rest of the salesforce can lead to productivity jumps of more than 200% (Ledingham, Kovac, and Simon 2006).

Customer-focused Supply Chain Strategy: Developing Business Value Added Framework

Pankaj M. Madhani
pmadhani@iit.edu

Associate Dean & Professor
ICFAI Business School (IBS)

Introduction

In the context of globalization, shortening product lifecycles, and changing customer preferences, the management of supply chains has become increasingly complex. Supply chain covers all movement and storage of materials and goods including inventory of raw materials as well as work-in-process, and finished goods from point of origin to point of consumption. Any initiatives to improve supply chain performance attempt to match supply and demand, thus simultaneously driving down costs and improving customer satisfaction. Customers are crucial to any business as without customers, there is no sales; without sales, there is no revenue and profits. Hence, there is lot of attention on 'customer-focus'.

With competition now at the supply chain level (Craighead *et al.,* 2007), competitive advantage comes from the ability of supply chain partners to co-ordinate and integrate strategies aimed at satisfying the ultimate customers of the supply chain at a relatively low total cost (Cohen and Roussel, 2005). Customer-focused supply chain strategy provides an approach to respond to these challenges and hence they are most likely to prosper within today's competitive global landscape. Customer-focused supply chain strategy strives to match supply and demand, thereby driving down costs simultaneously with improving customer satisfaction. In short, customer-focused supply chain strategy maximizes value to the ultimate customers of the supply chain in terms of both satisfaction with the product and/or services and a relatively low total cost of the product and/or service.

This research works in this direction to underscore significance of customer-focused supply chain strategy. It also provides supporting matrix to emphasize its various attributes; develops 4Rs framework for building customer-focused supply chain strategy and formulate business value added framework to emphasize benefits in terms of improved firm performance.

Literature Review

A supply chain is an interconnected set of relationships from customer to supplier, through a number of intermediate stages such as sourcing, manufacturing, and warehousing and distribution and it is a network of companies which influence each other (Agarwal and Shankar 2002). The 'supply chain' is a process that describes the flow of goods from the production of a product right through to the final sale to the end consumer (Bruce *et al.,* 2004).

Madhani, P. M. (2017). "Customer-Focused Supply Chain Strategy: Developing Business Value-Added Framework", *The IUP Journal of Supply Chain Management*, Vol. 14, No. 4, pp. 7-22.

LEVERAGING IT: BUILDING A CUSTOMER -FOCUSED SUPPLY CHAIN STRATEGY

DR. PANKAJ M. MADHANI, ASSOCIATE DEAN AND PROFESSOR
ICFAI BUSINESS SCHOOL (IBS)
pmadhani@hawk.iit.edu, pmadhani@iit.edu

Introduction : A supply chain is an interconnected set of relationships from customer to supplier, through a number of intermediate stages such as sourcing, manufacturing, and warehousing and distribution and it is a network of companies which influence each other. The 'supply chain' is a process that describes the flow of goods from the production of a product right through to the final sale to the end consumer (Bruce et al., 2004). Supply chain management (SCM) can be used to describe various concepts – the processes inside a manufacturing firm; purchasing and supply management relationships; the total chain; as well as a total firm network.

Supply chain strategy of the firm refers to the strategic goals and objectives of its supply chain and requires an end-to-end focus on integration of business processes throughout the value chain for the purpose of providing optimum value to the end-customer (Green et al., 2008). As supply chain strategy is part of the overall business strategy, organizations should understand customers' needs, and to choose and implement the appropriate supply chain strategy to satisfy customer demands (Dubey et al., 2017).

Implementing an effective supply chain strategy is an important issue in enhancing customer satisfaction. Various actors in supply chains need to be able to recognize changes in the environment and utilize opportunities that evolve to meet changing customer demands. Proper implementation of supply chain strategy improves the performance of the supply chain. Information Technology (IT) in SCM provides a reduction in cycle time, a reduction of inventories, a minimization of the bullwhip effect, improvement in the effectiveness of distribution channels and ultimately helps in building responsiveness, resilience, reliability and realignment required for building customer-focused supply chain strategy.

Customer-focused Supply Chain Strategy : In today's competitive business environment, customer satisfaction is an increasingly important component of an effective organization and hence every organization aims to become more sensitive and responsive to the changing needs of customers, i.e. "customer focused". Customer-focused supply chain strategy strives to match supply and demand, thereby driving down costs simultaneously with improving customer satisfaction. In short, customer-focused supply chain strategy maximizes value to the ultimate customers of the supply chain in terms of both satisfaction with the product and/or services and a relatively low total cost of the product and/or service. Table 1, below shows major differences between traditional supply chains and customer-focused supply chains according to competitive priorities.

Table 1: Traditional Supply Chains versus Customer-focused Supply Chains

Sr. No.	Competitive Priorities	Traditional Supply Chains	Customer-focused Supply Chains
1	*Responsive*	Modest ability to respond to changes	Strong ability to be proactive as well as responsive to changes
2	*Resilient*	Often limited to single chains or a large number of chains	Maintain a limited set of multiple chains to ensure distribution
3	*Reliable*	Focus on cost-efficiency	Focus on reliable and cost efficient supply chains
4	*Realigned*	Participants forced to choose between own and chain's interests	Interests of participants coincide (or is developed to be synergistic)

(Source: Madhani, 2017)

Competitive Priorities: Responsiveness, Reliability, Resiliency and Realignment : The competitive priorities of responsiveness, reliability, resiliency and realignment for a typical supply chain are explained below:

Responsiveness : Responsiveness in supply chain is the equivalent of agile and agile means capable of coping with wide changes in demand. Agility is the ability to respond to short-term changes in demand or supply quickly and handle unexpected external disruptions smoothly and cost-efficiently. Agility in a supply chain is the ability of the supply chain as a whole, and its members, to rapidly align the network and its operations to dynamic and turbulent requirements of the customers. Supply chain agility is the capability of the supply chain to respond quickly and effectively to market changes and accordingly adjust tactics and operations within its supply chain to respond to environmental changes, opportunities, and threats. Supply chain agility can also positively affect operational performance as it enables firms to meet delivery deadlines and to ensure dependability and accuracy of a service.

Resilience : Resilient supply chains are more capable of coping with the uncertain external environment i.e. they are more adaptable. Resilience means the capacity to anticipate unsafe and unexpected events for organizational survival in the face of threats, including the prevention or mitigation of failures in the systems. Adaptive supply chains or supply networks are those that are flexible enough to meet the uncertainty of changing customer demands and accordingly restructure the supply chain in response to changing markets and economic environments.

Reliability : Today's business scenario is characterized by higher levels of turbulence, volatility, unexpected shocks and discontinuities and reflects many uncertainties causing risks. Consequently, supply chains are vulnerable to disruption and, in consequence, the risk to business is increased. Hence, increasing reliability

Salesperson's True Potential vs. Salespersons Profitability Index

Pankaj M. Madhani

Abstract

Typically sales organizations measure only past sales performance and hence rely on historical metric. Sales people who brought in the most sales were considered 'stars'. However, such direct measure was neither an accurate gauge of a sales person's present worth nor a good indicator of his or her potential. By developing a forward-looking approach to forecast a salesperson's future value and linking sales performance with the types of training and incentives each salesperson has received, it is possible to optimize salesforce investments, boost revenue and profit and derive greater business value. Salesperson's profitability index (SPI) developed in this paper provides basis for internal benchmarking and helps sales organizations in measuring future value of salesperson. SPI is dependent on future value of sales people and salesforce investment. This research provides insights on how sales organization can incorporate SPI metric in salesforce investment and performance management to boost salesforce productivity and enhance competitive advantages.

Keywords: *Salesperson's future value, Sales performance, Training, Sales incentives, Salesperson's profitability index*

Dr. Pankaj M. Madhani
Associate Dean and Professor
ICFAI Business School (IBS)
IBS House, Opp. AUDA Lake
Science City Road, Off. S.G. Road
Ahmedabad – 380 060, India
Email: pmadhani@iit.edu

The salesforce represents a significant investment as it is a large percentage of total costs for most sales organizations. Each year businesses across the globe spend a massive amount on salesforce investment. U.S. businesses spend a whopping $800 billion annually on salesforce compensation and another $15 billion on sales training (Kumar *et al.*, 2015). Nevertheless sales organizations currently rely on backward-looking metrics to gauge the impact of these spendings.

Sales organizations have used many subjective and objective measures to gauge sales performance. In subjective measures, sales organizations focus on how hard sales people have worked in terms of the overall amount of efforts or time that sales people devote trying to achieve sales goals. While in objective measures, sales organizations monitor and reward their sales people with sales revenue or output measure. Such output based measures of performance are simple and easy to implement, but ad-hoc rather than

Logistics and Marketing Integration: Enhancing Competitive Advantages

Pankaj M. Madhani

Introduction

Success of a business as well as delivery of higher customer service is largely dependent on achieving an effective coordination and integration among individual units of the organization. Researchers have long recognized the importance of customer service in achieving customer satisfaction. The interface between logistics and marketing is critical to the delivery of customer service. However, achieving outstanding customer service levels is complex and challenging because it involves inter functional co-ordination, especially between the logistics and marketing functions. Without the successful link of logistics and marketing, the firm may be unable to provide good customer services and meet customer expectations, resulting in a dissatisfied customer or a lost sale. In fact, organizations often succeed or fail depending on their levels of customer service.

Logistics and marketing are usually concerned with satisfying the customers' needs and wants, respectively through their supply and demand functions in a marketing channel. The logistics activity may be dependent on a marketing activity in a marketing channel, and vice versa. The malfunctioning of one activity may severely impact the functioning of other activities. Therefore, the satisfaction of supply and the satisfaction of demand of customers' needs and wants have to be coordinated and synchronized in order to achieve customer value proposition. This research works in this direction and provides various frameworks for integrating logistics and marketing.

Literature Review

Logistics operations are responsible for the efficient and effective handling of a firm's goods and services with the ultimate aim to minimize costs, to improve customer service and to create a competitive advantage (Christopher, 2006).The efficient and effective logistics management is major component for organizational success. An important functional area in logistics is warehousing management. Warehousing can be a highly costly and labor-intensive function (Murphy and Poist, 1993).

Logistics interacts with a number of different areas within an organization, such as operations (production), marketing, procurement, and human resource management (Coyle et al., 1992) with the most common interface being with marketing (Schary, 1984).Although marketing was originally considered as including activities related to demand creation (personal selling, advertising, sales promotion) and demand supply (physical distribution), it has evolved to focus primarily on demand creation. Hence, logistics has emerged as a discipline to address the demand supply activities inherent in the physical distribution functions to fulfill the demand (Lambert and Cook, 1990).Warehousing and distribution are critical to the successful marketing of products: if the product is not where customers want it, when they want it, it is unlikely to sell (Lawrence, 1998).The typical interface between the logistics and marketing is in the area of customer service (Sharma et al., 1995).

Madhani, P. M. (2017), "Logistics and Marketing Integration: Enhancing Competitive Advantages", *The IUP Journal of Management Research*, Vol. 16, No. 3, pp. 7-29.

Leagile Supply Chain Strategy: Benefits of Both Lean and Agile Approach

Materials Management Review, Vol. 13, No. 9, pp. 9-11, (2017)

7 Pages
Posted: 27 Jul 2017
Last revised: 1 Mar 2021

Pankaj M. Madhani (https://papers.ssrn.com/sol3/cf_dev/AbsByAuth.cfm?per_id=765212)
IBS Hyderabad, ICFAI Foundation for Higher Education (IFHE) University, Hyderabad

Abstract

Supply chain strategies with traditional strategies do worse compared to those having a strategy focused on either lean, agile or a combination of lean/agile strategies. Though lean and agile strategies are often pitted as opposing paradigms, they share a common objective; meeting customer demands at the least total cost. As time has now become a vital factor in competitiveness due to customers becoming increasingly reluctant to accept long lead-times for products and services, the significance of speed and responsiveness in today's industry settings have blurred the boundaries of related concepts, such as agility and lean thinking and evolved concepts of legality. Leagile is a better supply chain strategy than lean or agile alone. Leagile supply chain strategies have led to a revolution in the way the firms manage their supplies as these concepts, have made business competitive and more profitable.

Leagile Supply Chain Strategy: Benefits of both Lean and Agile Approach

Dr. Pankaj M. Madhani
Associate Dean and Professor
ICFAI Business School (IBS)

Introduction

Supply chain strategy is a tool to control the supply, transportation, production and distribution of products to the end customers. Lean supply chain strategy is suited for competitive markets within sufficient assets while agile strategy, on the other hand, is a response to volatile markets. Lean supply chains are synonymous with commodity-type products aiming to reduce waste, maximize utilization and driving continuous improvement. In contrast, agile principles are applied when the supply chain needs to respond rapidly to fluctuating demands, ensure premium quality and/or deal with products that have short life spans (Madhani, 2017b). There are some instances where there is an economic justification for designing a 'Leagile' supply chain (hybrids of the lean and agile approaches), thereby getting the best of both worlds. This research works in this direction and identifies various configurations of leagile strategies to extract benefits of both lean and agile supply chain strategies.

Leagile Supply Chain Strategy: Mix of the Lean and Agile Approaches

Supply chain strategies can be classified as the ones that emphasize cost reduction (i.e. lean strategy), quick response (i.e. agile strategy) or a mix of both of them (leagile strategy) (Sharma and Kulkarni, 2016). In a leagile supply chain, lean material flow is upstream of agile material flow. It is called leagile approach as agile process is fully documented and understood by initially engineering a lean process and then adapting it by removing specific constraints and capacity limitations, thus enabling agility (Mason-Jones *et al.,* 2000a). It is possible to reap the benefits of both lean and agile concepts and they both can co-exist. According to study of Naylor *et al.,* (1999), lean and agile, supply chain strategies are not mutually exclusive. There are several examples that show the need to develop hybrid strategies comprising benefits of both lean and agile supply chain strategies (Christopher and Towill, 2000).

Illustration

Toyota – the very company regarded as the pioneer of 'lean concept' also demonstrated fruitful example of leagility. Scion, a splinter division of Toyota, is dedicated to serving a distinct segment of today's automotive market: the 18-25 year-old 'Generation Y' segment. The base vehicles are produced in a lean manner in Japan and shipped to the U.S. Toyota caters to this market through marketing mechanisms that avoid the mainstream media, choosing instead to sponsor local sporting events, concerts, and enthusiast clubs (Oser, 2004). Here major emphasis is on individuality when selecting and owning a car. After logging on to Scion's website, Toyota encourages visitors to modify one of the three base Scion models (the xA, xB, and tC), saying, "Build your Scion: We relinquish the power to you."

Madhani, P. M. (2017). "Leagile Supply Chain Strategy: Benefits of both Lean and Agile Approach", *Materials Management Review*, Vol. 13, No. 9, pp. 9-11.

Six Sigma Deployment in HR: Enhancing Competitiveness

Pankaj M. Madhani

Abstract

Six Sigma is a disciplined, quality approach and philosophy for eliminating defects in any process – from manufacturing to transactional and from product to service. Six Sigma is flexible enough to be applied to different challenges throughout business and organizations can use it in diverse areas such as HR. Six Sigma deployment in HR helps in its reengineering by increasing the speed, quality and efficiency of HR services. Six Sigma deployment in HR is important for overall performance and growth of business. This research provides HR process improvement steps in terms of efficiency and effectiveness, develops various frameworks for its successful implementation and document benefits of Six Sigma deployment in HR with various case studies.

Key words : *HR, Six Sigma, TQM, HRM practices, DMAIC, Competitive advantages*

Dr. Pankaj M. Madhani
Associate Dean and Professor,
ICFAI Business School (IBS)
IBS House, Opp. AUDA Lake
Science City Road, Off. S.G. Road,

pmadhani@iit.edu

In this highly competitive environment every functional areas of an organization needs to perform better, faster and cheaper, to keep the company ahead of the competition. In this context, human resource (HR) function is no exception as more cost effective and streamlined HR processes will create value for the organization, instead of just being a support function for the management. By aligning HR processes and scientifically building human capital, HR can contribute significantly to the organization's effectiveness and competitiveness (Becker and Huselid, 1998). Effective and efficient HR practices will streamline efforts of various functional departments in the organizations and thus increase the overall customer value. Six Sigma is well suited to contribute to and support these efforts of the organizations due to its focus on problem identification, process improvement, and its emphasis on the customer. Six Sigma aims to reduce variation in manufacturing and business processes and was adopted by a large number of companies in the 'Fortune 500' list with a view to make measurable improvements and savings based on evidence.

Six Sigma is a data-driven improvement methodology that emphasizes defect prevention over defect detection by

Supply Chain Strategy Selection: A Multi-Criteria Decision-Making Approach

Dr. Pankaj M. Madhani
Associate Dean and Professor
ICFAI Business School (IBS)

Introduction

Supply chain covers all movement and storage of materials and goods including inventory of raw materials as well as work-in-process, and finished goods from point of origin to point of consumption. Any initiatives to improve supply chain performance attempt to match supply and demand, thus simultaneously driving down costs and improving customer satisfaction. However, such initiatives require uncertainty within the supply chain to be reduced as much as feasible so as to facilitate a more predictable upstream demand. At times it is not possible to remove uncertainty from the supply chain due to the nature of product involved. If a product is innovative and having very short product life cycle (PLC), then by its very nature, its demand will be unpredictable. Hence, specific supply chains are faced with the situation where they have to accept uncertainty but need to develop a strategy that enables them still to match supply and demand. Hence, this research works in this direction and identifies various strategies to match demand and supply efficiently and effectively.

Supply Chain and Management and Strategy: Key Concepts

The 'supply chain' is a process that describes the flow of goods from the production of a product right through to the final sale to the end consumer (Bruce *et al.,* 2004). According to Harland (1997) the term supply chain management (SCM) can be used to describe a number of concepts – the processes inside a manufacturing organization; purchasing and supply management occurring within dyadic relationships; the total chain; and finally a total firm network.

SCM is defined as plans to be conducted repeatedly to satisfy the necessities of the final customer (Seferlis and Giannelos, 2004). SCM is an integration of all activities associated with the flow of goods, starting from raw material to the final product reaching the customer. SCM can improve the performance of the firm by integrating key business processes from end users through suppliers and vendors by providing products, services and information that add value to customers (Othman and Ghani, 2008). The basic premise of SCM is that the performance of a firm depends more and more on its ability to maintain effective and efficient relationships with its suppliers and customers (Chen and Paulraj, 2004). SCM emphasizes how to maximize the overall value of the firm by better deploying and using of resources across the whole of the firm (Sukati *et al.,* 2012). Today, firms view SCM as a strategic tool to increase their competitive advantage. This strategic view is encapsulated in the concept of the "supply chain strategy" (Qrunfleh and Tarafdar, 2013).

Madhani, P. M. (2017), "Supply Chain Strategy Selection: A Multi-Criteria Decision-Making Approach", *The IUP Journal of Supply Chain Management*, Vol. 14, No. 2, pp. 38-56.

Six Sigma Deployment in Sales and Marketing: Enhancing Competitive Advantages

Pankaj M Madhani
Associate Dean and Professor
ICFAI Business School (IBS)

1.0 Introduction

Organizations face constant competition to attract and retain customers, hence, revenue and profitability of some of the organizations' are at risk. One method of reducing this risk is to increase the customer satisfaction and overall customer value by streamlining sales and marketing efforts. Six Sigma is well suited to contribute to and support these efforts of sales and marketing due to its focus on problem identification, process improvement, and its emphasis on the customer. Organizations can use Six Sigma in the reengineering of sales and marketing operations to increase customer satisfaction by increasing the speed, quality and efficiency of its services.

Six Sigma deployment in sales and marketing will depend on its ability to change and adapt to the organizational needs as sales and marketing require a disciplined and strategic approach for value creation and market-share growth. Six Sigma approach helps sales and marketing in increasing market share and top line revenue in targeted product/markets by providing superior value. These are external objectives as opposed to the internal objectives of defect reduction and cost cutting for Six Sigma deployment in production and operation. In short, Six Sigma is a disciplined, data-driven approach and methodology for eliminating defects in any process – from manufacturing to transactional and from product to service.

2.0 Literature Review

Six Sigma is a business improvement program that targets process variation. Traditionally Six-Sigma has been used in the manufacturing for reducing defects. Krishna et al., (2008) studied a case study illustrating how a multinational Indian corporation was able to successfully implement Six Sigma principles to improve its manufacturing operations. Six Sigma problem-solving methodologies in manufacturing process was studied by Kumar et al., (2007) to identify the parameters causing casting defects and to control these parameters.

Six Sigma is not only for manufacturing, but any process where an opportunity exists for error and hence can be used in diverse business areas to improve on time delivery; reduce cycle time for hiring and training new employees; improve sales forecasting ability; and improve quality of customer service (Mehrjerdi, 2013). Kumar et al. (2008b) presented a case of implementation of the Six Sigma approach for improvement in service system by a major consumer electronics and appliance retailing company in the USA.

Diverse Roles of Corporate Board: A Review of Various Corporate Governance Theories

Pankaj M Madhani[*]

The board of directors (i.e., board) has generally been perceived as the backbone of corporate governance. Board is one of the most important internal corporate governance mechanisms used by the shareholders to monitor management. Board has diverse functions and roles such as control role, strategic role, service or resource provision role and advice and counsel role. There are many theories of corporate governance to explain such diverse roles of corporate boards. Any single corporate governance theory cannot fully explain the complexity and heterogeneity of the board functions in a corporate business. Hence, this research study reviews some of the corporate governance theories with a view to understanding how board functions and how board compositions are related to firm performance. This study looks at four main theories, namely, agency theory, stewardship theory, resource dependency theory, and resource-based view theory, that have influenced corporate governance development related to board functions.

Introduction

Corporate governance has predominantly focused on the relationship between the management of firm and the board of directors (board), particularly on separating these two functions for effective professional management. It is mainly because, the board members usually may not get enough time and the management of the firm has to manage the day-to-day affairs. So, the role of board as a driver of corporate governance becomes even more pertinent. Corporate governance is constantly changing and evolving and changes are driven by both internal as well as external environmental dynamics. There are many theories of corporate governance to explain the diverse roles of corporate boards. Effective and good corporate governance cannot be explained by one theory. Hence, it is best to use multiple corporate governance theories. Any single corporate governance theory cannot fully explain the complexity and heterogeneity of the board functions in a corporate business. So, it is important to re-visit various corporate governance approaches in the light of the diverse nature of these theories with a fresh angle. This research describes the various roles of corporate board from agency theory, stewardship theory, resource dependency theory and Resource-Based View (RBV) perspectives.

Literature Review

Corporate governance is defined as the organizational controls that govern the behavior of managers and define their discretionary powers (Charreaux, 1997). Corporate governance can also be more narrowly defined as the instruments that are in place to guarantee the maximum rate of return on investment to the shareholders and creditors of the company (Shleifer and Vishny, 1997). The broader objectives of corporate governance are: to protect the interests of shareholders and various other stakeholders including customers, suppliers, employees and society at large, to ensure full transparency and integrity in communication and to make available complete, accurate and clear disclosure to all concerned.

A good system of corporate governance will facilitate the resolution of corporate conflicts between minority and controlling shareholders, executives and shareholders, and between shareholders and stakeholders. Corporate governance typically protects investor from managers who instigate self-deal, theft of corporate assets as well as corruption (Dalton and Daily, 1999). Corporate governance stands for responsible business management geared towards long-term value creation. Good corporate governance is a key driver of sustainable corporate growth and long-term competitive advantage (Madhani, 2007). Good governance means little expropriation of corporate resources, which contributes to better allocation of resources and better performance (Madhani, 2014).

The outcome of a good corporate governance practice is an accountable board of directors who ensures that the investors' interests are not jeopardized. Board of directors is one of the most important internal corporate governance mechanisms used by the shareholders to monitor management. Perry and Shivdasani (2005) state that, "charged with hiring, evaluating, compensating and ongoing monitoring of the management, the board of directors is the shareholder's primary mechanism for oversight of managers". The board of directors has generally been perceived as the backbone of corporate governance as board contributes to alleviating agency costs to the firm by monitoring and rewarding top executives to ensure wealth maximization for the shareholders. McNulty and Pettigrew (1996) identified the various roles of board directors in terms of three main perspectives: a governance perspective (the monitoring function of the board), a strategic perspective (decisions enabling the firm to change), and the resource perspective (how the board links the firm to its external environment and enables it to acquire critical resources). Any board effect on firm performance will be highly dependent on context-specific situations such as stage of organizational life cycle (Johnson, 1997), industry homogeneity and regulation (Palia, 2000), competitive conditions (Carpenter and Westphal, 2001), technology changes (Castanias and Helfat, 2001) and general industry conditions (Finkelstein and Hambrick, 1996).

Boards have an oversight role and as such it oversees strategy and monitors the managerial decisions of the top management team (Harrison, 1987; Johnson *et al.*, 1993 and1996; and Withers and Hillman, 2008). Research also states that boards serve critical functions in firms, such as monitoring management on behalf of shareholders and providing valuable resources to firms, including advice, expertise, connections to environmental contingencies, and legitimacy (Hillman and Dalziel, 2003). Board (board of directors) members may have

Lean versus Agile Supply Chain Strategy: Key Decision Criteria

Dr. Pankaj M. Madhani
Associate Dean and Professor
ICFAI Business School (IBS)

Introduction

Supply chain management (SCM) can be used to describe a number of concepts – the processes inside a manufacturing organization; purchasing and supply management occurring within dyadic relationships; the total chain; and finally a total firm network. Hence, it is an integration of all activities associated with the flow of goods, starting from raw material to the final product reaching the customer. Supply chain performance improvement initiatives strive to match supply and demand, thereby driving down costs simultaneously with improving customer satisfaction. This invariably requires uncertainty within the supply chain to be reduced as much as practicable so as to facilitate a more predictable upstream demand. Sometimes, however, uncertainty is impossible to remove from the supply chain due to the type of product involved. Thus, specific supply chains are faced with the situation where they have to accept uncertainty but need to develop a strategy that enables them still to match supply and demand. This research works in this direction and identifies various strategies to match demand and supply efficiently and effectively.

Supply Chain Management and Strategy: Key Concepts

SCM can improve the performance of the firm by integrating key business processes from end users through suppliers and vendors by providing products, services and information that add value to customers (Othman and Ghani, 2008). SCM emphasizes how to maximize the overall value of the firm by better deploying and using of resources across the whole of the firm. Today, firms view SCM as a strategic tool to increase their competitive advantage. This strategic view is encapsulated in the concept of the "supply chain strategy" (Qrunfleh and Tarafdar, 2013).

Supply chain strategy is defined as a set of approaches utilized to integrate suppliers, manufacturing, warehouses, and stores so that merchandise is produced and distributed at the right quantities, to the right location, at the right time, in order to minimize system-wide costs while satisfying service level requirements (Simchi-Levi *et al.,* 2008). Therefore, supply chain strategy of the firm refers to the strategic goals and objectives of its supply chain and requires an end-to-end focus on integration of business processes throughout the value chain for the purpose of providing optimum value to the end-customer (Green *et al.,* 2008).

As the modern business environment becomes almost borderless, there is advent of cutting-edge supply chain strategies. When developing a supply chain strategy that will facilitate matching supply and demand, the relationship between product type, supply chain and sales predictability is pivotal to ensuring that the optimal approach is adopted. Implementing an effective supply chain strategy is an important issue in today's competitive markets. Proper implementation of supply chain strategy improves the performance of the supply chain (Gunasekaran *et al.,* 2004).

This study investigates the factors influencing the Chinese manufacturing industry's innovation and industrial performance utilizing a panel data approach on a sample of Chinese manufacturing enterprises over the period of 2008–2013. The industries were grouped according to related sectors into five groups, a general group was also created which included the whole data sample. The study found that research and development (R&D) expenditure positively influenced the growth of product innovation and industrial performance, but not necessarily knowledge innovation and export performance. Also, expenditure on new product development had a positive impact on both innovation and industrial performance. The growth of patent application was discovered to be influenced by an R&D project and foreign patent license. Finally, the number of enterprises and firm size (i.e. number of employees) contributed positively to the industrial output performance. The findings suggest that industrial R&D and new product development influences the success of product innovation and sales performance. The study recommends that the government should set up policies that will stimulate industrial R&D, while supporting technology transfers from foreign partners. Most importantly, government policies on the development of the industry should be addressed on a sectorial level and not a "one-size-fit-all" type of policy.

Keywords: China manufacturing industry; innovation; industrial performance; R&D; patent.

AGILE, ADAPTABLE, AND ALIGNED SUPPLY CHAIN: ENHANCING COMPETITIVE ADVANTAGES

DR. PANKAJ M. MADHANI
ASSOCIATE DEAN AND PROFESSOR, ICFAI BUSINESS SCHOOL (IBS)
pmadhani@iit.edu

Introduction : In the twenty-first-century as strategies and structures of the organizations are changing to cope up with increased competitive pressure and fast changing customer demand, it is imperative to study how those changes are manifest in their supply chains. Based on extensive study of more than 60 leading companies that focused on building and rebuilding supply chains, Lee (2004) found top-performing companies have the ability to develop supply chains that are agile, adaptable, and aligned (Triple-A). To achieve sustainable competitive advantage, organizations need supply chain having all three of these qualities. Wal-Mart, Amazon and Dell Computer have their supply chains not just fast and cost-effective but they are also agile, adaptable and aligned. Such Triple-A supply chains should generate superior supply chain performance which, in turn, leads to better organizational performance. The most successful companies work within supply chains that rapidly respond to short-term changes in immediate and ultimate customer' demands (agility), adjust to long-term changes in economies and markets by restructuring the supply chain (adaptability), and integrating business processes resulting in an equitable sharing of risks, costs, and rewards with all supply chain partners (alignment).

Triple-A Supply Chain: Enhancing Competitive Advantages : Great supply chains possess three very different qualities. First, top-performing supply chains are agile. They react speedily to sudden changes in demand or supply. Second, they adapt over time as market structures and strategies evolve. Third, they align the interests of all the partners in the supply network so that companies optimize the chain's overall performance when they maximize their interests. These organizational capabilities of agility, adaptability, and alignment are dynamic capabilities that result in competitive advantage as these capabilities are developed and renewed in response to changes in customer demand and changes in the structure of markets and economies. As these organizational abilities are integrated and coordinated with in supply chain networks, it ultimately develops competitive advantage related to the ability to satisfy the ultimate customers of the supply chain. It is necessary to decipher the needs of ultimate consumers - not just immediate customers. Otherwise, organization may fall victim to the "bull whip effect" which amplifies and distorts demand fluctuations. Only supply chains that are agile, adaptable, and aligned provide companies with sustainable competitive advantage (Lee, 2004). Key attributes of agile, adaptable, and aligned supply chain (SC) are given in Figure 1.

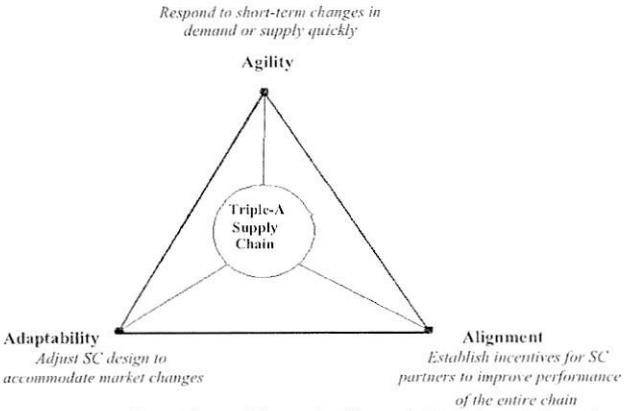

Figure 1: Agile, Adaptable and Aligned (Triple-A) Supply Chain: Key Attributes
(Source: Framework developed by author)

Key attributes of high performance supply chain are explained below in terms of agility, adaptability and alignment.

Agility : Agility of a supply chain is critical for the success of supply chain members (Van Hoek, 2006; Forsberg and Towers, 2007). Agility is the ability to respond to short-term changes in demand or supply quickly and handle unexpected external disruptions smoothly and cost-efficiently. Aligned supply chain aligns the interests of all participating firms in the supply chain with their own. As each player maximizes its own interests, it optimizes the chain's performance as well.

Agility provides the ability of supply chain partners to work together to rapidly react to changes in customer demand (Baker, 2008; Swafford et al., 2008). This ability to rapidly react to changes in demand depends on the degree to which the supply chain partners integrate and coordinate information flow throughout the supply chain (Swafford et al., 2008; Green et al., 2007). The ability to provide required information allows supply chain partners to share knowledge about plans, requirements, and status resulting in improved supply chain performance (Zhang et al.,2006). Such sharing of information strengthens collaboration among the supply Chain partners as collaboration is also key to the supply chain's ability to respond (Thomas,2008; Lee et al., 2008).

Successful companies foster supply chain agility by following various steps given below:

1. Promoting the synchronous flow of real-time information among supply chain partners by continuously providing data on changes in supply and demand so they can respond promptly.

Abstract

Asset prices in the markets are influenced by changes in economic environment and also reflect the intrinsic value of an individual stock in a particular industry. Various asset pricing models have been developed to predict asset returns as accurately as possible. CAPM is one of the most used models to understand the risk and return relationship. The Arbitrage Pricing Theory, a multi-factor model, assumes that asset returns are dependent on multiple risk factors including macroeconomic indicators such as inflation, changes in interest rates, growth in gross domestic product (GDP), or political and economic events which generally impact the returns of all assets. The objective of this paper is to examine the various macroeconomic factors that influence asset prices on the Indian bourses and use the APT (multi factor model) to explain asset returns on the thirty scrips included in the BSE SENSEX for the period April 2011 to March 2017. The statistical techniques used are exploratory factor analysis, multiple regression analysis and cross sectional regression analysis.

Key Words: **CAPM, Cross-Sectional regression, Factor analysis, Multi-factor model, Multiple regression.**

Introduction

Asset prices in the markets are responsive to the changes in economic environment besides obviously reflecting the intrinsic value of an individual stock in a particular industry. The economic environment representing the systemic milieu generally reflects the macroeconomic environment, the financial environment, the degree of market integration, the volatility in oil prices, and the level of political certainty amongst others in an economy. At the individual stock level, factors

Identifying the factors causing changes in optimum portfolio mix using Sharpe optimisation model

Dimple Pandey and Davinder Suri

Abstract
The performance of the SENSEX is a function of the performance of the individual stocks comprising the index. The individual stock performance is influenced by a complex interplay of factors related to the specific company, the factors related to the industry to which the company belongs and macroeconomic factors at large. The objective of this study is to investigate the impact of macroeconomic factors on the companies comprising the SENSEX. This paper would focus on active portfolio management of companies comprising Sensex using Sharpe Optimization Model. The model decides an optimum portfolio composition as well as proportion of each stock from the set of companies being examined. The study has been conducted for two time periods- April 2012 to March 2014 when the macroeconomic indicators in India were relatively weaker as compared to second period from April 2014 to March 2016 when the macroeconomic indicators were stronger. The paper has used daily SENSEX data for the model. The results of comparison from the Sharpe Optimization Model have been examined to justify the performance of individual companies based on macroeconomic factors.

Keywords: Macroeconomic factors, SENSEX, Sharpe optimization model

Introduction
The equity markets play a very important role in channelization of savings in an economy. There are myriad of factors impacting stock market prices and there have been studies examining factors influencing the stock market prices. These factors could emanate from the system such as macroeconomic variables, financial liberalization, market integration, oil price fluctuation, and the political certainty. Unsystemic factors such as company performance including liquidity, leverage, profitability, and growth, size of the firm and dividend rate impact the equity market price. Beyond the company itself, sector and industry performance also impact market price of a company. In the recent past in India, there were two distinct time periods where the macroeconomic factors were largely contrasting. In the period of 2012 to 2014, India was facing difficult times in terms of weak economic growth, high persistent inflation and headwinds from external sector while in the period 2014 to 2016, the Indian economy appeared to have weathered the storm. The performance of the stock markets faces pressure of these negative and positive shocks. Within the stock market, there may be some stocks that appear not to be affected by shocks and then some that are highly responsive to the systemic factors. We aim to understand the behaviour of stocks that comprise the S&P BSE SENSEX under the two distinct time periods when they faced the systemic headwinds and tailwinds respectively.
In the following sections, the underlying macroeconomic environment has been delineated comprehensively, followed by the earlier research work in this area followed by the explanation of the objective and methodology used and the conclusions and recommendations comprise the last segment.

Economic Parameters in India – 2012 to 2016
The year 2012-14 witnessed weakening economic growth in the economy along with inflationary trends, the pressure of twin deficits in terms of fiscal and current deficits and the Federal Bank of the U.S. indication of tapering of expansionary monetary policy.

2017

Towards a Holistic Model of Management Education

*Rajini Anand**

This paper discusses the linkages between spirituality and management education. Traditional education is not enough to develop well-rounded individuals capable of handling a volatile, complex and dynamic business world. It requires the addition of spiritual intelligence to make the change from self-consciousness to the consciousness of the self. It is this spiritual intelligence that aids the manager to awaken the firm to its true potential and greater role in terms of corporate social responsibility.

Introduction

Spirituality refers to the age-old values that have always sustained our society and life on planet Earth. These values serve as the very basis of a harmonious existence amid humans and all of nature.

Spirituality needs to be an important part of education. The goal of education is not to generate a generation only capable of understanding the language of machines. The real objective of learning is not just exposure to existing knowledge but also to critical skills like team building, leadership, creativity and a good mindset. Any education system which cannot address the above-mentioned scopes of personality is not comprehensive in itself. While they strive to acquire education, a degree and the qualifications to earn a good living, we should help our students understand that education for life is an entirely different thing. Education for life is spirituality, practicing values such as love, compassion, patience, forgiveness, etc. This alone will create a deep sense of responsibility towards our fellow human beings, nature and the world as a whole. Today, science and technology has reached the pinnacle of glory, yet widening the gap between poverty and affluence, leading to a state of despair and cynicism in the mass psyche.

The very purpose of education is to improve the quality of life, not based on knowledge alone but the value-based education and spirituality with a sense of purity and purpose. This doctrine surely helps the students to mold their attitudes—humane in temperament, refined in approach and divine in spirit. It would provide opportunities

The Mediating Role of Customer Relationship on the Social Media Marketing and Purchase Intention Relationship with Special Reference to Luxury Fashion Brands

Vikas Gautam [a] and Vikram Sharma[b]

[a]IBS Business School Gurgaon, IDPL Complex, Dundahera, Gurgaon, India; [b]IBS Business School Gurgaon, Marketing, IDPL Complex, Dundahera, Gurgaon, India

ABSTRACT

The reach of internet technology and social media has opened abundance of opportunities for marketers as well as for consumers across the globe. To anticipate future purchase behavior of consumers, marketers are not leaving any stone unturned. The main objective of this study is to investigate the direct and indirect impacts of social media marketing activities (entertainment, customization, interaction, word of mouth, and trend) on consumers' purchase intentions in luxury fashion brands. This study employed higher order Structural Equation Modeling to test the study model with (n = 243) sample data. We found positive significant impacts of social media marketing and customer relationships on consumers' purchase intentions. In addition, our study model confirmed full mediation of customer relationships in the relationship between social media marketing and consumers' purchase intentions. Based on our research findings, we strongly recommend that marketers of luxury fashion brands engage in social media marketing activities to provide value to customers.

KEYWORDS

confirmatory factor analysis, intimacy, luxury fashion brands, purchase intentions, social media marketing, structural equation modeling, trust

Introduction

The growth of internet technology has transformed the communication mode that affects billions of people across the globe. Popularity of social media has its roots in the early nineties and it is some sort of online community built on internet technology that aimed at facilitating more interactions among businesses and its customers without any physical boundaries (Campbell, Anitsal, & Anitsal, 2013). According to Zhou and Wang (2014), a large number of companies are making social media as an important part of marketing strategy on the basis of highly promising features such as; large and swift expansion of internet users, ease of use, speed of internet, etc. Marketers are motivated to engage in social media marketing due to high growth of internet and registered social media users (Carim & Warwick, 2013).

Ahmedabad, 380-060, India
Email: pmadhani@iit.edu

Abstract: The banking, financial services and insurance (BFSI) sector has faced fierce competition and such competitive pressure forces BFSI sector firms to improve their business processes for better performances. It is against this backdrop that Lean Six Sigma (LSS) has emerged as a vital tool as it helps firms in building and strengthening customer relationships by delivering improved customer service at the lowest cost. LSS deployment in BFSI sector firms increases service efficiency and effectiveness which in turn enhances overall customer value provided by firms. This research focuses on LSS deployment in BFSI sector and provides various frameworks and models for synthesising and determining value creation for both customers and organisations.

Keywords: lean; Six Sigma; Lean Six Sigma; LSS, banking; financial services; insurance; BFSI; customer value creation.

Enhancing HR Competitiveness: A Six Sigma Approach

Pankaj M. Madhani , Associate Dean and Professor,
ICFAI Business School

INTRODUCTION

Six Sigma has been extensively used by organizations as a strategic management tool. Statistically, Six Sigma means 3.4 defects per million opportunities (DPMO) whereas in management terms, it is an improvement methodology that aims to reduce the cost of poor quality by focusing on process effectiveness and efficiency. Six Sigma is designed primarily to improve performance and enhance process capability. Six Sigma deployment can help in the reengineering of human resources by increasing the speed, quality and efficiency of its services. There are a myriad of examples of Six Sigma's effectiveness. The combination of Six Sigma and Human Resource Management (HRM) was first applied at General Electric (GE), where Six Sigma deployment helped improve the overall quality of HRM. U.S. defense contractor Raytheon has also employed Six Sigma in HRM as a broad tool for creating customer value and changing culture to make HRM processes more efficient, cost-effective and user-friendly. In 2006, Hewitt Associates (now part of Aon) introduced Six Sigma process improvement methods and reported remarkable results in retaining employees. Company officials said that Six Sigma allowed HR specialists to think differently about business issues and solve the fundamental problems (Leatherbury 2008).

SIX SIGMA-BASED HR PRACTICES: ENHANCING PERFORMANCE

Human resources is a service department with internal customers to satisfy, government rules and regulations to comply with, HR budgets to meet and a bottom line to improve. The Six Sigma approach adds more science to the art of human resources. Six Sigma is a set of structured tools designed to reduce cycle time, eliminate product or service defects and increase customer service. The focus is on working smarter and doing things right the first time. The statistical orientation of Six Sigma can be an effective tool for analyzing HR issues and improving performance of the HR department. With Six Sigma's focus on the entire process, its methods would be more appropriate for a complete overhaul, rather than refinement, of HR processes. The outcomes of these HR improvements can be better, faster and more cost-effective services in the organization, improved internal customer satisfaction and greater motivation and job satisfaction of HR employees. Differences between traditional HR practices and Six Sigma-based HR practices are shown in Table 1.

Abstract

Return on human resources (HR) investment may not remain stable over time for organizations, due to changes in business conditions. The "real options" approach enables organizations to evaluate investment opportunities of HR in uncertain environments and highlights how these investments create value through future choices (i.e., HR options). HR options are "investments in the human capital pool of an organization that provides the capability to respond to future contingent events." This research applies this logic to analyze the uncertainties associated with HR in organizations and discuss how organizations manage these uncertainties through HR "options" that are capabilities generated by various HR management practices. With appropriate HR capabilities, organizations are able to manage uncertainties proactively. Research emphasizes that certain HR management practices create HR options in terms of reducing uncertainties of return, volume and costs. Research also underscores that effective compensation and benefits practices reduce uncertainties of costs significantly.

Keywords

human resources, real options, uncertainty, flexibility, HR options

Introduction

With the increasing focus on identifying and evaluating risks in organizations, risk management has become a key strategic priority. Risk management is considered to involve the identification, analysis, evaluation, control and monitoring of risk. In a current scenario of increased complexity and rapidly changing environment, effective risk management may be a source of competitive advantage for organizations. Businesses adopt and integrate risk management practices into their operations, and accordingly various standards such as the International Organization for Standardization, ISO 31000: 2009 (*Risk Management Principles and Guidelines*) along with a multitude of tools and frameworks emerge.

However, this focus on risks has primarily focused on financial and physical assets, largely neglecting the area of human resource management (HRM). For any organization, human resources (HR) are assets that can provide value and competitive advantage; however, such assets have associated uncertainties and risks. There is growing recognition that one of the key risks in a business is related to

Building a Customer-focused Culture in Organizations: Developing 7Cs Model

Pankaj M. Madhani

1 Introduction

Customers are crucial to any business as without customers, there is no sales; without sales, there is no revenue and profits. In the current scenario of highly competitive market, developing a strong relationship with customers is vital in achieving the goals of both the customers and the organization.

"There is only one boss, the customer. And he can fire everybody in the company from the chairman on down, simply by spending his money somewhere else" – Sam Walton.

Slogans such as "The customer comes first" or "The customer is king" are quite common in business world. These slogans are used to emphasize the role of the customer to the stakeholders such as owners and employees of a service firm (Olsen *et al.,* 2014). To be successfully focused on customers, organizations must ensure a high level of consensus and cohesiveness around the belief that its existence relies on being responsive to the needs of its customers. For true success, the organization has to ensure superior customer experiences which add continuous value for customers. Instead of a goal of maximizing performance measured in terms of financial metrics, the goal of the organization should be to add value to and delight the customer, as financial success follows continuous innovation to provide unique value to customers (Denning, 2016). Customer focus has a positive impact on new product performance and the firms' performance (Nickell *et al.*, 2013). Sun and Kim (2013) also reported that customer focus can significantly influence the firms' financial performance.

The practice of customer focus has been identified as pivotal for any organization seeking to reach a level of sustainable performance (Mokhtar, 2013). Sustainable performance refers to an expectation that an organization is able to react rapidly and efficiently when faced with emerging customer-related issues. This is an important factor, given the dynamic nature of customer expectations (Mukerjee, 2013). Hence, there is lot of attention on 'customer-focus'. Customer focus is described as: "... the set of beliefs that put the customers' interest first, while not excluding those of all other stakeholders such as owners, managers, and employees, in order to develop a long-term profitable enterprise" (Deshpande *et al.,*1993). Customer-focus is also defined as organizations' concerns with their customers' needs, wants, and expectations (past, present, and future); and their strong commitment to understand and satisfy them in a proactive manner for long-term growth (Bartley *et al.,* 2007).

Madhani, P. M. (2018). "Building a Customer-focused Culture in Organizations: Developing 7Cs Model", *International Journal of Business Excellence*, Vol. 16, No. 2, pp. 199-232.

Executive Summary

Viewing Salespeople as Real Options

Extending the concept of real options, this research considers a salesforce as a strategic asset and subsequently emphasizes creation of salesforce options to reduce uncertainties of return, volume and costs. The underlying logic of real options provides an extension of how practitioners can approach the management of salesforce uncertainty to reduce business risk and enhance organizational value.

Viewing Salespeople as Real Options

By Pankaj M. Madhani, Ph.D., ICFAI Business School

INTRODUCTION

Salesforces can provide value and competitive advantages, but such assets have associated uncertainties and risks. The salesforce represents the single largest marketing investment for most business-to-business (B2B) companies. U.S. companies alone spend more than $800 billion on their sales staffs each year —three times more than they spend on advertising (Steenburgh and Ahearne 2012). Salesforces generally fluctuate due to changes in business conditions. The "real options" approach enables organizations to evaluate the investment opportunities of salesforces in uncertain environments and highlights how these investments create value through future choices. Research applies this logic to analyze the uncertainties associated with human assets in sales organizations and discusses how sales organizations can proactively manage these uncertainties through the real options approach.

REAL OPTIONS AND ENVIRONMENTAL UNCERTAINTY

Real Options Approach

The real options theory explicitly addresses the issue of investment choices for future resources and capabilities. Real options are investments that are discretionary in that they provide organizations with the right, but not the obligation, to undertake some future action. The theory assumes that an organization develops a level of foresight sufficient to invest in resources with options characteristics that provide flexibility for future investments and imply that there are ways to hedge against risk and reduce uncertainty.Based on capabilities provided by real options, the organization may choose to adjust, reduce, increase or abandon the investment in the future, thereby helping stabilize returns from such assets. Thus, real options help organizations adjust to future shocks and business risks.

Environmental Uncertainty and Salesforce Options

Environmental uncertainty is caused by unexpected events that put the sales organization in an unstable state. Such environmental uncertainty is difficult to accurately predict as is its impact on an organization's ability to meet financial-performance indicators. In this scenario, a sales organization must rapidly adjust to a changing environment or perish. Such heightened demands on sales organizations have subsequently called for a salesforces of flexible, versatile and capable individuals. These circumstances have forced sales organizations to make paradigm shifts in managing their salesforces. Salesforce attributes such as enhanced skill levels, greater work-related flexibility and productivity, and increased capacity to respond to fast-changing business dynamics can provide competitive advantages.

Madhani, P. M. (2018). "Viewing Salespeople as Real Options", *World at Work Journal*, Vol. 27, No. 1, pp. 33-41.

Enhancing Return on Salesforce Investment: Reallocating Incentives and Training Resources With Intrinsic Valuation Approach

Pankaj M. Madhani, Associate Dean and Professor, ICFAI Business School

Abstract

In most sales organizations, salesforce performance evaluation has mostly relied on reflective metrics such as sales volume, revenue, and manager's evaluations of salesforce, and hence they have limited insight into how a salesperson will do going forward and what types of training and incentives will be most effective. Sales organizations should emphasize sustaining and improving their salesforce performance by proactively reallocating investment in incentives and training resources. The main question is what type of incentives and training will bring out the best in a high performer or help a promising sales employee improve? Salesperson's intrinsic value measurement and analysis provides directions for finding an answer. With this approach, sales organizations can then make strategic decisions about rewards and training optimization. These findings will help organizations reallocate their expenditure levels (i.e., training and incentive investments) to maximize salesperson's intrinsic value, enhance salesperson's future performance and ultimately boost revenue and profitability.

Keywords

salesforce performance, sales training, sales incentives, intrinsic value, salesperson's value investment ratio, salesperson's intrinsic value

Introduction

This research studies the impact of salesforce investment on training (directed toward improving the salesperson's knowledge, skills and abilities [KSAs]) and reward (used to encourage the salesperson to perform better) on salesperson's future performance. It is imperative that managers have the ability not only to measure a salesperson's current performance but also to predict the salesperson's performance in the future for better reallocation of incentives and training resources. In most organizations, sales employees are usually made up of mainly solid performers (60%), with smaller but roughly equal proportions of laggards and rainmakers (20% each).[1] Though most incentives and training programs approach these three groups as if they were the same, each group has different incentives

Six Sigma in Sales and Marketing: Enhancing Competitiveness

Pankaj M Madhani
Associate Dean and Professor
ICFAI Business School (IBS)

Introduction

The Greek letter sigma (σ) is used in mathematics to represent standard deviation (i.e., how much a process varies from its average value). A sigma quality level offers an indicator of how often defects are likely to occur, whereby higher sigma quality levels indicate a process that is less likely to create defects as the quality level also increases accordingly. Under the Six Sigma methodology, deficiencies are described in terms of 'defects' per million opportunities, with the score of Six-Sigma quality level equal to 3.4 defects per million opportunities (DPMO). Here, an 'opportunity' is defined as any chance for non- conformance or not meeting the required specifications. Six Sigma is a disciplined, data-driven approach and methodology for eliminating defects in any process – from manufacturing to trading, and from product to service. It was originally developed at Motorola in the 1980s for production processes characterized by high volume and the high degree of standardization with goal of eliminating waste by achieving near-perfect results.

In a current business environment characterised by changing buyer preferences, channel leverage, shorter product life cycles and increase financial pressure on sales growth, profits, and shareholder value, there is a lot of interest in deploying Six Sigma to sales and marketing to reduce the uncertainty inherent in it. Six Sigma has been applied by various organizations in their sales and marketing processes with the ultimate goal of increasing customer satisfaction, sales revenue, market growth and profitability. Organizations such as 3M, Allied Signal, Dell, HSBC, Johnson & Johnson, LSI Logic, Owens Corning, Service Master, Standard Register (Taylor Communications) etc. have deployed Six Sigma in sales and marketing and achieved significant growth in top line and bottom line performance.

Six Sigma Evolution: Various Generations

The initial focus of Six Sigma was the rigorous process of defect reduction in manufacturing operations and was termed as Generation I of Six Sigma.

Enhancing Customer Value Creation with Market Culture: Developing 7Cs Framework

Pankaj M Madhani*

Market culture is a corporate business philosophy that puts the customer's satisfaction first, while taking into account the role played by the other market factors. Market culture addresses the degree to which the customer's values and beliefs are embedded within the organization and in its activities. Market culture consists of some combination of artifacts, values and norms, and underlying assumptions that organizational members share about their customer-centric behavior. This study focuses on market culture and identifies various elements in terms of 7Cs framework for building market culture. These 7Cs of market culture are: customer insight, competitor awareness, collaborative approach, CEO leadership, criteria for decision making, compensation strategy, and customer value. Significant steps can be taken in each of the 7Cs to strengthen an organization's market culture. The study develops various frameworks to establish a relationship between market culture and firm valuation and also provides supporting illustrations.

Introduction

There are many sought-after market factors of external environment that obviously should enhance the financial performance of an organization in terms of sustained profitability and above-normal financial returns. Some of the market factors are high barriers to entry, non-substitutable products, a large market share, low bargaining power of buyers and suppliers or rivalry among competitors. Still, there are many organizations exhibiting financial success even in the absence of such desirable market factors. In reality, for some organizations, the key ingredient of success is something less tangible but more powerful than the market factors listed above. The major distinguishing feature in highly successful organizations and their most important competitive advantage is their organizational culture. Organization culture is a key driver in enhancing the performance of the organization and is an explanatory variable that distinguishes one organization from another.

Effective Salesforce Management Practices: A Real Option Approach

Pankaj M Madhani

ABSTRACT

Salesforce are strategic assets to the sales organization, but their returns may not remain stable over time due to changes in business conditions. Salesforce investments are similar to investments in other types of real assets and thus carry uncertainties. Research identifies the uncertainties of return, volume and costs associated with salesforce and discusses various salesforce 'options' which are capabilities generated by some salesforce management (SFM) practices and their combinations. The 'real options' approach enables organizations to evaluate investment opportunities of salesforce in uncertain environments and underscores how these investments create value through future choices. Research also develops various frameworks for managing different types of salesforce uncertainties through better management practices.

BUILDING CUSTOMER-FOCUSED SUPPLY CHAIN STRATEGY WITH 4R MODEL

Dr. Pankaj M. Madhani*

*) Associate Dean & Professor, ICFAI Business School, Ahmedabad, India
E-mail: pmadhani@iit.edu

ABSTRACT

Purpose

With competition now at the supply chain level, competitive advantage comes from the ability of supply chain partners to satisfy the ultimate customers of the supply chain. In this context, customer-focused supply chain strategy strives to match supply and demand, thereby driving down costs simultaneously with improving customer satisfaction.

Design/methodology/approach

This research underlines significance of customer-focused supply chain strategy and underscores various attributes of customer-focused supply chain strategy. It also develops 4Rs (responsiveness, resilience, reliability and realignment) framework for building customer-focused supply chain strategy and formulate value creation framework to emphasize overall benefits in terms of increased competitive advantages. The research reviews cases from the real-life world to develop the framework.

Findings

Customer-focused supply chain strategy helps organizations to sense consumer demand and respond to it in real-time, provides a superior consumer experience at every opportunity while also decrease time to market, trim overall costs and optimize productivity and thus achieve customer-focus objectives.

Research limitations/implications

Customer-focused supply chain strives to achieve the ideals of fully integrated efficient and effective supply chains and hence increase customer value proposition. Such supply chains are capable of creating and sustaining competitive advantage by balancing downward cost pressures and the need for efficiency, with effective means to manage the demands as well as the known risks of routine supply chain failures.

Originality/value

Research underlines significance of customer-focused supply chain strategy and provides supporting matrix to underscore various attributes of customer- focused supply chain strategy. Research also emphasizes overall benefits in terms of improved firm performance by providing various case studies.

Keywords: *Customer focus, Supply chain, SCM, Supply chain strategy, Responsiveness, Resiliency, Reliability, Realignment*

Abstract

Salesforce constitutes one of an organization's most productive and most expensive assets and has a major impact on overall performance of the sales organization. Salesforce sizing affects profitably of a sales organization by affecting both revenues and costs. The salesforce size affects customers, salespeople and the overall sales organization. A salesforce that is of the right size is challenged and motivated, but not overworked, connects with customers effectively, sales compensation costs are reasonable and sales as well as profitability of the organization is strong. The organization that is more effective than others (e.g., sales growth, profit contribution, market position and customer satisfaction) has a more optimal salesforce size. There are many internal and external factors affecting salesforce sizing decisions such as strategic objectives, product maturity, competitive environment, market trends and financial goals. All these factors together determine optimal return of investment for salesforce investment. This research provides a mathematical model for practicing managers to determine the optimal size of a salesforce.

Keywords

salesforce size, sales compensation, ROI, breakeven ratio, sales productivity, salesforce sizing errors

Introduction

Each year businesses across the globe spend huge amounts on salesforce investment. The salesforce is the engine that drives revenue of organizations and also represents a significant investment for most organizations; for example, each year the U.S. economy alone spends conservatively $800 billion on salesforce compensation and hires at least 22 million people to carry out their sales function.[1] The salesforce represents a large percentage of the total costs for sales organizations. Most companies spend 10% of sales on cost of salesforce, and some spends as much as 22%.[2] The salesforce plays a major role in driving a firm's revenue generation compared with any other marketing resources, as research suggests that spending on the salesforce has a greater impact on revenues than spending on advertising.[3] Hence, the strategic value of the salesforce is at an all-time high as it has a major impact on overall organizational performance.

About

Abstract

As with any other insurance companies, the role of IFFCO Tokio was working the non-life risks. The major issue which IFFCO Tokio was coping with, just like other insurers, was managing the liability payments which at times could be highly variable due to completely unknown business risks as well as contractual nature of obligations. Being a non-life insurance company, the investment policy of IFFCO Tokio could not be the same as any other life insurance company. So what was the best investment policy and the best way to manage the interest rate risk?

About

Abstract

On December 3, 2016, Venezuela, once Latin America's richest country, entered the record book of historical events to become the 57th country in the economic history of the world to have experienced hyper-inflation. Its central bank reported the highest-on-record inflation of 180 per cent and 240 per cent in 2015 and 2016 respectively. The country was facing the world's worst ever economic disaster. The citizens were suffering from food shortages, hunger, death due to lack of medicines, and escalating homicide rates, which were turning the nation into the second most violent country in the world outside of open war. There was no sign of improvement in the year 2017 either; in fact, it was worse than 2016. The opposition party (Congress) in Venezuela claimed that the inflation level had risen further to almost 800% between the end of 2016 and the beginning of the year 2017. According to IMF projections, inflation was expected to reach 13000% by the end of the year 2018, which would reduce the size of the economy by 15%. Economists claimed that too much dependency on oil and not having made policy changes to adapt to the low petroleum price were the major reasons for the plight in which the country found itself. None of the steps taken by the government headed by President Nicolas Maduro to control inflation, like implementing price control or fixing currency exchange rates, were effective in improving the situation. It remained to be seen how Venezuela would come out of this economic crisis.

Data Analytics in HR Effectiveness

Dr. Bidhan Datta[1], Ms. Vaishnavi Gadwe[2], Ms. Rajeshreeba Gohil[3]

[1]Faculty of Management, ICFAI Business School, Pune, (India)
[2,3]Student, ICFAI Business School, Pune, (India)

ABSTRACT

HR analytics is the process of data mining and business analytics techniques in human resource management tomanage and utilized data in effective manner to excel HR effectiveness. The Business objectives and HR objectives should go hand in hand for maximizing revenue of anybusiness. One of the most important functions of HR practices is to focus in managing human capital through proper HR planning. Talent management and retention of skilled employee is a challenging job in any organization. Usage of data analytics will help the organization to effectively manage employees' information and to take relevant decision time to time.

Key Words: Data Analytics, HR effectiveness, Human Capital, Skills, Talent Management

I. INTRODUCTION

The aim of data analytics is to analyze the insight of information about human capital and then using those on decision making process to improve the HR excellence. The challenges in-front of human resource analytics is to identify the organizational needs in short term and long term basis and accordingly use of data to optimize return on investment on human capital. PTA (Predictive Talent Analytics) will help to improve strategic workforce planning and create talent-ready for organizations. Thus, any company wants to hire an employee these available resources of data will help to can make quick decision. As a rise in prominence of 'big data' came into picture, HR Analytics got more exposure. It is helping to manage and analyze the smartness of data behavior and predict outcomes. Data analytics when combined with HR, it can bring various transformations and can help in all major roles of HR. While few are with disagreement with analytics, many are adapting it (Kylie, 2016).

II. LITERATURE REVIEW

Aligning HR activities in line of organizational strategies for has become a necessity to get a sustainable competitive advantage. Strategic human resource management can be regarded as a necessary approach to identify the process that need to be undertaken for the maximum productivity (Muscalu & Anca, 2014). Here it is also necessary that HR professionals and management must develop a strategic of how human capital contributes to organizational success prior to incorporating HR analytics (Kylie, 2016). PTA (Predictive Talent Analytics) provides the turnover rate of the employees. So by analyzing the data of those employees who left the job, analyst can get a rough idea about reason/ any problem they were facing. If in most of the cases it is observed same kind of issues like attitude, personality or any other, then company can get to know that people with such personality won't be suitable for that type of job or position after a particular point. In India, in HR companies uses PTA to analyze the performance of the candidate. A survey from Timesjob.com reveals that, "though 90% of the companies were impressed with PTA but only 7% adopted it and 55% of the organizations don't use PTA for future requirement". So, the reason can be that still at some point HR believes in traditional way of hiring employees. It helps to analyze the risk of hiring a candidate too (TimesJobs, 2015).

III. APPLICATIONS OF DATA ANALYTICS IN HR

- Providing information to CEO/ Organizational head by HR analyst, which shows the reviewed data on attrition, hiringemployee cost, talent acquisition, workforce management and many other factors related toHR functions.
- Improving operational activities such as analyzing video interviews, catching fraud, work pattern to improve payroll leakage etc.
- Providing a platform to analyze productivity, talent acquisition, cost effectivenessthrough data analytics.

Commodities Derivative Price Behavior in Emerging Market

Sharon K Jose, Prashoban Palakkeel

Abstract

Economic studies on the Commodity price behaviour in the developed markets has addressed a lot of issues in the commodity price dynamics. This can be attributed to the existence of uninterrupted trade and the data can be traced to almost 100 years, for example, Chicago Mercantile Exchange, Chicago Board of Trade or London Metal exchange. The commodities futures trade started in the same time period in India but the banning of futures trade resulted in lack of availability of data which has kept Indian research at a nascent stage. This paper tries to explore various developments with the commodities prices in the emerging commodity market. Commodity prices have been modelled using state-space specification. The forecasts are most efficient for most of the commodities considered under the study. It shows that state-space specification and Kalman filter algorithm is an ideal method for modelling and forecasting commodity prices in the emerging market. Forecasting the right prices in such economies will help the framer to make better storage decisions.

Strategic Supply Chain Management (SSCM): Developing Conceptual Framework and Research Propositions

Pankaj M. Madhani

ABSTRACT

In current era of highly comptitive and fast pace business environment organization are struggling to survive as product lifecycles (PLCs) have become shorter, clock-speed has become faster, and the consequences of disenchanting a customer have become more severe. Thus, organization are looking for ways to be more productive, creative and competitiveas these factors affect their performance. Strategic supply chain management (SSCM) enable firms to create value in multiple ways and shows how the role of supply chain is being redefined, from an operational tool to a bonafide competitive strategic weapon. The strategic supply chain management not only focuses on use of a supply chain as a means to deliver products to right place, but also as an enabler to enhance strategic outcomes that drive overall performance of the organization. Strategic supply chain management drives an organization to deliver what its customers want, when its customers want it and streamlining operations to provide great service at lower cost.

Value-creation aspects of the strategic supply chain management have become a new competitive ground to which most organizations can aspire. Strategic supply chain management needs four key components in order to be as customer-centric as possible: Responsiveness, Resiliency, Reliability and Realignment (4Rs). Strategic supply chain management enhances customer value proposition through competitive priorities of 4Rs and hence they need to be integrated in order to create the most value within an organization's operations as well as for the customers. Strategic supply chain management mitigates the challenges of customer value creation in today's highly complex and competitive business environment. This research has developed a research framework for better understanding of customer interface and organizations from inside-out. The research has formulated various propositions and emphasized that 4Rs are important drivers of strategic supply chain management in improving business performance.

Key words:
Strategic supply chain management, SCM, SSCM, Responsiveness, Resiliency, Reliability, Realignment, Customer-centric, Customer-focus, Competitive Advantages

A Study on Gender & Educational association with the perception of crowd funding as a viable option to raise pre-seed capital.

Ms. Seeboli Ghosh Kundu[1], Dr. R. Venkataraman[2]
[1] Asst. Professor- ITM Business School & Research scholar, Bharathiar University
[2] Professor, Centre for Management Studies, Presidency College

Abstract- *The role of Crowd funding is become significant after the Start up revolution and has the potential to solve this problem to rais capital at pre-seed stage for Startups. In the last three years the startup fever has gripped this country and have the potential to catapult i into the planned path for economic supremacy. In this backdrop of startup revolution, pre-seed capital is become one of the most talked abou topic. Raising capital is not easy for Startups in nascent stage. Though different modes of raising capital like angel investors, ventur capitalists, bank loans are available in the market still these options are not effective enough always to raise pre-seed capital. Howeve Crowd Funding, which is already a well known option to raise pre-seed in developed country, has the potential to bridge this gap. Thi paper has tried to identify the Gender & Educational association with the perception of crowd funding as a viable option to raise pre-see capital.*

Key Words: IT Startups, Crowd funding, Pre-seed Capital, Equity based crowd funding.

INTRODUCTION

Raising capital has become a key problem for all kind of startups in today's world. Many entrepreneurs are facing challenges and landing i failure while raising the capital for their projects. External support is not always easily available while starting a new venture. The traditiona modes of raising funds have their own limitations. For example while issuing loan, banks generally ask for collateral of the organizations whic results in failure in many cases as the start-ups are not able to fulfil the requirement of getting loan. Another problem of raising capital is lack o historical data that includes asymmetric information for investors. One famous mode of finance is to identify venture capitalist where they als prefer to invest relatively large amounts and only if the project has potential and significant return propositions. Adding on to this, ventur capitalists are generally not interested in pre-seed capital and prefer to fund on later stage companies because of the safe return on investment an a more precise valuation process (EY, 2012). All these issues have made the crowd funding as one of the most popular tool to raise fund. Eve Governments has recognized the importance of this mode and the potential of crowd to raise capital for startups (Collins, 2012). Compared t the traditional mode of raising capital, crowd funding is recognized as one of most important and talked about alternative avenue for raisin capital in pre-seed stage.

OBJECTIVES:

1. This study helps to understand in detail the various funding options available to start -ups in general.
2. To explore the relationship between Gender & the perception of various options to raise pre seed capital.
3. To explore the relationship between Educational Qualification & the perception of various options to raise pre seed capital

HYPOTHESIS TESTING

Hypothesis 1:

H0: There is no difference in the score between the two genders in terms of their perception of the feasibility of the different options of raisin pre seed capital.

H1: There is a significant difference in the score between the two genders in terms of their perception of the feasibility of the different options c raising pre seed capital.

Hypothesis 2:

H0: There is no difference in the score between the different levels of highest education received in terms of their perception of crowd funding a a feasible option of raising pre seed capital.

H1: There is a significant difference in the score between different levels of highest education received in terms of their perception of crow funding as a feasible option of raising pre seed capital.

METHODOLOGY

This paper revolves around the responses circulated through a questionnaire. The number of samples collected is 500. The questionnaire ha questions both in terms of continuous variables and categorical variables including 5 point Likert Scale.

Abstract

Revolution of Startups have played very pivot role in the growth of Indian economy. The huge growth in Indian economy for the next decade is expected to be taken by the startup revolution, driven by private enterprises. This revolution has largly contributed in the incremental development of our country and as result service and manufacturing sectors has witnessed doubled digit GDP growth that achieved during 2003-2007. In the recent three years the startup fever has gripped this country and have the potential to catapult it into the planned path for economic supremacy. In this backrop rasing pre-seed capital is become a significat and burning topic. Researches have indicated that raising capital was always a challenge for the startup. Though different modes of raising capital like angel investors, venture capitalists, bank loans are available in the market still these options are not effective enough always to raise pre-seed capital. The role of Crowd funding is become significant here and has the potential to solve this problem to raise capital at pre-seed stage for Startups. However the awarness of crowd funding is still in the nasent stage.There exist a big Gap between the demand and supply in terms of fund availability and that gap can be easily bridged with the help of popularly emerging option known as crowd funding. This paper is the indicative of different trypes of crowd funding and their acceptability in the area of startups.

Key Words: IT Startups, Crowd funding, Pre-seed Capital, Crowd Funding.

Introduction

Title: Strategic supply chain management for enhancing competitive advantages: developing business value added framework

Authors: Pankaj M. Madhani

Addresses: ICFAI Business School (IBS), Opp. Annapurna Dham, Por, Adalaj Koba Highway, Ahmedabad, 382421, India

Abstract: With strategic supply chain management (SSCM) approach, supply chains develop capabilities to prosper within today's competitive global landscape. SSCM helps organisations to anticipate demand of consumers precisely; cater such demand reliably and swiftly and enhance supply chain efficiency and effectiveness. Greater insight into demand and delivery schedule provided by SSCM will improve operational performance and help organisations in creating the business value they seek. Research develops appropriate competitive priorities of SSCM in terms of responsiveness, resilience, reliability and realignment to enhance SCM efficiency, effectiveness and competitive advantages. Research underscores the dynamic capabilities of responsiveness, resiliency, reliability and realignment as important drivers of SSCM and develops relevant research propositions. The main purpose of the research is to emphasise how strategic supply chain approach improves business performance and accordingly formulates an integrated SSCM framework for business value added.

Keywords: strategic supply chain management; supply chain; business value added; competitive priorities; organisation performance; dynamic capabilities; responsiveness; resiliency; reliability; realignment.

How Compensation and Benefits Build and Sustain a Customer-Focused Culture

Pankaj M. Madhani , Associate Dean and Professor,
ICFAI Business School

INTRODUCTION

Customer-focused culture is based on the concept that what's best for the customer is best for the business. Organizational culture affects employee perceptions, as well as workplace behaviors that contribute to the success or failure of an organization. Properly designed compensation and rewards systems keep employees focused on what's important from an organization's perspective, reinforce desired employee behavior, and eventually lead to alignment of organizational and individual goals. Therefore, a systematic way to build a customer-focused culture is to value, recognize and reward behaviors that support the desired culture. A customer-focused culture requires seven building blocks (7Cs): customer insight, competitor awareness, a collaborative approach, CEO leadership, criteria for decision making, customer value creation and a compensation system (Madhani 2018). A compensation and rewards system is one of the powerful levers in building a customer-focused culture.

Compensation and rewards practices define the relationship between the organization and the individual member by specifying the terms of exchange. Organizational culture expresses values and norms to which employees must conform and specifies the contributions expected from them as well as the rewards individuals can expect to receive as a result of their performance. Three key elements of organizational culture — values, norms and beliefs — influence the behavior of employees. Values are the qualities an organization considers most significant to its business operations, employees and customers. Norms are unwritten rules of behavior in the organization that help "operationalize" actions that are consistent with values and beliefs, such as behavioral expectations of how employees interact with customers. For example, a common norm within customer-focused organizations is that employees are customer advocates. Beliefs are opinions individuals hold about their organization and themselves. Values and beliefs of customer-focused culture include customer-centric goals and values.

An organization should use its values and beliefs as the foundation for hiring, managing, rewarding and shaping the behavior of the employees. Once the desired organizational culture is defined, compensation and rewards systems should be tailored to support and reinforce that culture (see Figure 1). Compensation and rewards plans linked with customer metrics provide employees with an opportunity to focus and share in the success (or challenges) of the customer experience. Thus, compensation and reward systems affect and influence the organization's values and beliefs and ultimately organization culture.

Building a Customer-Centric Supply Chain Strategy: Enhancing Competitive Advantages

*Pankaj M Madhani**

Customers are crucial to any business, as without customers, there will be no sales; and without sales, there will be no revenue and profits. Hence, there is a lot of attention on 'customer-centricity'. With competition now at the supply chain level, competitive advantage comes from the ability of supply chain partners to co-ordinate and integrate strategies aimed at satisfying the ultimate customers of the supply chain at a relatively low total cost. Customer-centric supply chain strategy provides an approach to respond to these challenges as it strives to match supply and demand, thereby driving down costs and simultaneously improving customer satisfaction. This study works in this direction to underline the significance of customer-centric supply chain strategy. The study also provides supporting matrix to underscore the various attributes of customer-focused supply chain strategy; develops 4Rs (responsiveness, resilience, reliability and realignment) framework for building customer-centric supply chain strategy; and formulates a value creation framework to emphasize the overall benefits in terms of improved firm performance.

Introduction

In today's highly competitive business environment, organizations are struggling to survive as Product Lifecycles (PLCs) have become shorter, clock-speed has become faster, and the consequences of disenchanting a customer have become more severe. Thus, organizations are looking for ways to be more creative, competitive and innovative as these factors affect their performance. There are various drivers influencing the performance of the organizations. One of them, customer-centric performance, is the organization's performance as perceived by its customers. Accordingly, dependability, responsiveness, delivery speed, customization, and customer satisfaction are manifests of customer-centric performance (Evans and Lindsay, 2005). Slogans such as "The Customer Comes First" or "The Customer Is the King" are quite common in the business world. These slogans are used to emphasize the role of a customer to the stakeholders such as owners and employees of a service firm (Olsen *et al.*, 2014).

In the current era of competitive global scenario, developing a successful supply chain strategy is critical to an organization's long-term success. The management of supply chains has become increasingly important as well as complex in the context of globalization, new product development, diffusion of innovation and changing customer preferences. Thus, organizations are looking for ways to be more creative, competitive and innovative as these factors affect the performance of the organizations. Supply chain covers all movement and

Abstract

The performance of the SENSEX and individual sector indices is a function of interplay of various macroeconomic factors impac the economy at large. The objective of this study is to identify the relationship between various macroeconomic factors and SEN and the sector-specific indices and also examine the magnitude of impact. The sector-specific indices selected for study contrib more than ten percent to the SENSEX. The study has been conducted using vector autoregression after examining the stationa the selected variables for the period April 2010 to March 2018 using monthly data series. This will help the investors to understa the extent of the variability in the indices explained by the macroeconomic factors over time. The present study peered beneath SENSEX to examine the effect of various macroeconomic on the index and on individual indices. The result of the analysis wou help the investors to optimise returns based on understanding of the relation between macroeconomic factors and a specific inc

The New Monetary Policy Index : Case Study of the RBI's Monetary Policy

PRAKASH ANANT SALVI*
DAVINDER KAUR SURI**

Abstract

This study attempts to design monetary policy index to capture the stance as well as tools used by the RBI at various points in time in the backdrop of it operating frameworks. The New Monetary Policy Index (NMPI) is primarily based on methodology used by Samantaraya (2009), using both qualitative data as well as quantitative data. Qualitative data is collected through various circulars issued by the RBI from time to time and quantitative data is collected from the RBI's Handbook of Statistics on Indian economy. The choice of monetary policy tools to be included in the index and the weights assigned to the index variables are selected through Principal Component Analysis. To examine the alignment of the NMPI with the actual monetary policy stance, sharp contractions in the index are corroborated with actual data published by the RBI for the periods and compared with inflation, industrial output and bank credit at the time. This gives us positive results for the index designed.

I. Introduction

THE CENTRAL BANK has three main tools of monetary control. They are (a) changing the discount rate (the rate the central bank charges on its loans to banks and other financial institutions), (b) changing reserve ratios (percentage of commercial banks' total deposits liabilities required to be kept in cash with the Central Bank and in liquid assets kept with themselves) and (c) conducting open market operations (buying and selling government bonds to banks and public). Each tool works by changing the excess reserves in the banking system (McConnell and Brue, 2005). When the Central bank takes monetary policy actions, it sets in motion a series of actions in financial markets, which, in turn, lead to changes in spending, production and

A COMPARATIVE ANALYSIS ON ECONOMIC GROWTH OF INDIA AND CHINA

Dr. Bidhan Datta[1], Banantika Datta[2], Aseem Attri[3]

[1]*Faculty of Economics and Management, ICFAI Business School, Pune, India*

[2]*Research Scholar, IIM Bangalore, India*

[3]*Post-graduate Student, ICFAI Business School, Pune, India*

ABSTRACT

Import and export plays a vital role in an economy. It is an important factor for the GDP growth of any country. People's Republic of China and India are the most populous and the largest Asian countries experiencing rapid economic growth over the last two decades. The aim of this paper is to compare the past, study the present to predict the future economic scenario by consideringvariousindicators, mainlyimports-exports of minerals, fuels, chemicals and metals.The comparison is done on the basis of secondary datafrom reliable sources.India started its financial reforms since the economic liberalisation in July 24, 1991. Thus, data from the year 1991 to 2018 is considered for this paper. China grabs the largest market share of Asian, as well as western countriesby providing cheap manufacturing goods and known as manufacturing hub of the world. On the other hand, India has made its footprint in the service sectors. Indiaand China have been growing at increasing rate since 1980s and the growth accelerates after 1991.This research tries to find out whether India will be able to competewith China in thelong run, despite a large gap in their present economic scenario.

Keywords: *China, EconomicGrowth, Export-Import, GDP, India*

I. INTRODUCTION

India and China (People's Republic of China) are the two most fast-growing and powerful countries in Asia as well as in the world. Although the US economy is the largest, but China is the second largest economy, far ahead of France, United Kingdom, Germany and Japan. Similarly, Indian economy is growing at faster rate and in near future it can become the 3rd largest economy after the US & China, and may cross France, United Kingdom, Germany and Japan as well.Indian and Chinese economies are growing rapidly among the Asian countries due to economic reforms UNTACT Stat and Morgan Stanley Research from the period of 1980 to 2009 (Rezwanul Hasan, 2013). This study aims to compare the economy of these two fastest growing countries.Since the structural reforms in China in1978, its GDP has grown at an average rate of about 9 percent per annum (Narendra Jadhav and Janak Raj, 2005). In 1978 China was ranked 9thin nominal GDP with 214 USD billion. Presently, it stands2nd13.45 trillion USD andis the world's largest manufacturing hub.

A Comparative Study of Demographic and Risk Tolerance Profile of Conventional and Socially Responsible Investors in India†

Vineeta Mishra* and Ajit Mittal**

This paper is an attempt to examine whether demographic factors like age, gender, income, occupation, marital status and education, and a risk tolerance score calculated through a structured questionnaire could be used individually or in combination to differentiate between investors keen to invest in socially responsible investment avenues and conventional investors whose investment decision is mainly based on risk and return. A single cross-sectional survey was conducted among 236 investors of different age groups and investment experience. The respondents included individuals who have at least two years of investment experience. Age, marital status, occupation and socially responsible investment behavior show strong association with Financial Risk Tolerance (FRT) of Indian investors.

Introduction

Sustainable, Responsible and Impact Investing (SRI), also known as socially responsible investing, is an investment ideology that focuses on Environmental, Social and Corporate Governance (ESG) criteria in order to generate financially competitive returns in long term, which also impacts the society positively. It is said that social responsibility screening process is more likely to have a positive impact on the investment portfolio by selecting financially stronger, more stable and profitable companies.

Investor's behavior is influenced by many factors during investment decision making. Whether to invest in conventional stocks and products or to invest in

† This paper was presented at the International Conference on 'Management Imperatives for Sustainable Growth' held at ICFAI Business School (IBS) Gurgaon on August 24, 2018.

have suggested that a person's knowledge of personal finance and economic expectations may play a role in shaping risk preferences.

As far as Indian studies are concerned, Kannadhasan's (2015) study on 778 retail investors has reported that men, younger individuals, single individuals, professionally qualified people and self-employed people have higher level of FRT than others. However, the level of risk tolerance does not change with income. He has also studied the financial risk behavior and concluded similar results as FRT.

Sulaiman (2012) in his study on Indian investors observed that most of the anticipated relationship between financial risk tolerance and each of the demographic features from the literature were found to be relevant. However, his study does not support the view that FRT decreases with age.

There are many studies which have examined the demographics of socially responsible investors. Most of these studies have been done on countries where there is a well-established market for socially responsible investments or social screening is an established norm like the US, UK and Australia.

In a study conducted on 4,000 socially responsible investors, Rosen *et al.* (1991) found that these socially responsible investors were mostly highly educated. Around 60% had a graduate degree. As far as occupation is concerned, 81% of the respondents were in white-collar jobs. The result of this study was compared to that of a study done in 1986 by the same researcher but on conventional investors. The study concluded that socially responsible investors were younger, better educated but not as rich as conventional investors. However, wealth could be a function of the number of active years of investment and hence nothing conclusively can be said on the same line.

Junkus and Berry (2010) studied the well-informed individual investors of the US (who were members of American Association of Individual Investors) and concluded that females are more likely to be socially responsible investors. They also reported that single individuals, younger individuals, better educated individuals and comparatively less wealthy individuals are more likely to opt for socially responsible investment.

Woodward (2000), analyzing the socially responsible investors, identified that a typical socially responsible investor is likely to be middle-aged, highly qualified and in a managerial profession. However, their income is relatively low as compared to conventional investors.

Lewis and Mackenzie (2000) did a similar study by administering a questionnaire to 1,146 socially responsible investors of UK. The summary indicated that socially responsible investors are frequently middle-aged and are middle-income and professional investors.

Nilsson (2008) conducted a study on Swedish investors using a questionnaire. The questionnaire was answered by 439 socially responsible investors and 89

"Sound and Fury, Signifying Nothing": What Makes Men and Women Experience and React to Destructive Emotions at Work?

Rita Rangnekar and Sumeet Manerikar***

Destructive emotions and their propensity to distort mental equilibrium have been well-researched in Buddhist philosophy, especially, the works and teachings of the Dalai Lama, who has extensively written about various ways in which strong feelings and emotions create 'havoc' in the minds and hearts of people. This study examines the differences in the experience of and reactions to destructive emotions in men and women. The study looks into an association between the experience of destructive emotions and the intensity of the experience, reactions and triggers at work with respect to gender. The study is based on empirical research conducted through a quantitative analysis of data collected from 110 employees or working professionals. The findings show that all factors trigger destructive emotions at work and that different genders react differently to destructive emotions at work. There is a difference in the way men and women are provoked by destructive emotional state and how they react.

The infernal serpent; he it was, whose guile, Stirr'd up with envy and revenge, deceiv'd the mother of mankind.

– John Milton

Introduction

Destructive emotions and their propensity to distort mental equilibrium have been well-researched through studies in Buddhist philosophy especially, the works and teachings of the Dalai Lama, who has identified various ways in which strong feelings and emotions create 'havoc' in the minds and hearts of people (which have been termed as "destructive emotions"). The Dalai Lama's Discourses with Daniel Goleman in the

Pull-A-Vehicle Approach for Transport with Internet of Things (IoT) based Fleet Management System (FMS)

[1]Sudarshan Kumar Baurai, [2]V. N. Bajpai, [3]Vipin Khurana
[1]Research Scholar, Dr. APJ Abdul Kalam Technical University, Lucknow, UP, India
[2] Chairperson-PGDM Programme, Institute of Technology & Science (ITS), Mohan Nagar, Ghaziabad, UP, India.
[3] Dean & Area Chair (Quantitative Techniques & Analytics), ICFAI Business School, Gurugram, Haryana, India

Abstract: Logistics and Transportation processes have got a positive impact and a paradigm shift in its operations out of use of technology solutions. Emerging Internet of Things (IoT) provide solutions for the Logistics & Transportation processes. This article explains an IoT based FMS for people and goods transport service provider by integrating passenger in decision-making process and balancing the trade-off of Vehicle Capacity & Wait Time. For this Pull-A-Vehicle Approach has been conceptualized. This paper carries a good study of research literature for gap analysis and concept building. This also provide overview of vehicular communication that creates the basis for research objectives and concept approach of Pull-A-Vehicle.

Key words: Logistics, Transportation, FMS, IoT, IoLT, IoV, Mobility Communication, VANET, ITS

1. INTRODUCTION:

Logistics & Transportation is key to economic development of a society. A good transport system in logistics activities, provide better logistics efficiency, reduce operation cost, and promote service quality (Tseng, 2005). Transportation need for people and goods, result high motorisation, urbanisation and population density, which is resulting in traffic congestion, increasing travel time, fuel consumption and air-pollution (Cowell, 2010). Passenger and freight transport have different challenges. Passenger journeys are decided in terms of origin and destination, mode, timing and frequency of travel by individuals while freight journeys have a single purpose of transporting goods from one point in the supply chain to another (Allen, Browne, & Cherrett, 2012).
A fleet of vehicles is used either for transporting human passengers or containers of goods. However the two have different complexities and challenges. The presence of customer during the passenger journey process itself presents a challenge. To reduce the wait-time for passenger in one hand and at the same time the optimized capacity utilization of vehicles to keep operations viable are trade-offs to be balanced. Therefore a solutions based on Internet of Things (IoT) for good fleet management to realize optimum returns from limited resources is an emerging business opportunity.

1.1 FLEET MANAGEMENT SYSTEMS:

Fleet is a collection of vehicles used in any transport through land, water or air though in this paper it refer to a fleet of vehicles for road transport. Fleet operator is the owner of these vehicles used in any type transport and based on the number of vehicles a fleet operator can be small, mid, large or very large fleet operator. A Fleet Management System (FMS) is an information system to help the fleet operator which is a logistics organizations to operate in efficient & effective manner and realize maximum returns on their investment (Kolaric, 2008). In a competitive environment, technology intervention is a necessity for managing smooth transportation modes and services (Blythe, Rackliff, Holland, & Mageean, 2000). Fleet management include every aspect of the life cycle of a vehicle therefore it is important for companies to employ efficient fleet management systems to reduce risks and increase quality of service in addition to operational efficiency of a fleet at minimal cost (Malekian, Moloisane, Nair, Maharaj, & Chude-Okonkwo, 2017).

1.2 INTERNET OF THINGS (IOT):

The term Internet of Things (IoT) was first used by Kelvin Ashton in 1999 and it has been conceived in parallel to Wireless Sensor Networks (WSNs) (Gawade & Meeankshi, 2017). Through IoT, any physical object referred as thing can be paired with another object, that will enable transmit, receive and process data to and from one object to another (Roberto Minerva, Abyi Biru, 2015) (Li, Xu, & Zhao, 2015). With a smart sensor attached to the object, it get a tiny computer features. And when they do so, they are often called smart things, because they can act smarter than things that have not been tagged (FLEISCH ElgarFleisch, 2010). The new realized capabilities in smart things are of immense value in managing processes. Any process having smart things transmit process status transparently to improve efficiency, performance & effectiveness so that the entire system would become intelligent. In near time the dominance of people-to-people communications will soon be overcome by device-to-device D2D communications (Aloi et al., 2016).

1.3 INTERNET OF LOGISTICS THINGS (IOLT):

The scope for technology is growing in providing innovative solutions for various improvement dimensions of logistics and transportation. Satellite based positioning, ever increasing reach of fast telecommunication and IoT provide more and more technology based solutions. Therefore Barcodes and RFID Tags, which provide control on the basic functionality is now have IoT based solutions covering almost the entire Supply Chain. (Decker et al., 2008). Real-time monitoring and control through smart devices is becoming a necessity in highly competitive environment (Luo et al., 2016).

Abstract

Background and Objective: Leadership research has come a long way from trait theory, through human relations school of thought, to contingency and/or situational model. It is critically important to consolidate the leadership research so as to set-up the agenda for future. This paper aimed to summarize the research published in the integrated field of leadership and organizational research. **Materials and Methods:** This paper systematically reviewed the research papers about leadership and organization published between 2010 and 2017. The approach of the paper was in line with single-journal systematic review methodology, which reviewed publication of a single important journal. Out of 208 papers published in this period, 119 papers related to leadership studies were reviewed. **Results:** The paper brought out seven important research gaps for the future researchers to fill, which indicated that the research arena was wide open for the future research in the area of leadership and related areas that could be explored by novel research particularly with a focus on developing markets as none of the reviewed papers focus on developing markets. **Conclusion:** The paper concluded that Future research could also focused on meta-analysis and explored the significance of case study/literature review or comparative analysis in addressing leadership problems in organizations.

Key words: Systematic review, research gaps, leadership, organizational research and developing markets

IMPACT OF THE AMBIANCE OF A SHOPPING MALL ON CONSUMERS' PERCEPTIONS AND PREFERENCES: AN EMPIRICAL STUDY IN THE INDIAN CONTEXT

Seeboli Ghosh Kundu, Subhankar Baishya

ABSTRACT

Atmospheric branding is becoming one of the most important marketing communication points to create positive consumers' perception. It has been identified that consumers' preferences are highly influenced by the atmosphere of the shopping mall. There is a positive association between consumers' emotions, preferences, and store atmosphere. Very limited studies have been conducted on atmospheric branding of a shopping mall, in the Indian context. This present study aims to identify the factors of the ambiance of shopping malls that influence the consumers and classify them broadly. Furthermore, the study also tries to identify the extent to which the impact is created by the factors. Lastly, the present study is being conducted to rank the factors based on their importance and find the variable that influences the most. The results statistically support that a) all the variables can be broadly classified into six categories namely: Basic Benefits, Sensitivity and Care for Customers, Brand Reputation, Exclusive benefits , Layout and Nature of the crowd, b) The result also indicates that Behaviour of the staffs, Exclusive Brands, Fire Exit, Degree of Brightness in the mall, Nature of the crowd impact the minds of the customers the most followed by the behaviour of the staffs and the Presence of exclusive brands.

Luxury Retail in India: A Covid 19-Induced Transition to the Digital Mode or an Interim Arrangement?

Renu Sharma and Seema Unnikrishnan***

As the pandemic-induced "new normal" dawned on luxury retail firms in India as early as the first lockdown in March 2020, transitioning to the online mode seemed like the only option. That option was, however, inherently against the nature of luxury retail buying, which was, essentially, "an experiential phenomenon" of in-store purchases. Ironically though, globally, the share of online purchase of luxury goods had grown at a fast clip even in pre Covid-19 times and was expected to increase further, but the Indian luxury retail largely remained a "physical" phenomenon up until Covid-19 struck. While online seemed to be the only way out of the fix, luxury firms were mulling different scenarios, including "phygitization" (physical + digital) because the pandemic was still capable of impacting businesses. What would the future luxury buying scenario be like? Will the "physical" prevail over the "digital" or vice-versa, or will the two work in tandem?

BACKGROUND OF THE CASE

By around March 2020, the Covid-19 pandemic had engulfed major parts of the world, severely impacting different spheres of life. In India, though, the effects of the pandemic were just beginning to make themselves felt, leading to the first lockdown in the country. Firms, spread over industries and sectors, were beginning to feel the heat as the virus started to have severe implications for businesses as evidenced by the numbers later. Many of these businesses came to a standstill, pushed to a near-collapse situation. How the situation would pan out in the next few months was anybody's guess. Every sector was hit, some in a major way, and some relatively less so, but the frenetic movement of the virus from cities to towns to villages signaled there were "chaotic" days ahead. Great thought was given to an online dissemination of services across industries and sectors. Firms in sectors/industries like luxury retail for whom the "offline" buying experience was central to their offerings, found themselves in a fix. How would they transition to online when the nature of "experiential" buying dictated otherwise? Simply put, the firms in the luxury retail space did not have the "luxury" of moving to the online mode on account of the nature of buying for their products. In a situation where survival was the first thought, a quick transition to the online wasfraught with danger. Was taking a leaf, though, from other sectors, and moving to online even at the cost of defying the fundamentals of co-creation, and an experiential environment leading to the point of sale in luxury retail in-store buying (Vigolo, 2007; Ramaswamy, 2009; Schmitt, 1999), the need of the hour and a survival clue, even if temporarily so? Alternatively, was waiting for the tide to go out and business return to normal justified? What if the pandemic never relented and the "new normal" impacted business even in the physical/in-store mode of buying? Some of the foreign firms in India had already resorted to a combination of physical and digital (phygitization), successfully, but such examples being far and few between, the situation looked grave. That said, the "ubiquity" of the digital mode -

MakeMyTrip's Marketing Campaigns

Sanjib Dutta and Smita Ray***

The case talks about the marketing strategy behind the success of MakeMyTrip (MMT). It starts out with a brief history of MMT and then describes the company's unique marketing strategy, which includes the use of innovative digital technologies and launch of digital campaigns. The case touches upon the use of social media by MMT for the promotion of these campaigns. The case describes the impact of these marketing campaigns on the performance of the company, also highlights future plans.

"As smartphone penetration further drives growth for online travel bookings in India, we have seen how travelers frequently turn to mobile devices for travel planning – whether inspirational travel research, planning an existing trip or booking a last-minute getaway. We want to inspire, engage and delight our customers as well as the uninitiated consumers through compelling content in-app that will help them bag best travel deals. With this exciting and rewarding engagement campaign, we hope to acquire new users while driving long-term user retention."

– Rajesh Magow, Co-founder & Chief Executive Officer, MakeMyTrip, 2019[1]

"We are unveiling the biggest online travel gameshow in a never-before-attempted format on our App to increase engagement that will spur higher category reach and booking conversion. With enticing deals, attractive rewards and carefully crafted content that will appeal to the masses, this campaign is geared at driving customer engagement and retention on our app like never before."[2]

– Saujanya Shrivastava, Group Chief Marketing Officer, MakeMyTrip, 2019[3]

INTRODUCTION

In April 2019, India based travel-booking portal MakeMyTrip (MMT) stepped into the corporate travel booking segment with the acquisition of a company Quest2Travel.com (Quest2Travel).[4] Through this acquisition, the company aimed to extend its service offerings to large corporates and fulfill their travel requirements. The same month, the company launched an innovative travel game show series called MMT Knock-Knock on its App with the aim of driving customer engagement through incredible travel bids, deals, rewards, and games. To make the series engaging and fun, the live show was anchored by well-known television celebrities Gauhar Khan and Purab Kohli. The 30-minute in-app show comprised segments like live bidding for delightful travel deals, quizzing for attractive prizes, original travel

Raymond: Giving a New Spin to Khadi

V Namratha Prasad[*]

The case talks about the efforts of Indian textile major Raymond Ltd. (Raymond) in repositioning India's traditional fabric 'Khadi' as a new fashionable fabric, as part of its growth strategy. The case starts with a brief look at Raymond's history and its textile innovations. It then gives a short history of Khadi and its importance in the Indian milieu. The case discusses in depth Raymond's deal with the statutory government body Khadi Village and Industries Commission (KVIC) that branded and promoted Khadi. The deal allowed the company to offer 'Khadi by Raymond'. The issues that Raymond faced in making Khadi market ready are also described. Raymond's efforts at changing certain preconceived notions about Khadi through a new advertising campaign are discussed as well. The case ends with a brief look at the future prospects of Raymond in the Khadi space.

"With world-class product quality and steadily increasing sourcing capability, we are committed to make Khadi a global currency of fashion from India."[1]

– Sanjay Behl, CEO of Lifestyle Business of Raymond Ltd., in June 2019

"Elevating Indian craftsmanship to a whole new level, Raymond's Khadi initiative celebrates a fabric, unique to the Indian ethos and blends it with contemporary sensibilities appealing to today's discerning consumer. It also creates a socially inclusive business model providing economic upliftment to millions of artisans across the country."[2]

– Gautam Hari Singhania, CMD, Raymond Ltd., in December 2018

INTRODUCTION

In June 2019, leading Indian textile company Raymond Ltd. (Raymond) announced that during FY 2018-19, the company had been able to create over three million work hours for artisans who made the traditional Indian fabric – Khadi – and had given them wages that were 30% higher than the norm.[3] The company further claimed that it had significantly developed the tailoring ecosystem in India. Chairman and Managing Director Gautam Hari Singhania (Singhania) said, "In a bid to encourage inclusive growth, Raymond continues to enrich the tailoring ecosystem, providing a platform for skill development in the textiles and apparel manufacturing industry by rapidly adding tailoring hubs across the country."[4]

Raymond was one of the strongest players in the Indian textile and apparel industry with a long history of bringing about innovations in Indian textiles *(See **Exhibit I** for a glimpse into Raymond's market position)*. The company had built several strong clothing brands with

Marketing 'Baahubali': India's Biggest Blockbuster

Syeda Maseeha Qumer and Koti Vinod Babu***

This case is about the marketing strategies adopted by the makers of the blockbuster epic movie 'Baahubali – The Beginning', two years prior to its release. The stupendous success of the film was attributed to a well-executed promotional approach, which included regular movie updates, introductory videos of lead stars, and interactive quizzes on social media platforms such as Facebook, Twitter, and YouTube. Apart from this, the makers also launched a website and sold merchandise such as apparel for men and women, accessories, and collectibles like concept sketches and posters to promote the movie. The magnum opus was marketed as the most expensive movie ever made in Indian cinema. This created hype and helped in positioning the film crossing the language barrier. Despite being a regional film, Baahubali garnered tremendous national appeal and emerged as the biggest box-office opener in the country. With aggressive online promotional strategies for Baahubali, the makers had taken film promotions in India to a new level, opined analysts.

INTRODUCTION

Indian movie production house Arka Mediaworks' first instalment of the two-part epic fantasy film Baahubali ("The One with Strong Arms") – the Beginning (Baahubali) took the Indian box office by storm and set the cash registers ringing, raking in Rs.2.15 billion in revenue within just five days of its release worldwide on July 10, 2015.[1] The movie also set records in North America, earning $3.6 million in a 236-screen limited release, for an exceptional $15,254 per-screen average.[2] It was among the top 10 movies released that week in the US ***(See Exhibit I).*** According to trade analysts, rarely had an Indian regional movie created such a box-office frenzy as this fantasy epic mounted on a lavish scale and marketed in an equally slick way had done. According to Debasmita Ghosh, content manager for brand Code{ur}idea[3], "Given such smart marketing strategies through with Baahubali spread its wings on social media, and dared to walk off the beaten track, it certainly comes as no surprise that this was a campaign that many are henceforth going to take a leaf out of."[4]

Touted to be the most expensive production in the history of Indian cinema, Baahubali was made on a lavish budget of $18 million. It was a bilingual, simultaneously produced in Telugu and Tamil, and dubbed into Hindi and Malayalam. The story of the film with heavy visual effects revolved around two brothers who battled for supremacy over a prosperous medieval kingdom. The movie was released across 4,650 screens in India and 250 screens in the US on July 10, 2015.

The OTT Market in India: Challenges and Opportunities

Ankur Srivastava and Hima Bindu Pagidimarri***

This case study provides a brief overview of the global and Indian OTT markets in terms of facts and figures sourced from recent industry reports. The evolution of OTT market in India and reasons for its growth have also been assessed. The case study explores the key players in Indian OTT market, briefly analysing their strengths. It ends with some key developments and trends that could contribute to the future growth of the OTT market in India and globally.

INTRODUCTION

At the end of 2020, India was the fastest-growing Over-the-Top (OTT) market in the world and was expected to become the sixth-largest market by 2024.[1] A Boston Consulting Group report predicted that the OTT content market in India would reach $5 billion in size by 2023.[2] An increase in personal income, Internet penetration into rural markets, increasing use of smartphones, and OTT content adapted to different demographic segments, were the key driving factors for the growth of the OTT market in India.

Growth in the OTT market escalated during the pandemic in 2020, when cinema theaters and outdoor entertainment not only took a back seat but also left consumers with ample time to explore the new form of entertainment through OTT. It was not just in India, but also all over the world that subscription rates and viewership for OTT platforms rose drastically in the year 2020 compared to the previous years. There were just two OTT platform providers in 2012 in India, but the number had increased to about 40 players by February 2020.[3] The OTT service as a disruptive technology grew rapidly in India within in a very short time. Cinemas were a major source of entertainment in India. In 2020, Subscription-based OTT *(Refer to Table I)* streaming services overtook the revenue from cinemas. Video-on-demand (VOD)[4] services facilitated access to entertainment for the consumer, anytime, anywhere, on-demand, on any device. The boom in the OTT market attracted many players from small to big, including global players like Amazon Prime and Hulu to very small players like regional OTT platforms. However, to cater to the niche markets, and compete with the global OTT players, the new brands had to come up with bigger budgets for better entertainment content. These brands also faced many other technological and social challenges in the Indian OTT market.

AMUL Girl: Staying Relevant in the Digital Age

Sanjib Dutta[*] and Shubhanjali Chakravarty[**]

This case study is about the "Amul Girl", the moppet used by the Anand Milk Union Ltd's (Amul) for brand promotion and advertisement. The Amul Girl had been the face of Amul since 1966 and was considered the longest running advertising campaign in Indian advertising. The case traces the journey of the Amul Girl since inception and lists her crisp and witty takes on Indian and world events, with amusing slogans being used for Amul's brand promotion and product advertisement. The case also describes how Amul used its moppet in different mediums like the radio (1976), television commercials (since 1976 and a fresh start in 1994), and social media like Facebook (2014), Twitter (2014), and YouTube (2014), to increase the engagement rates of its users. It also describes the challenges faced by Amul in using the Amul Girl to connect with the millennial, lack of refreshing content on digital media, and Amul's no celebrity endorsement policy. The case concludes with the steps taken by Amul to be relevant and the launch of its new media strategy.

"The Onida devil died away, the Liril girl did not live long and we don't really know how long the Air India maharaja will live. But innovation, in the Amul girl's case, was never really needed. We never had to really play on the way she looked. Because along the way, she became the country's darling."[1]

– Rahul DaCunha (Rahul), Managing Director and Creative Head of DaCunha Communications, in 2016

"*Amul has dangerously stagnated in Indian consumer's psyche. While the elderly connects to it emotionally, the brand lacks an aspirational connect to draw the youth who would decide the fate of all brands during this decade.*"[2]

– N Chandramouli (Chandramouli), CEO, Trust Research Advisory[3], in 2011

INTRODUCTION

On May 24, 2019, the Anand Milk Union Limited (AMUL's) "Amul Girl", the moppet used by Amul for brand promotion and advertisement, congratulated the Prime Minister of India, Narendra Modi, on the Bhartiya Janata Party (BJP's) win in the 2019 Lok Sabha elections, and on his being elected the Prime Minister of India for the second term. While the tagline read, "*kamaal ka performance*" (great performance), the second caption, was, "*Amul lotus and lotus of taste*!" (Lotus happens to be the BJP's symbol) *(Refer to **Figure 1**)*. On January 30, 2019, the Amul Girl paid a tribute to Bollywood[4] actor, Vicky Kaushal, for his

Chobani: Reinventing to Re-Disrupt the Yogurt Market?

Indu Perepu[*] and Munmun Samantarai[**]

This case discusses Norwich, New York-based leading Greek yogurt manufacturer Chobani LLC (Chobani) and its reinvention strategy. In November 2017, the company unveiled a new look for its logo and redesigned packaging and announced several new additions to its product lines. The company also tried to morph into a "food-focused wellness company" with emphasis on Nutritional wellness, Social wellness, and Environmental wellness. Keeping in view the changing customer preferences and the predicted downfall in demand, Chobani adopted the strategy of reinvention to spark interest in yogurt again. But industry experts viewed this as a move to protect its place in the yogurt market. The competition among the players in the yogurt market had intensified over the years and they were eating into each other's market share. Moreover, a shift in consumer preference was also noticed with the increasing sales of yogurt smoothies and other drinks. This was an indication that the Greek yogurt was losing its luster and Chobani had no option than to reinvent itself.

"Ten years ago, when [Chobani] launched, it disrupted the yogurt category. These guys disrupted the market and grew their category dramatically and smartly—[but] a lot of their competition has copied them. The result is the category is overly complicated, [and] there is a sameness to the way [these brands] appear on the shelf. So in order to stay ahead of the curve Chobani had to do something. They didn't have a choice."[1]

- Gary Stibel, founder and CEO of the New England Consulting Group, in 2017

INTRODUCTION

On November 28, 2017, Chobani LLC (Chobani), a leading Greek yogurt manufacturer based in Norwich, New York, unveiled a major brand evolution to commemorate its 10th anniversary.[2] The company revealed the new look of its logo and its redesigned packaging and announced several new additions to its product lines. By reinventing itself, Chobani aimed to again disrupt its signature yogurt market, a market it had disrupted a decade earlier. This time, it sought to do this as a food-focused wellness company. Peter McGuinness (McGuinness), Chobani's chief marketing and commercial officer, said, "*We spent the past 10 years focusing on the impact our company can and does have on communities across America, using food as a force for good. That's framing how we're looking at the next decade, and our new packaging is the first glimpse into that. It's a beautiful translation of*

Linc Pens: Marketing Strategies to Survive the Covid-19 Pandemic

Sanjib Dutta[*] and Smita Ray[**]

The case talks about how India-based stationery products manufacturing company Linc Pen & Plastics Ltd. (Linc) navigated through the Covid-19 crisis. It starts out with the announcement made by the company regarding its sales achievement. The case gives a brief history of Linc and then describes the business strategies adopted by the company before the Covid-19 pandemic. This included launching of new products, innovative pricing, and its expansion to different locations across the world. The case then dwells upon the strategies implemented by Linc during the pandemic such as expansion of its distribution network and extension of product line. It also highlights how these strategies helped the company to protect its sales. The case ends with the future plans of Linc.

"The improvement was owed to focus initiatives: deeper reach, wider range and equipment automation. Besides, we believe this change in our business model is laying the foundation of a reinvented Linc."[1]

- **Deepak Jalan, Chief Executive Officer (CEO), Linc Pen & Plastics Ltd, in March 2021**

"The Pentonic BRT is a classy extension to the great success enjoyed by our entire range of Pentonic products. In an era when the world is leaning towards digitalization, the Pentonic BRT will give us a lot of reason to write, thanks to its sleek corporate look, curvilinear body, smooth grip, fluidic finish as well as superior ink technology." [2]

- **Deepak Jalan, Chief Executive Officer (CEO),Linc Pen & Plastics Ltd, in March 2021**

INTRODUCTION

In Q1 (April-June) FY 2022 (during the peak of the second wave of the COVID-19 pandemic), Linc Pen & Plastics Limited (Linc), an India-based stationery company, reported a sales turnover of Rs.551.30 million as compared to Rs.275.17 million in Q1 (April -June) FY 2021 (*Refer to **Table I** for Quarter wise sales of Linc for FY 2020, FY 2021 and FY 2022*).In Q4 (January-March) FY2021, Linc achieved sales ofRs.937.7 million in i.e., 92.85% of the Rs.1009.8 million sales achieved in the same quarter of FY2020.[3]

The company stated that adoption of aggressive marketing strategies, which included expanding its distribution network and re-launching its Pentonic brand along with new products, had helped it to achieve more than expected sales during the COVID period.

FedEx's Social Media Strategy: An Integrated Approach

Achyut Telang, J Prince Vijai** and Gaurav Bhatt****

FedEx, a logistics service company based in the US, was always known for its innovations. It became the first shipping company to use computers to manage packages, brought parcel tracking to the shipping industry for the first time by introducing a hand-held bar code, and offered tracking of online packages by launching a website, thus allowing customers to conduct business via the internet. It also released a new BlackBerry application and an enhanced mobile website so that customers could ship, track, and find FedEx locations on the go. Similarly, FedEx recognized the growing importance of social media quite early and decided to take to it in a big way. They went beyond just setting up accounts on different social media platforms and made it an integral part of the company. FedEx also used social media to connect with the workforce and community, and build customer relationships. It was poised for further growth leveraging the power of social media.

"From multiple blogs to multiple service-oriented Twitter feeds and even community sponsorship, FedEx has made social media a priority[1]."

- Jennifer Leggio, Vice President, Corporate Communications at Sourcefire & Forbes.com Contributor, 2009

"We are in the midst of a fundamental shift from mass communication to mass collaboration. ...With social technologies, we are not only consumers of information, but producers and co-creators. This democratization of collaboration and creation is the real social revolution.[2]"

- **Mark Bonchek, Senior Vice President of Communities and Networks, Sears, 2012**

INTRODUCTION

In 2008, Federal Express Corporation (FedEx), one of the world's leading shipping companies decided to take to social media in a big way. The thinking behind this move was that social media should be seen not just as a fad but as a practice that had to be incorporated into the organization. FedEx went beyond just setting up accounts on Twitter[3], making

Recipe of the Chocolate Empire: Marketing Analysis of Hershey's

Sweta Singh, Rashmita Saran** and Rachita Kashyap****

The case study evaluates the key marketing effortsof Hershey's, one of the biggest chocolate producing companies globally. Hershey's had established a presence in more than 85 countries around the world and sold over 90 of its brands worldwide. One of the most significant features that led to Hershey's success was its readiness to change and the courage to make striking turns in the course of the business. The company positioned its chocolates as "affordable luxury," and made it available at economical prices. It was taking various measures to sustain its competitive advantage.

"We are proud to be recognized for our long-standing values of integrity and making a difference in our environment, workplace and communities. Our deep-rooted purpose of making more moments of goodness influences how we work each and every day."[1]

- Michele Buck, Chief Executive Officer at The Hershey Company, October 15, 2020

INTRODUCTION

The Hershey Company, also known as Hershey's, was one of the biggest chocolate-producing companies in the US chocolate and non-chocolate market. As per the IRI[2] 2020 report, Hershey's held the top position in the US confectionery, chocolate, and mint market with 32 percent, 45.7 percent, and 35.1 percent market share, respectively. Its competitor Mars[3], with 27.2 percent and 27.3 percent market share held the second position in the US confectionery and chocolate market while Nestlé[4] was second in the mint category with a 23.7 percentage

Celebrity Brand Endorsement Crisis at Subway

Sriram Soundararajan and Anil Anirudhan***

The case is about the crisis Subway faced after the arrest of its key spokesman Jared Fogle (Fogle). The case details the rise of Fogle as brand ambassador of Subway and his role in the gradual growth of the organization. Subway responded to the crisis, caused by Fogle's arrest by disassociating itself from Fogle. It strove to manage the crisis, even though the company did not have a crisis management plan. The case discusses the risks associated with a long-term brand endorser and puts forth various opinions of branding experts and public relations experts. It concludes by taking a look at Subway's decision to hire a management consulting firm to restructure its business and reduce its dependence on brand endorsers and to focus more on the brand itself.

"Whether he is guilty or not, Subway is currently being associated with child pornography, and so the most important thing to act on is to clarify that they take allegations of this nature very seriously with a short brand statement."[1]

- Sarah Aitken, Chief Marketing Officer, Iris Worldwide, in July 2015

"They have to acknowledge they are in a horrific situation and then pivot back to the fact that the spokesperson's actions will in no way affect the brand's dedication to providing customers with a healthy fast-food alternative."[2]

- Patrick Hillman, Vice President, Levick Communications, in August 2015

On July 7, 2015, Jared Fogle (Fogle), a key spokesman for fast food restaurant chain Subway, was arrested by the FBI on charges of possessing child pornography and indulging in paid sex with minors in the US. The arrest was made after the FBI raided his home and found incriminating evidence which supported the fact that he was guilty of the said offence. Fogle, a brand ambassador for Subway, had been associated with the company for 15 years.[3^4]Subway immediately disassociated itself from Fogle and issued statements ending the relationship with him. Two weeks after Fogle's arrest, on July 21, 2015, Tony Pace (Pace), Chief Marketing Officer at Subway, submitted his resignation to the management. Pace was handling the Fogle crisis, when he decided to leave Subway.[5]

Nestlé India: Adopting a Regional Approach in Its Distribution Strategy

KVSSN Narasimha Murty and Koti Vinod Babu***

This case discusses the logistics and distribution strategy of Nestlé India Limited (NIL), the Indian subsidiary of the world's largest food and beverage company, Nestlé SA. The case gives a brief insight into the distribution structure of Nestlé and the terms of operations it employed for its intermediaries. It then provides details about how technology helped NIL's outbound logistics system at NIL. The case moves on to discuss the possibilities of channel conflicts and stresses the need for NIL to strengthen its own distribution channel in order to avoid differences between prices of its products in different regions, product positioning, and promotional campaigns. The hyper local cluster approach of NIL is dealt with as well – wherein it divided India into various clusters and then crafted product placements, distribution, marketing, and promotions for each cluster. Suresh Narayanan, Chairman and Managing Director of NIL, was hopeful that NIL would continue to improve its distribution strategies to serve the Indian markets better.

"We would need to have distribution centres based more on location, consumption and the cheapest freight routes."[1]

– Suresh Narayanan, Chairman and Managing Director of Nestle India Limited in October, 2017

INTRODUCTION

In July 2020, the Indian subsidiary of Switzerland-based Nestlé SA (Nestlé) and leading packaged food manufacturer, Nestlé India Limited (NIL), reported Rs 33,253 million in revenues for Q1 2020, as compared to Rs 31,493 million in the last quarter of 2019.[2] However, the company stated that its sales had been adversely impacted by the nationwide lockdown[3] imposed due to the Coronavirus pandemic (Covid-19)[4].[5] Suresh Narayanan

HubSpot's Inbound Marketing Strategy for SaaS Businesses

Jitesh Nair and Bitra Vasudev***

The case study sheds light on the inbound marketing concept conceptualized by Dharmesh Shah (Dharmesh) and Brian Halligan (Brian) in 2004. The two, founders of HubSpot, a US-based software company, developed a cloud-based marketing, sales, and customer service platform called 'Growth Platform,' which enabled clients to expand their businesses using the inbound marketing concept through a platform called the 'Growth Platform'. The case study also talks about the inbound marketing and sales strategies applied by HubSpot to sell the 'Growth Platform' as an apt marketing strategy in the information age for e-commerce firms, specifically SaaS businesses.

"Buyers have more information available to them, and higher expectations for a relevant, personal experience when making a purchase. Giving them that relevant, personal, "delightful" experience that is driven by their needs and happens on their timeline is what an inbound approach to sales is all about."[1]

– Brian Halligan, CEO, HubSpot, in 2013

"Inbound marketing at scale works incredibly well, If you look at our cost to acquire customer over time, it's largely trending down over time.... We're our own best case study."[2]

– Brian Halligan, CEO, HubSpot, in 2019

INTRODUCTION

HubSpot, Inc. (HubSpot), a US-based software company that offered an integrated cloud-based marketing, sales, and a customer service platform to businesses,[3] was founded in 2006 at Cambridge, Massachusetts, the US, by Dharmesh Shah (Dharmesh) and Brian Halligan (Brian), two Massachusetts Institute of Technology (MIT)[4] alumni. The two co-founders realized that the age-old outbound marketing and sales practices, which focussed on pushing the product to the customer without much thought going into how the product could help the customer's business grow, had lost their efficacy in the age of e-commerce.

Repositioning Maggi in India

Debajani Sahoo[*], *B Radhakrishna*[**] *and Syeda Maseeha Qumer*[***]

The case discusses the marketing and promotional strategies adopted by Nestlé India Ltd (NIL) to revive the Maggi brand in India. In June 2015, Maggi was banned for six months across India after the Food and Drug Administration (FDA) of India found much higher than permissible amounts of lead in samples of Maggi 2-Minute noodles – one of NIL's best-selling products in India. The company had to recall 38,000 tons of Maggi noodles from millions of retail shelves across the country. After getting clearance from the apex court, the ban was relaxed in November 2015. The controversy affected the company significantly with Maggi losing over Rs.10 billion in sales and its brand image suffering a serious blow. Suresh Narayanan (Narayanan), Managing Director of NIL, was on a mission to resurrect the beleaguered Maggi brand. The plan included spending heavily on advertising and brand building initiatives in addition to stepping up consumer engagement on the digital platforms.

"The Maggi crisis can eventually prove to be a blessing in disguise for Nestlé and help shake things up under the new MD, who we believe is pressing the right buttons. Though we like his focus areas, we believe the task ahead for the new MD is herculean. Focus on volume growth, innovation and newfound vigour in the management are key positives. Nonetheless, it will be a while before the fruits of [the] new strategy are realised."[1]

– Motilal Oswal, Chairman and MD,
Motilal Oswal Financial Services Ltd in 2016

INTRODUCTION

In January 2018, marking 35 years of the presence of the iconic food brand Maggi in India, its parent company Nestlé India Ltd (NIL) launched a new marketing campaign aimed at clearing all fears about the safety of the product. The campaign contained two promotional videos. The first, a proposed television campaign 'Kuch Achha Pak Raha Hai' (something good is cooking), focused on the changing status of women. The other featured the complete manufacturing process of Maggi noodles wherein consumers got a view of the eight stages of making Maggi, from the farm to packaging in retail form.

Maggi was banned in India in June 2015 for about five months over the alleged use of carcinogenic elements in its tastemaker. Following the relaunch of Maggi in November 2015, NIL tweaked its positioning strategy for the brand in order to regain its market share. Reportedly, the market share of Maggi dropped to 42% in January 2016 compared to 75% prior to the crisis. In August 2015, Suresh Narayanan (Narayanan), CEO of Nestlé's Philippines unit, was appointed as the head of the Indian operations as the company battled its worst ever public relations crisis in the country.

Survival Strategy in Pandemic @ Baskin Robbins

*Farrah Zeba**

Baskin Robbins is one of the most loved and leading brands world-wide in the ice cream segment. It commands a vast world-wide distribution network with a variety of ice cream flavors. The implementation of lockdown during the COVID-19 pandemic badly affected the food industry, especially the ice cream sector. The summer of 2020 in India, Baskin Robbins' peak sales period, had been a disappointment, as sales dropped by almost 50 percent. Baskin Robbins quickly responded to the adverse effects of COVID-19 and came up with an agile survival strategy. The main objective of this case study is to understand the survival strategy of Baskin Robbins with respect to COVID-19.

"Coronavirus upends global food supply chains in the latest economic shock."[1]

"Countries are starting to hoard food due to coronavirus outbreak, threatening global trade."[2]

INTRODUCTION

Newspaper headlines such as the above had become the first thing that caught people's eye in the months after the outbreak of the coronavirus, Covid-19. All over the world, people had remained isolated and caged in their homes, waiting for the day when they would again be able to walk on the streets unrestricted and to visit public places. But what was worse than this, was the impact the coronavirus had had on different industries. The food industry was one of those most affected. The food industry comprised an intricate network of farmers and various businesses that worked together to meet the food requirements of the world population. It covered various activities ranging from food production, supply, harvesting, processing and packaging, to distribution. In short, it wielded strong economic power that drove the economy of any country. According to reports, the pandemic had forced many restaurants, food, and ice cream parlors to shut down, thus affecting the production of food items and causing an imbalance of demand and supply of food items all over the world. This imbalance had cost the industry millions of dollars. Globally, food prices continue to rise every month due to logistical problems. Moreover, some shortages in basic goods had also been reported in several places, thereby disrupting the supply chain of the raw materials for food processing.[3]

The ice cream industry, one of the fastest-growing segments of the dairy or food processing industry globally, was also drastically affected by the Covid-19 pandemic. American ice cream brand Baskin-Robbins, a popular chain of ice cream and cake shops that sold its ice creams in nearly 50 countries, had been severely impacted by the ill effects of the coronavirus. The summer of 2020 in India, its peak sales period, had been a disappointment as sales had dropped by almost 50 percent. While these short-term impacts were evident, the magnitude of the long-term impact of the outbreak of Covid-19 on the food industry remained to be seen.[4]

Heineken: Worlds Apart!

Indu Perepu and Rupali Chaudhuri***

This case study discusses the 'Worlds Apart' advertising campaign of the Netherlands-based beverage company, Heineken N.V. (Heineken). The company had launched the four-minute advert organically in April 2017. Heineken wanted to showcase the fact that people with polarized views could also open up and connect with each other. And to prove this, it brought people with differing views together, got them to crack open a bottle of beer and created great moments. The advert was well received in the social media and also won awards at the Cannes Lions festival of creativity in 2017. The case analyzes the advert in reference to the contact theory.

"*People get so many messages today, so many brands talking to them, you have to touch people and be relevant to cut through.*"[1]

– Cindy Tervoort, Head of Marketing, Heineken UK

"*We are far more united and have far more in common with each other than things that divide us.*"[2]

– Jo Cox, British Labour Party Member of Parliament

Dutch brewing company Heineken NV (Heineken), one of the leading global brewers of beer brands like Heineken, Amstel, and Desperados, was well known for its award winning marketing campaigns. The Heineken brand denoted openness and the company's campaigns showcased confident, broad-minded people enjoying a premium beer.

In 2017, the company felt the brand, which had a universal tag line 'Open Your World', needed to re-establish what it stood for. It wanted to trigger a spark among consumers through a meaningful storyline, of people with polarized ideologies connecting and collaborating over a drink. And to showcase this, Heineken conceived a four-minute advert – 'Worlds Apart', in April 2017. This advert featured people with opposite views bonding over a task and cracking open a bottle of beer to create great moments together.

BACKGROUND NOTE

The Netherlands-based brewing company Heineken N.V. (Heineken), founded in 1864, owned more than 250 beer brands across the world. Some of these beer brands were Heineken, Sol, Tiger, Tecate, Red Stripe, Krušovice, and Birra Moretti. Heineken operated in Africa, the Middle East, Europe, the Americas and the Asia Pacific. For the year closing on December 31, 2017, the company's revenues were €21,888 million with 218 million hectoliters of beer sold during the year.[3]

iD Fresh Enters the Traditional Beverage Segment Through Its Filter Coffee Decoction

Jitesh Nair and Bitra Vasudev***

The case study describes how iD Fresh Food (India) Pvt. Ltd. (iD Fresh), a relatively new entrant in the Indian food and beverages market, forayed into the Indian coffee market by addressing the unmet demand for ready-to-make authentic filter coffee. In 2018, the company entered the beverages segment through 'iD Fresh – Traditional Filter Coffee Decoction' (iD Filter Coffee Decoction). The case study provides a brief note on the Indian ready-to-drink (RTD) market and explains the reasons for iD Fresh finding a potential market for iD Filter Coffee Decoction, especially with the lifestyle of many Indians becoming more hectic due to the rise in urbanization, increase in the number of nuclear families, and growth in the number of dual-income households. Many Indians had thus abandoned the practice of brewing filter coffee at home and turned towards instant coffee powders. However, many coffee connoisseurs continued to seek authentic filter coffee.

"Making that authentic, aromatic cup of South Indian filter coffee can be a time-consuming and painstaking process, which perhaps explains why not many people today attempt it at home. We, at iD Fresh, are keen to help our customers overcome this barrier by offering the perfect decoction made of the finest coffee beans. You don't need any special equipment, skilled hands, or loads of time to make filter coffee now."[1]

– Musthafa PC, CEO and Co-Founder, iD Fresh Food, in October 2018

"Much like we did with our pioneering product in the idly and dosa batter market, our coffee decoction is a bid to revolutionise the coffee industry. It comes in the form of ready-to-use liquid (decoction) rather than the conventional powder form available in the market."[2]

– Musthafa PC, CEO and Co-Founder, iD Fresh Food, in June 2019

INTRODUCTION

iD Fresh Food (India) Pvt. Ltd. (iD Fresh), a Bengaluru-based manufacturer of 100% natural ready-to-cook (RTC) food products, entered the ready-to-drink (RTD) beverage segment in 2018 under the brand name 'iD Fresh – Traditional Filter Coffee Decoction' (iD Filter Coffee Decoction). Unlike most other existing filter coffee products that were sold in the form of coffee powder, 'iD Filter Coffee Decoction' was sold in the form of ready-to-use decoction[3] (liquid). To make filter coffee from the decoction, consumers just had to shake

Tata Salt's Promotional Strategies

Achyut Telang and Syeda Maseeha Qumer***

The case discusses the promotional campaigns undertaken by Tata Salt, India's first iodized salt brand, to enhance its market share in the Indian branded salt industry. Tata Salt was the first to introduce iodized, hygienic, and standardized salt in the Indian market. It started its product positioning on the rational platform of purity. Through its communication campaigns, Tata Salt advocated the importance of pure, iodized, and iron-rich salt in people's diet. The case discusses the various promotional strategies adopted by Tata Salt to capture the position of the most trusted brand in the Indian salt industry. Over the years, the brand was successful in establishing an emotional connect with customers by tapping the nationalist and patriotic fervor through campaigns such as 'Namak ho Tata ka — Tata namak', 'Desh ka Namak' and 'Ghul Milke'. The case concludes by discussing the need for the brand to identify future market needs and address them as it continues to grow.

Very few brands in India, across categories, can lay claim to be 'desh ka.' And the ubiquitous salt brand [Tata Salt] can stake claim to that unique aspiration.[1]

– Amit Bapna, Assistant Editor, The Economic Times Brand Equity[2], in 2015

INTRODUCTION

Tata Chemicals Limited (TCL), the parent company of Tata Salt, a pioneer in the Indian branded salt market, launched a new promotional campaign 'Desh Ka Salaam, Sarhad Ke Naam'(nation's salute to the armed forces on the border) to coincide with the 69th Independence day of India (August 15, 2015). The campaign bagged two Guinness World Records[3]. The first was for the loudest indoor shout with a crowd-sourced slogan 'Jai Hind' (victory to India) being shouted out at the 122.2 decibel level; the second was for the longest line of postcards with a chain of 6400 hand-written messages and postcards from Indian citizens to the armed forces in the country. Moreover, a crowd-sourced national anthem sung by more than 76,310 people as part of the campaign found a place in the Limca Book of Records[4] for being the first initiative of its kind. Commenting on the campaign, Richa Arora (Arora), COO, Consumer Product Business, TCL, said, "Tata Salt has evolved from being a packet of salt to being known as 'Desh Ka Namak'. The 'Desh Ka Salaam' Independence Day campaign is dedicated to the soldiers who selflessly safeguard the nation. Through this campaign what we simply did was connect millions of people to the soldiers located at the

Vitamin Shoppe's Failed Reinvention Efforts

V Namratha Prasad and Smita Ray***

The caselet talks about the failed attempt of Vitamin Shoppe Industries Inc. (VSI) to reinvent itself in a bid to improve its business prospects. The case starts out with the circumstances that forced VSI to think about reinventing itself. It then explains the various measures taken by the company, as a part of its reinvention strategy. The case goes on to delve into the reasons for the reinvention strategy failing to improve the company's sales and financial position. It ends with the additional steps VSI was taking to avoid having such a failure again and takes a brief look at the possibility of the company's prospects brightening. Does VSI need to continue reinventing itself?

INTRODUCTION

On February 27, 2018, Vitamin Shoppe Industries Inc. (VSI) declared its Q4 2017 results, which showed a decline of 11.8% in its total net sales as compared to Q4 2016.[1] It also announced that the tenure of Colin Watts (Watts), Chief Executive Officer (CEO) of the company, would end in May 2018 and that it had begun the search for his successor. The poor financial results further reinforced the failure of the 'reinvention strategy' that the company had begun implementing from 2015 to achieve a turnaround of its dwindling business. However, Watts and Alexander Smith (Smith), Chairman of VSI, were optimistic about the company's web sales and expected VSI's performance to improve in future.

ABOUT VSI

VSI, founded in 1977, was a US-based omni - channel[2] retailer and manufacturer of nutritional products (*Refer to Exhibit I for more details on product categories*). The company's products were sold under the brand names *Vitamin Shoppe, Body Tech, True Athlete, Plnt, Pro Bio care, MyTrition, Next step, Betancourt Nutrition, and Vitapath.* In addition, VSI offered more than 900 national brands, along with some third party line of products, including professional and specialized lines.

The company operated through three business segments: Retail, Direct, and Manufacturing. The retail segment included super supplements retail store formats. As of July 2017, VSI operated through 783 company-owned retail stores in the US and Puerto Rico. The company had 16 franchise stores in four countries outside the US. In the direct segment, products were sold through the Internet, primarily on the company's website – vitamainshoppe.com. The manufacturing segment comprised custom manufacturing and private labeling of VMS (vitamin, minerals, and supplements) products, apart from development and marketing of

Rebranding Facebook

Amar Raju G[*]

The case is about Facebook's rebranding to Meta. With the rebranding, Facebook would be one of many products under a parent company whose offerings include Instagram, WhatsApp, and Oculus. The case discusses aspects of the rebranding decision taken by Co-founder and CEO Mark Zuckerberg, who suggested that the company saw itself with a very different future focus – a focus on the idea of "metaverse", which was a vision of a social media universe that could move seamlessly between several connected devices. The case could be used to discuss the concept of rebranding, its objectives, risks, and advantages.

"I think we're basically moving from being Facebook first as a company to being metaverse first,"

- Mark Zuckerberg, Co-founder and Chief Operating Officer, Facebook

"Over and over again Facebook chooses expansion in new areas over sticking the landing on what they've already done,"

-Frances Haugen
Former Product Manager and Whistleblower, Facebook

INTRODUCTION

On October 28, 2021, Mark Zuckerberg, Co-founder and Chief Operating Officer announced at the annual connect conference of Facebook that the firm would change the name of its holding company to Meta.[1]

With the rebranding, Facebook would be one of many products under a parent company whose offerings included Instagram, WhatsApp, and Oculus. Facebook's rebranding suggested that it saw itself as a company with a very different future focus – a focus on the idea of the "*metaverse*", which was a vision of a social media universe that could move seamlessly between smartphones, VR goggles, and augmented reality glasses.[2]

The decision to rebrand came at a time when the social media giant was facing criticism from lawmakers and regulators over its market power, algorithmic decisions, and the policing of abuse[3] on its services. As the announcement came when the company was in the middle of a fresh controversy, the question on people's minds was whether the rebranding was just a shallow PR exercise, with Zuckerberg trying to reset the Facebook brand after

Dunkin Donuts to Dunkin': A Rebranding Exercise

Anil Anirudhan and Debapratim Purkayastha***

This case is about the rebranding exercise undertaken by the Dunkin Brands Group, Inc. (Dunkin) in the US. The company had dropped the word 'Donuts' from its brand name 'Dunkin Donuts' and rebranded to only 'Dunkin'. The rebranding created ripples in the restaurant industry because though the organization had changed its logo and appearance even earlier, this was the first time it was dropping the word 'Donuts' from its brand name. In fact, the word 'Donuts' was closely associated with the brand, and was almost synonymous with "Dunkin Donuts'. The case discusses the evolution of the brand name, the reasons for the rebranding initiative, and the strategies undertaken by Dunkin to successfully rebrand itself.

"This isn't a change for the sake of change. Our new branding is a clear signal that there is something new at Dunkin. It says we are a dynamic, on-the-go brand yet still pays homage to our great heritage."[i]

- David Hoffman, CEO, Dunkin Brands Group, Inc.in September 2018

"No, You're Dunkin Donuts, not just Dunkin. You're gonna go to all Dunkin Donuts a just take down the Donut part of the sign? 68 years is a long time, and this is stupid to me to change the name after almost 70 years."[ii]

- Bilda House, Customer, on Twitter [1], in September 2018

On September 22, 2018, Dunkin Brands Group, Inc. (Dunkin), announced that it had dropped the name 'Donuts' from 'Dunkin Donuts' and rebranded itself to only 'Dunkin'.[iii] Effective January 1, 2019, all the stores across the US were to display the new name and logo.[iv] The change in the brand name was the result of the company's plan for a premier brand positioning in the beverages sector and for relating more to the millennial[2] generation. As part of the rebranding exercise, Dunkin planned to shift its focus to teas and coffees and add a wide variety of menu items without restricting itself to donuts. Changing consumer preferences and the need of customers for healthy products were reportedly he triggers for the rebranding.

The Message Strategy Behind CEAT's 'Be Idiot Safe' Campaign

V Namratha Prasad and Smita Ray***

The case talks about the creative strategy behind Cavi Elettrci Affini Torino Limited (CEAT) Ltd.'s successful 'Be Idiot Safe' (Idiots Campaign) ad campaign, which went on to have several re-launches in later years. The case starts out by mentioning how the 'Big Idea' for the 'Idiots Campaign' was arrived at in 2010. It then describes the ads that were launched as part of the 'Idiots Campaign' and their impact on CEAT's brand value. Details are also provided about how the campaign was revisited in 2011 and 2014, and how this too turned out to be successful. The case ends with the latest re-launch of the 'Idiots Campaign', under the name 'Meet the 'Mahapurush' (Mahapurush campaign), in 2017.

"CEAT's purpose is to make mobility safer and smarter every day, and the chaos caused by jaywalkers[1] creates the context for delivering the message that CEAT is the safest bet on the roads."[2]

– Arnab Banarjee, Executive Director (Operations), CEAT, in 2017

"I feel like the planner/creative has been through situations like these. I ride a bike myself and I could not agree more with the thought of the commercial. Everyone from the 'car-wallahs' to the pedestrian on the street chooses to ignore bikers. I remember after seeing the ad, I had told a friend, 'Yes, idiots are what we find everywhere'."[3]

– Rajesh Sharma, Planning Head, Mumbai, TBWA India[4], in November 2010

INTRODUCTION

In July 2017, Cavi Elettrci Affini Torino SpA (CEAT) Ltd. took its successful ad campaign the '*Be Idiot Safe*' (Idiots campaign) further with its new ad campaign, '*Meet the Mahapurush*' (Mahapurush campaign).

In the Idiots campaign which the company launched in 2010, CEAT had used satire and humor to advertise the strong grip provided by its tyres, which helped bikers avoid mishaps with various 'idiots' on the road, i.e. people who didn't follow traffic rules.

Amul's Marketing Strategy

*Madhavi Garikaparthi**

Amul, the taste of India – the brand that changed the face of dairy in the country; the brand that benefitted both the suppliers and the consumers and continued to win over consumers with its utterly delicious milk products. Every generation from the baby boomers to the millennials had relished its products. Amul was not content with just being another dairy cooperative. It had a commitment to give the consumer the best quality product, and it was this commitment that made Amul different from other brands. This case focuses, among other things, on Amul's marketing strategies during the pandemic.

INTRODUCTION

Amul had been unstoppable in the food industry since its inception. Over the years, it had evolved tremendously in various sectors of dairy produce. What had begun as a small milk factory set up by some farmers had turned into a multibillion company and its growth had been witnessed not only by its employees but also by consumers. The cooperative had given a lot to its consumers. Amul had never compromised on the quality of its products and that helped it built trust over the years. Most Indian millennials had grown up using one or the other of its products and advertisements featuring the little girl famously known as The Amul Girl had remained with consumers for decades. Amul was formed with the intention of serving the best to its consumer and exposing them to different dairy products and it ensured that it did just that. Amul was formed in 1946 with just 10 farmers working for it. By 1948, it had seen rapid growth and its employee count went up to 432. Amul brought about a surge in rural India. It also contributed immensely to the Indian economy. Amul is considered as an undisputed leader in the dairy industry and a competitive player in every market that it entered.

MARKETING STRATEGY OF AMUL

The Brand name – Amul promoted all its products under one common brand name – Amul – and this allowed it to gain more brand visibility and resulted in its incurring less marketing and advertising costs than it would otherwise have *(Refer to Exhibit I for points of parity and points of differentiation for Amul).*

Product Portfolio – Amul had a diversified product portfolio and was able to satisfy the needs of all segments, ranging from young to old.

Innovation – Amul was known for coming up with new innovative products for different customer segments.

Pricing Strategy – Amul always fulfilled the needs of all the economic segments without compromising on product quality in any way. Its products covered a huge market segment and were used on a daily basis. They included milk, ghee, ice-cream, cheese, and butter and they were priced lower than the products of competitors.

Advertising Campaign – Amul held the Guinness World Record for the longest running advertisement campaign. The *AMUL GIRL*[1], a cartoon figure, was used by the company to

Amul vs. Kwality Walls – Ice Cream Ad War

V Namratha Prasad and Anil Aniruddhan***

The case talks about the repercussions of the controversial TVC and print media ads put up by Gujarat Cooperative Milk Marketing Federation (GCMMF), makers of Amul ice cream. The ads prompted Hindustan Unilever Ltd (HUL), makers of 'Kwality Walls' frozen dessert and ice creams, along with Vadilal Industries Ltd. and Vadilal Diary International Ltd. to file a case in the Bombay High Court against Amul for product disparagement. HUL and its co-petitioners later won the case, thus preventing the controversial ads from being aired. The case starts off with a description of the controversial ads, which mainly talked about ice creams being a healthier option than frozen desserts. The case also delves into the reasons that prompted Amul to air the ads and the benefits it intended to gain from it. It then highlights how the ad war was in reality a disguise for an ongoing brand war between HUL and Amul for market share in the ice cream market.

"Most consumers are bothered about the experience they go through eating ice cream or frozen desserts. Ice creams are defined from childhood for most of us. On a hot summer day, it is the taste and experience that matters. This ice cream war is not about the ingredients, it is about dominating the market."[1]

– Sulina Menon, Managing Partner, Omnicon Media Group,[2] in May 2017

INTRODUCTION

On June 16, 2017, the Bombay High Court passed an order restraining Gujarat Cooperative Milk Marketing Federation (GCMMF), makers of 'Amul' ice cream, from telecasting its controversial Television Commercial (TVC) and print advertisement. The ad talked about the differences between 'ice cream' and 'frozen dessert' and urged customers to choose Amul ice cream that was made with 'real milk', and not 'frozen dessert', which it claimed was made using a highly controversial ingredient 'Vanaspati' or 'hydrogenated vegetable oil'[3].

On March 21, 2017, Hindustan Unilever Ltd. (HUL), makers of 'Kwality Walls' frozen desserts and ice creams, filed a case against GCMMF in the Bombay High Court, seeking a ban on the ads as they were disparaging the 'frozen desserts' category.

Logo Redesign at Zara: Future Focused?

Indu Perepu and Koti Vinod Babu***

This case study discusses the logo redesign exercise carried out by Spanish fast fashion retailer Zara SA (Zara). The changed logo, released in January 2019, was designed by the advertising agency Baron&Baron Inc., founded by French publisher and artistic director Fabien Baron. The existing logo of Zara had been in use since 2010 and had the letters ZARA printed in block capital sans serif characters with large spacing in between. But in the new logo, the text was crowded close together, the letters were kerned, and they overlapped. Also, there were curved intonations on the 'Z' and 'R'. The logo was redesigned as part of Zara's efforts to appeal to the millennials and retain its fast fashion brand image. It wanted to send out the message that it was willing to change according to the changing trends. The changed logo came in for a lot of criticism from designers as well as customers who said the name of the company was not clearly visible and vented their anger on social media. But Zara maintained that the new logo reflected its new identity.

ZARA'S NEW LOGO FACES BACKLASH

In January 2019, Spanish fast fashion[1] garments retailer Zara SA (Zara) owned by Industria de Diseño Textil, S.A. (Inditex)[2], unveiled a new design for its logo on its social media channels and through advertisements, along with its spring 2019 collection, in an attempt to digitally streamline its brand. Compared to the existing logo, the new logo had letters that were taller and kerned, overlapped each other, and had curves added to the letters Z and R *(See Exhibit I)*. With this move, Zara was following in the footsteps of many other luxury brands that were remodelling their legacy logos to appeal to millennials. However, as soon as the new logo was out, social media users started criticizing it on their Twitter[3] accounts, lambasting Zara's choice.

As of 2019, Zara was one of the world's most successful fashion retail brands. It offered men's and women's clothing, children's clothing (Zara Kids), footwear, and accessories. Zara came up with its first logo in 1975 and an update was made in 2010. The update was well received by consumers, as it was similar to Zara's earlier logo. This design was the work of the advertising agency Baron&Baron Inc.[4], founded by the French publisher and artistic director, Fabien Baron (Baron), best known for his work on the magazine *Harper's Bazaar*[5]. The redesign in 2019 unleashed a spate of criticism from netizens and customers. "This new Zara logo is wrong in so many aspects that it's hard to synthesise in one tweet. Nonsense kerning, absurd letter spacing, lack of uniqueness,"[i] said one customer.

Analysts felt that though rebranding was an effective marketing strategy to cater to the changing tastes and preferences of customers, Zara's redesign had failed to appeal to most

Mercedes-Benz India – Targeting a Younger Segment Without Diluting the Brand

Jitesh Nair and Bitra Vasudev***

The case study describes how Mercedes-Benz India Pvt. Ltd. (Mercedes-Benz India) regained its leadership position in the luxury car segment in India. Mercedes-Benz entered India in 1994, the first luxury car brand to do so. Despite this, Mercedes-Benz India fell behind BMW and Audi, its fellow German luxury car brands, in terms of sales volume between 2009 and 2014. The case study details the various targeting strategies that Mercedes-Benz India adopted, including revamping its product portfolio with compact and sporty models, introducing customer-friendly in-house finance schemes to prospective younger customers, and using an omni-channel approach to promotion. The case also focuses on how Mercedes-Benz India made use of digital technologies in its product, service, and marketing to offer enhanced personalized services to its customers, especially the younger segment.

"If a boy or a girl takes a test ride of our vehicle, I am convinced he/she will like it. We have developed the design, styling and introduced many variants. Mercedes-Benz cars are not just for the elite or senior people owning it for pride; they are for youngsters too. Today, many youngsters love the German car for styling, dynamics and modern features like 'connected cars.'"[1]

– Martin Schwenk, MD & CEO Mercedes-Benz India Pvt. Ltd., in October 2019

"The 'New Generation' cars segment of our brand consists of more than 50 per cent of our sales volume, which is a testimony to the growing number of young customers."[2]

– Roland Folger, Former MD & CEO Mercedes-Benz India Pvt. Ltd., in 2016

"We do not have vehicles in certain segment of the luxury market in India right now. Perhaps, we made a mistake in not recognising it and reacted slowly to bring smaller vehicles in India."[3]

– Matthias Luhrs, Head of Overseas Region, Mercedes-Benz Cars, in 2012

INTRODUCTION

Mercedes-Benz India Pvt. Ltd. (Mercedes-Benz India) was established in 1994 and the company rolled out India's first luxury car, the Mercedes-Benz W124E-Class Series, in 1995.[4] Despite having the first-mover advantage in the Indian luxury car market, Mercedes-Benz India lost market share to rivals BMW and Audi between 2009 and 2014. In 2012,

Nike 'Pro Hijab': Targeting Muslim Women Athletes

Indu Perepu and Syeda Tahera Sadia***

This case study discusses the segmentation and targeting strategy adopted by Nike to launch its competition sportswear titled 'Pro Hijab', a performance headscarf targeted at Muslim Women Athletes (MWAs) in general, with a special focus on Middle-Eastern athletes. The case explores the reasons that caused Nike to come up with the idea of the Pro Hijab and how it consulted several famous MWAs across the globe before designing the sports headscarf. The case also presents the measures adopted by Nike to ensure that the Pro Hijab was designed in such a way as to meet all the needs of the MWAs. At the end, the case facilitates a critical discussion on Nike's decision to launch its new brand and the strengths and potential limitations attached to it. Will this decision to target such a niche segment be beneficial to Nike, given the criticism and negativity it had to face in launching the Pro Hijab?

"Sports is one of the few platforms that brings people together, and the more big brands are noticing the impact of Arab Muslim female athletes, the more the inclusion there is - with everyone having an equal chance at sports."[1]

– Amna Al Haddad, Emirati Weightlifter

INTRODUCTION

US-based Nike Inc. (Nike), the world's leading sportswear company, officially announced in early March 2017 that it would be launching its competition sportswear called the 'Pro Hijab[2]', a performance headscarf targeted at Muslim[3] women athletes (MWAs), who wanted to cover their heads while playing the sport without compromising on their religious beliefs. The product, estimated to cost around $35[4], was scheduled to be launched in the spring of 2018.

Nike, an American multinational corporation founded in 1964 by Bill Bowerman and Phil Knight, initially operated as a distributor for Japanese shoe maker Onitsuka Tiger[5]. Over the years, it developed into one of the world's largest and leading sportswear manufacturing and supplying companies. Headquartered in Oregon, Nike sponsored several teams and high profile athletes around the world, with its highly recognized trademarks of 'Just Do It' and the 'Swoosh' logo. Nike believed in fostering the culture of invention to come up with innovative products that would serve athletes around the world. The Pro Hijab was another such milestone in its mission, 'To bring inspiration and innovation to every athlete in the world'.

Product Positioning and Promotional Strategy of Fevicol

Debajani Sahoo and Syeda Maseeha Qumer***

The case discusses the product positioning and promotional strategy of Fevicol, the largest selling adhesive in Asia with a presence in over 50 countries. Fevicol had become successful not only due to its quality but also because of its unique advertising campaigns. The case discusses the innovative promotional strategies adopted by Pidilite, the parent company of Fevicol, to enable an industrial product like Fevicol to carve out a niche as a top consumer brand in the urban as well as rural markets in India. The creative strategy employed for Fevicol is to make bonding a Fevicol attribute, and its advertising has used intelligent humor to convey this meaning. The biggest challenge for the brand going forward would be to retain its dominant position in the Indian glue market in the light of increasing competition from the unorganized sector. It remains to be seen whether the uniqueness of its advertising strategy will give Fevicol a competitive advantage in the future.

INTRODUCTION

Fevicol, the flagship adhesive brand of Pidilite Industries Limited (Pidilite), enjoyed a dominant position in the adhesive business in India with a market share of 70% as of 2015. Reportedly, Fevicol was the largest selling adhesives brand in Asia with a presence in over 50 countries. In 2015, Pidilite reported a turnover of Rs 46.52 billion, of which 40% came from sales of Fevicol. According to some analysts, Fevicol's dominance in the Indian adhesive market could be attributed not only to the brand's inherent strength and quality but also to a series of advertising campaigns launched by the company over the years to promote the Fevicol brand. *"Although Fevicol is not a consumer product, but it has managed to reach out to every Indian thanks to the brilliance and humour of the campaigns,"*[i] said Abhijit Avasthi (Avasthi), former National Creative Director of Ogilvy & Mather India[1] (O&M).

Launched in 1959, Fevicol was promoted as easy to use glue for carpenters, as an alternative to fat and collagen based adhesive which had to be boiled before application. Over the years, the brand had proved its mettle in terms of consistency, quality, and strong distribution method and customer relationship. It had become a generic name in the adhesive category in India. According to industry experts, Fevicol had strong brand equity and remained embedded in the minds and hearts of the customers. Since adhesive was a low involvement category, Pidilite adopted creative marketing strategies to increase the sales of the adhesive, they said. Over the years, Fevicol's simple, creative, and humorous advertisements clicked with customers and contributed to the success of the brand, opined industry experts.

Despite the success of Fevicol, Pidilite faced competition from other adhesive brands such as Vamicol, Henkel, and Sika India. According to industry experts, one of the biggest threats for the company was the entry of new players who could enter the market very easily as entry barriers for the adhesives sector were low. Whether the uniqueness of its advertising strategy would help Fevicol beat the competition and maintain its lead in the Indian adhesives market remained to be seen, said analysts.

Safaricom Uses Marketing Research Insights to Turn a Crisis on Its Head

Jitesh Nair and Bitra Vasudev***

The case describes how Safaricom, a Kenyan mobile communications company, used marketing research insights to effectively respond to a potential loss of market share and brand image due to dissatisfied millennial customers. The case brings to light the importance of understanding consumer segments and sub-segments and Safaricom's efforts to customize products, services, and marketing initiatives according to sub-segments, a practice that was previously not common in the Kenyan telecommunications industry. Safaricom gained a reputation in the Kenyan market through its successful mobile banking initiative M-Pesa, which provided basic banking services to several unbanked Africans.

"Customers are getting angrier and angrier. They related their empty pockets to Safaricom."[1]

– Sylvia Mulinge, Chief Customer Officer, Safaricom, in 2016

"BLAZE is a platform created to empower youth, enable and celebrate their unconventional journeys to success and give them the freedom to choose how they want to communicate. It's unlike anything we've ever done before."[2]

– Late Bob Collymore, Ex-CEO of Safaricom, in 2016

"Customer service is at the heart of our operations. We want the youth to know and see for themselves that Blaze is a brand that listens when they speak; a brand that understands their needs and is ready to invest significant amounts of money to meet those needs."[3]

– Sylvia Mulinge, Chief Customer Officer, Safaricom, in 2018

INTRODUCTION

Safaricom PLC (Safaricom), a Kenya-based public telecommunications company, was established in 1997 as a subsidiary unit of Telkom Kenya, a telecommunications company owned by the Kenyan government. In May 2000, the UK-based Vodafone Group PLC acquired a 40% stake in Safaricom and in 2008 the government offered 25% of its 60% shares to the public through the Nairobi Securities Exchange. As per the annual report 2019, Vodafone Kenya Ltd.[4] held a 40% stake in the company, the government of Kenya a 35% stake, and the general public a 25% stake.[5] Safaricom was one of the 400 African companies with annual revenues of over $1 billion.[6]

SellMed Online: Selling to Corporate Clients

Mohandas Janardhan Menon[1], Mahesh Kumar Soma[2], Debapratim Purkayastha[3] and Navarun Roy[4]

SellMed Online Pvt. Ltd (SellMed) was a technology company whose stated purpose was to provide every Indian access to the best possible healthcare. It aimed to be the pioneer healthcare hub in India that would bring all stakeholders on to a single platform to ensure a seamless healthcare experience for the customers. The company offered two services – lab testing and diagnostic services – in collaboration with healthcare partners and the home delivery of online Pharma orders via its app. Silvia John (Silvia), Head of Sales of SellMed, was charged with developing corporate accounts and entering into a tie-up with pharmaceutical companies. She had put in place a standardized Corporate Outreach Program with clearly outlined procedures and an action plan to be followed by the sales team. The case looks at the challenges before Silvia as she sought to expand to newer areas, especially Tier 2 and 3 towns. She also wanted her sales team to be more productive and to improve the success rate of sales closure.

INTRODUCTION

Silvia John (Silvia) was happy with the progress SellMed Online Pvt. Ltd, (SellMed) was making in adding new corporate clients for the company's online pharma retail and lab testing services. In the three years that she had been with SellMed as National Sales Manager (since 2016), Silvia had put in place a standardized Corporate Outreach Program with clearly outlined procedures and an action plan to be followed by the sales team. However, she intended to expand into newer areas, especially Tier 2 and 3 towns. She also wanted her sales team to be more productive and to improve the success rate of sales closure from the current 50% to more than 60%.

After addressing the All India Sales Meeting for the company in 2019, Silvia was in her cabin in a contemplative mood. She was thinking about ways to make the sales team work more efficiently. She felt that while the company's present sales team was rather good, supplementing the team's efforts would get better results. In fact, at the meeting she had even asked the sales team to suggest more innovative means to attract more corporate customers. She was not a great believer in myths such as 'salespeople are born' and strongly believed that people could be trained to be excellent sales personnel.

Silvia wanted to review the existing procedures followed by SellMed's sales force at different steps of the sales process, namely:

- Prospecting and Qualifying
- Preapproach

Taj Hotels: Using Technology to Offer Personalized Services

Jitesh Nair and Bitra Vasudev***

The case describes the various technology-based initiatives taken by Taj Hotels Palaces Resorts Safaris (Taj Hotels) to offer personalized services to its guests in India and abroad. The brand's unwavering commitment to offering customer-centric services resulted in its being listed by Brand Finance, a London-based brand valuation consultancy, as the strongest Indian brand in June 2020. It was also considered as a leader in the Customer Experience Excellence metric in a survey by KPMG, a global business consultancy, in 2018. The case study discusses the various digital and non-digital strategies adopted by Taj Hotels at individual properties as well as across its chain to provide personalized services and experiences to the millennials. In 2018, Taj Hotels launched Taj.Live, a digital media monitoring and response system, to listen, interact, engage, respond, and delight consumers across all digital media channels, including social media platforms such as Facebook, Twitter, YouTube, and Instagram.

"Our greatest opportunities reside at the very heart of our brand – our people, authentic guest experiences and unmatched value. We shall aim to have a value proposition for each of our customers at different points in their lifecycle. Our service ethos, epitomized in what we call 'Taj-ness' will continue to be the soul of our company."[1]

– Puneet Chhatwal, MD & CEO, Indian Hotels Company Limited, in February 2018

"No technology is ever a replacement for delivering great hospitality. However, with Proxce we have seen good traction in a few areas. While we were pushing out messages before Proxce, we will now be able to deliver much more personalized services with the contextual mobile marketing technology. Instead of bombarding everyone with promotions (which can be annoying if out of context), we will be able to target specific messages to the relevant subsegment of our guests."[2]

– Chinmai Sharma, Former Executive Vice President & Chief Revenue Office, Taj Hotels, in August 2018

INTRODUCTION

Indian Hotels Company Limited (IHCL), a Mumbai, India-based hospitality group, announced in February 2017 that it would group all the hotels in its portfolio globally under a single umbrella brand[3] called Taj Hotels Palaces Resorts Safaris (Taj Hotels). IHCL stated

Croma: Omni-Channel Marketing

Indu Perepu[*] and Sonali Nagpal[**]

The case talks about the omni-channel marketing strategy of Croma, an electronics retailer belonging to the India-based Tata Group. Croma was launched in 2006 and was termed as India's first large format specialist retail chain for consumer electronics and durables. It was among the first electronics retailers to launch the online portal 'cromaretail.com' in 2012 to face growing competition from both brick-and-mortar and online retailers, who were making their presence felt in the Indian market. The foray into e-commerce helped Croma integrate its physical stores with its web portal and mobile phones. This became popular as the omni-channel strategy. Through this, Croma allowed buyers to order online and pick up the product in the store. Or, customers could check the products online, order at the store, and have them delivered at home. This became highly popular, and almost 50% of the customers visited the website before visiting the store.

"This journey is no longer about a customer choosing between the touch-feel-try experience with the friendly Croma store staff and the convenience of purchasing a product online. It is now about allowing the customer to choose the best of both worlds in an entirely new shopping paradigm for India." [1]

– Avijit Mitra, CEO, Croma, July 2015

INTRODUCTION

On May 27, 2016, India-based electronics retailer Infiniti Retail[2] joined hands with Trent[3], the retail arm of India-based conglomerate Tata Group, to enter the ecommerce space with a website named 'TataCliQ.com'. TataCliQ.com allowed customers to buy products of Tata's brands "Westside and Croma[4]" online along with other non-Tata brands. On the launch of Tata's online venture, Cyrus P Mistry, Chairman of the Tata Group, said, "TataCLiQ.com, a first-of-its-kind phygital e-commerce marketplace brings to India a smart combination of the reassurance and in-store experience of a large on-ground network with the convenience of online shopping, bringing the best of both worlds together." [5]

Cristiano Ronaldo-Coca-Cola Fiasco

Dwarakanath Siriguppi[*]

When soccer star Cristiano Ronaldo removed the Coca-Cola bottles from the table in front of him at a press conference during Euro 2020, it drew the attention of fans, the media, and many others. Ronaldo was one of several celebrities who were distancing themselves from unhealthy brands, either because of a feeling of social responsibility or a fear that the association might tarnish their image. The incident led to a fall in Coca Cola's valuation and dented its image. However, experts opined that other factors might have contributed to the fall in Coca-Cola's valuation.

"Players are offered water, alongside Coca-Cola and Coca-Cola Zero Sugar, on arrival at our press conferences... everyone is entitled to their drink preferences [as everyone has different] tastes and needs"[1]

– **Official Statement of Coca-Cola, June 2021**

"It does make a huge difference when someone like Ronaldo, considered a God by millions across the globe, makes a gesture like that. It will affect the shares and market value of Coke, but only momentarily. And these share prices don't reflect the actual turnover,"."[2]

– **Prahlad Kakkar, Advertising Legend, June 2021**

On June 14, 2021, during Euro 2020, famous Portuguese soccer player Cristiano Ronaldo created a stir when he removed the Coca-Cola bottles placed on his table at a press conference, picked up a bottle of water and smilingly said 'Agua' (Spanish word for water). Ronaldo's gesture caused a furor and drew the attention of fans, the media, and others, who saw it as a move by the star footballer to promote water over Coca Cola. This incident led to a fall in Coca-Cola's market capitalization (market cap) and image. However, many experts opined that this might not be the main reason for the sudden fall of Coca-Cola's market cap.

The Ronaldo–Coca-Cola incident was not the only such incident. On June 15, 2021, during Euro 2020, Paul Pogba, the French soccer player, removed the Heineken beer bottle from his press conference.[3] In the same tournament, Manuel Locatelli, midfielder of Italy, replaced the Coca-Cola bottles which were in front of him with a water bottle during a press conference.[4]

Myntra Revamps Employee Experience Program

M Showry and Balaswamy Pasala***

The case describes how the retailer made use of the leave benefit policy as a lever to initiate a successful transformation of Myntra's employee experience program for a healthier, happier and productive workforce. It seeks to highlight the importance of cultivating a sense of belonging and well-being among employees since it is considered a strong driver of employee engagement. The case describes how Myntra addressed this issue by replacing the sick leaves with wellness leaves to indicate a change in approach to employee welfare that considered mental and emotional wellness along with physical health. This was necessary for the company since the key drivers of employee engagement shifted significantly during 2020 as a result of the COVID-19 pandemic. Listening and acting on employee feedback, and top management support for the employee experience were a few key elements that led to the successful transformation of Myntra's employee experience program. It also touches upon existing leave and healthcare policies. The case ends with a brief mention of the impact of these initiatives which ensured that Myntra's workforce took good care of their mental and physical wellbeing.

"It has been our constant endeavor to extend optimal support for the well-being of employees in a holistic way. This step will be yet another pillar of strength, enhancing the scope for employees to take care of their priorities at work and beyond, while maintaining a healthy work-life balance"[1]

- **Amar Nagaram, CEO Myntra, in February 2021**

"We recently launched unlimited wellness leaves for our employees, to give them the flexibility to take time off anytime, without worrying about leave balances, and focus on their physical, and emotional well-being."[2]

- **Sneha Arora, Vice President of Human Capital, Myntra, in February 2021**

INTRODUCTION

Myntra, an Indian fashion e-commerce company, initiated an enhanced leave policy in February 2021 for a healthier, happier, and more productive workforce. As part of the leave benefit program, its employees could avail of an umbrella of leave benefits such as unlimited wellness leave and an additional host of other leave options like wedding, vacation, and family care leave. This was done since Myntra believed that its workforce was defined by talented, young, and discerning employees with a contemporary outlook to life and the

Ola–Transforming Transportation in India with Innovative Offerings

*Anitha Acharya**

The case is about cab aggregator Ola and its growth in the Indian market. It also describes some of the strategies Ola followed to make a mark in the Indian cab market. The case first discusses the history of Ola, and highlights the innovative services the company introduced to its customers and the marketing strategy it adopted to create brand awareness. The case then discusses the business model innovation at Ola and how it became successful in a short span of time. Ola needed to be very discerning about the opportunities it pursued because of the huge funding it has received. The company has raised 4.30 billion US dollars as of November 2021. Although Ola was successful, the question is whether the company would continue to be successful in the long run and whether the potential Initial Public Offer (IPO) in 2022 would open new avenues for growth.

"Ola leads by example, and we look forward to working with state governments and other partners to introduce accessible, affordable, and sustainable mobility solutions at scale."[1]

– **Bhavish Aggarwal, Co-Founder and CEO of Ola in 2018**

INTRODUCTION

Ola Cabs (Ola), founded in the year 2010 by two IIT Bombay alumni Bhavish Aggarwal (Bhavish) and Ankit Bhati, was India's first and largest cab and auto rickshaw aggregator with more than 4,000,000[2] cabs across102 cities[3]. As of December 2015, Ola held an 80% share of the Indian can aggregator market, followed by Meru (12%) and Uber (4%)[4]. Ola integrated car transportation within the bounds of the city onto a technology platform, providing convenient, credible, and rapid service fulfillment for customers and drivers[5]. Customers could contact Ola at very short notice through its customer service center, on the web, or through their mobile app[6]. Ola did not own or operate a fleet of vehicles; it only aggregated small operators and owners with single vehicles, and added a touch of modern technology to the entire setup. Apart from the taxi service, the booking options available to customers were half day/ full day rental and they could also book Ola for traveling outside the city. Cab owners who tied up with Ola enjoyed the advantage of being able to procure customers easily and enhance their income

Airtel's Call Drop Compensation Plan

Syeda Maseeha Qumer and Benudhar Sahu***

In September 2015, Indian telecom major Bharti Airtel announced that it would move to a more affordable pay-per-second plan for all its prepaid mobile customers in the wake of government's warning to telecom service providers to compensate the customers for their call drops. Airtel's decision to go in for a per-second billing option would provide great relief to customers who were earlier charged on a per-minute basis irrespective of whether the call got disconnected midway. As per the new per-second billing option of Airtel, the users would be charged based on the length of time they used the network. Industry experts observed that though Airtel's per-second billing plan would benefit the users, it is not the best solution and that there need to be more stringent measures in place for addressing this issue.

On September 21, 2015,[1] India-based telecommunication company Bharti Airtel Limited (Airtel) announced that it was moving all its prepaid mobile customers to a per-second billing plan. According to Airtel, the move to the per-second billing plan was intended to provide relief to the customers, who were earlier being charged on a per-minute basis even when their call dropped midway. Airtel's announcement came amid the concerns voiced by the Telecom Regulatory Authority of India[2] (TRAI) over frequent call drops. The TRAI had proposed that the telecomservice providers should compensate the customers for their call drops and poor quality of services.The seriousnessof the call drop concerns led to TRAI examining whether the telecom companies had any tariff plans wherein the call drops actually incentivized or benefited the companies. Airtel said that as a part of the company's customer-centric commitment, it had decided to introduce the new "Pay For What You Use"[3] initiative, which would ensure that the customers paid only for the time for which they used the network. Underlining the company's commitment toward its customers, Ajai Puri (Puri), Director – Market Operations, Bharti Airtel (India & South Asia), said, "Our customers are the reason for us to be in business, we therefore constantly introduce innovative initiatives with a commitment to deliver a world class experience to them."[4]

Founded in July 1995 by Sunil Bharti Mittal, Airtel was a leading global telecommunications company which operated in 20 countries across Asia and Africa. Headquartered in New Delhi, India, Airtel was the third largest mobile operator in the world behind Vodafone

Consumer Minimalism: The KonMari Lifestyle Brand

Jitesh Nair and Bitra Vasudev***

The case details how Marie Kondo (Marie), a young Japanese woman, capitalized on the trend of consumer minimalism to build a business through her company KonMarie Inc. Her de-cluttering and organizing method, called the KonMari Method, helped her achieve a self-worth of $8 million in a decade. Marie had had a penchant for cleaning and organizing her home since childhood. By the time she turned 19 in 2003, her friends began offering her money for her tidying services. After graduation, though she took up regular employment at a staffing agency, she began to offer her tidying services as a part-time professional service. Marie soon had a waiting list of customers that stretched over six months. Realizing the business potential in this concept, Marie quit her regular job and converted her side hustle into a full-time business. The case focuses on the various promotional initiatives, including book publishing, talk shows, working with celebrities, and appearing in a Netflix series that led to Marie becoming a celebrity in Japan and later in the US.

"The best way to choose what to keep and what to throw away is to take each item in one's hand and ask: "Does this spark joy?" If it does, keep it. If not, dispose of it. This is not only the simplest but also the most accurate yardstick by which to judge."[1]

– Marie Kondo, Founder of KonMari Media, Inc, in 2014

"My consumption habits actually did radically change after I did the whole method the first time. I now check in with my values and my gut feelings before I bring anything into my house."[2]

– Nora Revenaugh, Marketing Director at Foreign Affairs Magazine[2], in 2019

INTRODUCTION

Marie Kondo (Marie), a well-known minimalist home tidying and de-cluttering expert and the author of bestselling self-help books on tidying, was also the founder of KonMari Media, Inc., a US-based lifestyle brand. The brand offered a range of products, content, and services designed to help customers in organizing their homes. Marie christened her minimalism-inspired tidying and decluttering method the KonMari Method™. This method focused on tidying and de-cluttering houses category-by-category instead of room-by-room with the ultimate aim of creating houses that sparked joy for its occupants. (***Exhibit I*** *briefly details*

Fortune Rice Bran 'Heart Healthy Oil' Brand Ambassador Suffers a Heart Attack

Sanjib Dutta and Manish Agarwal***

The case study discusses the Fortune Rice Bran Health Oil fiasco that occurred when its brand ambassador, 48-year-old Sourav Ganguly, President of the Board of Control for Cricket in India (BCCI) and former captain of men's National Cricket Team, suffered a heart attack. It was a tough situation for the company as a whole and for the Fortune branding team in particular, as the oil brand had positioned itself as a healthy oil for the 40-plus age group. The brand manager had to take quick action to control the damage caused by the incident.

"Legends rise higher and stronger with every fall. Dada's legend is infallible. Think-out-of-box with a whole new take on advertising with beating odds and rise and shine. Being together and supportive in toughest times is the best way to articulate the strongest bonds you have."[1]

– Harshavardhan Chauhaan, VP, Marketing and Omnichannel, Spencer's Retail & Nature's Basket, January, 2021

"Oil is at the center of Indian cooking. Out of the many oils available to us, rice bran is accepted to be the healthier choice for the heart. Several national and international health organisations agree."

– Angshu Mallick (Mallick), Deputy Chief Executive, Adani Wilmar Limited January, 2021

INTRODUCTION

On January 2, 2021, Sourav Ganguly (Ganguly), President of the Board of Control for Cricket in India (BCCI) and the former Indian men's national cricket team captain[2], complained of chest pain during his regular workout session at around 11 a.m. at his home in Kolkata, India, and was rushed to the city-based Woodlands Hospital by his family. Doctors attending on him reported that he had suffered a mild heart attack and had to undergo angioplasty. The news came as a shock to cricket fans as he was just 48 years old, and was known to maintain a healthy lifestyle.

Ganguly was also the brand ambassador of various brands including Fortune Rice Bran Health Oil, promoted by Adani Wilmar Limited (AWL). The brand positioned itself as a healthy oil for the 40 plus age group. Ganguly's heart attack set off a huge storm in the social media. AWL came under sharp criticism from all parts of the country after its brand

Paridhan: Patanjali's Foray into Branded Apparel

Indu Perepu and Benudhar Sahu***

The case is about Indian consumer goods company Patanjali Ayurved Limited's foray into the apparel industry with the launch of its fashion arm, Patanjali Paridhan. The philosophy behind the launch of Paridhan was to leverage the brand value of Patanjali to provide a range of world class apparel for Indians. Targeting men and women across age groups, Paridhan offered denim, casual, ethnic, and formal clothes under the brands Livefit, Aastha, and Sanskar. With the aim of promoting the Indian traditional textile industry, Patanjali Paridhan focused on the concept of 'Swadeshi' or Indianness. To promote Paridhan, the company initiated an ad campaign that aimed at creating a movement toward embracing 'Swadeshi' fashion. Paridhan planned to make the apparel range available on e-commerce platforms, multi-brand outlets and the shop-in-shop stores, and also distribute through unorganized retailers across the country.

INTRODUCTION

On November 5, 2018, Indian consumer goods company Patanjali Ayurved Limited (Patanjali) forayed into the apparel segment through its fashion arm, Patanjali Paridhan (Paridhan). Under Paridhan, the company offered products such as jeans, yogawear, sportswear, clothes for men, women and kids, accessories, and footwear. After disrupting the fast-moving consumer goods (FMCG) sector which it had entered with the launch of Patanjali Ayurved Limited in 2006, Patanjali was looking at making an impact on the apparel market in the country with its Paridhan brand. According to the company, the objectives behind the launch of Paridhan were to promote 'Swadeshi' (Made in India) clothing, bring Indian dressing into vogue, and increase the company's appeal among the youth. Much like its other product offerings, Patanjali emphasized Indianness in its foray into the fashion segment. The brand wanted to bring Indian fashion fabrics and styles back into everyday life. "*At the Patanjali Paridhan store, we made a blend of Indian cultural traditions, handicraft and weaving while considering modern trends with product categories that are affordably priced,*"[1] said KN Singh (Singh), CEO, Patanjali Paridhan.

However, observers said it would not be a smooth ride for Patanjali in the fast-growing Indian apparel market, where both domestic and global brands competed with numerous unbranded clothing suppliers. The challenge for Paridhan was to bring alive the feeling of Indianness as it intended to and balancing it with the demands of the youth who preferred Western wear and international brands. Against this backdrop, it remained to be seen whether Paridhan's wide range of products from jeans to ethnic wear, competitive prices coupled with attractive campaigns with a Swadeshi twist, would help it make a mark in the branded apparel sector in the country.

BACKGROUND

Patanjali was founded in 2006 by Yoga teacher Baba Ramdev (Ramdev) and Acharya Balkrishna (Balkrishna) with the objective of establishing the science of Ayurveda, which

Reckitt Benckiser's Dettol Co-Created with Moms

Jitesh Nair and Bitra Vasudev***

The case study throws light on the new and innovative product development and marketing strategies adopted by Reckitt Benckiser India (RB India) to increase the market share of its flagship brand, Dettol, in the Indian personal care products market. The case study takes a look at the history of brand Dettol, its introduction in India in 1933, and its gradual acceptance by Indians who until then had used naturally available spices and herbs as germicides and disinfectants. Next, the case study talks about the need for a new product category and the marketing research conducted by RB India, which led to its co-creating a product range with the contemporary, well-placed, millennial Indian mother. The case also details the innovative marketing campaign executed by RB India for the new 'Dettol Co-Created With Moms' range of soaps and liquid handwash.

"Whenever we have stepped out of the Dettol bottle (personal care segment) there have always been apprehensions. As long as the offering manages to live up to the core promise, the job is more of opening people's minds."[1]

– Chander M Sethi, Senior Vice President (SVP) South East Asia, Reckitt Benckiser, in 2013

"Dettol has always created products with consumer needs at heart. For us, it was an obvious next step to create an offering that caters to the requirements of a new set of parents. As consumers evolve, it is important for brands to also evolve to remain relevant, without losing their core."[2]

– Pankaj Duhan, Chief Marketing Officer, RB South Asia Health, in 2019

"For this new product, we went ahead of the curve and directly engaged with mothers to understand what they want in a product. This range has been co-created with moms to give them exactly what they want."[3]

– Pankaj Duhan, Chief Marketing Officer, RB South Asia Health, in 2019

INTRODUCTION

Reckitt Benckiser (India) Ltd. (RB India), a well-established player in the Indian personal care and antiseptics market, launched the 'Dettol Co-Created with Moms' range in mid-2019 to increase its share in India's soap market. The product range was exclusively targeted at

Swiggy's 'Voice of Hunger' Instagram Campaign

Jitesh Nair and Bitra Vasudev***

The case study is about the social media marketing campaign, #SwiggyVoiceofHunger. The campaign was conceptualized by Swiggy – the biggest on-demand food delivery platform in India, and Dentsu Webchutney – a Gurugram-based online advertising agency. The case study provides details of the campaign objectives to make brand Swiggy the preferred food delivery platform among the millennials (its key target consumers), increase the number of Swiggy's Instagram followers, and engage consumers through a memorable experience. The case study also explains the conceptualization of the campaign by Dentsu Webchutney.

"There are very few things for a marketer that match the thrill of a properly executed User Generated Content (UGC) campaign. We're hoping this hits the right chords, literally. By innovating with the voice note feature on Instagram, we're excited to offer our audience a creative way of interacting with Swiggy and expressing their love for food, winning a year's worth of food vouchers in the process."

– Ashish Lingamneni, Assistant Vice President (AVP), Swiggy, in February 2019

"Within half an hour of actually rolling out the challenge, which was the #VoiceOfHunger challenge, we got at least 500 entries. That's when we realized we have something big on our hands"

– Srivats TS, Vice President of Marketing, Swiggy, in April 2019

INTRODUCTION

In February 2019, Swiggy, the biggest on-demand food delivery platform in India, launched a marketing campaign on Instagram called #SwiggyVoiceofHunger. The campaign's primary aim was to make brand Swiggy the preferred food delivery platform among millennials (its key target consumers), increasing the number of Swiggy's Instagram followers, and engaging consumers through a memorable experience. Interestingly, the campaign was not based on photo sharing, the primary feature and functionality of Instagram, but on voice note, an ancillary feature of the platform's direct message tool. (Refer to Exhibit I for a brief note on the voice note feature of Instagram). The campaign turned out to be a smash hit in terms of attracting new millennial Instagram followers, increasing sales, and consumer engagement. Following the campaign, Swiggy registered a 40% increase in the number of Instagram followers with nearly 40,000 of them belonging to the millennial cohort. The campaign also won several awards for marketing excellence including the 2019 Cannes Silver Lion award for User Generated Content and Co-creation in the 'Direct' category.

ENGAGING WITH MILLENNIALS THROUGH INSTAGRAM

As of 2019, Swiggy was valued at US$3.3 billion, had 120,000 delivery staff across over 100 cities, registered 30 million orders per month, and was the gold-standard for online food delivery businesses in India. However, the company faced stiff competition, primarily from

Tanishq Ad Controversy: Need to Deal Cautiously with Social Issues

V Namratha Prasad and Koti Vinod Babu***

The case talks about the backlash resulting from the airing of an ad by Indian jewelry brand Tanishq, which sought to showcase religious harmony in India but ended up exposing the country's bitter religious divide. Tanishq, a division of Titan Company Limited – a subsidiary of the large Indian conglomerate, The Tata Group – released the ad in different Indian media channels for its new collection called 'Ekatvam' – which means 'oneness'. The case starts out by mentioning the reasons for Tanishq coming up with that particular ad. It then goes on to describe the key points on which the ad was criticized by several sections of society. It also provides the views of certain sections of society who lauded the ad for its message of religious unity. The hullabaloo around the ad led to Tanishq's withdrawing it within three days of its being aired.

"We didn't set out to do audacious things, we set out to do correct things, things happening around us and this is normal reality. A mother-in-law taking care of the daughter-in-law is the reality."[1]

– Amit Akali, Managing Partner and Creative Head of 'What's Your Problem' Ad Agency[2], in October 2020

On October 9, 2020, Tanishq, an Indian jewelry brand and a division of Titan Company Limited[3] (Titan), a subsidiary of the large Indian conglomerate The Tata Group[4] (Tata), released an advertisement on different Indian media channels. The ad released in various Indian languages was for its new jewelry collection called 'Ekatvam' – which meant 'oneness' in Sanskrit. The jewelry brand had tied up with 1,000 craftsmen across 15 cultures of India to launch the Ekatvam collection.

The 45-second ad showed an affluent Indian Muslim family making preparation at home for a traditional Hindu baby shower ceremony[5] (also referred to as Godh Bharai, Sreemantham, or Valaikaapu) for their pregnant Hindu daughter-in-law. Traditionally, during the ceremony, sandalwood is applied on the expecting mothers' hands and faces; they are given gold

Bacardi's Tryst with Experiential Marketing to Woo Indian Millennials

V Namratha Prasad and Koti Vinod Babu***

The case discusses the nuances of the experiential marketing strategy adopted by one of the leading Indian alcohol beverages company, Bacardi India Private Limited (Bacardi), to attract millennials. As alcohol advertising in India was prohibited, Bacardi resorted to an experiential marketing strategy centered on music. Bacardi's experiential marketing strategy enabled it to overcome the advertising restrictions and create a strong brand identity. Will Bacardi's association with music enable it to keep attracting the coming generations?

"Right from advertisements to experiences, brands are aggressively innovating to tap into passion points or emotions, beyond conventional product or campaign extensions. With the evolving eco-system, we want to be front and center at the heart of the "moments that matter" to the consumer. As a company, we are constantly innovating to create platforms, occasions and immersive experiences rooted in culture."[1]

– Anshuman Goenka, the Head of Marketing for BacardiIndia Private Ltd., November 2019

In India, alcohol beverage companies had a difficult task in marketing themselves, given the long-standing ban on advertising liquor products. While countries like the US, the UK, and Australia allowed alcohol advertising with certain restrictions, it was completely forbidden in India. The Press Council of India (PCI)[2] strictly barred any advertisement that *"promotes directly or indirectly production, sale or consumption of cigarettes, tobacco products, wine, alcohol, liquor and other39 intoxicants"*.[3] A similar code was set under the Cable Television Networks (Regulation) Act of 1995[4].

The tough media-related rules led Indian alcohol beverage companies to resort to surrogate advertising[5], wherein music CDs, packaged drinking water, and other items were advertised

Burger King's Satisfries: The Failed French Fry

Syeda Maseeha Qumer and Benudhar Sahu***

Burger King failed to attract nutrition-conscious diners through Satisfries, a lower-calorie, healthier version of its French fries, with the result that the company withdrew the product from two-thirds of its restaurants. The failure of Satisfries was a major blow to the global fast food giant which was struggling to provide better dining experiences to customers by serving healthy fast food at its restaurants. Burger King introduced the lower-calorie fries with the objective of attracting more health-conscious consumers and boosting its health-friendly image among the fast food giants in the world. But critics questioned its claim about offering fewer calories and a healthier fast food option than its rivals. The product also failed to satisfy consumers who were not clear about the advantages of Satisfries, compared to the company's regular fries. Moreover, its overpricing, weak brand positioning, bad marketing decision, wrong social media advertisements, and lack of product differentiation, among others, resulted in the failure of Satisfries.

In August 2014, Burger King Worldwide Inc. (Burger King) dropped 'Satisfries', the low fat French fries which it had introduced less than a year earlier, from the menus of about two-thirds of its restaurants across the US and Canada. The move was attributed to poor sales and failure on the part of the fast food giant to convince customers that Satisfries were a healthier option than regular fries. According to Drew Kerr, President and CEO of Four Corners Communications, Inc.[1], "People who consider themselves in good or excellent health have not been radically moved by Burger King's efforts and in the long run, it was unable to sustain itself with this demo."[2]

Founded in 1954, Burger King was the second-largest fast food hamburger chain in the world after McDonald's Corporation[3] (McDonald's) as of 2015. Over the years, it had expanded its menu from a basic offering of burgers, French fries, sodas, and milkshakes to a larger, more diverse set of product offerings such as the Whopper, salads, wraps, and desserts. As of 2015, Burger King had about 14,000 outlets in over 100 countries.

In September 2013, Burger King forayed into the lower-calorie fast food segment and launched Satisfries, a low calorie version of French fries ***(See Exhibit I)***. The company reportedly spent two years developing the product in association with its regular fries supplier, McCain Foods Limited[4]. The idea was to attract health conscious customers by providing a tasty alternative to regular fries while scaling back on the calories. According to the company, Satisfries had 30% fewer calories and 40% less fat than the traditional French

Dabur's Foray into Ready-to-Drink Ethnic Beverages Category

Amar Raju G and Syeda Maseeha Qumer***

The case discusses the entry of Indian FMCG giant Dabur India Ltd (Dabur) into the ready-to-drink beverage category with the launch of Hajmola Yoodley (Yoodley), an ethnic drinks range. Yoodley is an extension of Dabur's popular digestive brand Hajmola into the fast growing ethnic beverages category in India. Yoodley is an example of Dabur's continued focus on innovation to drive strong growth. The case discusses the rationale behind the launch of Yoodley, product attributes, and competition in the ethnic beverages category. It concludes by discussing whether Yoodley would be able to make a dent in the crowded beverages market in India and give its competitors a run for their money.

On July 27, 2015, Indian Fast-Moving Consumer Goods (FMCG) giant Dabur India Ltd (Dabur) extended its popular digestive brand Hajmola into the growing ready-to-drink beverage category[i] with the launch of Hajmola Yoodley (Yoodley). Priced at Rs.30 ($0.45) for a 250ml pack, Yoodley, an ethnic drinks range, was available in six flavors[ii] – Ajooba Aam Panna (green mango drink), Nimboora Shikanji (a spicy lemon drink), Guava No.1 (guava flavor), Jazbaati Jaljeera (a digestive cumin drink), Golmaal Golgappa (Indian water ball), and Kabhi Kala Kabhi Khatta (a tangy blackberry drink). According to Sanjay Singal (Singal), Marketing Head, Foods, Dabur India, "Innovation has always been an essential part of our business strategy and our vision. From its birth as a digestive tablet in the 1970s, brand Hajmola was later extended to the candy market. The previous year saw the brand strengthening its presence in the Confectionery space with the launch of Hajmola Chuzkara. Hajmola Yoodley is the latest example of Dabur's continued focus on innovation to drive strong growth. The product, with its amazing taste and bold communication, would stand out in the ready-to-drink beverage category."[iii]

According to experts, the market for ready-to-drink ethnic beverages in India was a niche one. Moreover, Yoodley faced competition from already established players in the market such as the Paper Boat[1] brand of ethnic drinks. Analysts felt that Yoodley as a new product needed to generate adequate demand to be successful in the ready-to-drink beverages category as customers were spoilt for choice in this category.

DABUR INDIA

The parent company of Hajmola, Dabur, was a leading consumer goods company in India with a turnover of Rs.78.064 billion in 2015.[iv] From its humble beginnings in 1884 as an Ayurvedic[2] medicines company, the 130-year-old company had come a long way to become one of the biggest Indian-owned consumer goods companies with the largest herbal and

Parle Must Get the Marketing Mix Right for Rol-a-Cola 2.0

Sanjib Dutta and Anil Anirudhan***

The case is about the relaunch of the Rol-a-Cola candy of Parle Products Private Limited (Parle) in India. Rol-a-Cola candy was taken off the shelves in 2006 due to product rationalization. The case deals with the circumstances behind the re-launch of the Rol-a-Cola brand in 2019 due to demand from consumers who wanted the brand back in the market. Aided by digital media, Parle embarked on an advertising campaign on social media and re-launched the Rol-a-Cola brand in the market. The case next dwells on the state of the confectionery market in India and the various competitors of Parle. Digital media was used for the promotion and advertising of the Rol-a-Cola brand. The strong distribution network of Parle and the company's low-cost pricing strategy along with its advertising strategy on digital media garnered sales for the Rol-a-Cola brand across the country. The question was whether the momentum would last and bring in profits for Parle.

"Old memories always induce nostalgia. Parle cashed in on nation's craze for Coca-Cola and the nostalgic value of brand Poppins. It devised Rola Cola – a cross of both – the taste of Coca-Cola in the form of Poppins".[1]

– Prahlad Kakkar, Advertisement Professional, India, October 6, 2019

"While a tweet created a disruption in the market for a comeback of the iconic Rol.a.Cola candy, we connected with the emotions to honor consumers demand. Earlier, consumers had no platform in which they could voice their opinions and concerns. Now, they can simply reach out to a brand they like and let them know what they think."[2]

– B Krishna Rao, Senior Category Head, Parle, India, October 6, 2019

INTRODUCTION

In February 2019, a Twitter user from Kerala posted a picture with the tweet *"Dear PARLE. Bring this back"*. The tweet urged Parle Products Private Limited (Parle) to bring back Rol-a-Cola, a cola-flavored candy the production and sales of which it had discontinued in 2006. Even though the product had been taken off the shelves in India due to product rationalization, Parle continued to sell it in international markets such as Africa and West Asia.

Following 10,000 retweets for the recall of Rol-a-Cola in a month, Parle decided to bring back the iconic brand. As of October 2, 2019, the #BringRolaColaBack campaign had secured more than 0.7 million impressions on Twitter. B Krishna Rao (Krishna Rao), Senior

Amul Forays into Carbonated Drinks Market

Syeda Maseeha Qumer and Syeda Ikrama***

The caselet discusses home grown dairy brand Amul's foray into the carbonated drinks space in India with the launch of a fizzy fruit-based dairy drink 'Tru Seltzer' in October 2020. Said to be India's first seltzer, Amul Tru Seltzer was available in two flavors — lemon and orange – and was affordably priced at just Rs.15 for a 200ml PET bottle. The drink was targeted at the health-conscious younger generation. Given Amul's maiden foray into the carbonated beverages segment with Tru Seltzer, it was expected to face some challenges such as tough competition from big players in the Indian carbonated drinks space, defining the category as seltzers were still not a distinct category in the Indian beverages market, and scaling up the brand.

INTRODUCTION

In October 2020, in a major product diversification, India's leading home-grown dairy brand Amul entered the carbonated drinks space in India with the launch of 'Tru Seltzer', said to be India's first seltzer[1]. Marketed as a healthy beverage, Tru Seltzer was a mix of real fruit concentrate, milk solids, and fizz. According to the company, *"There has not been much innovation in this category. Consumers are also moving away from sugary beverages that only contain water, sugar & fizz. Amul researched deep into this category and figured that Seltzer which originated more than 300 years ago has never been explored in India,"*[i] the Gujarat Cooperative Milk Marketing Federation (GCMMF), which marketed Amul products, stated.

However, some analysts felt that Amul's foray into the carbonated drinks segment with a seltzer could be risky as it might not appeal to health-conscious consumers and to Indian palates. Also, seltzers were still not a distinct category in the Indian beverages market and the challenge was for it to create a space for itself, they said. *"With Amul's legacy, distribution network, and advertising campaigns, achieving brand salience will be a cakewalk. But can the brand climb further up? If so, to me new history is made. Moreover, as we all know, Seltzer as a concoction holds a legacy of a few centuries but will it fit with the Indian taste palate? I strongly believe Amul and Tru Seltzer is a brand and category misfit. Will this brand qualify to be in the category of carbonated beverage? How can a carbonated beverage be healthier?"*[ii] questioned N.S. Padmanabhan, a contributor to marketing-brains.blogspot.com.

BACKGROUND NOTE

Amul was formed as a part of a cooperative movement against Polson Dairy[2] in Anand, Gujarat[3], which procured milk from local farmers of Kaira District at very low rates and sold it to the then Bombay government. Everyone except the farmers benefited from this trade.

HDFC Life's Click2Protect Plus Advertising Campaign

Syeda Maseeha Qumer and Benudhar Sahu***

The caselet focuses on the advertising campaign launched by HDFC Life for its new term insurance plan — Click2Protect Plus. The objective of the campaign was to create awareness about the new and unique combination of features available in the Click 2 Protect Plus plan. It discusses how HDFC Life used an emotional appeal in its advertisements to explain the policy features of the plan and attract customers. The case concludes by discussing how the insurance company planned to take the campaign forward and reach a wider network.

On August 5, 2014,[1] HDFC Life, one of the leading life insurance companies in India, launched an advertising campaign to promote its new online term plan Click2Protect Plus. An extension of its flagship term plan Click2Protect, Click2Protect Plus was a traditional, non-participating pure term insurance plan that offered some additional benefits and multiple options to the customers and also allowed them to customize it as per their insurance requirement. Commenting on the new campaign, Sanjay Tripathy (Tripathy), Senior EVP – Marketing, Product, Digital & Ecommerce, HDFC Life, said, "Following the launch of HDFC Life Click2Protect Plus, our new term insurance plan, we have embarked on this new ad campaign to spread awareness about the importance of having a term plan that is flexible enough to help the buyer customize it as per his needs. For example, we understood that as life's responsibilities grow, there is a need to increase life cover too. Most term plans don't allow this, while with Click2Protect Plus, the customer has the option to increase life cover at key milestones such as marriage or the birth of a child."[2]

HDFC Life started as a joint venture between HDFC[3]and Standard Life plc[4] in the year 2010[5]. One of the premier life insurance companies in India, it provided a range of group and individual life insurance facilities related to health, pension, savings, investment, and protection. The group's insurance plans offered customers the added advantage of customizing plans by including optional benefits called riders at a nominal price. HDFC Life had 23 retail and 8 group products in its portfolio, along with 9 riders as of 2014.[6] The company's distinction in providing best services was recognized by awards and accolades, some of which were – the Finnoviti 2015 Award for innovations in the Banking, Financial

Customer Service Challenges at Rogers Communications

G V Muralidhara and Hadiya Faheem***

This case discusses the customer service challenges faced by Canadian telecommunications giant Rogers Communications (Rogers). The company had been making efforts since 2009 to tackle its customer service issues but had not met with much success in improving its relations with its customers. For a wireless communications company like Rogers, it was essential to offer excellent customer service. However, the communications giant had been neglecting its customers and this had led to its losing its wireless subscribers to other Canadian communication majors such as Telus and Bell Canada Enterprise (BCE). And that was not all. The company's reputation and brand image were also at stake. While other communication companies benefited from customer loyalty programs, Rogers did not, as is evident from customers' complaints that enrolling for Rogers' 'First Rewards' program led to their losing discounts from other services.

A 2014 survey by market research company, JD Power and Associates, revealed that Canadian telecommunications giant, Rogers Communication (Rogers), had tied with Bell Canada Enterprises (BCE) for the dubious distinction of being the company reporting the worst customer satisfaction among wireless operators in Canada. According to Guy Laurence (Laurence), CEO of Rogers, the carrier's customer service issues were the direct result of its attitude of neglecting its customers.

Rogers Communications, a Canadian communications and media company, had operations in wireless communication, digital cable television, high speed Internet, Home Phone, and Smart Home Monitoring Services. Since late 2013, the company found itself in the news for its poor customer service. The company's customer service issues came out into the open after a November 2013 report from the Commissioner for Complaints for Telecommunications Service (CCTS), an independent agency in Canada, stated that for the fiscal year 2012-2013, Rogers and BCE topped the list of telecom companies receiving complaints from wireless customers. CCTS was formed in 2007 as an independent Canadian agency to work with consumers, local telecom service providers, and small business customers to resolve complaints related to deregulated telecommunications services.

CCTS reported that complaints about Rogers were up by 32 percent year over year. The independent agency reportedly received 4,814 complaints against Rogers and its discount brands Fido, cellular telephone service provider, and Chatr, wireless service provider for entry-level consumers, for the fiscal year 2012-2013.[1]

Bata's Direct Marketing Initiatives

Jitesh Nair and Bitra Vasudev***

The case study throws light on the various direct marketing initiatives implemented by Bata India Ltd (Bata India), India's largest organized footwear retailer, to drive sales and reach out to customers during the COVID-19 pandemic, and thereby sustain business activity. Bata India decided to slow down its retail expansion amid the coronavirus pandemic in mid-2020 and strengthen its online channels for growth. It segmented customers into Digital Natives, Digital Adopters, and Digital Novices based on their proficiency in using technology and introduced direct-to-home marketing initiatives targeted at different segments, namely, 'Bata Chat Shop' and 'Bata Store-On-Wheels,' that allowed consumers to shop from the comfort and safety of their homes.

"In tandem with the ongoing market trends, Bata has shifted its focus towards driving online sales and expanding its e-commerce footprint by ramping up presence in online marketplaces, rolling its omnichannel home delivery offerings through 900+ stores, increasing its pan-India footprints in order to meet customer demands."[1]

– Sandeep Kataria, President/CEO, Bata India Ltd, in June 2020

"With consumers shopping remotely, we are seeing an increase in our online sales. We believe the trend will continue for the festive season as well."[2]

– Anand Narang, VP Marketing, Bata India Ltd, in October 2020

INTRODUCTION

Bata India Ltd. (Bata India) earned a profit of INR573 million in the first three months of 2020, a dramatic fall compared to the Rs.1,052 million profit earned in the first three months of 2019. The fall in profit was primarily due to the Covid-19 pandemic that resulted in lockdowns across the world and a significant reduction in business activity.[3] Bata India introduced several initiatives to drive sales and reach out to customers following the country-wide lockdown.

Bata India, India's largest organized footwear retailer, was a pioneer in organized footwear retail in the country. Established in 1931, the company operated as a subsidiary of Switzerland-based Bata Shoe Organization (BSO). As of 2020, the company sold a wide

Britannia's Rural Market Push

Jitesh Nair and Bitra Vasudev***

The case study describes the product and distribution strategies of Britannia Industries Limited (Britannia) to strengthen its presence in rural India. This helped Britannia achieve a 21.5% year-on-year revenue growth even as other FMCG companies were registering sluggish growth during the COVID-19 pandemic. Britannia's growth was attributed to its strong presence in the rural markets, which were not as adversely impacted as the urban markets by the COVID-19 pandemic. The case begins with the origins of Britannia's rural push, followed by the product strategy applied by its Managing Director, Varun Berry (Varun), for the rural markets in which appropriately priced and packaged Lower Unit Packs (LUPs) of both basic and premium products were offered. Next, the case focuses on the distribution strategies applied by Britannia, including the direct distribution and zero-day inventory models that ensured efficient and cost-effective delivery of its products. The case ends with a note on the future investment plans of Britannia to further deepen its distribution network in rural areas, launch vitamin-rich and immunity-boosting products, expand its dairy offerings and establish new production units.

"Britannia has vacated valuable market share in the space of lower end offerings. In biscuit play, one needs to have a wide presence that not only gets you the margins, but the volumes as well. Britannia needs to get back to looking at a dominant market-share game-play as well."[1]

– Harish Bijoor, Founder, Harish Bijoor Consults Inc., in December, 2013

"Increased MNREGA spends, reverse migration and with the monsoons headed in the right direction, there has been in a surge in rural consumption. Building distribution in rural India was a priority and that's what we have been doing in the last 7-8 years. That has significantly helped us."[2]

– Varun Berry, Managing Director, Britannia Industries Limited, in August, 2020

INTRODUCTION

Britannia Industries Limited (Britannia), one of the leading Fast Moving Consumer Goods (FMCG) companies in India, posted a 26.7% growth in revenue, 105.4% growth in PAT[3], and 81.7% growth in EBITDA[4] in the first quarter of FY2020-21.[5] The revenues increased by 21.5% year-on-year. Britannia's stupendous growth amidst unprecedented economic and

'Ek Kadam Unnati Ki Aur' (EKUKA): Intel's Initiative to Boost Digitization in Rural India

Syeda Maseeha Qumer and Benudhar Sahu***

This caselet is about Intel's campaign to augment rural digitization in India. Under the initiative, Intel joined hands with the national and state governments to work out a blueprint for a government-sponsored digital program in rural India. It started the program under the banner of 'Digital India' drive of the government which aimed at empowering rural citizens to change their lives through the adoption of technology. Further, Intel partnered with ecosystem players and undertook multiple initiatives to create a wider platform for realizing the 'Digital India' vision of the government.

INTRODUCTION

On November 18, 2015,[1] the Indian arm of technology giant Intel Corporation (Intel) launched the 'Ek Kadam Unnati Ki Aur' (One step toward progress) (EKUKA) initiative in association with the national and regional governments to usher in digital literacy in rural India. Under EKUKA, Intel set up Unnati Kendras at select Common Service Centers[2] across eleven states in India where it introduced and trained the citizens on how to use a computer to transform their lives. The program aimed to empower non-urban citizens through technology enabled transformation measures at the grass-root level. Commenting on the strategy behind the campaign, Sandeep Aurora (Aurora), Director, Marketing and Market Development Head, South Asia, Intel, said, *"We looked at the data points and we realised that PC penetration in India is still low. It is at 10-11%, compared to other countries like Brazil, Russia, US and China which are in the range of 50-70%. This is actually pulling India back from its own competitive standpoint in the market. We decided to find out the reasons behind this low penetration. We realised that, fundamentally a lot of people say I want a PC, but they don't know when they want it. Or probably they think they need one for their business, but consider it very difficult for use. The question of relevance comes to the consumer's mind. To address this issue that PC is not an expense but an integral part of their life, we have launched our new campaign."*[3]

Founded in 1968, Intel was an American multinational technology company which manufactured one of the largest and highest valued semiconductor computer circuits in the world. Being a leader in computer innovation, the company designed essential technologies such as motherboards, processors, server products, wireless, consumer electronics, and solid state drivers which supported the world's computing devices. In addition, the company produced Personal Computers and Devices, Mini PCs, Wearables, etc. Fueled by innovative

Evolution of the Barbie Brand: Mattel's 'Imagine the Possibilities' Campaign

Indu Perepu and Shwetha Kumari***

The case talks about US-based toy manufacturer Mattel Inc.'s (Mattel's) campaign of 2015 to address the problem of falling sales that its flagship brand Barbie was experiencing. The campaign aimed to revamp the popularity of Barbie among its target audience and to promote a positive message about the Barbie doll. The case starts out by providing details about the company and the products it sold other than Barbie dolls. It then documents the rise of Barbie dolls and the advertisements launched by Mattel to influence the target audience, which included school-going girls, pre-teens, and teenagers. The case describes the fall of Barbie due to growing criticism and tough competition from various brands like Bratz dolls and Disney's popular Frozen line. It then discusses the newly launched campaign and provides insights from experts on whether the new campaign will be able to change the perception about the doll and help Mattel revive its fortunes.

"We want to remind the world what Barbie stands for. Founded by a female entrepreneur and mother in 1959, the Barbie brand has always represented the fact that women have choices. This ongoing initiative is designed to remind today's parents that through the power of imagination, Barbie allows girls to explore their limitless potential."[1]

– Evelyn Mazzocco, General Manager, Barbie, 2015

US-based Mattel Inc. (Mattel), the world's largest toy company as of 2016, was founded in 1945 by Elliot and Ruth Handler (Ruth). As of 2016, the company designed, manufactured, marketed, and distributed a large variety of toys in 150 nations. The Mattel family comprised best-selling products such as Barbie[2], the most popular fashion doll ever produced; Hot Wheels, car and race games; Monster High which included products such as toys, play sets, video games, and TV Specials; American Girl – 18 inch dolls of various ethnicities; Thomas & Friends, a remote control toy train; and the Fisher-Price brand for infants and children, including Little People and Power Wheels. Mattel also produced a wide range of entertainment inspired toy lines based on various characters from Disney and Sesame Street and games such as Scrabble and UNO.

Barbie, Mattel's flagship product, had been a leader in the toy industry ever since it was introduced in 1959 as a teenage fashion model doll. The idea for creating the doll originated when Ruth saw her daughter showing a preference for playing with adult-looking dolls rather than baby dolls. The Handlers then started designing teenage dolls. The doll became popular when it was showcased at the New York Toy Fair in 1959. Mattel quickly launched official fan clubs for Barbie across the United States and these clubs had a total membership of about 1.5 million by 1968. Apart from the doll, Mattel also sold clothes and accessories for Barbie.

Flipkart - Making Online Shopping Affordable for Tier II Shoppers

Jitesh Nair and Bitra Vasudev***

The case briefly describes Flipkart's long-term business strategy to become a value player in the Tier-II and III cities of India. The case delves specifically into the various credit products offered by the e-tailer to attract more buyers from Tier-II cities to its e-commerce platform. These include partnerships with a number of large banks to offer equated monthly installments (EMIs) on debit cards, zero interest or no cost EMIs, and payment options through Paytm to buyers. The case also focuses on certain strategic moves by Flipkart to improve affordability and convenience for small town shoppers, including launching 'Flipkart Pay Later' and applying for a non-banking financial company (NBFC) license. The case ends with a look at Flipkart's continuing efforts to scale up the GMV (gross merchandise value), bring more medium and micro, small and medium enterprises (MSMEs) onto its platform, and focus on video commerce aimed at consumers from small towns and lower-income groups.

"We have been focussing on Tier 2 business but it has become more intense now. We want to be a value player focussed on Tier 2 locations"[1]

– Rajneesh Kumar, Chief Corporate Affairs Officer, Flipkart, in 2020

"We have expanded our partnerships and have launched a simpler way to avail credit for first-time and Tier-II shoppers."[2]

– Smrithi Ravichandran, Business Head-Payments, Flipkart, in October 2020

INTRODUCTION

In 2018, Walmart Inc. (Walmart), the US-based retail giant, acquired a controllable stake in Bengaluru, India- based e-commerce company Flipkart for US$16 billion. Launched in 2007, Flipkart had grown exponentially to become one of India's largest e-commerce companies. Its inventory included more than 80 million products across 80 categories, including books, clothes, home & kitchen appliances, footwear, mobiles, laptops, and baby care. About 100 million registered users and 100 thousand sellers transacted on the e-commerce platform.[3]

Post the acquisition by Walmart, Flipkart decided to focus on Tier-II cities of India and, as part of its long-term business strategy in the country, shift its proposition from efficiencies in delivery to becoming a value player. The company was of the view that this differentiator would work in its favor and help to grow its business further. Another reason for the shift in

HUL's Mobile Marketing Campaign: Kan Khajura Tesan

Syeda Maseeha Qumer and Benudhar Sahu***

The caselet is about an innovative marketing campaign launched by HUL in 2013 to provide entertainment to the people living in the media dark remote rural areas of India and to advertise the company's products through entertainment channels on the mobile platform. 'Give us a missed call and get free entertainment' was the promotional message of the campaign. The campaign was a win-win strategy for both consumers and the company. The people benefitted from the mobile entertainment, while the company gained a lot in terms of mobilizing potential consumers and running a massive awareness drive for its brand products.

In 2015, 'Kan Khajura Tesan'[1] (earworm radio channel) (KKT), a campaign launched by FMCG[2] giant Hindustan Unilever Limited (HUL) in India, was adjudged as the best marketing campaign globally by global marketing intelligence service Warc 100[3,4]. The aim of the mobile marketing campaign launched in 2013 was to deliver a free radio-on-demand service to people in remote rural areas and to advertise HUL products through entertainment channels on the mobile platform. The channel became so popular that it attracted 12 million subscribers in less than 10 months of its launch. These included 1 million unique callers per month.[5]

The mobile marketing initiative of KKT stemmed from a 'missed call' campaign conducted by HUL in 2012 for the promotion of Wheel detergent. The company planned to popularize its branded products through telephonic entertainment in remote areas. Some analysts observed that reaching out to people in remote areas through mobile networking would be a great opportunity for HUL in terms of its business promotion and expansion. The campaign used All India Radio (AIR) to invite people to call a certain number and hang up. The company would then call them back to confirm their participation besides providing them 18 minutes of free entertainment consisting of local music, jokes, dialogues, educative information, and HUL advertisements *(See **Exhibit I**)*. A Radio Jockey would host the show.

In 2013, the pilot KKT campaign was started in Bihar and then expanded to other states such as Jharkhand, Madhya Pradesh, Uttar Pradesh, and Rajasthan. The promotional message –

KFC's Digital Marketing Campaigns

Sanjib Dutta and Smita Ray***

The case talks about the digital marketing campaigns launched by KFC India to reinforce the connection between the brand and its customers in India. The campaigns also helped KFC to engage with its customers. The case touches upon the use of social media by KFC India to run the campaigns. It also describes the benefits KFC India accrued from the use of digital channels to reach out to its customers.

"Music is a huge youth passion and Radio KFC, our newly launched music platform, looks to provide amateur artists a launch pad to showcase their talent. We believe that everyone has an artist within, and the Radio KFC RJ hunt is the first in a series of initiatives to give that artist a chance to shine. We look forward to receiving some great entries."[1]

– Tarun Lal, General Manager, KFC India & Area Countries, in 2012

INTRODUCTION

In July 2020, the Indian arm of Kentucky Fried Chicken (KFC), the US based fast food restaurant chain, launched an engagement campaign on the occasion of Fried Chicken Day (July 6) through social platforms like Facebook, YouTube, Twitter, and Instagram. The campaign was aimed at reinforcing the connection between brand KFC and its consumers. It also aimed to remind the consumers about their love for food. As part of the campaign, the company organized a contest, in which fans were encouraged to express their love for chicken through creative memes, songs, quotes, poems, stickers, etc. They were also allowed to add different Bollywood[2] songs to their comments. Fried Chicken Day had always been a special day for the company to celebrate with its consumers. But due to the extended lockdown period during COVID -19, KFC India focused more on the use of social media platforms and offered an opportunity to its fans to come forward and confess their love for Fried Chicken in a unique and interesting manner. As a result, by the end of August 2020, the company had received more than 700 confessions of love from followers across Facebook, Instagram, and Twitter. KFC India also reached more than 1.3 million fried chicken fans.[3]

LAUNCH OF SUCCESSIVE DIGITAL MARKETING CAMPAIGNS

In August 2012, KFC India launched the 'Design your own bucket' campaign to launch a new tagline 'So Good' KFC *(Refer to **Figure 1** for Design your own bucket' campaign)*. This campaign was designed by Blink Solutions[4]. To execute the campaign, KFC created a Facebook app named Design Your Own Bucket App. In this campaign, the company

Mondelez India's AI-Powered Hyper-Personalized Ad Campaign

Jitesh Nair and Bitra Vasudev***

The case study describes the hyper-personalized, artificial intelligence-based campaign of Mondelez India, launched during the 2020 Diwali festival. Through the campaign, Mondelez India took its 'generosity' brand proposition to the next level by promoting over 1,800 local, small businesses for free. The digital campaigns were carried out through 'Not Just a Cadbury Ad, but the Most Generous Ad' and the '#TheSweetestDiwali' social media campaign that promoted Cadbury Celebrations gift box containing Cadbury Dairy Milk chocolates. The campaign underscored Mondelez India's 'Kuch Achha Ho Jaye, Kuch Meetha Ho Jaye' (Let something good happen, let something sweet happen) brand proposition introduced in 2018.

"The advertisement leverages Artificial Intelligence and is possibly India's first hyper-personalized ad. We are certain that this will help in instilling a better recall for local sellers and cascade into action once people start visiting and purchasing from them, and an even stronger consumer connect for the brand through a new level of personalized engagement within the digital realm."[1]

– Anil Vishwanathan, Senior Director, Marketing (Chocolates), Mondelez International, in November 2020

"The Cadbury's brand has taken the idea of togetherness to a different level by involving and doing something meaningful for a segment of society that has been badly impacted by Covid - the local neighbourhood retailers. It has played the role of a truly responsible, inclusive brand that believes growth is sustainable when the eco system grows together."[2]

– Ronita Mitra, Founder and Chief Strategist, Brand Eagle Consulting, in November 2020

"I have always said that just using data to increase reach is not good enough. It builds no affinity, no connect, no nothing. It's a mere transaction and brands have to be more than just mere transaction. Technology enables us to connect better. Hence we must use technology to tell better, engaging stories."[3]

– Sukesh Nayak, Chief Creative Officer, Ogilvy India, in November 2020

INTRODUCTION

Mondelez India, the Indian business arm of Mondelez International Inc, a US-based confectionery, food, beverage, and snack food multinational, launched a marketing campaign 'Iss Diwali Aap #KiseKhushKarenge?' (Who do you plan to bring joy to this Diwali?) in

Zenoti's AI-Driven Smart Marketing Tool

Jitesh Nair and Bitra Vasudev***

The case study describes the entrepreneurial journey of Zenoti, a US and India-based software company that offered an all-in-one cloud-based software solution for the wellness industry, including spas and salons. The case touches upon how the new software solution helped Zenoti's subscribers simplify both their front office operations (including customer service, marketing, and sales) and back office operations (including record maintenance, quality compliance, billing and payments, and customer feedback). This helped the wellness center to focus exclusively on offering superior customer experience.

"In an industry where customer loyalty defines the success of the business, engaging customers between visits is crucial. We developed Zenoti Smart Marketing in response to the key challenges that salon and spa managers face in driving customer loyalty, retention and even spend."[1]

– Sudheer Koneru, Co-Founder & CEO, Zenoti, in 2019

"Smart Marketing harnesses the power of automation and machine learning to more effectively manage the cadence of marketing emails and send personalized communications at scale, resulting in marked performance improvement and revenue growth."[2]

– Saritha Katikaneni, Co-Founder & Former VP Marketing, Zenoti, in 2018

INTRODUCTION

Zenoti, a software company based in Bellevue, Washington, the US, and Hyderabad, India, engaged in offering an all-inclusive cloud-based software solution for spas, salons, and medical spas[3], surpassed $1 billion in valuation in 2020 after it raised $160 million in a 'Series D' funding round[4] in December. The round of funding was led by Advent International, a multinational private equity firm; Tiger Global, a global investment firm; and Steadview Capital Management, an asset management company. As of 2020, the company's software was being used by over 12,000 spas and salons in 50 countries across the world. The same year, the company claimed that it had registered a 100 percent year-on-year growth.[5] Sixty percent of Zenoti's revenues in 2020 came from the US, 15-20 percent from

Paper Boat: Riding on the Tide of Nostalgia

Indu Perepu and Medha Chintala***

After a couple of attempts at penetrating the Indian beverages market with their energy drinks, Frissia and Tzinga, proved unsuccessful, the four founders of India-based Hector Beverages Pvt. Ltd. knew they had to overhaul their strategy. In 2013, they launched Paper Boat – a brand that represented a wide range of ethnic Indian drinks. The brand was priced to represent a premium product and was positioned as a drink that stood for hygiene with a blend of nostalgia. The ethnic flavors and appeal of Paper Boat quickly captured the Indian customers' attention and also attracted support from investors. With the addition of a wide variety of juices and flavors, tie-ups with major Indian restaurants, airlines, and railways and collaboration with a Japanese firm for deeper distribution, the sales grew rapidly.

"There will be lot of hurdles when you start. You need to be extremely convinced about your idea. Look at the problems a consumer is facing and their needs. If you try to solve them and make things easier for the consumer, I think things will get better."

– Neeraj Kakkar, Chief Executive of Hector Beverages Pvt. Ltd, September 11, 2012[1]

INTRODUCTION

Paper Boat, produced and marketed by Hector Beverages Pvt. Ltd., entered the traditional Indian non-carbonated beverages market in August 2013. In just over three years – by 2016 – it had established a strong following as a fashionable and natural beverage brand in India. The company had unveiled plans to expand overseas as well.

In early 2017, Paper Boat's founders decided to enter into the business of age-old Indian foods. They decided to make ethnic Indian foods in a hygienic manner, and supply them with hassle free packaging, convenient to carry around. The idea of entering foods came about when Neeraj Kakkar, (Kakkar), one of the founders of Paper Boat and CEO of Hector Beverages, visited a chikki[2]-making cottage industry. Kakkar observed that the chikki was made under poor hygienic conditions and he felt there was an immense business opportunity there for Paper Boat. In November 2016, the company announced its foray into Indian foods with the launch of Paper Boat Chikki.[3]

BACKGROUND

Paper Boat was founded by Kakkar, Suhas Misra, (Misra), James Nuttall, (Nuttall), and Neeraj Biyani, (Biyani). From being classmates when they were doing their Master's in Business Administration from MDI, one of the leading Business Schools in Delhi, Kakkar, Misra, and

Sales Territory Design: An Exercise

K S Venu Gopal Rao, J S K Chakravarthi** and Debapratim Purkayastha****

Hushtek Corporation, a European FMCG company which was involved in selling detergents brands, entered the Indian market. The company wanted to gain a foothold in southern India before expanding to other parts of the country. A priority for the company was to enter Telangana state, for which it recruited Mr. Desai as head of sales operations for the state. Desai's immediate priority was to design the sales territories for the state of Telangana and recruit salespeople accordingly and present it to the country head. As an initial and immediate assignment, Desai had to design sales territories in one of the districts, Nizamabad. The case provides an overview of how a sales manager plans to design territories and the factors one needs to consider while designing sales territories and ensuring market coverage.

INTRODUCTION

Early in the morning on February 2, 2016, Mr. Baker, the Country Head of Hushtek Corporation, called Mr. Desai, the newly appointed Head-Sales of the South Indian state of Telangana, on the telephone to discuss and finalize issues related to the launch of Hushtek Brands in his territories. Baker planned to initiate the sales operations in Telangana state depending on how quickly Desai prepared the blueprint for the launch. The essence of Baker's phone call was to get an update on the territory design. Two months earlier, Baker had presented his action plan to his boss in which he had indicated that the territory design for the state of Telangana would be completed by the end of February 2016. Baker felt that before proceeding with the appointment of channel partners, the territories had to designed and assigned. With Baker indicating on the phone that he was going to call Desai for a meeting on February 26 to review the progress, Desai had his task cut out for him. He started building up the logic for designing the territories that made business sense as well as fulfilled market coverage.

ABOUT HUSHTEK AND ITS INDIA OPERATIONS

Started in 2010, Hushtek Corporation (Hushtek) operated in the fast moving consumer goods (FMCG) business and had been identified as one of the fast growing players in the European detergents business. Competing with giants like P&G and Unilever, Hushtek had learnt the tricks of the trade and started giving stiff competition to these behemoths in certain markets. In 2015, the company started making elaborate plans to enter India, which was experiencing steady growth in GDP. Hushtek was aiming to do well in emerging countries like India.

Before joining as the Country Head of Hushtek, Baker had worked with companies like ITC, P&G, Reckitt Benckiser, and Marico across sales and marketing management functions in India.

Tata Motors' Project Neev: Rural Influencer Marketing

V Namratha Prasad[*]

The case describes India's biggest automobile manufacturing company, Tata Motors Ltd. (Tata)'s rural marketing initiative – Project Neev. As part of the initiative, Tata hired prominent rural people to serve as Tata Gram Mitras and do word-of-mouth marketing for its vehicle range in far-flung villages with a population of less than 50,000. Furthermore, Tata distributed its vehicles in those markets through third-party outlets called Tata Kisan Mitra, apart from leveraging the rural outreach programs of other enterprises through strategic partnerships. Project Neev was a success, enhancing Tata's competitive strength and accounting for a large proportion of the company's vehicle sales. Within a decade, Tata expanded the scope of Project Neev to cover almost all Indian states. So, will Project Neev continue to reap dividends for Tata in the future?

In 2019, the biggest automobile manufacturing company in India, Tata Motors Ltd. (Tata), stated that its rural marketing initiative called *Project Neev* (Foundation) was operational in 25 Indian states and had engagements in 448 districts.

In the early 2010s, Tata realized that the market for the SCV's in the hinterlands of the country was not growing as expected and therefore it looked for a strategy to expand its rural reach. Through its research, Tata concluded that its product portfolio and prices were appropriate for the rural markets, but there were issues with the other two P's of a typical marketing mix: Promotion and Place.

Launched in 2010, *Project Neev* intended to grow the sales of the company in the small commercial vehicles (SCV) segment in far-flung villages with a population of less than 50,000, through the word-of-mouth marketing done by an informal network of key rural influencers called *Tata Gram Mitras* (village friends).

The *Tata Gram Mitras* included teachers, local youth from the villages, doctors, mechanics, and a few people from the *Gram Panchayats* (local village councils). Speaking about the criteria used to choose a person to be a *Tata Gram Mitra,* Ramki Ramakrishnan, Senior-VP, Commercial Vehicles of Tata, said, "We needed ambassadors. We needed someone who knew the villagers well. We needed someone who understood their sentiments. We needed someone, who had their confidence. So, we went for this concept of feet-on-street, where we identified village youth, people who are known in the village...who villagers trust."[1]

Project Neev was intended to not only help Tata make a foray into the large untapped rural markets, but also to empower the rural population through self-employment. Tata paid the *Tata Gram Mitras* a regular stipend, and if any enquiry was converted into a sale, gave them an additional incentive. Analysts were of the opinion that it was not easy to convert an enquiry into a sale.

* Assistant Professor, IBS Hyderabad (Under IFHE – A Deemed to be University u/s 3 of the UGC Act 1956), Hyderabad, Telangana, India. E-mail: namrathap@ibsindia.org

The Journey from Vodafone Idea to Vi

Sanjib Dutta and Smita Ray***

The case talks about the rebranding exercise undertaken by Vodafone Idea Ltd. (VIL) in 2020. The case starts out with a brief history of both Vodafone India and Idea Cellular (Idea) and about their merger. It then describes the reasons behind VIL's rebranding exercise. The case touches upon the various elements involved in the rebranding exercise. It also describes the challenges that VIL could face in the future and the steps it could take to mitigate those challenges.

"Vodafone Idea came together as a merged entity two years ago. We have, since then focus on integrating two large networks, our people and processes. And today I am delighted to present VI, a brand that will bring important meaning to the lives of our customers.[1]

– Ravinder Takkar, MD & CEO, Vodafone Idea Ltd, in September, 2020

"Vodafone was an urbane, sophisticated global brand. Idea was more about rustic intelligence and native humour. When these two diverse entities came together, a unified new personality was a challenge. That challenge remained kind of unresolved for 2-3 years. Now the new brand is an opportunity to create a common new identity, but also define the personality of this new avatar."[2]

– Sandeep Goyal, Chief Mentor, Indian Institute of Human Brands, in September, 2020

INTRODUCTION

In September 2020, Vodafone Idea Ltd. (VIL), the third largest telecom operator in India born out of the merger between Vodafone India and Idea Cellular in 2018, rebranded itself as 'Vi'. The rebranding was taken up to create a unified identify as Vodafone and Idea had different appeals for different sets of customers. It was also seen as the final step in the integration of the two entities. The challenge for VIL was to retain the legacy of both the brands while creating a fresh appeal among its customers at the same time. Kavita Nair, Chief Digital Transformation and Brand Officer, Vodafone Idea Ltd., said, *"We wanted to carry forward the legacy of both the brands. We also wanted to create a new, dynamic edge to reflect the changing times and evolving consumer needs...We wanted to come up with something that is future-fit for both our organization and our customers. We saw this as an opportunity to shape up a new brand while carrying forward the legacy and heritage with us."*[3]

Heineken's 'Champion the Match' Campaign to Increase Brand Awareness

Indu Perepu and Shwetha Kumari***

The case talks about Heineken's 'Champion the Match' campaign, which was launched in 2015 during the prestigious football tournament, UEFA Champions League (Champions League) in 2015. It was built on the success of its 2013 award-winning campaign called 'Share the Sofa'. The campaign, using social media and the second screen brought together players and fans of the game. Experts believed that the campaign was highly beneficial in terms of increased sales of Heineken beer and also increased awareness about Heineken at the global level.

On February 17, 2015, Dutch brewing company Heineken International[1] (Heineken) launched a social media campaign targeted at football fans. The company, popular for being actively involved in sports related events and sports sponsorship campaigns, had been sponsoring the UEFA Champions League[2] (Champions League) since 2005. The Champions League was one of the most prestigious tournaments in the world and also the most prominent club competition in European football. Heineken's association with the Champions League helped the company build brand awareness in the European and African markets and also boosted its presence in higher growth emerging markets in Central America and Asia.

In 2015, during the Champions League, Heineken launched the 'Champion the Match' campaign, which offered fans from across the globe an opportunity to create a grand match night and also showed how far a fan could go to watch a football match.

The 'Champion the Match' campaign was built on the success of the 2013 award winning campaign called 'Share the Sofa'. Before Share the Sofa campaign was launched, the company did background consumer research and found that 76 percent of the people watched the Champion League alone at home. It was found that 65 percent of the people used their mobile phones while watching television. The Champions League was among the most tweeted events and Twitter was the number one platform people used to interact with others watching the match. Heineken found opportunities to bring people together digitally and to connect the brand with the people enjoying the game.

Heineken wanted to engage with these fans who watched the match alone and also had a device like a tablet handy. The company came up with a real-time football show designed for the second screen[3]. This meant that the fans could interact with the other viewers using their mobile phones or tablets, while watching the game on television. This provided the fans a multi-dimensional interactive experience and allowed them to interact with other fans

Mattel Loses Disney Princess Franchise to Hasbro

Indu Perepu and Shwetha Kumari***

The case focuses on how US-based toy maker Mattel lost the license for manufacturing the lucrative Disney Princess line, which it had been doing since 1996, to Hasbro. It discusses Mattel's focus on reviving the plunging fortunes of its flagship Barbie doll, and promoting its own princess-themed dolls and how this led to Disney withdrawing the license from Mattel and approaching Hasbro to revamp and launch a new Princess line. In the process, Mattel also lost the license to produce Disney's Frozen line of toys and accessories.

"We took Disney for granted. We weren't focusing on them. Shame on us."

– Chris Sinclair, CEO, Mattel Inc., December 2015[1]

On September 24, 2014, US-based toy and board game company, Hasbro Inc. (Hasbro), declared that it had secured the Disney Princess franchise, along with the license to manufacture Disney's 'Frozen' dolls.[2] With this announcement, the partnership between another toy maker, US-based Mattel Inc. (Mattel), and the entertainment giant, The Walt Disney Company (Disney), came to an end. Mattel had been associated with Disney since 1955 and had been manufacturing Disney Princess line of dolls[3] since 1996. On Hasbro getting the license, Gene Del Vecchio, a former executive at advertising agency Ogilvy & Mather, said, "Disney Princess was probably the greatest coup that Hasbro has had in the last three decades."[4] (Refer to Table I for more about Hasbro).

Table I
About Hasbro

US-based Hasbro, founded as Hassenfeld Brothers in 1923, produced popular toys like Mr. Potato Head, G. I. Joe, Transformers, licensed Sesame Street items, Playskool toys, Nerf toys, Tonka trunks, Easy Bake Oven, and Cabbage Patch Kids. It also produced popular board games like Monopoly. Over the years, Hasbro became one of the most recognized toy and game manufacturers in the US and across the world. In 2013, Hasbro launched the Nerf Rebelle, a Nerf gun for girls, and by 2013, a quarter of its revenue came from girls' toys.

Compiled from various sources

Mattel, the world's largest toy company as of 2016, was founded in 1945 by Elliot and Ruth Handler (Ruth). The Mattel family comprised best-selling products such as Barbie, the most

Charming's Woes

Shiv Ratan Agrawal and Sameer Sharma***

Charming has evolved from a C&F agency to a multi-product company of Rs.950 million employing 450 people. Its central stores with 5800 items catered to 10-line stores. The company has been recording high level of inventories with allegations of mismanagement. What has been causing an imbalance of inventories?

INTRODUCTION

Charming Products Private Limited (Charming) was established by the R.K. Iyer brothers in Chennai in 1982 as a trading and distribution company. It started off by taking up a C&F agency and retail distribution of new brands from reputed companies. It set up manufacturing facilities in Avadi in 1988 after going public earlier the same year. Its main products were luxury bath soaps, shampoos, hair oil, face creams, and talcum powder. It had a turnover of Rs.950 million and employed 450 people, more than half of them in sales. Its market was mainly in south India although the popularity of its products has made them available in select south Indian stores all over the country.

The factory made the various products in batches on a flow line basis. The final wrapping and packaging were done on fully automated machines. These machines and their spare parts were imported and had been functioning smoothly.

MATERIALS MANAGEMENT

The Central Stores catered to 10-line stores, each of which stocked over 300 commonly used items. The Packaging Material Store was the eleventh and the General Materials Store was the twelfth sub store of the Central Stores. Overall, the total number of stores items was 5800.

A Chief Materials Manager (CMM) headed the Central Stores and was responsible for receiving, storing, and issuing the items. He was also accountable for their physical custody and safe keeping. One Store Officer, 2 Materials Management Executives, and 3 workers assisted him in the Central Stores, while the 12 sub stores had an Assistant Materials Manager (AMM) and 1 worker each except the General Materials Store, which had 2 workers. The AMMs reported to the CMM.

The Central Stores operated only in the day time general shift. The sub stores withdrew items in advance for other shifts. If the Central Store was required to be opened at other times for some emergency, the items withdrawn were recorded in an Issue ledger in the presence of Security personnel. Such withdrawals were regularized the next day.

PURCHASE MANAGEMENT

The Purchase department consisted of a Purchase Manager assisted by 2 Purchase Officers and 2 workers. The main activities of the department were receiving purchase indents,

Bahubali: Making of an Epic Indian Movie

Adapa Srinivasa Rao and G V Muralidhara***

This case is about the epic historical film Bahubali, released in July 2015. Despite being made in the South Indian language of Telugu, the movie was successful all over the country. The movie was made with a budget of Rs.1,200 million ($18 million) but grossed Rs.6,000 million ($90 million) worldwide in the first fifty days of its release. Bahubali became the highest grossing Indian movie of all time by overcoming the inherent cultural differences prevalent in India. The first factor that contributed to the success of Bahubali was the focus on quality. Extensive sets and attention to detail given in the movie were unprecedented in the Indian movie industry. Arka Media Works, the production house which made the movie, followed innovative marketing strategies to create hype around the movie. Bahubali proved that movies made in South Indian languages could be successful all over the country.

"I doubt if anything like this has been seen in Indian cinema before. Every time I see something astonishing, I feel very envious and I wish I was part of it."[1]

– Amitabh Bachchan, Leading Actor of Bollywood in July 2015

Bahubali, an epic Indian historical film released in July 2015, set cash registers ringing and registered record collections at the box-office. To reach out to a larger audience, Bahubali (translates into 'The One with Strong Arms') was shot simultaneously in the south Indian languages of Telugu and Tamil and dubbed into other Indian and foreign languages like Hindi, Malayalam, and French. Apart from being successful in its home markets (major south Indian states), it did good business in India's north Indian markets where Hindi was primarily spoken.[2] The movie was based on a fictitious story set in ancient India. The plot of the movie revolved around two cousins from a royal family who fought against each other to gain control over the ancient kingdom of Mahishmati in south India. The protagonist of the plot was a tribal warrior boy called 'Shivudu' who was born into the royal family but due to certain circumstances, grows up in the forests. Shivudu, who later came to know that he was the reigning king's cousin and the son of the former king who had been murdered, set up a mission to take revenge. The plot was to conclude in the second part of the movie, slated to be released in 2016.

Bahubali was made on a budget of Rs.1,200 million ($18 million). Though the budget was small compared to those of major film markets in the world like Hollywood, it was considered extremely high for an Indian movie. The film grossed Rs.6,000 million ($90 million) worldwide in the first fifty days of its release.[3] It broke a number of records and became the highest grossing Indian movie ever. Its success was unprecedented in the Indian

Samsung and Disha Patani: Influencer Marketing Fail

V Namratha Prasad[*]

The caselet talks about the goof-up by Indian film actor and social media influencer Disha Patani in her Instagram post promoting two new smartphones in the Samsung Galaxy M Series. It starts by providing details about Patani's Instagram post and the blunder that she committed. The repercussions of the post on Patani's social media image are described and questions are raised on the role of her social media team. Finally, the impact that the botch-up had on Samsung's campaign and brand image is discussed.

INTRODUCTION

In early January 2019, Samsung India Electronics Pvt. Ltd. (Samsung)[1] chose popular Indian film actor, Disha Patani (Patani), to tease the launch of its upcoming Samsung Galaxy M Series on her Instagram[2] account that had 17 million followers. Samsung was expected to host a media event on January 28, 2019, in New Delhi, India, to announce two Galaxy M-series phones: the *Samsung Galaxy M10* and *Galaxy M20*. As of 2019, Samsung held second position in the Indian smartphone market, with a market share of 25%.[i]

Samsung's move to use Patani in its teaser ad was in keeping with the trend to use celebrities and social media stars with millions of followers on social media as 'Influencers'. This was because the celebrities and stars already had an established following among people who trusted them and so had the power to influence them. Thus, brands across the globe roped in influencers and paid them big bucks to talk about their products and showcase them in a positive light.

Samsung shot an ad video with Patani that featured her expressing excitement after receiving one of the yet-to-be launched phones in an M-shaped box. In the video, she was also shown taking photos using the phone's 'ultra wide' camera, while doing the yoga pose – *upavistha konasana*[3] and showering praise on the picture quality. By sharing her personal experience of using the phone, Patani was expected to generate a sense of 'need' for the phone, among her followers.

After editing the video, Samsung sent the ad – perhaps in an e-mail/chat – to Patani along with posting instructions that read, "*Hey – final video is here. Will mail you the high res video in something so please use that as the final video to be uploaded.* **Caption below**: I'M SO KICKED. Thanks to the Ultra Wide Camera in Samsung Galaxy M Series, I can go as wide

Warby Parker: Marketing Tactics

Indu Perepu and Alok Kavthankar***

The case discusses the low-budget innovative marketing tactics of Warby Parker (WP), an online retailer of prescription glasses. Founded in 2010 by four Wharton Business School colleagues, Neil Blumenthal, Dave Gilboa, Jeffery Raider and Andy Hunt, WP had defined itself as a lifestyle brand for those with a literary bent of mind. WP offered affordable prescription glasses which were priced at one-third of equivalent frames and donated one pair of glasses to the needy for every pair sold.

New York-based Warby Parker (WP), an online retailer of prescription eyewear and sunglasses, was valued at $1.2 billion in 2015[1]. WP, an entrepreneurial entity, was founded in 2010 by four Wharton Business school colleagues — Neil Blumenthal, Dave Gilboa, Jeffery Raider, and Andy Hunt. WP described itself as a lifestyle brand for those with a literary bent of mind and its product line was inspired by the retro intellectual look. It offered affordable prescription glasses priced at one-third of equivalent frames from other companies. It was also the hip do-gooder label which donated a pair of glasses to the needy for every pair of glasses sold, under the Buy-one-give-one model. The model leveraged on "compassionate consumerism", a term coined by retail analysts to describe the altruistic motives of consumers driven by a social cause.

In 2010, being a start-up, WP was running on a tight budget. It had a lean online low cost model with a dozen employees. But having the online-only mode had its downside, as without effective PR and marketing, it was arduous to pull traffic to the site. On the day of launch of the site, WP had placed articles in two popular fashion magazines, Vogue and GQ. The move generated enormous traffic with 20,000 people booking orders. A year after the launch, there was a cult following for the stylish brand. At the same time it was necessary for WP to create more and more interest in the brand.

In September 2011, the New York Fashion Week (NYFW) was slated to be held. NYFW, one of the four major fashion weeks across the world called the "big four" of fashion events, took place bi-annually. Entry to the event was only possible through a slew of expenses like production and PR, Venue, Models, and Make-up artists. Being a start-up and a novice in the fashion world, WP did not have enough resources to put up a runway show at the fashion week. So it decided to conduct its very own secret presentation a day before the fashion week started.

The venue chosen was New York Public Library (NYPL) where a couple of years earlier Dave Gilboa, the co-founder, had been for an exhibition which portrayed the work of Jack Kerouac[2]. Warby Parker was actually a combination of the names of two characters from Jack Kerouac's unpublished journals. WP had invited around 40 fashion editors to cover the

Snapdeal:
Risks and Rewards of Celebrity Endorsement

Alok Kavthankar[*]

The case discusses the backlash faced by the India-based e-commerce company, Snapdeal, in the wake of its brand ambassador, film actor Aamir Khan (Aamir) expressing his concern and despondency over the rising intolerance in India. Outraged by Aamir's comment, many Indians tagged the comment as blasphemous and demanded that Snapdeal disassociate itself from Aamir. Some people also downgraded or deleted the app from their mobile devices. But the whole incident had an unexpected outcome: with a spike in the number of downloads of the Snapdeal app.

INTRODUCTION

In 2015, the Indian e-commerce industry was on a steep growth trajectory. Analysts speculated that it would grow at 35% CAGR, crossing the $100 billion mark by 2020.[1] Backed by a slew of investors, the e-commerce companies were more focused on aggressive growth and the industry as a whole had not turned profitable till then. The industry was characterized by aggressive pricing and the deep discount model, which resulted in analysts questioning its sustainability. Top e-commerce companies splurged huge amounts on advertising and on signing up renowned celebrities from the Indian film industry to endorse their brands. It was estimated that the 2015 festive season triggered a cash burn of Rs.20 billion[2] in advertising expenses.

Founded in 2010, Snapdeal was an India-based e-commerce company owned by Jasper Infotech Pvt Ltd and was the second largest e-commerce company in the country. In March 2015, Snapdeal signed a contract with popular Indian film actor Aamir Khan (Aamir) to endorse its brand through TV commercials and online. Aamir was known to be selective about the brands he endorsed. In the past, he had been associated with brands like Coca Cola, Samsung, Godrej, Tata Sky, and Titan watches. A renowned film star, he was a recipient of the Padma Shri, India's fourth highest civilian award, and later the Padma Bhushan, the third highest civilian award, for his work. As a person, Aamir was reserved. He lived with his wife Kiran and son Junaid Khan.

On November 23, Aamir Khan, while speaking at a Journalism Awards function, expressed alarm and despondency over the rising display of intolerance in India. He later said "Kiran and I have lived all our life in India. When I sit at home and talk to Kiran, for the first time she said, 'Should we move out of India?' That's a disastrous and big statement for Kiran to make to me. She fears for her child. She fears about what the atmosphere around us will be. She feels scared to open the newspapers everyday. That does indicate that there is a sense of growing disquiet... growing sense of despondency. You feel depressed, you feel low...why is it happening? This feeling exists in me too."[3]

Illumina – Maintaining Growth Momentum in a Plateauing Genome Sequencing Market

G V Muralidhara and V Namratha Prasad***

The case talks about Illumina Inc.'s journey to becoming the market leader in the genome sequencing market and the challenges it faced in growing the market. The case starts out with a brief history of the company and the role played by Jay Flatley, its CEO, in keeping the company at the forefront of technological innovation in the genome sequencing industry. It then focuses on the company's breakthrough product, the HiSeq X10 that drastically brought down genome sequencing costs, thereby making it more affordable and paving the way for the development of various applications. The case also documents Illumina's efforts to spur the development of applications of genome sequencing in various areas such as prenatal health, oncology, consumer applications, and population sequencing. It concludes with an insight into the impact of market saturation on Illumina and the strategies it was adopting to propel market growth.

"We continue to see Illumina as a best-in-class growth story that is well positioned for multiple additional years of double-digit growth ahead."[1]

– Vamil Divan, an analyst at Credit Suisse Group AG[2], in April 2015

"It's rare that you find a company that has 80% to 90% share of anything and is driving the technology so fast that nobody can catch up. This is a stock in its infancy. I know that sounds crazy, given that it's over $20 billion, but it is true."[3]

– Cathie Wood, Chief Investment Officer at ARK Investment Management LLC[4], in August 2014

INTRODUCTION

In November 2016, the market leader in genome sequencing[5] machines, Illumina Inc. (Illumina), announced that it was entering into a partnership with Mayo Clinic[6] to combine their services and software in order to develop new tools that would support the latter's research into inherited diseases. In addition, Mayo Clinic intended to test Illumina's next-gen

Walmart's E-Commerce Strategy to Take on Amazon

Jitesh Nair and Barnali Chakroborty***

The case discusses the various strategies used by Walmart to transition from a traditional brick-and-mortar retail chain to one that adopted an online and further an omnichannel strategy. It touches upon how Walmart planned its digital strategy by setting up a strong team at Walmart Labs, acquiring brands with strong digital presence and creating the role of a CTO. The case also focuses on the various initiatives taken to integrate online and offline operations that helped establish Walmart as a viable alternative to Amazon. Walmart also partnered with platforms like Shopify, streamlined product assortments, used stores as warehouses and invested in automation. This helped the retailer experience a 207% growth in its e-commerce buyer base between early 2017 and early 2019.

"We have tremendous momentum having just completed a year with record sales and operating cash flow and have accomplished this while accelerating our long-term strategy of transforming Walmart into a dynamic omnichannel business. It's now time to accelerate even more."[1]

– Brett Biggs, CFO, Walmart, in February 2021

"The greatest part about Walmart using the Walmart store is that store is already profitable. If you can use those as warehouses, it's a game changer for us. Most of the cost of e-commerce is in shipping. If you think about the ability to have deployed inventory five miles away from 70% of Americans, and you can figure out that last mile, you're talking about a difference in profitability,"[2]

– Jeremy King, CTO, Walmart in March 2019

INTRODUCTION

Walmart Inc. (Walmart) reported that its e-commerce sales in the US had grown 79 percent in FY2021 compared to FY2020, going up to $43 billion from $24.1 billion. With this, it became the No 2 online retailer in the US.[3] *(Refer to **Exhibit I** for Online Sales of Walmart by Division).* The growth was driven by sales on the Walmart marketplace, and the launch of services like buy-online-pickup-in-store (BOPIS) and curbside pickup and delivery.

In May 2021, Walmart reported e-commerce sales were up 37% in the first quarter of FY2022 compared to the same period of the previous year. Industry experts were of the opinion that combining brick-and-mortar with e-commerce had proved to be a winning

Pokémon Go: Disrupting the Disruptors in Mobile Gaming

Debapratim Purkayastha and Koti Vinod Babu***

This case is about Pokémon GO, a free to play augmented reality game for iOS and Android smart devices, in which players had to physically move around the real world in order to capture Pokémons. The game was a hit across 45 countries and was getting ready for release in more countries. The companies associated with the creation of the game experienced a phenomenal growth in their profits. But there were complaints from many countries about the side effects of playing Pokémon Go. Many players became victims of accidents and robberies; a few even lost their lives while playing the game. There were technical issues with the game and device performance like fast draining of battery, hiccups in performance like lagging of phone, and data consumption. Nevertheless, the game was a huge success with people of all ages and players were seen searching for Pokémon with their mobile cameras at public places in countries where the game had been released.

INTRODUCTION

Pokémon Go, a free to play location-based mobile game released on July 6, 2016, created a sensation in mobile gaming within eight days of its release by beating Twitter[1] in the number of daily users on Android.[2] Developed by Niantic Labs (Niantic) for iOS[3] and Android devices, the game was churning out an annual revenue rate of more than $1 billion. Pokémon Go was a game based on augmented reality[4] and was available in 45 countries. According to some estimates, Pokémon generated about $1.6 million in revenues per day and had crossed 100 million downloads by the first week of August 2016 worldwide. The game was the largest grossing game in the history of mobile applications with an estimated value of $36.9 billion.[i]

Pokémon Go was a joint venture between The Pokémon Company and Niantic. Nintendo Co., Ltd. (Nintendo) was a shareholder in both the companies and also owned the trademarks to Pokémon and the Pokémon character names. According to the company, Pokémon Go had even surpassed the dating website Tinder in its popularity.[5]

Walmart's Support to Stakeholders During the Covid-19 Crisis

Jitesh Nair and Barnali Chakroborty***

The case describes the various challenges faced by Walmart with the onset of the COVID-19 pandemic that included operational and employee challenges as well as changes in consumer purchase behaviour. It focuses on Walmart's response plan for its various stakeholders to ensure business continuity and sustain growth. Walmart focused on changes in operating hours, new safety guidelines and enhanced health benefits for employees. The retailer invested in various technologies to offer contactless shopping services. It took steps to hire on contract basis employees laid off by other companies. The retailer also offered financing support to business partners and suppliers and collaborated with the national governments to offer vaccination support through its stores for the local communities.

"We hear the word "unprecedented" a lot these days, and that's probably because there's not really any other way to describe what's going on. And the crisis isn't over at this point; we've got to keep learning and adjusting."[1]

– Doug McMillon, President and Chief Executive Officer, Walmart Inc., in May 2020

"For Walmart, this is the World Series, Super Bowl and Stanley Cup all wrapped up in one."[2]

– Ken Harris, a managing partner at Cadent Consulting Group, in March 2020

"The unfortunate spread of the COVID-19 virus has created an unprecedented spike in demand for grocery and household products, as consumers prepare for weeks (maybe months) of school closures, work from home and restaurant closures. This change should be sticky, and favor WMT [Walmart], as it's invested in its infrastructure, technology and people, to evolve its model. Bottom line, WMT is well positioned to serve the consumer through this difficult period as well as on the other side, as the customer acquisition benefits compound."[3]

– Seth Sigman, Research Analyst at Credit Suisse, in March 2020.

INTRODUCTION

In May 2021, Walmart Inc. (Walmart) announced its earnings for the quarter ended April 30, 2021, and reported net sales of $137.16 billion, up 2.6% from $133.67 billion a year earlier. The company announced robust sales gains in its US operations. Walmart US's comparable sales increased 6% with market share gains in the grocery segment, while operating income

China's Cheetah Mobile: Strategy Development for a Global Business

V Namratha Prasad and Debapratim Purkayastha***

The case is about China-based Cheetah Mobile's (Cheetah) efforts to sustain itself in the global mobile app market through various strategic moves and technological adaptations. It starts out by providing a brief history of Cheetah that started off as a PC (Personal Computer) software company, but later shifted to mobile apps, due to the growing prospects of the mobile industry. The monetization efforts of the company are also described briefly, especially its efforts in the in-app mobile advertising space. The case then delves into the reasons that prompted the company to target international markets and also documents its efforts in that regard. It mentions the various improvements made by the company in its apps to increase user engagement such as becoming a content provider, embedding the content app in its utility apps, and rolling out Artificial Intelligence (AI) technologies across most of its utility apps. The case concludes with a look at the challenges faced in the future focus areas of the company and its efforts to further monetize its business

"We think we can be successful in the US because our business is here, compared to other Chinese companies who achieved great success in China. Their center of gravity is still in China and the US is nice to have. But for us, 80% of our users are outside China so we need to get out and learn about other cultures."[i]

– Charles Fan, Chief Technology Officer (CTO) of Cheetah Mobile, in December 2016

"The mobile space makes the world flatter than ever before. There is a huge opportunity for any company in any country to go global."[ii]

– Sheng Fu, Chief Executive Officer (CEO) of Cheetah Mobile, in November 2015

In May 2017, leading Chinese mobile Internet company Cheetah Mobile (Cheetah) announced that its one-year-old live streaming platform Live.me had raised $60 million from various China-based investors, including Chinese news aggregator Bytedance Ltd.[1] The investment was intended to increase marketing budgets and improve back-end technology. Cheetah said it would continue its international-focused strategy for Live.me.

Cheetah was formed in 2010 with the merger of two companies – Conew Image founded by software entrepreneur Sheng Fu (Fu) and Kingsoft Security. The merger was brought about by Lei Jun (Jun) – co-founder of Xiaomi Inc.[2] – who was the non-Executive Chairman of Kingsoft Corporation, the parent company of Kingsoft Security.

Harley Davidson: Back to Basics

Syeda Maseeha Qumer[*]

The case focuses on iconic American motorcycle maker Harley Davidson's new turnaround plan known as the "Hardwire Strategy" designed to revive the struggling company and boost revenues. Under the new strategy, Jochen Zeitz, CEO of Harley Davidson, planned to shift the focus of the company back to its core customers and to go back to the basics of making big, expensive motorcycles for its devoted core customers, after struggling for several years to broaden its appeal beyond middle-aged riders. The plan focused on several key aspects that included ramping up investment in the touring, large cruiser, and trike bike segments; selling used bikes; scrapping entry-level models; and creating a new division dedicated to the development of electric motorcycles. However, it remains to be seen whether the company's back-to-basics strategy and shift in direction would boost volumes, improve profitability and help the motor cycle manufacturer regain its former glory.

INTRODUCTION

In the second quarter of 2021 ended June 30, US-based iconic motorcycle maker Harley Davidson Inc (Harley) posted a 24% increase in sales compared to the corresponding period of 2020, due entirely to an impressive sales rebound in North America. While North American sales were up 43% year-on-year in Q2, sales in Europe, the Middle East, and Africa (referred to as EMEA); Asia Pacific; and Latin America decreased by 7%, 13%, and 31% respectively for the same time period ***(See Exhibit I).*** In the first half of 2021, the company's global sales increased by 18%. Cheering the results, Jochen Zeitz (Zeitz), Chairman, President and CEO of Harley, said, *"I'm pleased with the pace of improvements and with the strong quarter that we have delivered. We are starting to see the initial proof points as we execute our Hardwire Strategy, as demonstrated by the positive financial results today. We are encouraged by the signs of consumer positivity in the market; however, we remain mindful of the significant supply chain challenges that we expect to continue to impact the sector."*[1]

Harley, the world's leading designer and manufacturer of motorcycles which included heavyweight[2], touring[3], cruiser,[4] custom, and performance motorcycles, had been battling continuously declining motorcycle sales, falling revenues, and a sinking stock price since 2010. Analysts attributed Harley's failure to a number of factors, including the aging of the company's core customer base, a drop in demand for expensive and heavyweight motorcycles, lack of interest from younger consumers, and growing competition. The embattled company spent several years trying to reverse a negative trend in both sales and revenue, leading to a strategic overhaul in 2020 that brought Zeitz in as its new CEO. Zeitz reversed a number of strategic decisions taken by his predecessor Matthew S. Levatich (Levatich), including shifting the focus of the company back to its core customers and going back to the basics of making

Fiserv's Acquisition of First Data Corporation

Sanjib Dutta and Manish Agarwal***

The case study discusses one of the biggest merger and acquisition deals in the global payments industry. Fiserv, one of the leading players in the payments industry, acquired another prominent but debt-laden player, First Data Corporation, at a relatively cheap price. Fiserv was expecting significant cost and revenue synergies from the acquisition. The case details the factors that led to the decision of the two companies to come together and the synergies to be reaped after the merger.

"We admire First Data for its excellence in merchant acquiring and global issuing services, and the tremendous progress they have made under Frank's leadership. We expect this combination to catalyze and support an enhanced value proposition for our collective clients and their customers."

– Jeffery Yabuki, President and Chief Executive Officer, Fiserv, January 2019

"We're creating an unparalleled fintech company...What this symbolizes is how much technology the payments space can take and have and we're going to be the leader in it."[1]

– Frank Bisignano, Chairman, and CEO, First Data Corporation, January 2019

INTRODUCTION

On January 16, 2019, Fiserv, Inc. (Fiserv) and First Data Corporation (FDC) announced that their boards of directors had approved the definitive merger agreement between the two companies in which Fiserv would acquire its rival FDC in an all-stock deal. Jeffery Yabuki (Yabuki), President and Chief Executive Officer of Fiserv, said, *"Through this transformative combination, we expect to redefine the manner in which people and institutions move money and information."*[2] Frank Bisignano (Bisignano), Chairman and CEO of FDC, commented, *"I have long admired what Fiserv has achieved over the years, and I look forward to working with the talented associates of both companies as we set a higher standard of innovation and service in the industry."*[3]

Industry observers stated that the combined entity would become one of the leading payment and financial technology providers. However, some experts pointed out to the timing of the deal and the share price at which FDC had agreed to sell to Fiserv as FDC was trading at

India's Kalyan Jewellers – Winning with a Hyperlocal Strategy

V Namratha Prasad and Koti Vinod Babu***

The case talks about the hyperlocal strategy used by India's leading jewelry chain, Kalyan Jewelers India Private Limited (KJ) that served as a foundation for its success. The case starts out by mentioning the entrepreneurial journey of KJ's Founder T S Kalyanaraman Iyer (Kalyanaraman). It then talks about the various business practices adopted by Kalyanaraman that disrupted the Indian jewelry industry – by not only altering the way people bought gold, but also changing the way it was sold. The case then delves into the nuances of KJ's key business strategy, namely, the hyperlocal business strategy. It describes the company's promotional tactics that primarily involved using celebrity endorsement and were also centered on the hyperlocal strategy. The case then documents the rise of the company and its success in attracting private investment. Can KJ go in for a successful IPO and succeed in its endeavor to become one of the largest jewelry brands in the world?

"So, right from the product, right from my staff in the showroom, right from the way I communicate, right from the people I endorse, we become local. So, people see us as a son-of-the-soil brand."[i]

– T.S. Kalyanaraman Iyer, Chairman and Managing Director of Kalyan Jewellers India Private Limited, in 2018

"Kalyan has been the most innovative company in the jewellery industry for years. They have ambitions, immense understanding and a passion for their business. When combined with their integrity and transparency, they have a real opportunity to build the best jewellery company in India."[ii]

– Vishal Mahadevia, MD and Co-Head, India, Warburg Pincus LLC in 2015

INTRODUCTION

In September 2018, one of India's largest jewelry store chains, Kalyan Jewellers India Private Limited (KJ), announced aggressive expansion plans to double the number of its retail stores to 250, both in India and abroad. As of FY 2017-18, KJ operated 121 stores in India and was also present in the Gulf Cooperation Council (GCC)[1], wherein it had operations in the UAE, Qatar, Oman, and Kuwait. Growing at a compound annual growth rate of over 10% since FY2015, KJ had notched up revenues of Rs[2].105.8 billion in FY2018.[iii]

KJ's Executive Director, Ramesh Kalyanaraman (Ramesh), said, "We are expanding our retail network aggressively. In this fiscal, we earmarked Rs.10 billion to open new stores. Already, Rs.6 billion has been spent to launch 10 stores in the first of this fiscal and the

Can Marks & Spencer Regain Its Lost Ground?

Syeda Maseeha Qumer and Koti Vinod Babu***

The case discusses the problems faced by UK-based iconic retailer Marks and Spencer plc (M&S) and its revival. M&S was experiencing unprecedented troubles with its sales stagnating, profits collapsing, and market share falling. The retailer had been offering high quality clothing, home products, and its own outstanding food brands for 125 years. After being the leading retailer in the UK for decades, M&S started to lose its edge in clothing as well as food with the advent of e-commerce and changing consumer preferences. In May 2016, CEO Steve Rowe (Rowe) outlined a five-year turnaround plan to address the problems, position M&S to deliver profitable sales growth, and revive its dwindling fortunes.

In the last three months of 2017, iconic British retailer Marks and Spencer plc (M&S) witnessed a slump in its shares after it reported a steep fall in clothing and food sales. M&S reported a 2.8% fall in like-for-like clothing and home sales at its stores over the 13 weeks up to December 30, 2017, while food sales dropped by 0.4%.[i] However, the retailer attributed the drop to the warm October weather in the UK. According to some analysts, M&S had disappointed with its food performance as rivals such as Tesco plc[1] (Tesco), Aldi[2] (Aldi), and J Sainsbury plc[3] (Sainsbury) had witnessed a sales boost with shoppers hunting for cheaper options due to rising inflation. CEO of M&S Steve Rowe (Rowe) insisted the retailer was on the road to recovery despite a worsening sales performance in both its clothing and food aisles. *"We do remain on track. We've made some costly but necessary decisions, so profits are down but they are in line with expectations."*[ii]

Founded in 1884, M&S was one of the leading retailers in the UK. It offered high quality and great value clothing and home products, as well as outstanding quality foods. As of 2017, it reported revenue of £10.6 billion, with £3.8billion from the clothing business, £5.6 billion food revenue, and £1.2 billion international revenue ***(See Exhibit I)***. It operated 1025 stores in the UK and 454 international stores in 55 countries[iii] as of 2017.

After witnessing steady growth for decades, M&S began facing problems since 2008 with its clothing division mainly because of its premium pricing and continued investment in brand-building advertising to justify that premium. On the other hand, competitors were slashing their prices to attract customers. M&S's clothing and homewares sales tumbled by 5.9% in the first three months of 2017.[iv] Rowe, who was appointed as the CEO of M&S in January 2016, announced a turnaround plan in early 2017 to revive the brand and boost the retailer's long-struggling clothing business. As part of the plan, Rowe planned to grow the retailer's food business while closing under-performing clothing stores, streamlining the supply chains, and doing away with discounting.

IDFC First Bank's Technology-Led Banking Services and Digital Media Promotion

Sanjib Dutta and Smita Ray***

The case talks about the various initiatives launched by India-based IDFC First Bank to be a leader in technology-led banking services in India. It case starts out with a brief history of IDFC First Bank and then describes the merger of IDFC Bank and Capital First Ltd. (Capital First). The case touches upon the use of digital technologies by IDFC Bank and the launch of its financial services. It then describes how the bank used digital media not only to promote its products and services but also to promote the brand – IDFC First Bank. The case also highlights the future plans of IDFC First Bank.

"We believe our complementary portfolio gives the combined entity access to high-growth customer segments. It enables us to enhance the lending platform and fast-track the building of the liability franchise, by offering customers a broader set of solutions. We look forward to enriching banking experience for the masses, by delivering technology-led quality banking services."

– V. Vaidyanathan, MD & CEO of IDFC First Bank, 2018[1]

"Our endeavour is to differentiate by consistently delivering superior customer experience across all customer touch points, digital and traditional, by leveraging new age technologies."

– Amit Kumar, Head – Retail Liabilities, IDFC First Bank [2]

"Digital will help us redefine the boundaries of banking."

– Avtar Monga, COO & Head- Retail Banking, IDFC First Bank, 2018[3]

INTRODUCTION

In October 2019, IDFC First Bank, the combined entity created out of the merger of IDFC Bank[4] and Capital First Ltd. (Capital First)[5] in 2018, announced its partnership with Sodexo[6],

Skechers – A Checkered Past: Will It Have a Stable Future?

G V Muralidhara and V Namratha Prasad***

The case talks about the emergence of Skechers USA Inc. (Skechers) as one of the leading footwear companies in the US. It chronicles the early business ventures of Robert Greenberg (Greenberg), the founder of Skechers. The case then delves into the reasons for the collapse of Greenberg's earlier shoe company, L.A. Gear, Inc. (LAGI), in the early 1990s. It provides an overview of the product and marketing strategy undertaken by Greenberg to make Skechers a success. It gives details about the strategy adopted by Skechers to recover from the hit to its brand reputation, when it was accused of false advertising for a popular product. The case concludes with a look at the company's future plans for expansion.

"They're (Sketchers) the best at commercializing good ideas in the marketplace. It's not essential that you be first with an idea. You just need to be best."[1]

– Matt Powell, Footwear Industry Analyst at NPD Group[2], in August 2015

"The Skechers brand has evolved from a knock-off brand, to more one with its own looks and styles."[3]

– Analyst at Morgan Stanley[4], in May 2015

INTRODUCTION

In March 2015, Skechers USA Inc. (Skechers) emerged as the No. 2 player in the US sports footwear market, according to a study by the NPD Group. Skechers with a 5% market share managed to surpass Adidas AG's (Adidas)[5] market share of 4.6%, while market leader Nike Inc. (Nike)[6] had more than a 60% share. However, Skechers exhibited a higher market

Chime: Leading the Pack of Neobanks in the US

Sanjib Dutta and Smita Ray***

The case talks about the journey of Chime from a fintech startup to a strong challenger bank in the US. The case highlights the factors that led to Chime emerging as a leader in the neobanks landscape in the US. It starts out with a brief history of the bank and then goes on to describe Chime's innovative products and services launched over the years which helped it to connect with the millennials. The case also highlights the competitive landscape in the US digital banking industry and how Chime was facing stiff competition from others players such as Venmo, Varo, and Simple. It ends with the challenges Chime faces in its bid to sustain its competitive position and the future plans of the bank.

"People don't really want to touch ATMs anymore. They don't want to handle cash as much as they used to and they are getting more and more comfortable with paying for things through apps, managing their accounts through apps."

– Chris Britt, Chief Executive Officer (CEO), Chime, in March 2021[1]

"Chime is the company best positioned to disrupt the core banking relationship in the U.S. market. The startup is 'determined to bring to Americans a healthier banking experience, which is a great need today.'"

– Dennis Barrier, Co-Founder of Cathay Innovation, in September 2017[2]

"Chime has serious growth and strong unit economics, unlike other banking startups that have failed to build a sustainable business. The startup is 'building the bank of the future.'"

– Satya Patel, Partner at Homebrew[3], in September 2017[4]

INTRODUCTION

In late 2020, Chris Britt, Chief Executive Officer (CEO) of Chime, a US-based neobank[5], announced that Chime was preparing to launch an initial public offering (IPO) by the end of 2021.[6] The move reflected a growing preference for online banking during the COVID-19 pandemic and Chime's desire to capitalize on this opportunity. Since its launch in 2013, Chime had raised $1.5 billion from several investors.

Chime started operations by launching Visa debit cards, a website – chime.com, and a mobile app for Android or iOS in 2014. Over the years, the bank had launched various products and services such as free checking accounts, savings account, credit cards, no

Amazon's Acquisition of Self-Driving Car Startup Zoox

Sanjib Dutta and Manish Agarwal***

The case discusses the acquisition of Zoox by Amazon. The deal was expected to help Amazon consolidate its efforts at automating its distribution network, especially its last-mile delivery service. However, many common shareholders of Zoox were not happy with the deal. They went to court and filed a lawsuit against Zoox, alleging that the proceeds of its sale were dwarfed by the bonuses paid to Zoox's executives by Amazon. The completion of the merger deal was crucial as it would ensure the commercial launch of Zoox's ride-hailing service by the end of 2020. The launch had already been delayed due to the COVID-19 pandemic.

"Since Zoox's inception six years ago, we have been singularly focused on our ground-up approach to autonomous mobility...Amazon's support will markedly accelerate our path to delivering safe, clean, and enjoyable transportation to the world."[1]

– Jesse Levinson, Co-founder, and CTO at Zoox, June 2020

INTRODUCTION

The first half of 2020 saw almost all the nations around the world becoming affected by the Coronavirus disease (COVID-19). The US was the worst-affected as millions became infected and thousands died due to the deadly virus. Economic activities slowed down, the unemployment rate went up, and the share market went south. It was in such tough market conditions that Aicha Evans[2] (Evans), Chief Executive Officer (CEO)of self-driving car start-up Zoox Inc. (Zoox) in the US,was trying hard to generate funds for the company. Zoox was burning cash at the rate of $30 million per month and was expected to run out of cash by July 2020.[3]

Zooxhad also been looking for a suitable buyer for many months. Evans had already appointed Qatalyst Partners, an investment banker, to scout for a suitable buyer. Although Evans knew that it was not the right time to sell Zoox as she would not get a fair value for the company, she evaluated a few offers and sealed one with Amazon, Inc. (Amazon).On June 26, 2020, Amazon announced the biggest ever investment by any online retailer in the autonomous vehicle industry with the acquisition of Zoox.Jeff Wilke, CEO of Amazon'sWorldwide Consumer segment, said, *"Zoox is working to imagine, invent, and design a world-class autonomous ride-hailing experience.....Like Amazon, Zoox is passionate about innovation and about its customers, and we're excited to help the talented*

Flipkart in Trouble?

Syeda Maseeha Qumer and Koti Vinod Babu***

This case discusses the problems faced by leading Indian e-tailer Flipkart Online Services Private Limited (Flipkart) in the Indian e-commerce market. Faced with a fund crunch, heavy losses, tough competition, a management churn at the top, and tougher government regulations, Flipkart found itself in the middle of a storm with the imminent possibility of it ceding the top slot to rival Amazon in the online retail market in India. The company's new CEO Kalyan Krishnamurthy (Krishnamurthy) faces an uphill challenge in improving Flipkart's flagging sales growth, stemming market share losses to Amazon, and sustaining its dominant position in the Indian e-commerce space.

INTRODUCTION

Leading Indian e-tailer Flipkart Online Services Private Limited (Flipkart) hit rough weather after being devalued twice in 2016. Mutual investment company Morgan Stanley[1], in its filings with market regulator US Securities and Exchange Commission[2] (SEC), had reduced the value of its holding in Flipkart by 15.5% in February 2016, pushing Flipkart's overall valuation to below $10 billion. According to Morgan Stanley, Flipkart's enterprise value stood at $9.39 billion, against around $15 billion in 2015[i]. In February 2016, another investor, T Rowe Price Group Inc.[3], also reduced the value of its holding in Flipkart by 15%. According to experts, the devaluation would impair Flipkart's capacity to raise funds in the future. Apart from this, Flipkart was in hot water due to tough competition in the e-commerce space, frequent changes in its top management, government regulations on e-tailers, and diminishing profits. Commenting that Flipkart's strategies were flawed, Media group Network18'[4]s founding CEO Haresh Chawla said, "Flipkart is in the middle of a storm of its own making. The ignominy of squandering its first mover advantage to Amazon will only heighten the crisis brewing inside."[ii]

Launched in October 2007, Flipkart was the leading e-commerce company in India with about 8 million shipments per month and 100 million registered users as of 2016. In January 2017, in a major restructuring, Kalyan Krishnamurthy[5] (Krishnamurthy) who was heading the Category Design Organization at Flipkart, was appointed as its new CEO replacing co-

IndiaMART – The Evolving B2B Marketplace

V Namratha Prasad and Anil Anirudhan***

The case talks about the growth of IndiaMART InterMESH Ltd. (IndiaMART) in the Indian B2B marketplace and the solutions provided by it for the buyers and sellers on its platform. Initially, IndiaMART catered to the needs of the exporters by listing them on its website and creating websites for them. Gradually, with the changing economic conditions, IndiaMART gravitated toward the domestic SMEs (Small and Medium Enterprises). The case provides details about the way IndiaMART facilitated business between sellers and buyers through its platform. The company's innovative technological solutions that enabled business interactions are described. Its impact on the Indian B2B marketplace is discussed, apart from the various challenges faced by it. The case ends with a glimpse into the future opportunities for the company that had targeted achieving Rs.2000 crore in revenues by the year 2020.

"IndiaMART was started out of nothing in the mid-Nineties. Nothing but the belief that the Economic Liberalization in 1991 had a long way to go for nobodies like us, then, to get on board, realize the opportunities, innovate and deliver. When we began, we just didn't have the money to match up to the 'big' requirements of the Indian market. At the same time, at the core of our idea was the belief that we needed to start something for the 'small'. That was our opportunity!"[1]

– Dinesh Agarwal, Chief Executive Officer and Founder, IndiaMART InterMESH Ltd., in April 2016

INTRODUCTION

In October 2017, India's largest online marketplace IndiaMART InterMESH Ltd. (IndiaMART) launched a payment gateway through which its 40 million buyers and three million sellers could transact their business electronically.[2] The changing mindset of the Small and Medium Enterprises (SMEs) *(See Exhibit I for information on SMEs)*, its core market, toward digital payments had prompted IndiaMART to launch the payment gateway. The payment gateway had features like escrow[3] services, a digital payment platform, and financing for the SME's.

Natura's Acquisition of Avon Products

Indu Perepu and Benudhar Sahu***

The case is about the acquisition of Avon Products, Inc (Avon) by its competitor, Brazilian cosmetics and personal care firm Natura&Co (Natura). The acquisition created the fourth-largest beauty company in the world. A lot of synergies were expected from the acquisition as both the companies were known for their direct selling models. At the same time, the companies were expected to face integration challenges due to their diverse cultures and values. Avon had been struggling for years, as there had been a fall in its door-to-door cosmetics sales due to changing consumer tastes, growing demand for online beauty products, and stiff competition from rivals. Natura was also fast expanding its footprint by broadening its exposure to the global market with the acquisition of The Body Shop and Aesop. In May 2019, Natura reached an agreement with Avon under which it would buy Avon via a share swap.

INTRODUCTION

On May 22, 2019, Brazil-based cosmetic company Natura & Co (Natura)[1] agreed to acquire its competitor Avon Products, Inc[2] (Avon) in an all-stock deal. The acquisition would create the fourth largest beauty company in the world. The combining of the two companies would create a best-in-class multi-brand and multi-channel beauty group, with direct connections to consumers on a daily basis, analysts observed. According to Jan Zijderveld (Zijderveld), Avon's Chief Executive, *"Together with Natura, we will have broader access to innovation and a portfolio of products, a stronger e-commerce and digital platform, and improved data and tools for Representatives to drive growth and enhance value for shareholders."*[3]

Natura was a cosmetic and personal care giant operating in the US, Latin America, and France. Founded by Antônio Luiz Seabra (Seabra), Natura became a public company in 2004. Avon was a direct selling company in the beauty, household, and personal care categories. It had a network of millions of beauty advisors (independent Avon Representatives), who supported customers worldwide with personal beauty advice and products. Avon had been struggling for years as revenues from its popular door-to-door cosmetic sales model continued to fall due to increasing competition from rivals, changing consumer tastes, and the growing preference for shopping for beauty products online.

Natura aimed to take advantage of the thriving global natural and organic beauty market and believed that combining the two businesses would help its growth. The acquisition with potential synergies of $150-200 million a year was expected to benefit both the companies through Natura's innovative and ethical products and Avon's global reach. Despite the potential, analysts opined that integrating two companies that were vastly different in culture and values could be a huge challenge.

The Fall of Reliance Communications

Indu Perepu and Nagendra Kumar M V***

The case study describes the journey of Reliance Communications (RCom) from being an industry leader to going bankrupt. Despite being in a strong competitive position, RCom was unable to sustain its position due to the changing dynamics of the telecom industry and the acute competition from various players in the market. The failure to maintain its momentum in the face of the ever changing market dynamics put RCom in a critical position with a growing debt burden. The launch of Reliance Jio by Mukesh, which marked his re-entry into telecom, proved to be the death knell for RCom. The present case study provides scope to discuss the competitive scenario in the Indian telecom industry, the strategy adopted by RCom, the reasons for the failure of the company, and the future of the telecom industry in India.

INTRODUCTION

In the year 2005, Anil Ambani (Anil), younger son of Indian business tycoon Dhirubhai Ambani (Dhirubhai), has got the telecom, energy, and financial services businesses as a part of his share from the family-owned conglomerate Reliance Industries Limited (RIL). The businesses of RIL were divided between Anil and his brother Mukesh Ambani (Mukesh). The businesses acquired by Anil were considered to be lucrative with a lot of potential to grow in future, especially the telecom business, Reliance Infocomm[1] (later renamed as Reliance Communications or simply RCom since 2005)[2].

The telecom business was also considered to be the brain child of Dhirubhai, who had wanted to create a revolution in the Indian telecommunications sector by offering telecom services at affordable prices. Anil then reorganized the companies he owned and brought them under the Reliance Anil Dhirubhai Ambani Group (ADAG) or The Reliance Group. After making a mark in the field of telecom industry in its early days, RCom was unable to sustain its market position, and it lost its share to more nimble competitors. The market capitalization of RCom, which was Rs.1.65 trillion in 2008, came down to Rs.16.87 billion by early 2019, due to sharp decline in revenue coupled with huge debt[3].

Owing to the pressures from the debtors, the company filed an insolvency petition, in February, 2019 to initiate steps for the voluntary closure of the telecom business. On the other side, due significant failures in other businesses, the personal wealth of Anil declined from $42 billion in 2008 to $109 million by 2019.

* Assistant Professor, IBS Hyderabad (Under IFHE – A Deemed to be University u/s 3 of the UGC Act 1956), Hyderabad, Telangana, India. E-mail: indup@ibsindia.org

** Senior Research Associate, IBS Hyderabad (Under IFHE – A Deemed to be University u/s 3 of the UGC Act 1956), Hyderabad, Telangana, India. E-mail: nagendra@ibsindia.org

1 Reliance Infocomm was formed as a subsidiary of Reliance Industries Limited. Later, its ownership and control were transferred to Anil Ambani, younger son of Dhirubhai Ambani, as a part of his share during the division of the family owned businesses.

2 For understanding the company is represented as RCom throughout the case, based on the time period in which it was referring to can be considered with the respect to with which it would be referring for that particular period.

Staying Ahead of Competition: Zoomcar

Vaibhav Shekhar, Ramendra Pratap Singh** and Tulika Sharma****

Zoomcar, a self-drive car rental company, was founded in 2013 with a view to filling the gap of transportation challenges in Indian market. Making use of the emerging innovative technology solutions such as Internet of Things (IoT) the company aimed to provide a superior driving experience to its customers. Backed by several rounds of funding, Zoomcar targeted to expand its fleet size to 8,000 cars operating pan India. In order to achieve the objective, the company shifted its business model from 'asset heavy' to 'market place model,' which indicated a shift from owning the cars to letting individuals rent their car for use. Through its Zoomcar Associate Program (ZAP), it further expanded its fleet size. However, the car rental market witnessed an increase in competition with the entry of players like JustRide and Myles. In the above scenario, would Zoomcar be able to sustain its growth in a market which was becoming increasingly competitive? How would it differentiate itself from its competitors? Would the modifications in its business model enable Zoomcar to achieve its targeted growth?

INTRODUCTION

In 2014, at a time when the Indian car rental industry was dominated by the unorganized sector and cab aggregators, India got its first self-drive car rental company, Zoomcar, that was co-founded by Greg Moran (Moran) and David Back (Back). Backed by several rounds of funding, the company took several measures to provide a superior driving experience to its clients and establish a better connection with its target customers. It adopted various technology-based innovations (especially the Internet of Things) to offer a wide array of car options and pricing plans to customers, enhancing its overall offering and actively promoting the brand on various media platforms. As a consequence, it grew steadily and became EBITDA profitable by the end of 2017. Zoomcar had the ambitious plan of growing its fleet size to 25,000 cars by the end of 2018. To do this and to improve profitability, it modified its business model. However, the management of the company soon realized that the growth was not in line with its plans as it had achieved only one-eighth of its targeted fleet size by the end of 2017. Since 2014, the organized self-drive car rental market in India had also witnessed the emergence of similar players such as Myles, JustRide, Voler, and Revv, all using technology and innovation to up their game. So, could Zoomcar sustain its growth in a market that was becoming increasingly competitive? How would it differentiate itself from its competitors? Would the modifications in its business model enable Zoomcar to achieve its targeted growth?

ABOUT THE INDUSTRY

Till 2014, the Indian car rental market was dominated by unorganized players who constituted almost 90 percent of the market and consisted mainly of individual car owners,

IKEA Builds Smaller Format Stores, Comes Closer to Customers

Sanjib Dutta and Anil Anirudhan***

The case is about the tweak in the strategy followed by Inter IKEA Systems B.V. (IKEA) of opening small stores (Planning Studios and Touch Points) within the city limits in place of large big format stores in the city outskirts. IKEA was also implementing newer technologies like Augmented Reality (AR app) and focusing more on online sales with home delivery to cater to the change in the millennials' preference for ease of commutability and minimalistic furniture. The change in strategy was implemented as more millennials settled in the cities with requirements of multi-utility furniture in smaller living spaces. The market conditions and trends were more towards online sales, usage of new technologies and smaller stores within the city centers. IKEA was focusing more on online sales with plans to tie-up with Amazon and Alibaba. Will IKEA's new strategy bring results? Will it be the end of the large blue and yellow big box?

"This is how we have accelerated in our ambition to become more accessible. It's never going to be that we go back to only opening big stores. It will be a mix of formats, including smaller stores closer to where people live or work or move."[1]

- Jon Abrahamsson, CEO, IKEA, in January 2021

"At Ikea we're on a journey to transform our business to meet our customers wherever they are and how they like to shop. As life at home has taken on a new meaning this year for so many people, our customers' needs and behaviors are changing too, and we hope our new Queens store will serve as a convenient and accessible source of inspiration and home furnishing experience for New Yorkers."[2]

- Javier Quinones, President and Chief Sustainability Officer, IKEA Retail U.S., in January 2021

INTRODUCTION

In January 2021, Inter IKEA Systems B.V. (IKEA) opened a smaller-format store at Rego Park Shopping center, Queens, New York, US. The store, spread over 115,000 square feet, was the first of IKEA's planned mini stores in the US with two more to come up in Chicago and Los Angeles by 2023.[3] The Rego Park stores were aimed at satisfying the customers' need for shoppable take-home items as well as larger items that were deliverable to any location in New York City and had a home assembly option.

Micromax Returns

Syeda Maseeha Qumer and Syeda Ikrama***

The case discusses the re-entry of homegrown smartphone brand Micromax Informatics Limited (Micromax) into the Indian smartphone market with a new range of 'In' smartphones launched in November 2020. In an attempt to cash in on the anti-China sentiment triggered by the India-China military clash in Galwan Valley in June 2020 and backed by the Indian government's Production Linked Incentive (PLI) scheme, Micromax plotted a grand comeback to the Indian smartphone market. As Micromax embarks on its second innings in the highly competitive Indian smartphone market, it will face certain challenges, including intense competition from Chinese rivals, the onset of 5G, reduced customer spending due to COVID-19, and regaining the trust of customers. Whether Micromax can make a strong reentry and reclaim its lost market position remains to be seen.

"They [Micromax] need to sort out their internal goals. What exactly are they going to do? It is not easy to become the number one smartphone brand anymore. Very difficult to fight a spec and price battle. What can they do that Chinese vendors can't, that's the question that will need to be answered."[i]

– Rushabh Doshi, Research Director at market research firm Canalys Research, in 2020

INTRODUCTION

On October 16, 2020, Rahul Sharma (Sharma), CEO of India-based smartphone maker Micromax Informatics Limited (Micromax), announced the re-entry of the brand into the Indian smartphone market with a new range of affordable smartphones called 'In'. A rising intense anti-China sentiment in India following the Indo-Chinese standoff[1] at Galwan province of Ladakh on June 15, 2020, and Indian Prime Minister Narendra Modi's call for an AatmaNirbhar Bharat (self-reliant India), had reportedly prompted Micromax to make a comeback after a nearly two-year-long hiatus. Commenting on the company's comeback plans, Sharma said, *"We want our old position back. That is the target, else we would not be making this comeback. We understand the sweet spot of this market and you will have a Micromax product disrupting all of these sweet spots. We have the infrastructure and manufacturing set-up in place and are investing big time in R&D. We are here to disrupt."*[ii]

Micromax was once India's leading mobile phone company with a market share of 17% in 2014. However, intense competition, spurred by an onslaught of Chinese smartphone makers and India's rapid transition from 3G to 4G, hit the company's business and led to its fall. As Micromax embarked on its second innings in the country, it was likely to encounter some

Nestlé and Starbucks Licensing Deal – A New Brew in the Global Coffee Market

Indu Perepu and Koti Vinod Babu***

The case is about the strategic alliance between US-based food and beverage company Starbucks Corporation (Starbucks) and Switzerland-based food company Nestlé S.A. (Nestlé). The former gave Nestlé the perpetual rights to sell the packaged food products of Starbucks globally. Through this association, the two companies would work closely together on innovation and on marketing Starbucks' products globally. Starbucks was looking at ways to distribute its products globally, but did not have the capabilities to do so on its own. Developing a new distribution system was not a cost effective solution. Earlier, the company had entered into a partnership with Kraft Heinz to market its products, but it later called off the deal alleging that Kraft had mishandled the distribution. Nestlé was looking at expanding its presence and appeal in the US market, where its Nespresso was facing competition from several players.

INTRODUCTION

On August 28, 2018, Swiss transnational food and drink company Nestlé S.A. (Nestlé) and American coffee company and coffeehouse chain Starbucks Corporation (Starbucks) announced the finalization of a $7.15 billion licensing deal that allowed Nestlé the perpetual rights[1] to market Starbucks consumer packaged goods and foodservice products globally *(See Exhibit I)*.This association would give Nestlé the right to sell the packaged coffee products of Starbucks in supermarkets, restaurants, and other retail outlets under the Starbucks brand. Nestlé would also sell Starbucks' ancillary brands like Seattle's Best Coffee, Starbucks Reserve, Starbucks VIA, Teavana, and Torrefazione Italia.

Analysts felt that the alliance would synergize the experience and competences of both companies, bringing in better products for coffee aficionados globally. MarkSchneider (Schneider) CEO of Nestlé, said, "This partnership demonstrates our growth agenda in action, giving Nestlé an unparalleled position in the coffee business with a full suite of innovative brands. With Starbucks, Nescafé and Nespresso we bring together the world's most iconic coffee brands."[2]Kevin Johnson (Johnson), president and CEO of Starbucks, said, "This global coffee alliance with Nestlé is a significant strategic milestone for the growth of Starbucks."[3]

Agthia Group's UAE Growth Through Acquisitions

V Namratha Prasad and Subhanjali Chakravarthy***

This caselet emphasizes the inorganic growth strategy of the Agthia Group PJSC (Agthia) by way of acquisitions and Joint Ventures (JVs). It describes the company's story since its inception in 1978. Agthia's struggles to prosper under government ownership and the operational problems it faced due to a vague organizational structure are described. It also takes a look at the acquisitions and JVs undertaken by the company to turn its operations around and grow. It discusses the company's restructuring exercise in 2015 and the strategies used. The opportunities existing in the United Arab Emirates' (UAE) Food & Beverage (F&B) sector are highlighted. The caselet also goes into the challenges the company might face due to external factors in the UAE's F&B markets. It concludes with a glimpse into Agthia's future prospects.

"...We continue to remain steadfast in our commitment to innovation, further emphasizing our responsibility to acknowledge our consumers' health and wellbeing consciousness. We likewise do this to set the bar in the food and beverage industry and become an example in our collective obligation to address our nation's health and wellness issues..."[1]

– Dhafer Ayed Al Ahbabi, Chairman, Agthia Group PJSC, UAE, May, 2017

INTRODUCTION

On August 7, 2018, Agthia Group PJSC (Agthia) reported a Q1 2018 net profit of AED[2] 109 million and revenues of AED 1.01 billion, representing a growth of 1% yoy. The company's profits had increased by 6%, driven by its focus on attaining cost efficiencies and enhancing product mix across key categories *(See Exhibit I for the Net revenues and Net Profits for the period 2012-2017).*

Established in 1978, Agthia had been dominating the Food and Beverages (F&B) industry of the United Arab Emirates (UAE)[3], for almost a decade (2008-2018). The company, also considered one of the leading market players in the F&B sector in the Gulf Cooperation Council (GCC)[4] region, owned a portfolio of well-integrated businesses and brands.

Agthia began in a small way, but it expanded its market share and revenues over the years due to a plethora of acquisitions and greenfield expansions[5]. That enabled the company to

Birchbox (A)

Indu Perepu and Alok Kavthankar***

The case discusses Birchbox, a New York-based beauty products subscription start-up, which had executed a second round of lay-offs in June 2016 in an attempt to steer itself toward profitability. Birchbox's operations were labour-intensive, which was a limiting factor and kept the company from exploring more customization while keeping the same cost structure. Subscribers were finding a mismatch between their preferences and the samples which Birchbox delivered to them. The surprise element which happened to be one of the core offerings of Birchbox was fading. The only way to effectively monetize its model was to convert the subscribers to full product buyers on its online portal. But Birchbox's subscription also boosted its competitors' sales as customers were free to make full purchases from any site of their choice. Birchbox had a generous loyalty program in place, but its effectiveness came into question because there was a view that the subscribers were keener on earning loyalty points than on the products themselves.

INTRODUCTION

In January 2016, Birchbox Inc. (Birchbox), a New-York based beauty products subscription start-up, laid-off 15% of its workforce. The company said the lay-offs were done to rebalance the organization and attain profitability and were in line with the demand from its investors. Katia Beauchamp (Beauchamp), co-founder of Birchbox, said, "It's 100% the right decision for the company."[1] Earlier that month, Birchbox had had to shelve its plans to expand because it couldn't draw additional funding from new investors. But Beauchamp remained bullish on the company's future growth prospects. She said subscriptions were growing and orders of full-sized products had doubled year-on-year.

Birchbox was founded in 2010 by Hayley Barna (Barna) and Beauchamp when they met at Harvard Business School[2]. The idea was to enable consumers to discover great products at their convenience. The concept was popularized as discovery retailing. Birchbox sold curated monthly boxes containing five beauty samples (Skin Care, Hair Care, Make-up, Body Care, and Fragrance) for a fee of $10 a month. The contents of the boxes were assorted and were in accordance with the profile and preferences of the customers, which were captured when they registered on the website. Birchbox also sold full-sized products through its site. By 2016, around 35% of the revenue[3] came from subscribers who went on to buy full-sized products of the samples they had tried. In 2014, Birchbox set up its first physical store in New York[4] and had plans to expand its retail footprint through other similar stores.

Though the company was doing well, Birchbox found the funding environment difficult and laid off 45 people in January 2016. Beauchamp said, "It's 100% the right decision for the

Hershey's Acquisition of Amplify Snack Brands

V Namratha Prasad and Anil Anirudhan***

This case is about the acquisition of Amplify Snack Brands, Inc. (Amplify) by The Hershey Company (Hershey) in end 2017 under its new CEO Michele Buck (Buck). It details the terms of the acquisition and provides a brief background of Hershey and Amplify. The various stated reasons for the acquisition by Hershey are discussed, including the necessity to capitalize on the growing consumer preference for healthy products and the need for greater product diversification. Hershey's revenues, which had been down in the previous three years, provided the right impetus for the acquisition. The case also discusses the various potential risks involved in the acquisition. Going forward, can Buck consolidate Hershey's position in the US snacking segment with more acquisitions?

"The acquisition of Amplify and its product portfolio is an important step in our journey to becoming an innovative snacking powerhouse as together it will enable us to bring scale and category management capabilities to a key sub-segment of the warehouse snack aisle."[1]

– Michele Buck, Chief Executive Officer, the Hershey Company, in December 2017

INTRODUCTION

On December 18, 2017, The Hershey Company (Hershey) acquired Amplify Snack Brands, Inc. (Amplify) for $1.6 billion. Michele Buck (Buck), who became the CEO of Hershey in March 2017, was the main driving force behind the deal and the acquisition was the first big initiative led by her. All the outstanding shares of Amplify were acquired by Hershey for $12 per share, a 71% premium on the share price.[2] The $1.6 billion deal included a net debt of $600 million and tax obligations of $76 million of Amplify.[3] Post the acquisition, Amplify was expected to function as a standalone entity throughout 2018 and to subsequently be integrated with Hershey.

ABOUT HERSHEY AND AMPLIFY

Founded by Milton S. Hershey in 1894 in the US, Hershey's products were sold in over 60 countries worldwide. As of 2017, Hershey was the largest North American manufacturer of chocolates with a market share of about 44.6%.[4] The company also manufactured sugar confectionery products; gum and mint refreshment products; pantry items such as baking ingredients, toppings, and beverages; and snack items such as spreads. Across the world, Hershey had more than 80 brands, the most famous being *Hershey's, Reese's,* and *Kisses.*

Amplify, founded in 2010, was a US-based snack food company, whose product range included popcorn, potato chips, tortilla chips, and protein bars. The company's key brands

JioMart: Changing the Dynamics of Retail Industry in India

Indu Perepu and Benudhar Sahu***

The case is about JioMart, an e-commerce venture of Reliance Retail Limited, the retail arm of leading business conglomerate in India, Reliance Industries Limited. JioMart, launched in December 2019, aimed to integrate digital and neighborhood physical retail stores to help customers get easy access to household essentials. The JioMart platform aimed to connect local grocers through an offline-to-online business model that would help consumers to place orders online and get groceries delivered from a store located nearby. Reliance started signing up small kirana stores (mom-and-pop stores) to empanel them. JioMart acted as the digital storefront, representing a blend of Reliance Retail's distribution centers, Reliance Jio's customer base, the neighborhood mom-and-pop stores, and other organized retail outlets owned by Reliance. Reliance partnered with Facebook's WhatsApp messaging service in April 2020 to pilot its online food and grocery channel JioMart. JioMart expected the partnership to lead to WhatsApp being used by small businesses to connect with customers. Later, the online grocery platform extended its services to 200 cities and towns across India.

INTRODUCTION

As of May 2020, JioMart, the e-commerce venture of India-based Reliance Retail Limited, had launched its JioMart service in 200 cities across the country. Reliance Retail, the retail arm of the India-based conglomerate Reliance Industries Limited (RIL), ran India's largest chain of neighborhood supermarket stores and consumer electronics stores. It was also the top wholesale supplier to the country's small shopkeepers. Reliance launched its online grocery shopping portal JioMart in India in December 2019 and the portal picked up during the nationwide lockdown imposed to control the COVID-19 outbreak in the country. Due to the COVID-19 pandemic, online grocers saw explosive demand as people preferred to shop for their groceries digitally. Mukesh Dhirubhai Ambani (Mukesh), chairman and managing director of RIL, said the introduction of a more remote way of ordering food would help people who were staying at home amid the pandemic and preferred to shop for their groceries digitally. *"Ultra-convenience food delivery opportunities are booming amid the COVID-19 outbreak, and Reliance is clearly looking to turn fresh demand into revenue, following in the footsteps of similarly expanding operators such as Deliveroo, UberEats, GrubHub and DoorDash, across Europe and the US,"*[1] said Thomas Brereton, Retail Analyst at leading data and analytics company GlobalData Plc.

JioMart offered its customers free express grocery delivery from neighborhood mom-and-pop stores. The platform covered everything related to grocery, Fast-Moving Consumer Goods (FMCG), and consumer goods as well as farm produce. Reliance partnered with millions of small merchants and kirana stores (neighborhood retail outlets) to allow customers to order online groceries from their neighborhood shops amid the coronavirus crisis.

McDonald's in India: Troubled Times, Troubled Ties

Indu Perepu and Alok Kavthankar***

The case is about the tussle between US burger major McDonald's and its Indian joint venture partner Vikram Bakshi (Bakshi), which impacted the fortunes of the company in the highly attractive Quick Service Restaurant market in India. After more than 15 years of smooth operations, during which McDonald's acquired a pan-India presence and became synonymous with fast food in the country, the ties between Bakshi and McDonald's grew strained. McDonald's said CPRL did not maintain the required quality and had failed to pay royalties for two years. It sought to buy out CRPL at a low price. Bakshi claimed that the money meant for the royalty was used to settle a debt of which McDonald's was aware. At the same time, McDonald's went in for a friendly buyout of HRPL, after which its fortunes took a turn for the better. McDonald's issued notice to CPRL to close down its restaurants and terminated the agreements with its suppliers. But Bakshi continued to operate with a different set of suppliers. The parent company termed it as a breach of contract. As the stalemate continued, competitors started gaining ground in the Indian QSR market.

INTRODUCTION

On August 21, 2017, US global burger chain, McDonald's released a notice announcing severance of all ties with its Indian master franchisee (for the North and East Indian regions), Connaught Plaza Restaurants Limited (CPRL), thereby ending a 22-year-old relationship. Termination of the relationship would result in the shutdown of 169 McDonald's outlets and a loss of around 6,500 jobs along with the abrupt termination of the long-term supply contracts with vendors and property lessors. CPRL was a 50/50 joint venture between McDonald's India Pvt. Ltd (MIPL), a subsidiary of McDonald's, and Vikram Bakshi (Bakshi). The CPRL board comprised four members; two McDonald's representatives, Bakshi, and his wife.

McDonald's cited that default in the payment of royalties by CPRL was the primary reason for termination of the partnership. The termination notice stated, "CPRL has to cease using the McDonald's system (which includes proprietary rights in McDonald's names, trademarks, designs, branding, operational and marketing practice and policies, and food recipes and specifications) and its associated intellectual property in relation to these restaurants within 15 days of the termination notice."[1]

Bakshi alleged that McDonald's was aware of the fact that royalties were not being paid and that the money was being used to settle the debt overhang and interest expenses instead and that the two McDonald's representatives on the CPRL board had approved the transactions. Observers opined that non-payment of royalties was used as a silver bullet to sever ties with the master franchisee which McDonald's had been trying to do for almost a decade. It was not that severing ties with franchisees was unprecedented for McDonald's, which had thousands of franchisees across the world. But CPRL was a master franchisee and that too a 50:50 JV, one which had access to millions of Indians and their rising disposable incomes;

Paytm's Foray into Payments Banking

Dwarakanath Siriguppi[1], Amar Raju[2], Manish Agarwal[3] and Vijayudu G[4]

The demonetization decision by the Government of India in November 2016 opened new horizons for digital wallet companies. One of the objectives of demonetization was to transform the Indian economy into a cashless economy and the digital payments industry was in a position of strength to leverage on this opportunity. One of the biggest beneficiaries of demonetization was Paytm, one of the popular mobile wallet services in India, as people moved toward cashless payments. To take advantage of the growing use of digital payments, Paytm diversified its business to the payments banking industry and launched Paytm Payments Bank at the end of 2017. Even though the demonetization decision, high penetration of the Internet, and increase in the number of smartphones had created a new avenue for cashless transactions, it was not easy for Paytm Payments Bank to capitalize on the opportunity as the majority of the people still preferred cash transactions.

"The Paytm Wallet is being complemented with the Paytm Payments Bank account. This will enable our customers earn interest on their deposits in the bank account."[1]

– Renu Satti, former MD and CEO, Paytm Payments Bank, October 2017

"Digital payments was our entry point, we want to become a vertically-integrated financial services company."[2]

– Vijay Shekhar Sharma, Founder, Paytm and Paytm Payments Bank, November 2017

INTRODUCTION

On November 8, 2016, the Government of India (GoI) under the leadership of Prime Minister Narendra Damodardas Modi (Modi) made a surprise announcement on television that Rs.[3]500 and Rs.1,000 notes, the highest denomination currencies in India, would cease

Quikr's Inorganic Growth Strategies

Indu Perepu and Benudhar Sahu***

The case is about India-based online classifieds portal Quikr's expansion through acquisitions to fulfil its plans of becoming a sector leader. Founded as a classifieds platform, Quikr had identified five business segments – Cars, Homes, Jobs, Automobiles, and Real Estate – for its verticalization push. The company had focused on these segments in order to explore new sources of revenue and users. Over the years, Quikr had expanded inorganically by acquiring several companies. However, Quikr's acquisition strategy did not work out as well as the company expected. Like many other e-commerce platforms, the company was struggling to monetize its platform and was concentrating on businesses that were losing less money. It faced tough competition from the other players like OLX, which listed refurbished products on its platform. Even after a decade of existence, Quikr's revenues were only Rs.1.99 billion. It needed, therefore, to consolidate its position before thinking of other acquisitions, opined experts.

INTRODUCTION

On April 25, 2019, Indian online classified portal Quikr India Pvt Ltd. (Quikr) announced the acquisition of Zefo, an online marketplace based in Bengaluru, India, to further scale its pre-owned goods and services vertical. "*The acquisition of Zefo is in-line with the phenomenal consumer acceptance of the Assured products and services on our platform...Now, with Quikr and Zefo as a combined entity, we will be able to offer a broader selection of products at even more competitive prices along with as strong a focus on quality*,"[1] Pranay Chulet (Chulet), co-founder and CEO of Quikr, said.

As a diversified platform operating across several segments like consumer goods, automobiles, real-estate, and jobs, Quikr catered to a diverse set of consumer needs. In 2008, it started as a classic horizontal online classifieds platform that brought buyers and sellers together to address their needs in the simplest and fastest way. Subsequently, the company allowed its users to list different types of products ranging from mobile phones, electronics, cars, bikes, jobs, furniture, homes, to services. The company also expanded to enable payments on its platform and facilitated logistics across cities. While the company's multiple business verticals aimed to explore new sources of revenue, Quikr also planned to use the inorganic route to fuel its expansion. By April 2019, Quikr had acquired 15 companies, investing around $250 million in their acquisition.

However, the company was struggling to convert traffic on its platform into revenue and to expand its business verticals into profitable segments. Despite having become a unicorn[2] in 2015, Quikr's revenues were only Rs.1.99 billion for the year ending March 2018 and it was still making losses even after 10 years of existence (2008-2018). Analysts believed that while Quikr faced an increasing threat from competitors in different segments and needed to spruce up its strategies to benefit from the acquisitions in order to turn profitable.

Business Model of Online Cab Aggregators in India

Ankit Kesarwani and Debapratim Purkayastha***

The online cab aggregator industry in India had witnessed tremendous growth since 2013. This was not only in terms of customer growth, but venture capitalists had also shown confidence in the industry by making investments of billions of dollars across a few companies including start-up firms, which might take a longer time to pay back the amount. What differentiated these cab aggregators from radio taxi operators was that there was no need for them to hold inventory and they had to face fewer legal hurdles as they neither owned the vehicles nor did they have any drivers on their payroll. The online cab aggregator industry operated on a pay-for-performance business model, where the cab drivers were paid for the pick-up and drop services of the cab aggregator companies.

"There is a lot of supply and a lot of demand for taxis in every city, but there is no platform that connects the two. We believe that technology can bridge this gap and add a lot of value to this space," [i]

– Bhavish Aggarwal, co-founder and CEO, Ola Cabs[1], ANI Technologies Pvt. Ltd., in 2013

"Uber is efficiency with elegance on top. That's why I buy an iPhone instead of an average cell phone, why I go to a nice restaurant and pay a little bit more. It's for the experience." [ii]

– Travis Kalanick, Chief Executive Officer, Uber Technologies Inc.,[2] in 2015

ONLINE CAB AGGREGATORS: INDUSTRY OVERVIEW

Krishna, a full time bank-clerk, turned into a part-time taxi driver and earned more than Rs. 50,000 per month.[3] Krishna, who had worked as a bank clerk for five years, left his job as he did not like having to work 8-10 hours and or to follow others' instructions. Instead, he chose to work on his own terms. So, in 2015, he purchased a sedan through bank finance, and joined the bandwagon of drivers opting to work for an India-based cab aggregator company, Ola Cabs, owned by ANI Technologies Pvt. Ltd. (ANI). In the first month itself, he earned around Rs. 35,000 which was more than double his pay in the bank. Soon, he understood the dynamics of the online cab industry. So, as of 2016, on an average, he took around Rs. 50,000 back home. Ola, according to Krishna, also topped up with an additional incentive of Rs. 250 per completed trip during peak hours. And if the drivers maintained excellent ratings, they also earned incentives. Krishna said, "I am doing services for Ola

USAA's Century Old Spirit of Innovation: The Key Differentiator

Jitesh Nair[*]

The case focuses on how USAA, a US based financial services group, built a culture of innovation using a toolkit of different innovation programs over a century. It then describes how the management at USAA supported by a cross-functional organizational structure and sensitivity training for employees. The case also touches upon the establishment of an Innovation Lab where employees could partner with core innovation team to pilot new ideas. It also describes how USAA evaluated the ideas through employee participation which led to an innovation pipeline of products and services that were a first in the insurance sector. The case ends with the future plans of USAA to support customer-focused innovation and make the lives of its customers easier leading to enhanced customer experience. It can be used for postgraduate and executive programs in courses on Organizational Behaviour, Business Strategy and Human Resource Planning.

"USAA has always been an innovator, and the addition of Noblr, Inc.'s technology platform is another example of our commitment to deliver world-class service and experiences to our members." [1]

- **Wayne Peacock, President and Chief Executive Officer, USAA, in 2021**

What distinguishes USAA's innovation lab from others is its focus on revolutionary innovation. Rather than zoom in on what customers want today, USAA employees aim to meet the needs of future customers and markets.[2]

- **Tim Brown, Vice President of IT Innovation Research and Development, USAA in 2017**

INTRODUCTION

USAA (United Services Automobile Association), a Fortune 500 diversified financial services group of companies based in the US, had ninety-six percent customer retention; the highest Net Promoter Scores in home insurance, auto insurance, and banking for 11 consecutive years; consistent 'employer of choice' ratings on Glassdoor; and 64% of customers reporting that they were 'very satisfied' with the services they received.[3] The company attributed these recognitions to its approach of building a culture of innovation.

USAA believed that every employee was an innovator and that the sole purpose of innovation was to benefit customers. The company used a toolkit of different innovation programs that included an ideation challenge, competitions, and hackathons to enable employees to help solve strategic challenges through innovation. USAA reported that about

Diesel USA Bankruptcy: A Restructuring Plan for Survival

Indu Perepu and Benudhar Sahu***

The case is about the American arm of the Italian corporation Diesel S.p.A, Diesel USA Inc. (Diesel USA), best known for its high-end denim. Diesel USA ran into problems due to some of the strategies it had adopted in the post-recession US market. Since its launch in 1995, it had been the sole distributor of Diesel products in the US. Its five-pocket jeans dominated pop culture in the 1990s and early 2000s. But the global recession had a negative impact on the retail sector and Diesel USA fell victim to it. In an attempt to turn the company around, the management wanted to develop an exclusive presence in high-end locations, for which it executed several long-term, expensive leases and repositioned some of the existing stores in premium locations. But these strategies were ill-timed and non-productive and impacted the profits of the company. Incidents of cyber theft and fraud in the company only added to its problems. These failed strategic decisions implemented by the management compelled Diesel USA to file for Chapter 11 bankruptcy protection on March 5, 2019. In the court filing, the company outlined a three-year restructuring plan.

On March 5, 2019, the American arm of Italian corporation Diesel S.p.A, Diesel USA Inc. (Diesel USA), known for high-priced denim, filed for bankruptcy after experiencing years of shrinking sales and losses that were attributed to expensive leases and incidents of theft and cyber fraud. Since its launch in 1995, Diesel USA had been the exclusive distributor of Diesel products in the US.

Diesel's high-priced denim grew highly popular in the USA and, the company had a presence in major cities across the US. But the global recession in 2008 had an impact on the company's profits and its sluggish growth continued up to 2018. To bring about a turnaround in the post-recession period, the management of the company took certain long-term strategic decisions including relocating Diesel USA stores to premium locations to attract high-end customers. In order to open stores in new locations, the company entered into several expensive, long-term leases. But given the recession and its impact on the retail sector, the huge investments in real estate proved to be expensive, ill-timed, and ineffective. Though the strategies produced limited short-term results, net sales continued to fall and losses started to mount. Additionally, Diesel fell victim to multiple instances of theft and fraud, which resulted in losses approximating $1.2 million for the company over the period of three years (2016-18).[1]

Under the strain of $7.4 million in unsecured trade obligations[2], Diesel USA filed for Chapter 11 bankruptcy protection on March 5, 2019.[3] The company cited growing losses,

Ford's Dilemma: Make Lincoln in China?

D Satish and Manish Agarwal***

With China becoming a major market for Lincoln cars, Ford Motors has to take the crucial decision of whether to start production of Lincoln cars in China. While the Chinese luxury car market is set to grow much faster than any other market, shifting production to China would bring with it new challenges like working with a joint venture partner and transfer of technology issues. Interestingly, Ford's competitors like BMW and Audi already produce their luxury cars in China.

"It's different in the U.S. than in China...In China, our heritage plays very strong. Our favorable opinion in China is actually ahead of Lexus and on the factor of prestige, we're actually ahead of Audi."[1]

– Kumar Galhotra, President, Lincoln, January 2016

In October 2016, global automobile producer Ford Motor Company (Ford) reported a 56% decline in net profit to $957 million over the same quarter of the previous year. The company attributed the decline mainly to the slow demand in North America – one of its major markets – increased incentives, and a tough pricing environment. On the other hand, global sales of Ford's luxury band – Lincoln – went up by 17% to 8,546 vehicles and the Asia Pacific delivered a record pre-tax profit worth $131 million in 2016-Q3, up from $109 million in 2015-Q3, largely due to the growing demand from China. In China, Ford had three joint ventures and these contributed $302 million to pre-tax profit in 2016-Q3, $67 million more than in the same quarter of the previous year.[2,3]

Slowing growth in the US market and the continuous growth in China, especially for the Lincoln, made the Ford management give serious thought to producing Lincoln cars in China. Till early 2017, these cars were being produced in the US (at three locations), Canada (at one location), and Mexico (at one location) *(Refer to Exhibit I)*. Interestingly, its US competitor General Motors (GM) was producing the Cadillac[4] in China. Its German competitors were also producing their luxury (premium) vehicles in China, thereby saving on import taxes.

However, it was not easy as the Chinese automobile industry had several restrictions which foreign automobile players had to follow before they could set up production in China. The Ford management, had therefore to decide whether to set up a production line for its Lincoln brand luxury cars in China or continue importing them into the country.

FUTURECRAFT.LOOP – 100% Recyclable Sneakers from Adidas

Indu Perepu[*] and Faria Zafar[**]

In April 2019, Adidas AG of Germany launched its fully recyclable training shoes – FUTURECRAFT.LOOP (Loop). It took Adidas close to seven years to develop the Loop out of a single material and without using any form of glue or solvent. The shoes were launched in a beta phase and a full-scale commercial launch was slated for Spring 2021. The customers were supposed to return the Loop to Adidas once it had reached the end of its life. The company would then break down the shoes into their components and make a new shoe from the old one. For this purpose, Loop was constructed out of a single material – Thermoplastic Polye Utherane (TPU). Loop was a step toward reducing the waste and landfills created by the shoe industry. Making shoes out of used shoes was an entirely new concept as Adidas was recycling the old shoes instead of downcycling them. The company had been experimenting with various innovations to reduce waste and increase sustainability in the environment. And Loop was part of one such innovative offering from Adidas.

"I think it's a big achievement from a product-creation perspective, in that it's never been done before."

– Paul Gaudio, Global Creative Director, Adidas[1]

"We set out to create a new type of product that we can take back, grind up and reapply into new Adidas product."

– Tanyaradzwa Sahanga, Manager, Technology Innovation, Adidas[2]

INTRODUCTION

In 2019, FUTURECRAFT.LOOP by Adidas AG appeared on the Time list of *"Best Inventions of 2019"*[3]. James Carnes, vice president of global brand strategy at Adidas, said FUTURECRAFT.LOOP was meant to be the first step to *"clean up some of the environmental impact that we create through our massive product creation every year."*[4]

In April 2019, Adidas AG of Germany launched its fully recyclable training shoes – FUTURECRAFT.LOOP (Loop). The idea of launching recyclable shoes was a new one. It took close to seven years to develop Loop out of one single material and without using any form of glue or solvent. The shoes were launched in the beta phase and a full scale commercial launch was slated for Spring 2021.

GM Exits India

Syeda Maseeha Qumer and Koti Vinod Babu***

This case is about US-based automaker General Motors Company's (GM) exit from India and the resultant complications to its dealers and customers. The move came after GM's efforts at expanding its market share in the country failed to gain much traction. GM started on a successful note in India with its Opel cars and later on with Chevrolet cars, but it failed to sustain the momentum due to its lack of consistency in leadership, brands, and models. The tough competition in the Indian auto car market and the dominance of Maruti Suzuki and Hyundai in the small car segment only added fuel to the fire. GM was not able to survive in the Indian market with less than 1% car sales in the country and decided to exit. GM said it would, however, continue its production in India owing to the cheap cost of production and export the cars to Mexico and Central and South America. GM's strategic failure to even moderately succeed in the booming Indian car market could be attributed to the company's inability to understand the Indian market and the customers' preferences and to make viable cars that suited the Indian market.

INTRODUCTION

On May 11, 2020, Bharat Financial Inclusion Ltd (BFIL), a subsidiary of IndusInd Bank, announced that its business innovation 'Bharat Money Stores' (BMS) *(See **Figure I** for the logo of Bharat Money Stores)*had facilitated financial transactions of over Rs 1 billion in 5000 villages in the states of Odisha, Bihar, Karnataka, and Maharashtra in India. The wide network of the Rural Distribution Service Points (RDSP), also known as BMS, had enabled On May 18, 2017, US-based automaker General Motors Company (GM) announced that it was exiting the Indian car market as part of its international restructuring exercise. The company said it would stop selling cars in India after December 31, 2017. Despite being an early entrant, GM had struggled to boost its sales and market share in India in part due to its failure to launch low-cost yet feature-rich vehicles that Indian buyers preferred and the high cost of maintaining and servicing Chevrolet cars, said some analysts. Commenting on the move, Stefan Jacoby (Jacoby), president of GM International, said *"We explored many options, but determined the increased investment originally planned for India would not deliver the returns of other significant global opportunities. It would also not help us achieve a leadership position or compelling, long-term profitability in the domestic market."*[1] However, GM would continue production in India, leveraging India's skilled and low-cost labor force and lower raw material prices to supply to Mexico and Central and South America. The sudden announcement by GM left the company's dealers a worried lot. Around 400 direct workers of GM's Indian arm General Motors India Private Limited (GMPL) and thousands of employees at dealerships were facing the risk of losing their jobs. The journey of GM could be traced back to 1887 when Ransom E. Olds started the Olds Motor Vehicle Company Inc., (OMVC) in Michigan, USA, and started selling vehicles

Reliance JIO: Leadership Strategy in the Indian Telecom Sector

Debajani Sahoo[*], *Achyut Telang*[**] *and Mohit Rathi*[***]

The caselet is about Reliance Jio Infocomm Limited (Jio), one of the leading telecom networks in India. By 2019, Jio was next only to Vodafone in marketshare. Jio adopted a predatory pricing strategy to enter the Indian telecom market and initially offered free voice, data, and message services. Jio's move disrupted the competition and major competitors like Airtel, Idea, and Vodafone were forced to frame defense strategies to sustain their market share. They had no choice but to lower their tariffs to retain customers. Jio initially faced certain challenges like sharing of telecom spectrum, problems with other players related to Points of Interconnection, declining internet speed, number portability, etc. However, it moved ahead with its plans to start its commercial operations on April 1, 2017. By 2019, Jio's subscriber base was 340 million and it was rapidly adding more subscribers at the cost of its competitors. It remained to be seen whether Jio would be able to sustain its leadership position and how soon it would emerge as the biggest player in the Indian telecom market in terms of subscribers.

"Jio means to live and to be alive to every opportunity. World's demand for digital oxygen, that is data, is growing exponentially. Jio aims to fulfil this need of Indians. Access to information will now know no barriers"[1]

– Mukesh Ambani, Chairman and Managing Director, Reliance Industries Limited in 2016

INTRODUCTION

In September 2016, MukeshAmbani (Mukesh), Chairman and Managing Director of India-based conglomerate holding company Reliance Industries Limited (RIL)[2], unveiled the Reliance Jio (Jio)[3] plan for its mobile telephone services. Mukesh said that Jio was going to charge one-tenth of the existing global mobile rates[4]. Two-thirds of India's 1.3 billion

Charlotte Russe Bankruptcy: A Revival Plan

Indu Perepu and Benudhar Sahu***

The case is about US-based clothing retail chain store Charlotte Russe Holdings Corp. that filed for Chapter 11 bankruptcy protection in February 2019 in a bid to get relief from mounting debt. The fashion retailer had been struggling to cope for some time after it had incurred heavy losses in its business and had announced a deal to renegotiate certain debts. However, this deal failed to deliver. Soon after, the company entered into talks with prospective buyers to avoid liquidation of all of its assets. Nearly a month later, it announced that it would go out of business and close down all its stores as it had failed to find a buyer. Later, Charlotte Russe sold its brand and related intellectual property to Canadian fashion house YM Inc. YM Inc. announced plans to re-launch the brand by opening 100 retail locations across the country. It also had plans to launch a new online shopping experience. It remains to be seen whether the new management can manage to revive the company.

INTRODUCTION

On February 3, 2019, San Diego-based specialty apparel retailer Charlotte Russe Holding Inc. (Charlotte Russe) filed for Chapter 11 bankruptcy[1] protection. Charlotte Russe, which was purchased by private equity company Advent International back in 2009, continued to face an uphill battle even after the acquisition while it tried to shed its debt. The retailer was struggling with maintaining a brick-and-mortar presence, with sales steadily declining over the four years 2014-2017 due to in-store traffic slowdowns. The fall in sales was attributed to the company's business strategies, which did not resonate with young female shoppers – the company's target audience. Its marketing strategies failed to stay ahead of fashion trends and styles, analysts said. The company was floundering as debt mounted in what had become an increasingly difficult climate for mall-based retailers. In early 2018, the company tried to restructure its debt without going into bankruptcy, but it failed. Too much debt and poor sales hurt the retailer. The company, which operated 500 stores in malls across the US, announced that it was suffering "from a dramatic decrease in sales and in-store traffic" and was struggling with "the burden of maintaining a large brick-and-mortar presence."[2]

After filing for bankruptcy, the fashion retailer planned to close down 94 of its 500 stores nationwide. It stayed in touch with potential buyers to avoid liquidation of all of the company's assets. After failing to find a buyer, the fashion retailer announced that it would close its remaining stores and go out of business. In February 2019, it sold its assets to a liquidation company, SB360 Capital Partners LLC,[3] for $59 million and began conducting "going out of business sales"[4] at all its locations. Inventory belonging to the company valued

Design Thinking at BBVA

Sanjib Dutta and Smita Ray***

The case talks about the adoption of Design Thinking (DT) at Banco Bilbao Vizcaya Argentaria, S.A. (BBVA). It starts out with a brief history of BBVA and then goes on to describe the growth of BBVA over the years. The case covers in detail the concept of DT, the need for DT at BBVA, and the process followed by the bank to implement DT. It also touches upon the challenges faced by BBVA in adopting DT, the impact of DT on its operations, and the additional steps taken by the bank in its digital transformation journey.

"I think a key to our success has been this completely new way of collaborating across disciplines. We sit and work together in the same place, using agile methodologies and introducing customer insights at every stage."

– Margarita Barrera, Global Head of Design at BBVA, in 2020[1]

"The banking sector is going through a period of disruption, but this not the end of the industry. Instead, this disruption marks the genesis of the banking sector's new DNA: a combination of changes in business models, agile execution, and design thinking."

– Dieter Staib, Partner with Oliver Wyman, in 2018[2]

INTRODUCTION

Since 2007, Banco Bilbao Vizcaya Argentaria, S.A. (BBVA), a Spanish multinational financial services company and one of the largest financial institutions in the world with assets of €753 billion, had launched various initiatives under its digital transformation program. In mid-2016, it adopted Design Thinking (DT) in its different business areas worldwide. *(Refer to **Exhibit I** for a Note on DT).* BBVA believed that the implementation of DT would help the bank to promote new ideas and encourage the participation of the entire team in generating ideas. It would also promote collaboration within the team and exposure to new ideas. Lastly, the combination of an end-user focus, stimulation of a creative ideas process, and leveraging a diverse team would help BBVA to develop a competitive advantage in the industry.

Implementation of DT helped BBVA to increase customer satisfaction levels, grow the customer base, and improve the efficiency of the bank. With the help of DT, BBVA enabled customers to manage day-to-day finances easily and efficiently. The bank also provided one-on-one, personalized guidance to customers that helped them to take long-term planning decisions. Commenting on the benefits of DT, Margarita Barrera (Barrera), Global Head of Design at BBVA, said, *"Design is our best tool when it comes to growing customer*

N26: Europe's Leading Challenger Bank

Sanjib Dutta and Smita Ray***

The case talks about the factors that led to N26, a Germany-based neobank, becoming the highest valued German startup and one of the highest valued FinTechs in the world. It starts with a brief history of N26, and covers the innovative products and services which helped it to connect with millions of customers. The case also highlights the competition faced by N26 from FinTech companies like Revolut, Monzo Bank Ltd. (Monzo), and Atom Bank and how it was placed vis-à-vis the competition. The case ends with the future plans of N26, which include redesigning its banking operations and expanding geographically.

"The flexibility and security that digital banking offers is important now more than ever as the pandemic has changed the way consumers save and transact. We're excited to introduce additional tailored product features in the coming year and welcome new users to join us in experiencing a beautifully simple banking platform."[1]

– Alexander Weber, Chief Growth Officer of N26, in August 2020

INTRODUCTION

In December 2020, N26, a Germany-based neobank[2] announced its plans to raise another funding round before a possible initial public offering (IPO) in 2023. By the end of 2020, the bank had raised around $800 million in venture capital. At the same time, N26 became one of the highest valued FinTechs in the world and the highest valued German startup with a valuation of $3.5 billion.[3] It was also the first European challenger bank to enter the US market.

Launched in 2015, N26 became one of the preferred banks among the challenger banks (like Revolut[4], Monzo[5], Atom Bank[6], and many more) in Europe and served more than seven million customers in 25 markets.[7] [8] The innovative digital technology and financial services offered by N26 helped it to consolidate its presence in the European market and enter the US market in July 2019. By the end of 2020, the bank had 0.5 million customers in the US.[9]

Online Grocery Delivery Strategy in India: Amazon Prime Now's Transition to Amazon Fresh

V Namratha Prasad and Koti Vinod Babu***

The case outlines the attempts of multinational technology company Amazon.com, Inc. (Amazon)'s Indian subsidiary Amazon India to establish itself in the fast-growing online grocery delivery space. The case starts out by providing details about Amazon India's foray into the space with the Amazon Prime Now app. It then details the hardships that Amazon India faced with the Prime Now app that led to discontinuation of the app. Later, it takes a look at the company's decision to transition to the Amazon Fresh service – which was offered as part of the main shopping app/website – to remain relevant in the online grocery delivery space. The case then gives a glimpse into the Amazon Fresh service. Can Amazon India make a dent in the online grocery delivery space this time around with Amazon Fresh?

INTRODUCTION

In mid-2020, US-based multinational technology company Amazon.com, Inc.'s[1] Indian subsidiary Amazon India discontinued the 'Amazon Prime Now' (Prime Now) app that it had launched in February 2016. The app, launched as Amazon Now, was later rebranded as Prime Now. The app offered customers two-hour delivery of grocery items.

Prime Now was launched in select cities in India – Bengaluru, Delhi-NCR[2], Hyderabad, and Mumbai. However, the Prime Now service was meant exclusively for Amazon Prime[3] members. Later, it received an update after which customers could purchase electronic items such as Amazon Echo[4] and Kindle[5]. After some time, customers were allowed to even purchase smartphones and accessories through the app.

Un-Carrier – T-Mobile's Strategy to Disrupt the US Telecom Industry

Indu Perepu and Faria Zafar***

In March 2013, T-Mobile US Inc. (T-Mobile), a US-based wireless service provider, launched a marketing campaign called "Un-carrier". Some of the initiatives that the company took under the campaign disrupted the telecom industry in the US. Under the Un-carrier campaign, T-Mobile came out with monthly plans in an industry where long-term contracts were the norm. The complex pricing was replaced with flexible and easy-to-understand pricing. T-Mobile also allowed the customers to get their own phones, where the practice was for the customers to buy a phone from the carriers. T-Mobile came up with 13 Un-carrier plans till 2017. These plans were pocket-friendly for customers. There were "Un-carrier" programs such as unlimited streaming of Netflix.

"We were completely out of touch with customers. We needed to disrupt the industry and stand out from the other guys."

– John Legere, CEO, T-Mobile[1]

"Something this big isn't done overnight. It starts with a customer experience obsessed culture, and a mindset that says customer happiness is job #1."

– Mike Sievert, President and COO, T-Mobile[2]

INTRODUCTION

In 2020, T-Mobile US Inc. (T-Mobile), the US-based wireless service provider, announced that it would challenge the existing norms of the cable industry by launching TVision[3] – an online TV service. Mike Sievert, President and COO, T-Mobile, said, *"Just like we changed wireless for good, now we're gonna change T.V. for good."*[4] T-Mobile had changed the way the wireless industry worked in the US after it launched a campaign called 'Un-carrier' in March 2013. The game-changer campaign was aimed at bringing in radical changes into the generally customer unfriendly telecom industry in US.

Under the Un-carrier campaign, T-Mobile came out with monthly plans in an industry where long-term contracts were the norm. The existing complex pricing was replaced by flexible and easy-to- understand pricing. T-Mobile also allowed the customers to get their own phones, where the norm was for them to buy phone from the carriers. This was followed by

ITC-Sunrise Foods Deal: Creating Business Opportunities for ITC

Indu Perepu and Benudhar Sahu***

The case is about diversified Indian conglomerate ITC Limited's acquisition of Kolkata, India-based spice business company Sunrise Foods Private Limited (SFPL). SFPL, a leading family-owned company, was engaged primarily in the spices business. Over the years, the spice brand had established a loyal consumer base, both in the basic and blended spices category. ITC, earlier called the Imperial Tobacco Company of India Limited, was a private company with a diverse presence in FMCG, hotels, packaging, paperboards and specialty papers, agri-business, and information technology. The company was one of India's leading producers and exporters of high-quality foods and spices, sold under the Aashirvaad brand. To scale up its non-cigarette FMCG business and counter its rivals in the food business, ITC planned to grow in an inorganic manner. The FMCG giant looked to augment its product portfolio and significantly scale up its spice business across the country through acquisitions.

INTRODUCTION

On July 27, 2020, Indian Fast-moving Consumer Goods (FMCG) major ITC Limited acquired 100% of the equity share capital of Sunrise Foods Private Limited (SFPL), a branded spice business company based in Kolkata, India. After the acquisition, SEPL and its two arms – Sunrise Sheetgrah Private Limited, involved in transport, storage, and communications activity, and food stuff manufacturing company Hobbits International Foods Private Limited – became wholly-owned subsidiaries of ITC. Sunrise was a Kolkata-based family-owned company, engaged primarily in the spices business under the trademark *"Sunrise"*. ITC, a diversified business entity, had a presence across segments such as FMCG, hotels, packaging, paperboards, and speciality papers, agribusiness, and information technology. ITC completed the acquisition in an all-cash deal valued at Rs.21.5 billion amid the Covid-19[1] lockdown. *"This is a positive development for ITC as among its diversified portfolio... Branded spices is an exciting and high-growth segment as consumers shift from unbranded to branded due to higher focus on safety, trust and quality,"*[2] said Abneesh Roy (Roy), Executive Vice President (Research) at Edelweiss Securities Limited.[3]

ITC said the acquisition would augment its product portfolio and was in line with its ambition to scale up its spices business and expand its footprint across the country. *"The proposed acquisition is aligned with ITC's strategy to rapidly scale up its FMCG businesses in a profitable manner, leveraging its institutional strengths through deep consumer insight, a deep and wide distribution network, agri-commodity sourcing expertise, cuisine*

McDonald's Franchise in India: Spiraling Towards a Deadlock

Indu Perepu and Alok Kavthankar***

The case discusses the advent of McDonald's India in the country through its two master franchises. Connaught Plaza Restaurants Private Limited (CPRL), run by Vikram Bakshi (Bakshi), was a 50:50 joint venture which operated the chain in north and east India. The second master franchisee, Westlife Development Limited (WDL) through its subsidiary Hardcastle Restaurants Private Limited (HRPL) run by Amit Jatia (Jatia), owned the master rights for the west and south India operations of MCD India. The case further describes the relations between McDonald's and its master franchises and the way the two franchicees operated, which was as different as chalk and cheese. A friendly buyout of McDonalds' stake by WDL launched HRPL into a high growth orbit, while the strained relations with CPRL led to a spiraling toward a deadlock in the north and east. Due to the dispute with one of the master franchises, was McDonald's losing ground in India?

INTRODUCTION

McDonald's Corporation (McDonald's), headquartered at Oak Brook, Illinois, United States, was started in 1940 by two brothers, Richard and Maurice McDonald, as a typical drive-through restaurant with a large menu and a car hop service. In 1948, to speed up the service, the menu was reduced to 9 items, the staple being the 15 cent hamburger. In 1961, the McDonald brothers sold off their business to Raymond Kroc (Kroc), who had been managing the franchise operations at McDonald's. Under Kroc's leadership, the company reached new heights in terms of growth and worldwide expansion. In 2015, McDonald's had over 36,000 outlets spread over 119 countries across the world. It was the second largest fast food chain in the world after Subway. However, the global sales of McDonald's were showing a slump in 2015.

McDonald's India (MCD India) launched its first store in India's capital city, New Delhi in 1996. The number of outlets grew steadily to 380 outlets in the two decades of its operations in the country. In 2015, McDonald's India (MCD India) was going through troubled times for reasons of its own. MCD India, which was No.1 in revenues among the quick service restaurants (QSR) in the country till 2010, had slipped to the third position with Domino's[1] taking the pole position followed by KFC[2]. Moreover, the revenues had also been stagnant for the preceding 3 years. (Refer to Exhibit I for the revenues of MCD India)

In 2015, the Indian F&B (Food and Beverages) business was booming. The Rs.2,044 billion[3] Industry was estimated to grow to Rs. 3,800 billion by 2017[4]. As organized F&B contributed to

Micromax Informatics Limited: Growing Challenges for India's Largest Smartphone Maker

Syeda Maseeha Qumer and Benudhar Sahu***

The case discusses the growing challenges at Micromax Informatics Limited (Micromax), one of the leading smartphone makers in India. Micromax's market share in smartphones had dropped from 22% in Q4 2014 to 14.1% in the corresponding quarter of 2015. Moreover the company lost its coveted position as India's leading smartphone manufacturer to rival Samsung. Sales had plummeted and several top executives resigned from their positions. The case describes some of the steps taken by the top executives at Micromax to help the company reclaim its past glory. Whether the management would be able to come out with a strong strategy to tackle the issues and help Micromax regain its lost market position remained to be seen.

INTRODUCTION

In 2015, Micromax Informatics Limited (Micromax), one of the leading smartphone makers in India, witnessed a slump in its market share and lost its coveted position as India's leading smartphone manufacturer to rival Samsung[1]. Micromax's market share in smartphones had reportedly dropped from 22% in Q4 2014 to 14.1% in the corresponding quarter of 2015 ***(See Exhibit I).*** Micromax was facing turbulent times as sales had plummeted and several top executives had resigned from their positions. Moreover, the company was struggling to keep up with the booming but highly competitive smartphone market in India. "What the Indian brands did to the global brands two years ago, Chinese phone makers are doing to Indian brands now, and over the next year we see tremendous competition for Micromax and other Indian smartphone makers,"[2] commented Tarun Pathak, analyst at Counterpoint Technology Market Research[3]. The management team of Micromax needed to come up with a new game plan if they wanted to regain the company's punch back, remarked some analysts.

BACKGROUND

Micromax was originally incorporated in 2000 as an IT company. It was only in 2008 that the company started manufacturing mobile phones when its founders – Rahul Sharma (Sharma), Vikas Jain (Jain), Rajesh Agarwal (Agarwal), and Sumeet Arora (Arora) – decided to expand and distribute their IT hardware business. Though a late entrant into the thriving Indian smartphone market, Micromax differentiated itself by offering feature rich smartphones at affordable prices. Micromax launched the Canvas 2 A110 – the first dual-core smartphone to hit the Indian smartphone market in the budget category. With a price point of $150, the Canvas 2 was a game changer for the company. Reportedly, Micromax imported handsets from China and rebranded and launched them in the Indian market at

Peugeot Acquires India's Iconic Car Brand Ambassador

Indu Perepu and Medha Chintala***

The Ambassador car began operating in pre-independent India, and by the sixties and the seventies, it earned an iconic car status, the much sought-after car representing officialdom and meant for the Indian terrain. It was an inseparable part of Indian urban lifestyle. By the early nineties, due to lack of design upgrades, fierce competition from indigenous cars and the entry of foreign-made cars, Ambassador started losing its shine in sales. By 2013, only five cars a day were made and the market share drastically dwindled, while the plant was running in losses. In May 2014, after seven decades of the car being rolled out, its production plant was shut down. CK Birla Group, the owner of Ambassador, was looking for a strategic investor to solve its financial situation. It was an opportune time when the French car maker, PSA Group was looking at expanding to emerging markets like India. The two groups struck an acquisition deal for Rs.80 crore and another for Rs.700 crore for setting up a new plant and produce at least one hundred thousand cars a year.

"We sold the Ambassador brand to Peugeot (PSA), as Peugeot felt that it can utilize the brand better, particularly in the marketing area of its operations. It is good that the iconic brand is coming back to life."[1]

– Uttam Bose, Director, Hindustan Motors, and Former Managing Director of Ambassador, in 2017

"Hope that the taxi, made by the oldest car company in India, continues to be seen "bowling" along the roads. I say bowling because the curvaceous Ambassador always reminds me of a bowler hat on wheels."[2]

– Mark Tully, Former BBC India Correspondent, in 2013

INTRODUCTION

In early February 2017, India-based CK Birla Group, (Birla Group), owner of the Ambassador,[3] the iconic Indian car brand, signed a deal with French carmaker [4] (Peugeot) that owned and manufactured the Peugeot and Citroën vehicles. The deal included Peugeot's acquisition of the Ambassador and its related branding and trademarks from the Birla Group for Rs.800 million ($12 million). The Ambassador had come a long way since the time it was launched in India in 1958. It covered a gamut of uses – from being the car VIPs traveled in to a common man's taxi – till its production was suspended in 2014.

The Tata Group-BigBasket Potential Deal

Sanjib Dutta and Smita Ray***

The case talks about the Tata Group eyeing a stake in online food and grocery store BigBasket. it gives an overview of the various Tata Group businesses and the revenues by segment along with a brief history of BigBasket. The case also covers the advantages of the potential deal for both the Tata Group and BigBasket. With this deal, the Tata Group was expected to get a foothold in the online grocery market, while BigBasket would be able to expand its business in India. The case also touches upon the level of competition in the Indian online grocery market and how the competition is set to intensify with the entry of the Tata Group.

"The Tatas are a highly credible, value-adding (beyond just financial) potential partner to BigBasket. BigBasket has done well so far but the battle for dominance in the online grocery space is going to become much more intense in the future."[1]

– Arvind Singhal, Chairman, Technopak Advisors, in December, 2020

"The main objective of the Tata group is to win a large market share in one shot. BigBasket can make that possible, and the deal will also help the Tata group in conceptualizing its proposed 'Super App' by adding a wide range of household items and grocery products from BigBasket."[2]

– Spokesperson, Tata Group, in December, 2020

INTRODUCTION

In December 2020, the Tata Group, the Indian multinational conglomerate, announced that it was planning to acquire around a 70% stake in online food and grocery store BigBasket with an investment of $ 940 million-$ 950 million, and a majority stake in India-based online pharmacy network, 1mg, with an investment of $ 250 million.[3] Initially, in October 2020, the Group had announced its plans to acquire a 51% stake in BigBasket.[4] The proposed deal between the Tata Group and BigBasket would not only be beneficial for the Tata Group but would also facilitate BigBasket's entry into other segments and for it to get fresh investments. This deal would also lead to both the Tata Group and BigBasket cross-selling their products on each other's platform.

The entry of the Tata Group into the Indian online grocery market was expected to increase the level of competition among existing e-commerce players in the market. In August 2020, Reliance Retail, the retail arm of Reliance Industries Limited, had acquired a 60% stake in

Birchbox (B)

Indu Perepu and Alok Kavthankar***

The case continues from the second round of lay-offs followed by a round of funding which gave breathing room for the cash-strapped start-up Beauchamp, which tweaked the loyalty program, but was not well received by its subscribers. Birchbox also launched a new service called Birchbox Select which gave the subscribers more choices and control to customize their Birchbox for an extra fee of $5. In April 2017, Birchbox announced it had turned profitable because of all the cost-cutting measures it had adopted and maintained that profitability had also come with growth. Birchbox went on to sign strategic partnerships with beauty brands and Vogue, a lifestyle magazine. Case (B) concludes with challenges that Birchbox could face with the entry of well-established e-commerce platforms with a high degree of vertical integration, into the beauty subscription space.

INTRODUCTION

In August 2016, Birchbox, a cash-strapped New-York based beauty products subscription start-up, received a much needed $15 million through round C of funding from its existing investors – First Round Capital, Accel Partners, and Viking Global Investors[1]. Birchbox had just finished with its second round of lay-offs, triggered by its attempt to achieve profitability.

Birchbox was founded in 2010 by Hayley Barna (Barna) and Katia Beauchamp (Beauchamp) when they met at Harvard Business School[2]. The idea was to enable consumers to discover great products conveniently. The concept was popularized as discovery retailing. Birchbox sold curated monthly boxes containing five beauty samples (Skin Care, Hair Care, Make-up, Body Care, and Fragrance) for a fee of $10 a month.

The year 2016 had proven to be a rough ride for Birchbox. Its subscription sale had dropped by 7%[3]. In total, the start-up had to let go 15% of its employees from its strength of 300 employees. Birchbox also had to halt its expansion plans in Canada and China and to put its plan to set up stores on indefinite hold. It faced attacks from every direction. Falling subscriptions, bored customers, copycat start-ups, and limited capital were some of the immediate concerns for the company.

One of the core value propositions which Birchbox offered was curating boxes for the different skin types and preferences of its subscribers. But customization had its limits. Even though Birchbox shipped around 100 combinations of boxes, it did so with its labor intensive operation set-up. Customization in subscription commerce didn't benefit so well from

Powell's Books' Stand Against Amazon: Can Small Businesses Survive?

V Namratha Prasad[*]

The case talks about the decision taken by the world's largest independent bookstore, US-based Powell's Books (PB), to abandon the world's largest online marketplace, Amazon.com, Inc. (Amazon), as a sales channel. The case provides the reasons that drove PB – that was at the end of the day, a small business – to take that particular decision. The influence of the COVID-19 pandemic on PB's decision is also discussed. An insight is given into how the particular discussion could impact the future prospects of PB. The case strives to ask questions about how small businesses can survive changes in buying behavior, advances in technology, and unexpected business upheavals.

"I'm going to do my best to find a way to compete and hope that at the end of the day the value to our community is enough to keep us going. If in the meantime our political systems realize that this business (Amazon.com) is having a detrimental impact on our economy, even though it looks the opposite, I'll be pleasantly surprised."[1]

- **Emily Powell (Powell), the CEO of Powell's Books, in August 2020**

In August 2020, US-based Powell's Books (PB)[2], the world's largest independent bookstore for new and used books, announced that it would no longer sell its books on the world's largest online marketplace, Amazon.com, Inc. (Amazon)[3]. Emily Powell (Powell), CEO of PB, stated in a letter to customers, that the COVID-19 pandemic[4] had finally pushed the company to abandon Amazon as a sales channel. The company specified that it would, however, continue to sell books through its own online store (launched in 1994, a little before Amazon was launched), apart from its four brick-and-mortar stores.

2 Powell's Books founded in 1971 in Portland, Oregon, is the world's largest new and used independent bookseller. It has four stores and its flagship store "City of Books" occupies a full city block in Portland and carries a million books. It's a family business currently helmed by the third generation.

3 Amazon.com, Inc., is a US-based multinational conglomerate technology company based in Seattle. It focuses on e-commerce, cloud computing, digital streaming, and artificial intelligence and was founded in 1994. As of 2019, Amazon had US$ 160.4 billion in product sales and overall net sales of $280.5 billion.

4 COVID-19 (Coronavirus disease 2019) is an infectious disease caused by the severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2). It was first identified in December 2019 in Wuhan, Hubei, China, and later resulted in a global pandemic. The International Monetary Fund estimated that the global economy declined by more than 3% in 2020, owing to the pandemic.

GoDaddy Acquires 'Over'

Indu Perepu and Faria Zafar***

GoDaddy Inc., a US-based domain registrar and web hosting company, decided in 2020 to expand beyond its core business of domain registration and web hosting. With this aim, it acquired a Cape Town, South Africa-based social content start-up Over Inc. (Over), in January 2020. GoDaddy intended to integrate Over's capabilities into its Websites + Marketing platform. It expected the move to improve user experience for small businesses and entrepreneurs who did not have much of an online presence or the technical knowhow to build an eye-catching website.

INTRODUCTION

GoDaddy Inc., a US-based domain registrar and web hosting company, decided in 2020 to expand beyond its core business of domain registration and web hosting. With this aim, it acquired a Cape Town, South Africa-based social content startup Over Inc. (Over), in January 2020.

Over, an app available on iOS as well as Android, had more than 1 million monthly active users ranging from large businesses, graphic designers, and entrepreneurs to bloggers, vloggers, and influencers. The app was used in more than 120 countries worldwide. Over had exclusive fonts, artwork, and other graphic enhancement tools to edit photos and videos that could be shared on social media or through emails.

GoDaddy intended to integrate Over's capabilities into its Websites + Marketing platform. It expected the move to improve user experience for small businesses and entrepreneurs who did not have much of an online presence or the technical knowhow to build an eye-catching website.

GoDaddy

GoDaddy Inc. was a publicly traded technology company headquartered in Scottsdale, Arizona, USA. The company was founded in 1997 by an American entrepreneur Bob Parsons[1]. As of 2019, the company had 5600 employees.

GoDaddy provided web hosting and domain registration services and tools to help small businesses (*Refer to **Exhibit I** for GoDaddy Product Catalog).* By 2019, it had become the largest ICANN[2]-accredited registrar on the internet and also the world's largest web host[3]. Over time, the company grew in size and offered more and more services (*Refer to **Exhibit II** for GoDaddy History).*

IndusInd Bank's 'Bharat Money Stores'– Enabling Financial Inclusion for the Masses

Sanjib Dutta and Anil Anirudhan***

The case is about the business innovation of Bharat Financial Inclusion Ltd (BFIL), a subsidiary of IndusInd Bank. BFIL had come up with Bharat Money Stores (BMS), a Rural Distribution Service Points (RDSP), in the villages of India. BMS was a banking and transaction platform that enabled the small merchant shops or grocery stores to provide financial services to the rural population in the rural and remote areas. The case discusses the need for financial inclusion of the masses in the rural areas and also dwells upon the business model of BMS. Most of the merchants and the beneficiaries were satisfied with the services of BMS. As of June 2021, BMS had 65,000 small merchant shops in 27,500 villages across ten states in India. In the following two years, that is, by 2023, BMS planned to open 300,000 RDSPs in 180,000 villages across the country. Will the BMS model stand the test of time? Will it continue to provide financial services to the masses?

"As Dr Amartya Sen has rightly said, poverty should be seen as a deprivation of basic skills rather than just a low income. To achieve comprehensive economic development, financial inclusion is a necessary step towards inclusive growth, which elevates the poor, unbanked and underserved."[1]

-Ritesh Chatterjee, Chief Distribution Officer and Head, Bharat Money Stores, in June 2021

"Kirana Points will eliminate, for rural borrowers, the past insurmountable obstacles like PINs, and usher in the most convenient cash-in, cash-out points featuring biometric authentication and friendly neighbourhood guide."[2]

-Madapati Ramchander Rao, Managing Director and CEO, Bharat Financial Inclusion, in June 2017

INTRODUCTION

On May 11, 2020, Bharat Financial Inclusion Ltd (BFIL), a subsidiary of IndusInd Bank, announced that its business innovation 'Bharat Money Stores' (BMS) *(See **Figure I** for the logo of Bharat Money Stores)*had facilitated financial transactions of over Rs.1 billion in 5000 villages in the states of Odisha, Bihar, Karnataka, and Maharashtra in India. The wide network of the Rural Distribution Service Points (RDSP), also known as BMS, had enabled the direct distribution of funds from the government to the beneficiaries.[3]

The Debacle of Amazon's Fire Phone

Syeda Maseeha Qumer and Benudhar Sahu***

The caselet discusses the debacle of the Fire Phone which was a major setback for global online retailing giant Amazon. The failure of the Fire Phone was attributed to its high price, limited features, small App store, late market entry, and lacklustre approach to prime customers. Reportedly, Amazon's CEO Jeff Bezos' (Bezos) focus on creating a high-end product, instead of the kind of service that has always distinguished the company, proved imprudent. Despite the fiasco of the Fire Phone, Bezos remained committed to the company's strategy of continuous innovation.

INTRODUCTION

E-commerce giant Amazon.com, Inc.'s (Amazon) first smartphone, the Fire Phone, launched in 2014, was a major flop and reportedly cost the company hundreds of millions of dollars. Available in the US for $199 (32GB) or $299 (64GB) on a two-year exclusive contract with AT&T Inc, the Fire Phone was a disaster for the company mainly because it was overpriced and lacked compelling features compared to other Android phones in the smartphone market, said some analysts. Undeterred by its failure, Amazon CEO Jeff Bezos said the Fire Phone was a "tiny little blip"[1] compared to some of the larger experiments his company was undertaking. Citing Amazon's foray into the smartphone market as an example of the company's healthy innovative spirit, Bezos said, "It is our job, if we want to be innovative and pioneering, to make mistakes and as the company has gotten big – we have $100 billion-plus in annual sales, 250,000-plus people – the size of your mistakes needs to grow along with that."[2]

Launched as an online bookstore in 1995, Amazon quickly expanded beyond books to include all types of consumer goods. The company constantly innovated with its business model and moved from consumer electronics to cloud computing services and later into the technology business. Amazon's business model was built around low prices, a vast selection, fast and reliable delivery, and a convenient online customer experience. In 2014, Amazon's net sales increased 20% to $88.99 billion, compared to $74.45 billion in 2013. Net loss was $241 million, while its net income was $274 million in 2013.[3]

The Fire Phone project, code-named "Tyto" (generic name of barn owl) was rolled out in 2010, around the time Apple launched the iPhone 4. Amazon wanted a phone of its own as it would provide a more direct link to its users who accessed the Amazon website via iPhones or other Android devices. Moreover, the company wanted to make a mark in the lucrative smartphone arena. Bezos wanted to wow customers with something big and distinctive. The Tyto team started experimenting with some promising technologies such as near-field communication for contactless payments, hands-free interactions to allow users to navigate

Unilever Buys Out Dollar Shave Club

Indu Perepu and Medha Chintala***

US-based Dollar Shave Club (DSC), with its unique low-cost business model of leveraging technology, ecommerce and online marketing, sold subscription-based men's razor shaving blades, shaving accessories and men's personal care products. Backed by efficient founders, within two years of its founding, DSC had more than 200,000 online subscriptions. Its share in the online men's shaving and personal grooming was seen growing causing a threat to even Gillette and Schick, the established retail brands that dominated the market. In mid-2016, Unilever, the company that owned over 400 brands, was intending to fill the void in personal care and men's grooming segment and shift its focus from the slow-growing food brands. Unilever struck the acquisition deal of DSC for $1 billion. The cost of acquisition surprised the analysts, as it was five times DSC's annual expected sales for 2016.

INTRODUCTION

On July 19, 2016, Unilever PLC (Unilever) [1], the Anglo Dutch FMCG company, finalized the acquisition of the US-based Dollar Shave Club, (DSC), an online subscription-based company selling men's razors, shaving blades, and other accessories, for $1 billion. Analysts were intrigued by the deal as Unilever had paid five times the annual revenue that DSC was projected to earn in the year 2016. By mid-2016, DSC's value stood at $630 million[2] and it held a mere 1 percent market share in the business of men's razor blades and the shaving market in the US. DSC had not yet turned profitable although its subscriptions were growing; it had two million members that got its shipment every month.

DSC started with a simple idea of the CEO, Michael Dubin, (Dubin). Instead of paying $10 or $20 a month at a store for disposable razors and cartridges, a customer could have an online subscription with DSC to receive a regular order shipped every month to the customer's home, at a fraction of the retail cost.[3] With its perfect blend of a cheap and convenient product, and subscription-based home delivery, DSC's online sales soon grew and it was competing with Procter & Gamble's Gillette[4] and Energizer's Schick, the market behemoths. The acquisition was one of Unilever's strategic moves to fill up the void in its brand portfolio in the men's shaving business to grow in the men's personal care category where it did not have much of a presence.

Whole Foods Under Amazon: What Is the Way Forward?

Syeda Maseeha Qumer, Rupali Chaudhuri** and Debapratim Purkayastha****

The case discusses the acquisition of leading US-based natural and organic grocer Whole Foods Market, Inc.(Whole Foods) by Seattle-based e-commerce giant Amazon.com Inc. (Amazon) and whether the combined entity can disrupt the US grocery market. Since the beginning of 2016, Whole Foods had been facing problems due to declining sales, growing competition, and increasingly price-conscious consumers. In February 2017, Whole Foods, which had reported a sales decline at its stores for seven consecutive quarters (4Q 2015-1Q 2017), came under pressure from activist investor Jana Partners LLC to consider putting itself up for sale. On June 16, 2017, Amazon acquired Whole Foods in a $13.7 billion all-cash transaction. Post acquisition, Whole Foods continued to operate stores under the Whole Foods Market brand, with John Mackey (Mackey) remaining its CEO. Going forward, there were several challenges before Amazon's CEO Jeff Bezos (Bezos) and Mackey.

INTRODUCTION

Seattle-based e-commerce giant Amazon.com, Inc. (Amazon) took the global retail industry by surprise when it acquired natural and organic grocer Whole Foods Market, Inc.(Whole Foods) in a $13.7 billion all-cash transaction on June 16, 2017. Post-acquisition, Whole Foods would continue to operate stores under the Whole Foods Market brand with John Mackey (Mackey) remaining its CEO. Following the announcement of the deal, the shares of some big box retailers in the US such as Wal-Mart, Target, Costco, and Kroger plummeted as investors were worried about the wide-reaching implications of the deal. According to some analysts, the deal would be a catalyst for change in the US grocery market as consumers would benefit from pricing and selection and competitors would be forced to cut prices in order to survive. As of 2016, Whole Foods accounted for 1.2% of the US food and grocery market share while Amazon's market share was just about 1%.

Founded in 1978 in Austin, Texas, Whole Foods Market was the leading natural and organic foods supermarket and the first national "Certified Organic" grocer. It was uniquely positioned as America's Healthiest Grocery Store. Whole Foods had about 462 locations in the US, Canada, and the UK and a market value of almost $12 billion as of 2016. In fiscal year 2016, the company had sales of approximately $16 billion. However, since the beginning of 2016, Whole Foods had been facing problems due to declining sales, growing competition, and increasingly price-conscious consumers. The organic retailer, nicknamed 'Whole Paycheck', had been struggling to shed its image of being too pricey, upscale, and too out-of-touch with customers who wanted organic foods at affordable prices. In February 2017, Whole Foods, which had reported a sales decline at its stores for seven consecutive quarters (4Q 2015-1Q 2017) came under pressure from activist investor Jana Partners LLC to consider putting itself up for sale ***(See Exhibit I and Exhibit II).*** Though Mackey was initially incensed over the idea, he decided some months later to sell Whole Foods to Amazon. According to Mackey,

Can Vodafone-Idea Emerge as India's Top Telecom Provider?

*Syeda Maseeha Qumer**

The case discusses the merger between telecom giants Vodafone India and Idea Cellular and whether the combined entity can emerge as India's Top Telecom Provider. By combining their operations, Idea and Vodafone would boast of about 400 million customers, a 35% customer market share, and a 41% revenue market share, overtaking market leader Bharati Airtel Limited (Airtel) and posing a strong threat to new entrant Reliance Jio (Jio). The merger was expected to be completed by 2018. However, some analysts felt that longer timelines on deal conclusion and synergies in a hyper-competitive market as well as cultural and regulatory hurdles would pose some challenges. Moreover, it could also lead to job losses for employees of both the companies. Whether Vodafone and Idea would be able to overcome a host of challenges and emerge as a strong player in the Indian telecom sector remains to be seen.

INTRODUCTION

Reeling under intense competition and the changing dynamics within India's telecom sector, Idea Cellular Ltd.[1] (Idea), a subsidiary of the Aditya Birla Group, and Vodafone Group Plc.'s (Vodafone) Indian arm announced on March 21, 2017, that they had decided to merge in a $23 billion deal. The merger would create India's largest telecom company by subscriber base and revenue market share and the world's second largest mobile telecom operator. Reportedly, the combined entity would boast of about 400 million customers, a 35% customer market share, and a 41% revenue market share, overtaking market leader Bharati Airtel Limited[2](Airtel) and posing a strong threat to new entrant Reliance Jio[3](Jio). The merger was expected to be completed by 2018. Kumar Mangalam Birla (Birla), chairman of the Aditya Birla Group, would head the merged entity. Though the merger would create a strong player in the Indian telecom sector with an unmatched spectrum footprint, some analysts felt that longer timelines on deal conclusion and synergies in a hyper-competitive market as well as cultural and regulatory hurdles would pose some challenges. They wondered whether post-merger, Vodafone and Idea would continue to remain separate brands or unite into a single brand. Could the combined entity take on the competition and move toward its goal of becoming the top telecom provider in India?

VODAFONE INDIA

Vodafone India is a fully-owned subsidiary of Vodafone Group, one of the largest telecommunications companies in the world. It provides a range of services including voice, messaging, data, and fixed communications. Vodafone was launched in India in September

LuLaRoe– Skyrocketing Growth and a Steep Slide: Can It Bounce Back?

Indu Perepu[*]

The case is about US-based multi-level marketing company LuLaRoe, which sold colorful, patterned leggings, tunics, tops, skirts, and other clothes. Founded in 2012, LuLaRoe developed a cult following in just five years and achieved sales of $2 billion. The company could not, however, retain its popularity, with complaints pouring in about an unfair return policy, poor quality products, and an unresponsive leadership. Several lawsuits were filed, accusing the company of operating a pyramid scheme. The founder, DeAnne Stidham needed to take a quick decision before it was too late to revive the company.

INTRODUCTION

Founded in 2012, a US-based multi-level marketing company, LuLaRoe, sold colorful, patterned leggings, tunics, tops, skirts, and other clothes[1]. In a span of just five years, it developed a cult following and achieved sales of $2 billion. However, the company's popularity waned after complaints about an unfair returns policy, poor quality products, and unresponsive leadership began pouring in. Several lawsuits were filed against LuLaRoe alleging that it was operating a pyramid scheme. (Refer to Exhibit I for more about Multi-level Marketing in the US). The founder DeAnne Stidham (Stidham) needed to take a quick decision before it was too late, to revive the company.

The Rise of an Empire

LuLaRoe was founded on the lines of Tupperware and Herbalife[2]. The unique proposition of the LuLaRoe clothes was that it had sizes to fit all body types, colors that were attractive, and exclusive patterns. These could be purchased exclusively from the consultants of the company. The consultants posted pictures of the clothes and advertised on Facebook to their friends and other followers, and hosted events to popularize the products. Stidham said that consultants could earn anywhere between $50,000 and 100,000 a year.

The consultants were mostly women looking for additional income. They paid around $5,000 to $9,000[3] to join LuLaRoe and were given a start-up kit based on the package. (Refer to Exhibit II for different packages). The items were chosen by the company, and could be returned only if they were damaged. The consultants were required to order a minimum of 33 pieces a month to remain active[4]. Customers could buy the clothes through the consultants[5] and pay using the payment system of LuLaRoe[6]. The consultants could mark

* Assistant Professor, IBS Hyderabad (Under IFHE – A Deemed to be University u/s 3 of the UGC Act 1956), Hyderabad, Telangana, India. E-mail: indup@ibsindia.org

1 LuLaRoe's sales were at $2.3 billion in 2017.

2 The multilevel marketing companies like Avon and Mary Kay recruit people who work independently from their homes. There are several levels of recruits. These people are paid commissions based on the products sold.

3 This was a high initial investment, as companies like Mary Kay charged only $100 toward startup kits.

4 To make a profit of around $2,600, a consultant was required to sell at least 300 pieces.

5 LuLaRoe did not have any other channel to sell the clothes.

6 After deducting the sales tax and credit card charges, the amount was credited directly to the consultant's account.

Best Buy's Strategy to Beat the Pandemic Blues

V Namratha Prasad and Koti Vinod Babu***

The caselet discusses the various measures taken by US-based multinational consumer electronics retailer Best Buy Co., Inc. (Best Buy) to beat the business crisis that stemmed from the COVID-19 pandemic and the resultant lockdown restrictions in the US. Best Buy formulated a crisis management strategy and the case documents the various measures the company took to keep its stores up and running during an unprecedented crisis such as the pandemic. The case also mentions some of the human resource (HR) measures taken by Best Buy to keep up employee morale and encourage vaccination against COVID-19. The various measures taken by Corie Barry (Barry), the CEO of Best Buy, proved effective in keeping up the sales. Can Barry's successful crisis management strategy be an example to emulate in the retail industry?

INTRODUCTION

In June, 2021, US-based multinational consumer electronics retailer Best Buy Co., Inc. (Best Buy)[1] launched an employee sweepstakes[2] with more than $100,000 in cash prizes to encourage its staff to get vaccinated against the COVID-19 virus and contribute to the all-round efforts to beat the ongoing pandemic[3].

Best Buy employed about 102,000 people at its stores across the US. The company said that 21 workers would win $5,000 each after presenting proof of vaccination to the company. While 20 winners were to be chosen from its field employees, one winner would be selected from its corporate offices based in Richfield, US.

A portion of the memo notifying employees about the sweepstakes provided to an insider of the company, said, *"The best reason to get the COVID-19 vaccine is to avoid contracting the virus yourself and to prevent the spread of COVID-19 to your family, friends, co-workers and community. The second-best reason is that any Best Buy employee could be one of 21 winners across the company to win $5,000!"*[4]

1 Best Buy Co., Inc. is a US-based multinational consumer electronics retailer. It has more than 1,230 stores in the US, Canada, and Mexico. Its stores sell a variety of electronic gadgets and wearables, tablets, movies, music, computers, mobile phones, and appliances. Its net worth was $45 billion as of May 2021. It was founded in 1966. In March 1998, Best Buy officially entered the e-commerce realm by launching an online music store at bestbuy.com. Over the years, the Best Buy online store offered electronics, computers, appliances, cell phones, video games, and newer tech. There were separate online stores for the US, Canada and Mexico.

2 A sweepstake is a type of contest where a prize or prizes may be awarded to a winner or winners who were randomly chosen, and not because of any skill or activity.

3 The COVID-19 pandemic was a result of the spread of a severe acute respiratory syndrome caused by coronavirus 2. More than 33.7 million confirmed cases had been reported in the US since January 2020, resulting in more than 606,000 deaths by July 8, 2021, the most of any country.

Amazon Go: A Retail Disruption or a Flash in the Pan?

KBS Kumar and Indu Perepu***

In 2018, Amazon, the US-based online marketplace, launched 'Amazon Go', a chain of retail stores. These 'new retail' stores were different from the typical brick-and-mortar retail stores in the sense that they were cashier-less super stores that had phased out some of the conventional features of a retail super store – queues at the counter, billing of the purchase, swiping of the card, and a security check at the exit. This was made possible through three technology drivers – Machine Learning, Computer Vision, and Sensor Fusion. The case discusses whether Amazon Go will have a long-term impact on the retail industry.

"*Amazon Go is just the shiny penny on the ground, daring the competition to pick it up, while an unlocked safe of gold lies waiting around the corner for those daring enough to experiment with better answers.*"[1]

Chris Walton, a leading expert in Omnichannel Retailing

In 2006, IBM, the US-based tech giant, released a 62-second advertisement[2] that gave a glimpse into what the experience of retail shopping could be like in the future. Fast forward to 2016. Amazon, the US-based online marketplace, announced 'Amazon Go'– a chain of brick and mortar grocery stores that promised to catapult the retail scenario to the next level.

In January 2018, Amazon launched its first cashier-less super store[3] (occupying 1,800 sq. feet) that phased out some of the conventional features of a retail super store – queues at the counter, billing of the purchase, swiping of the card, and a security check at the exit. Touted as '*Just Walkout technology*', Amazon Go introduced what competitors feared was a revolutionizing experiment. An article in Forbes described the store as the "*veritable Seventh Wonder of the retail world.*"[4] To shop in Amazon Go, all that the customers had to do was walk in, bag the commodities needed, and walk out – the rest was automatically taken care of.

Technology - In Brief

An idea powered by three technology drivers – Machine Learning, Computer Vision, and Sensor Fusion – had helped Amazon Go get on the front foot of what was seen as a revolutionizing experiment.

All it needed was an activated Amazon Pay app on the customers' smartphone, which was recognized by the sensors while entering the store. Once inside, every minute movement of the customer was captured by the hundreds of cameras mounted on the ceiling of the store. The number of cameras was approximately equal to the number of square feet that made up

HyperPure: Zomato's Foray into B2B Foodtech

Indu Perepu and Benudhar Sahu***

The case is about the entry of India-based foodtech unicorn Zomato into the business-to-business (B2B) food ingredient ordering platform through HyperPure. Zomato, which was started in 2008, was looking at transforming itself into a farm-to-fork food company, and it acquired Bengaluru (India)-based raw materials and procurement start-up WOTU (We Organize The Unorganized) in August 2018. With this in mind, WOTU was rebranded as HyperPure, and through it, Zomato directly sourced products including vegetables, fruits, poultry, groceries, meats, dairy, and beverages from farmers, mills, producers, and processors, and supplied them to restaurants. The case details the operations of HyperPure and the challenges that Zomato is likely to face in taking HyperPure ahead.

HyperPure, a business-to-business[1] (B2B) food ingredient ordering platform, was started by India-based online food order delivery unicorn Zomato in 2018. Through HyperPure, Zomato was looking to transform itself into a food supplying company, with complete control over the entire value chain. HyperPure directly sourced products including vegetables, fruits, poultry, groceries, meats, dairy products, and beverages from farmers, mills, producers, and processors and supplied them to restaurants. It allotted the HyperPure tag to restaurants that purchased products from Zomato to help customers make an informed choice about the food ingredients being used in the restaurants. To take this initiative further and be a part of the end-to-end value chain, Zomato was also planning to collect the waste from the restaurants and convert into compost, which would be supplied to the farmers.

With the launch of HyperPure, Zomato brought together restaurants, food suppliers, and logistic partners under a single umbrella with the focus on making clean ingredients more accessible to the consumers. It helped the restaurants to gain access to a wide range of fresh and high-quality ingredients at competitive prices. Gaurav Gupta (Gupta), Chief Operating Officer of Zomato, said, "*We believe Zomato is uniquely placed to shape the future of food. With HyperPure by Zomato, we've been able to disintermediate the supply chain, providing restaurateurs access to fresh, clean, fully-traceable food ingredients. This takes us a step further along the food value chain, creating greater affordability for farmers and restaurateurs, and improving the accessibility of quality food to our users.*"[2]

HyperPure was expected to help Zomato gain greater control over the food ecosystem by giving it a presence across the value chain from farm to fork. Ankur Pahwa, partner and national leader, e-commerce and consumer internet, EY India, said, "*Adjacent areas of operations that build synergies and improved efficiencies are needed to support discounts in the food-tech business. To improve unit economics you have to go deeper into the business and improve infrastructure usage, better client engagement, and raise delivery efficiencies.*"[3]

Mumbai's Dabbawalas: Moving Beyond Their Iconic Business Model Post COVID-19

Jitesh Nair and Bitra Vasudev***

The case study examines the impact of the COVID-19 pandemic on the business of the Mumbai dabbawalas, a 130-year-old organization primarily engaged in delivering lunchboxes mostly from customers' homes to their offices in the city. The case highlights the need for organizations to leverage on their core competence and diversify to survive and grow in a VUCA world. The case study focuses on the impact of the COVID-19 pandemic on the dabbawalas' regular business and their struggle to eke out a living during the lockdown period. It goes on to describe how the dabbawalas decided to leverage their core competencies to take a relook at their iconic business model following the lockdown. The dabbawalas entered into partnerships with various organizations to offer different delivery services, including the delivery of fresh vegetables to households from December 2020. They also planned to use a mobile application in future to facilitate their delivery services.

Mumbai's Dabbawalas: Moving Beyond Their Iconic Business Model Post COVID-19

"We are facing an unprecedented situation for the first time in the 130 years that we have been operational. If we have no customers, we have no earnings. Our stomachs depend on the stomachs of our customers."[1]

– Ulhas Muke, President, Nutan Mumbai Tiffin Box Suppliers Trust, in April 2020

"People know our professionalism and credibility, and if we supply fresh vegetables directly at home, there is no doubt that they will avail our services."[2]

– Vishnu Kaldoke, Spokesperson, Mumbai Tiffin Box Suppliers Association, in December 2020

INTRODUCTION

On March 19, 2020, the popular dabbawalas of Mumbai, who delivered lunchboxes mostly from customers' homes to their offices, announced suspension of their services in light of the COVID-19 pandemic. This was soon followed by the nationwide lockdown ordered by the Indian government on March 23, 2020. With office-goers, the core customer base of the dabbawalas, starting to work from home, the demand for the dabbawalas' services disappeared overnight. While 50% of the dabbawalas managed to return to their homes in villages near Pune (the second largest city in the state of Maharashtra after Mumbai) before the lockdown and found work on farms, the rest who could not leave Mumbai struggled to make ends meet. The challenge they faced was compounded by the fact that the wives of

Welspun: Can It Spin a Successful Comeback?

G V Muralidhara and Alok Kavthankar***

The case focuses on Welspun India Limited (Welspun), the country's largest home textile manufacturer which had found itself confronted with a quality issue. US-based Target Corp (Target), Welspun's second largest customer, had declared that it was severing its decade-old ties with the company after discovering that around 750,000 sheets and pillow cases supplied by Welspun and labeled as being made from Egyptian cotton, were actually made from a different grade of cotton. The case further unfolds Welspun's response to the crisis.

INTRODUCTION

On August 19, 2016, Welspun India Limited (Welspun), the country's largest home textile manufacturer, found itself confronted with a serious quality issue. US-based Target Corp[1] (Target), its second largest customer, had declared that it was severing its decade-old ties with the company after discovering that around 750,000 sheets and pillow cases supplied by Welspun and labeled as being made from Egyptian cotton, were actually made from a different grade of cotton. Egyptian cotton sheets made up 10% of Welspun's business with Target. Target accounted for 10% of Welspun's total revenue. Target also announced a refund to its customers for the sheets sold for as much as $75 a piece between August 2014 and July 2016.Welspun's other big accounts like Walmart and JC Penny also began probing the issue. The first impact of Target's drastic action was felt on the value of Welspun's stock, which declined by more than 40% *(Refer to Exhibit I)* at the Bombay Stock Exchange (BSE) within 4 days of the disclosure.

Incepted in 1993, Welspun had established its distribution presence in over 50 countries across the globe with a strong presence in key markets like the US, the UK, Canada, and Europe. In 2016, Welspun was one of the top 3 manufacturers of bed and bath linen in the world, with 95% of its revenue coming from exports. It was a trusted long-term vendor to 18 of the top 30 global retailers like Walmart, Macy's, Costco, Target Corp, etc. *(Refer to Exhibit II).*Balkrishna Goenka, chairman and director of the Welspun group, had proudly announced in the company's 2015-16 annual report that Welspun had been ranked as the No.1 home textile supplier to the US for the fourth year in a row. The US accounted for two-thirds of Welspun's business. The company had such a brand image that its towels were supplied to Buckingham Palace as well as to the Wimbledon tennis tournaments.

Welspun's 2020 vision was to become a $2 billion company by further expanding its global reach. As testimony to its quality, the company had received the Responsible Sourcing Award from Target in early 2016.In February 2016, Welspun was also awarded the Egyptian Cotton Gold Seal certification by the Cotton Egypt Association (CEA) in three product categories– terry towels, bed linen, and bath rugs. CEA's DNA-based authentication program was designed to free the supply-chain from falsely labeled cotton goods. Mukesh Saviani, president and head of innovation and global sales for Welspun, said, "This is an assurance to retailers that they will not get into any compliance issues."[2]

Zomato: Downsizing to Remain Competitive

Indu Perepu and Sonali Nagpal***

This case is about the restructuring strategy taken up by India-based restaurant search and review website, Zomato. Zomato was launched in 2008 by Deepinder Goyal (Goyal), a management consultant. Zomato was able to raise funds from various investors and in no time expanded pan India, and by 2012 reached its first oversees location. By 2015, it was operating in 23 countries. With rapid expansion and increased competition, the revenue of the company kept growing. However, EBITDA was negative and was continuing to fall. Goyal then decided to downsize operations. This had a positive effect, and within a few months, the company managed to break even. The case discusses in detail the inception and growth of the company and the strategies that helped it break even.

"We are going to have to make important changes to our business and make sure we put every dollar and every Zoman [Zomato employee] behind the things that matter the most" [1]

– Deepinder Goyal, CEO, Zomato

INTRODUCTION

In February 2016, India-based restaurant search and review website Zomato announced that it had operationally reached a break-even point in six markets – India, West Asia (United Arab Emirates, Lebanon, and Qatar) and Southeast Asia (the Philippines and Indonesia) – due to growth in its core advertisement business and tighter financial controls. Zomato, launched in 2008, provided in-depth information in terms of menu cards, contact details, pictures, directions, and ratings and reviews of restaurants and events to its users. In the next few years, the company expanded into several countries across the world. The company grew rapidly; however, its EBITDA[2] remained negative. In order to generate profits amidst growing competition, Zomato's CEO, Deepinder Goyal (Goyal), employed a three-fold strategy of reducing manpower, closing its cashless businesses in a few markets, and dividing the company's markets into two types, with different strategies to be applied in each. All these measures helped the company achieve break-even in early 2016.

The history of Zomato could be traced back to the time when Goyal, an alumnus of IIT Delhi, was working with Bain and Company (Bain) in New Delhi, India, as a Management Consultant. He noticed that during lunch, people in his office discussed menus from different restaurants to order food. The idea of providing access to food menus online then struck him. He decided to scan restaurant menus and upload them on the company intranet. Soon, he started his own company in New Delhi under the name Foodiebay.com with the menus of 1,200 restaurants in Delhi/the National Capital Region displayed on the website. The website provided in-depth information including reviews and ratings by people who had already visited the restaurant to help users make a well-informed decision before visiting it.

Goyal roped in Pankaj Chaddah (Chaddah), his junior from IIT, as a partner in mid-2008. Over the next year, the website expanded to Kolkata and Mumbai. In 2010, Foodiebay was one of the top 25 most promising internet companies in India named by SmartTechie

Barbie's Bumpy Ride in China

Indu Perepu and Shwetha Kumari***

The case talks about US-based toy company Mattel's opening of a Barbie flagship store — the House of Barbie — in Shanghai, China. The case starts out by providing details about the company, its launch in Sanghai, China, and its products such as children's bedroom furniture and young women's clothes in a 36,000-sq ft six-story building. The case then documents the reasons due to which Barbie was unable to impress the Chinese, leading to the closure of its flagship store in 2011. Further, the case also talks about the relaunching of Barbie in 2013. It concludes with an insight from experts and upper level managers on whether Barbie will make a successful comeback in China.

INTRODUCTION

US - based Mattel Inc. (Mattel), the world's largest toy company as of 2016, was founded in 1945 by Elliot and Ruth Handler (Ruth). As of 2016, the company designed, manufactured, marketed, and distributed a large variety of toys in 150 nations. The Mattel family comprised best-selling products such as Barbie[1], the most popular fashion doll ever produced; Hot Wheels, car and racing games; Monster High which included products such as toys, play sets, video games, and TV Specials; American Girl – 18-inch dolls of various ethnicities; Thomas & Friends, a remote control toy train; and the Fisher-Price brand for infants and children, including Little People and Power Wheels. Mattel also produced a wide range of entertainment inspired toy lines based on various characters from Disney and Sesame Street and games such as Scrabble and UNO.

Barbie, Mattel's flagship product, had been a leader in the toy industry ever since it was introduced in 1959 as a teenage fashion model doll. The idea for creating the doll was born when Ruth saw her daughter showing a preference for playing with adult-looking dolls rather than baby dolls. The Handlers then started designing teenage dolls. The doll became popular when it was showcased at the New York Toy Fair in 1959. Mattel quickly launched official fan clubs for Barbie across the United States and these clubs had a total membership of about 1.5 million by 1968. Apart from the doll, Mattel also sold clothes and accessories for Barbie. In 1961, the company launched the Ken doll as Barbie's boyfriend. In the next few years, Barbie became an ideal figure and the favorite doll of young girls all over the world.

After Barbie had gained popularity in the US, Mattel changed its focus to new markets in Canada, Mexico in the Americas, Europe, Latin America, Australia, New Zealand, etc. As of 2015, Barbie dolls were being sold in more than 150 countries around the world. While it was smooth sailing in several countries for Barbie, the Chinese market presented a set of challenges that were different from what Barbie had experienced before. Barbie had been sold in China since the 1990s, but it was not considered to be a cultural icon in China as it had been in the US and South America.

BARBIE STORE IN CHINA...

Marking the golden jubilee of Barbie, in 2009, Mattel opened a Barbie flagship store – the House of Barbie – in Shanghai. The store was a 36,000 square feet six-story building which had large collections of Barbie dolls displayed in 900 cases, and various other products like

Samsung Galaxy Note 7: Crisis Management and Beyond

D Satish and Medha Chintala***

Samsung, the world's leading smartphone maker, launched its most awaited Galaxy Note 7 smartphones in 10 major markets, including the US and South Korea, in August 2016. Within a week of its launch, there were incidents of Note 7s catching fire. Koh, the president of Samsung's mobile business, announced a recall and replacement of Note 7. But the replaced Notes also caught fire. The company had to announce a second recall and abandon the production of Note 7. With holiday season fast approaching, Samsung had to come up with a strategy to retain its loyal customers. Also its competitor Apple had just launched iPhone 7 and Google had launched its first smartphone – Google Pixel. The company had to also work on rebuilding its lost brand value and instill confidence in the customers, which was essential for Samsung to retain its position in the smartphone market.

INTRODUCTION

Samsung, the world's leading smartphone maker, was founded in 1938 as a trading company in South Korea. Over the decades, the company expanded into various businesses, and by 1969 it was also in the electronics business. In 1988, Samsung started manufacturing mobile phones and by 2007, it had become the world's second largest mobile phone manufacturer and the supplier of electronic components to Apple, Sony, HTC, Nokia, and other global companies. Its flagship smartphone, the Samsung Galaxy S series, (Galaxy), was launched in 2009.

At the end of the first quarter of 2012, Galaxy toppled Apple iPhone to make Samsung the largest smartphone maker in the world. With 95 million handsets being sold in 80 countries and 50 models, Galaxy accounted for 70% of the Samsung Group's revenues. The Galaxy handsets were known for their high quality and low prices. According to Interbrand's report in 2012, Samsung was the 9th most valuable global brand with an estimated worth of $32.8 billion. However, in 2015, Galaxy sales were showing signs of slowing down and Dongjin Koh, (Koh), who was instrumental in launching the Galaxy models, was made president of Samsung's mobile business.[1]

Galaxy Note 7 (Note 7), touted as the best smartphone in the market, was released on August 19, 2016.[2] With features such as water resistance, a note taking pen, expandable storage, dual-sided curved display, iris recognition, and a cooling system that prevented the handset from overheating, it was one of the most sought after gadgets. Within a week of its release, 2.5 million Note 7s were shipped to 10 major markets of the world, including the US and South Korea.

But within a week of Note 7s launch, there were reports of it catching fire. Angry customers took to social media to show photos of burnt phones and complaining about loss of data. For

Harley Davidson Hits a Roadblock in India, Takes a U-Turn

Sanjib Dutta and Anil Anirudhan***

The case is about the exit strategy adopted by Harley Davidson Inc. (Harley) in India. The iconic American motorcycle brand had ventured into India in 2009 with its heavyweight cruiser bikes. But it was not able to capture the market due to the high cost of its bikes and its failure to read the Indian mindset. The case dwells on the circumstances that led to Harley entering the Indian market and the challenges faced by it. Burdened with increasing losses, Harley had decided to exit the Indian market as part of the 'rewire strategy' adopted by its parent company. The case details the strategy adopted by Harley and discusses its planned exit and how it later decided to shelve its exit plan and enter instead into a strategic alliance with Hero MotoCorp to sell and service its bikes and other merchandise in the Indian market. It remains to be seen whether the strategic alliance with the Hero Group will bring Harley success.

"Under our focused participation model, we are exiting about 40 markets where low volumes and little profit do not warrant investments. We are establishing dealer-direct or distributor model in about 17 markets, and our 36 highest potential markets will have the leadership, resources and clearly defined operating framework that we believe will derive desirable growth and profitability in the future."[1]

– Jochen Zeitz, Chairman, President and CEO, Harley Davidson Inc., October 2020.

INTRODUCTION

In September 2020, Harley Davidson Inc. (Harley), the iconic American motorcycle brand, announced its exit from the Indian market. This decision was taken as part of the company's 'Rewire' strategy under which it would focus only on select markets and exit those where sales and profitability were low. Harley had entered India in August 2009 with its heavyweight cruiser bikes. Harley saw India as the right market to launch its bikes, given that the country had the second largest motorcycle market in the world, a growing middle class, and strong economic growth. Mark Levatich, Chief Operating Officer at Harley, said, *"Given the rapid development of India's economy and physical infrastructure, this is exactly the right time to bring the world's greatest motorcycles to one of the world's largest motorcycling nations."*[2]

In late October 2020, making a swift u-turn from its earlier announcement of exiting the Indian market, Harley announced that it had entered into a strategic licensing agreement with Hero MotoCorp Ltd. (Hero), the largest motorcycle manufacturer in the world and India, with a market share of more than 40% in the Indian two-wheeler market. As part of the licensing agreement, *"Hero MotoCorp will sell and service Harley-Davidson motorcycles,*

Tata Increases Stake in AirAsia India

Indu Perepu and Nagendra Kumar M V***

After a long hiatus, the Tata Group (Tata) entered the civil aviation industry in India through a joint venture partnership with Malaysia-based Airline Group Air Asia Berhad (AAB) after Foreign Direct Investment (FDI) norms were eased in India in the year 2013. The joint venture partnership was formed under the name Air Asia India (AAI) in the year 2014. Though it was considered to be an ambitious project for both entities, AAI remained unprofitable. In 2020, with the global aviation industry heavily impacted by the Covid-19 pandemic, AAB decided to sell its stake to its partner Tata and exit the joint venture. However, for Tata, the decision to purchase a stake in AAI remained a matter of strategic choice. The present case study can be used to discuss the concepts of joint ventures, their benefits and limitations, and the reasons for the failure of joint ventures.

INTRODUCTION

AirAsia India (AAI), a joint venture between Malaysia-based AirAsia Berhad (AAB) and Indian conglomerate Tata Sons (Tata), started operations in 2014. However, on finding that the project was not financially viable, AAB decided sell its share in the joint venture partnership in November 2020, and requested Tata to purchase the stake, so that it could exit the Indian operations.

The CEO of AAB was reportedly keen on scaling back operations post-Covid, and was also looking at reducing cash burn after AirAsia Japan filed for bankruptcy. Experts believed that where Tata was concerned, the acquisition of a stake in AAI would place it in a stronger position in its plan to bid for the state-owned, carrier Air India.

BACKGROUND

Tata had been associated with aviation in India since 1932 when it launched the country's first airline services, Tata Airlines. Tata Airlines, founded by JRD Tata, went public in 1946 and was renamed Air India. It was later taken over by the government and, since 1950, had been operated as a public sector entity. The Tata Group had not re-entered the airline industry due to several regulatory restrictions, bureaucratic hassles, and the tough operating conditions for aviation companies. However, in the year 1990, when the Indian government was looking at the option of allowing private players into the airline industry, Tata made an attempt to start an airliner, but was unable to do so. Again in the year 1994, it associated with Singapore Airlines to start a new airline in the country, but the deal did not materialize due to the restrictions on Foreign Direct Investment (FDI) in India.

TATA AND AAB

In the year 2000, Tata, in association with Singapore Airlines, tried to acquire a stake in the state sponsored airline services, Air India. Though the government was ready to sell a stake in the airline, the deal failed to go through due to political opposition. After several unsuccessful attempts, Tata entered the airline industry in association with AAB, after the FDI norms in the Indian Civil Aviation Industry were eased in the year 2013.The norms

Unilever Israel – The Salmonella Crisis

Indu Perepu[*]

Anglo Dutch FMCG Major Unilever found itself amidst a salmonella crisis in Israel, when Telma cereals were found to be contaminated in August 2016. Without the company's knowledge, the contaminated batch of cereals was distributed and reached the consumers. Unilever then recalled the cereals, but its production license was suspended. Unilever rapidly lost market share to its competitors. Before it could emerge from the crisis, the company faced another round of contamination. With two contamination occurrences in quick succession, Unilever was again in trouble. CEO of Unilever Israel, Anat Gabriel, faced the challenge of minimizing the damage done to the company's image and regaining the lost market share.

INTRODUCTION

On August 7, 2016, Israel's Health Ministry suspended the GMP (Goods Manufacturing Practice)[1] license of Anglo Dutch FMCG major Unilever[2] in the country after Telma cereals tainted by the salmonella bacterium were found to have reached consumers. The ministry announced that this was "a series of negligent mistakes and not an incident with malicious intent by the firm's management and quality control procedures."[3]

At the end of July 2016, consumers were surprised to find that supermarket shelves across the country did not have Telma cereals[4]. On being questioned by the media, the CEO of Unilever Israel, Anat Gabriel (Gabriel), told journalists that there was a fault in the quality assurance system and a secondary contamination had been found in one of the production lines in the plant in Arad[5]. On further questioning, Unilever admitted that Cornflakes of Champions and Deli Flakes had been found to be contaminated with salmonella[6] and informed the same to the Health Ministry.

The contamination was discovered by Unilever in late June 2016 after the lab that performed routine tests on the products, reported that undetermined bacteria had been found in a particular batch of cereals produced on June 27, 2016.

By then the batch of cereal had been moved to the warehouse and the contaminated products – 154,320 boxes (643 pallets of 240 packets each) – were not separated from the others but

* Assistant Professor, IBS Hyderabad (Under IFHE – A Deemed to be University u/s 3 of the UGC Act 1956), Hyderabad, Telangana, India. E-mail: indup@ibsindia.org

1 The GMP license was given to only about 80 plants in Israel. These plants were allowed to export their products.

2 Unilever operated in Israel as Unilever Israel Foods Ltd, a subsidiary of Unilever PLC. In Israel, Unilever was known by its popular cereal brand Telma. Cereals sold by Telma included Cornflakes of Champions, Deli Flakes mehadrin cornflakes, Delipecan cereal, Badatz hashgachah cornflakes, and Kookieman chocolate-flavored cereal. Unilever also sold Strauss Ice Cream, Blue Band margarine, 778 jams and jellies, and Lipton Tea as well as personal care products.

3 John Shepherd, Unilever Israel Licence Suspended over Salmonella Probe, just - food global news, August 11, 2016.

4 Unilever was the largest manufacturer of cereals in Israel. Telma had a share of 54% in the market, followed by Nestle with a share of 26%.

5 A City in the south of Israel.

6 Salmonella is a bacterium that lives in the intestines of human beings. It is spread through contaminated food, animals, and infected food handlers. It results in diarrhea and abdominal cramps.

Ola's Reentry into the Food Delivery Business

V Namratha Prasad and Debapratim Purkayastha***

The case is about India's mobile app-based ride-sharing firm Ola's attempt to make a reentry into the fast-growing food delivery space, which it had earlier exited. It starts out by mentioning the reasons that had driven Ola to make an exit from the Indian food delivery space. Ola's reentry through the acquisition of the fast-growing Indian food delivery company, Foodpanda, is then described. The caselet touches upon the advantages that Ola expected to gain through the reentry. It concludes with a look at the future prospects of Ola's food delivery business.

INTRODUCTION

In December 2017, India's mobile app-based ride-sharing firm Ola made a re-entry into the food delivery space. It acquired the third largest player in the market – Foodpanda India (Foodpanda) – for around US$ 50 million from Germany-based Delivery Hero Group. Furthermore, Ola planned to invest US$ 200 million (Rs.1,330 crore) in expanding Foodpanda's business, which was the largest funds infusion in an Indian food delivery company.

Ola's founding partner Pranay Jivrajka became the interim CEO of Foodpanda and was supported by the existing leadership team at the food delivery business. The company, however, had no plan to bring the Foodpanda ordering app (available in both mobile and desktop) into the Ola app.

EARLIER MARKET EXIT

It was in March 2015 that Ola – which was the market leader in the Indian ride sharing space – had launched its food delivery feature called 'Ola Café' on its app in select Indian cities (Delhi, Mumbai, Bengaluru, and Hyderabad). Ola Café promised to deliver food from nearby restaurants in less than 20 minutes. At that time, the food delivery space in India was at a nascent stage with very few major players.

In June 2015, Ola launched its hyperlocal grocery delivery service, 'Ola Store' in three cities – Bengaluru, Hyderabad, and Gurgaon – through a separate app. Ola had partnered with popular retail chains in a particular neighborhood in order to provide the service. Both the services were expected to help Ola better utilize its driver network.

In March 2016, Ola exited both businesses – 'Ola Café' and 'Ola Store' – due to lack of viability and growth. Startup ventures such as Ola Café found the Indian food delivery space a highly expensive proposition, causing several of them to close down. At that time, an average order was Rs.300 and the delivery cost was around Rs.50. However, food delivery companies charged around 10-15% of the order value in order to popularize the service and grab market share. This meant that a company like Ola lost money on each delivery fulfilled.

Industry observers felt that Ola had also been unable to stand up to the rising competition in that space and had failed to effectively differentiate itself. While other companies offered to

Ashok Leyland:
Using BI and AI in the Automotive Industry

V Namratha Prasad and Koti Vinod Babu***

The case discusses the digital transformation brought about by India-based multinational automotive company Ashok Leyland (Leyland) in the past decade (2010-2020). The case starts with a brief history of how Leyland grew to its stature of being one of the leading manufacturers of automobiles in India and across the world. It then provides details of how the company inculcated an information-led culture and adopted a user-friendly Business Intelligence (BI) tool. Having implemented digital solutions for improving efficiency and productivity, Leyland looked at how digital could play a role in generating new revenue models and profits. The case then discusses the varied features of Leyland's shared IT (Information Technology) services platforms – Digital Marketplace and Digital Nxt that harnessed the latest technologies such as Artificial Intelligence (AI), Internet of Things (IoT), Machine Learning (ML), mobile and cloud technology. Can Venkatesh Natarajan (Natarajan), SVP-IT of Leyland, the key person who orchestrated the revolutionary changes in Leyland, continue to harness new technologies to win in the competitive automotive industry?

"Ashok Leyland has always been at the forefront of innovation and technology. We have invested in creating these digital solutions to enhance customer efficiency, performance, and profitability through various means of 'anytime, anywhere' support for their vehicles. This will ensure that the customer enjoys the highest uptime with our vehicles and these solutions are unparalleled in the industry."[1]

– Vipin Sondhi, Managing Director and CEO of Ashok Leyland, in July 2020

"We truly believe that whatever we do is all towards fulfilling this promise which we have committed ourselves as an organization and as an ecosystem that includes our partners, dealers and suppliers also – you win, we win, your success, our success."[2]

– Venkatesh Natarajan, Senior Vice-President of IT in Ashok Leyland, in October, 2017

In late 2020, N.V. Balachandar, President-HR of Indian multinational automotive manufacturer company Ashok Leyland (Leyland), the flagship firm of Anglo-Indian

Chile's Earthquake: Proactive Disaster Management Helps in Quick Recovery

G V Muralidhara and Hadiya Faheem***

The case discusses the earthquake of February 27, 2010 in Chile and its devastating impact. The event, known as F27, displaced 1.5 million people from their homes, damaged around 370,000 houses, and killed 525 people. The low casualty figure was attributable to the proactive steps taken by the Chile government, which included designing seismic codes that prevented buildings from collapsing during temblors. The setting up of the National Emergency Office of the Ministry of Interior (ONEMI) in 1974 in the aftermath of the 1960 Valdivia earthquake that killed nearly 5,000 people, also helped Chile in better disaster preparedness as the ONEMI carried out frequent evacuation drills and earthquake simulations. Disaster management experts appreciated Chile for its disaster preparedness and recovery. But some experts pointed out that Chile's disaster planning did not focus on the community rehabilitation that would have to take place after a disaster.

"The government's approach to emergency and reconstruction was pro-active. Chile's management of the earthquake was successful overall."[1]

– Organization for Economic Cooperation and Development (OECD), an intergovernmental economic organization, in 2011

INTRODUCTION

On February 27, 2010, at 3:34 am (local time), a massive earthquake with a magnitude of 8.8 struck the coast of Maule region of central Chile. The event, termed as F27, was strongly felt in six regions of Chile from Valparaiso in the north to Araucania in the south. The earthquake and the ensuing tsunami displaced 1.5 million people from their homes and left hundreds of people trapped under the rubble of collapsed buildings.[2] Around 370,000 houses were damaged, 220,000 of them severely. Several schools, hospitals, ports, buildings, and bridges were destroyed. Telecommunication, water lines, and Internet services were also cut. A total of 525 people lost their lives. The tsunami devastated all the fishing villages in the southern coast of Chile with fishermen losing their fishing equipment and boats. The wine industry also suffered huge losses to the tune of $400 million. The F27 came at a time when the then President, Michelle Bachelet (Bachelet), was nearing the end of her term and Sebastian Pinera (Pinera) was to take over as the president of Chile.

Chile had had a long history of earthquakes and tsunamis. Positioned on the 'Ring of Fire[3], it was one of the most disaster prone regions in the world. Ever since the Talca earthquake of

Disaster Preparedness and Recovery: India's Tropical Cyclone Hudhud

G V Muralidhara[*] and Hadiya Faheem[**]

On October 12, 2014, a massive tropical cyclone, Hudhud, lashed the coastal states of southern India, killing around 46 people in the states of Andhra Pradesh and Odisha. The cyclone had made landfall at Vishakapatnam (also known as Vizag), a port city in Andhra Pradesh, and some districts of Odisha. It had a devastating impact on the two states, damaging houses and crops, forcing hundreds of thousands of people to evacuate their homes, and uprooting thousands of trees. The state governments had prepared themselves to handle the cyclonic disaster after the Indian Meteorological Department (IMD) issued a warning on October 8, 2014, about a landfall in Vizag and Odisha. The state governments of Andhra Pradesh and Odisha received appreciation for their disaster preparedness that helped in mitigating the loss of human lives. While the toll was low compared to the past cyclonic disasters in India, the economic losses due to Hudhud stood at US$ 11 billion.

"The successful preparation for cyclone Hudhud and typhoon Hagupit lies not only in the ability to predict the movement and intensity of storms, but also the capacity to engage and mobilise vulnerable communities in disaster preparedness."[1]

– Shamika Sirimanne, Director of Economic and Social Commission for Asia and the Pacific's[2] (ESCAP) Information and Communications Technology and Disaster Risk Reduction Division, in February 2015

"India has demonstrated again to the world that if you set the bar high for reducing your exposure to risk then you will save many lives and reduce your economic losses. Cyclone Hudhud was just as great a threat as last year's cyclone Phailin to a densely populated coastline."[3]

– Margareta Wahlström, Head of United Nations Office for Disaster Risk Reduction[4], in October 2014

Samsung: Going from 'Make for India' to 'Make for the World'

V Namratha Prasad and Koti Vinod Babu***

The case discusses how the manufacturing and the R&D strategies that the Samsung Group (Samsung) formulated to excel in India could help it succeed internationally. In the mid-2010s, Samsung launched the "Make in India" initiative and enhanced its domestic manufacturing to take advantage of certain sops given by the Government of India (GoI) to induce multinationals to make India their manufacturing base. In conjunction with that initiative, Samsung also launched the "Make for India" initiative, through which its Indian R&D centers came up with innovative products after studying Indian customer needs and taking into account customer feedback. Samsung eventually announced the launch of its "Make for the World" initiative, under which it planned to shift its production from other countries and make India a base from which to supply products internationally. Will Samsung make India its sole production base in future in Asia? Will its customer-centric products help beat the competition?

"Samsung is a long-term partner of India. We 'Make in India', 'Make for India' and now, we will 'Make for the World'. We are aligned with Government policies and will continue to seek their support to achieve our dream of making India a global export hub for mobile phones."[1]

– H C Hong, Chief Executive Officer, Samsung India Electronics Pvt. Ltd., in July 2018

INTRODUCTION

In December 2020, Samsung India Electronics Pvt. Ltd. (SIEL), a subsidiary of South Korean multinational conglomerate, The Samsung Group (Samsung), launched the #PoweringDigitalIndia initiative. The initiative was announced to commemorate the occasion of SIEL completing 25 successful years in India. Speaking on the occasion, Ken Kang, President and CEO of Samsung Southwest Asia, said, "Our new vision #PoweringDigitalIndia sets the course for India's future growth, in which Samsung will continue to be its strongest partner. Samsung is committed to work with the Government of India and various state governments to realize their vision of nation building, digital inclusion, digital empowerment and bridging of the digital divide through multiple initiatives in manufacturing, R&D, creation of jobs and entrepreneurship, responsible citizenship and transformational innovations."[2]

Netflix Migrates to the Public Cloud for Seamless Streaming

V Namratha Prasad and Koti Vinod Babu***

The case talks about the migration of US-based internet streaming company Netflix Inc. (Netflix)'s streaming services to the public cloud system through Amazon Web Services (AWS) owned by Amazon.com, Inc. (Amazon). The case starts out by mentioning the problems Netflix faced with regard to data storage and data scalability, given its growing business needs. It then documents how Netflix migrated to AWS by undertaking business process re-engineering, bringing about a sea change in its IT infrastructure and database systems, and designing some proprietary cloud-based systems. It also provides information about the benefits gained by Netflix after migrating to AWS. Though some analysts wondered whether Netflix would be ready for any failure of AWS in future, Netflix's Vice-President, Cloud and Platform Engineering, Yury Izrailevsky (Izrailevsky), was confident about the Netflix's data security future on the public cloud.

"It took time and effort to transform Netflix into a cloud-native[1] company, but it put us in a much better position to continue to grow and become a global TV network."[2]

– Yury Izrailevsky, Vice-President, Cloud and Platform Engineering at Netflix, Inc., in February 2016

INTRODUCTION

As of 2020, cloud computing platform Amazon Web Services Inc. (AWS) continued to be the most profitable part of the business of US-based technology company Amazon.com, Inc. (Amazon)'s [3,4] According to a marketing analytics company called *Intricately*, US-based Internet streaming company Netflix Inc. (Netflix), the key rival of Amazon Prime[5], was the top AWS user, based on an aspect of AWS – Amazon Elastic Compute Cloud (EC2)[6] monthly

The Changing Face of Information Systems at Toyota

V Namratha Prasad and Koti Vinod Babu***

This case discusses the changes in the Information Systems (IS) at Japanese multinational automotive manufacturer Toyota Motor Corporation (TMC) in its key operations, through the years. Based on the changes sweeping through the industry, TMC integrated new information processing technologies in processes such as new product development, production, general operations, sales, and customer service. The IS at TMC not only helped the company gain valuable business insights to improve its processes and produce innovative cars, but also assisted it in complying with global environmental standards and changes in the Japanese and global economy. TMC was open to innovative technology, and by adopting it in its IS, it tried to outdo others in the highly competitive and dynamic global automobile industry. Akio Toyoda, President and CEO of TMC, was confident that the IS capabilities of TMC would enable it to process and analyze data in such a way that it could be used to develop vehicles of the future.

"Toyota has a long history of building an (sic) excellent, reliable products and hardware, but building software is something that is a new capability for many traditional automakers. My mission is really to create a strong software center of excellence within the Toyota group at Toyota Research Institute – Advanced Development (TRI-AD[1]) and, working with our other partners, and create products that have both good hardware and good software together."[2]

– James Kuffner, CEO of TRI-AD, in July 2020

INTRODUCTION

In August 2020, Japanese multinational automotive manufacturer Toyota Motor Corporation (TMC), announced a deal with Amazon Web Services (AWS)[3] to develop a *Mobility Services Platform* that would help manage and monetize data gathered from TMC's global vehicle fleet. The new platform was expected to enable TMC to process and analyze data that could be used to develop vehicle services from ride and car sharing to behaviour-based insurance and maintenance notifications.

US Bancorp – Fighting Off Malicious Attacks and Ensuring Business Continuity

V Namratha Prasad[*]

The case documents the measures taken by US-based banking conglomerate US Bancorp to fend off malicious attacks on its information systems and the steps taken by it to ensure business continuity after any disaster. The case describes in detail the cyber threats faced by the bank, and the vulnerabilities of its information systems. It then provides an insight into the tools and technologies adopted by the bank, such as Artificial Intelligence (AI), Machine Learning (ML) and geolocation services, to prevent malicious attacks. The case also takes an in-depth look at the framework for security and control at the bank, including disaster recovery planning and business continuity planning.

"You don't want to make it hard for legitimate customers to do business with you, but you also want to be able to manage the financials of the bank and protect the customer's money."[1]

– Dominic Venturo, Executive Vice-President and Chief Innovation Officer for US Bank, September 2019

"Two to three years ago we'd walk in [to a bank] and talk about machine learning and AI and they'd look at us like we had five heads. Now they're showing us PowerPoint presentations about how it's part of their core strategy."[2]

– Adam Devine, Head of Marketing for WorkFusion[3], in March 2017

INTRODUCTION

In May 2019, the fifth-largest bank in the US, The US Bank (US Bank), warned customers to be wary of a phishing scam[4] that used its name to try and steal customer related information *(See **Exhibit I** for Information on the Top Banks in the US)*. Craig Browning, Regional President for US Bank, said customers were being sent texts from a number that claimed to be from US Bank that included a link for people to click on. He advised people not to click

Rebel Foods: Reinventing Cloud Kitchens through Innovative Tech

C Lakshmi Devasena and Syeda Ikrama***

The case discusses how India-based food tech operator Rebel Foods emerged as the world's largest Internet restaurant company operating in the cloud kitchen segment. Rebel Foods gained a head start as it pivoted from being a Quick Service Restaurant (QSR) chain to a multi brand cloud kitchen model powered by an efficient operating system for building and scaling brands globally. From a small food joint called Faasos in 2011, Rebel Foods grew to a 4000+ Internet restaurants chain with 450+ cloud kitchens spread across 50+ cities in 10 countries as of October 2021. Rebel Foods struck the right balance between exquisite culinary craftsmanship and technological infrastructure and built an efficient operating system with a full stack tech platform, culinary innovation center, cloud kitchen network/ supply chain, and robust operating DNA, with smart infrastructure at its core. The food tech platform leveraged modern technologies such as IoT, AI, and robotics in all its cloud kitchens that allowed it to automate cooking processes, and keep track of inventory, procurement, manufacturing, and warehousing. Sales of food products through its network of cloud kitchens grew by 83% to Rs 5.575 billion during fiscal 2020 as compared to Rs 3.051 billion in 2019. In October 2021, Rebel Foods turned a Unicorn with $175 million funding. Despite its stupendous success, it seemed likely that Rebel Foods would face some challenges going forward such as growing competition in the cloud kitchen space, excessive dependence on online food aggregators, no direct offline relationship with customers, huge operational investments, and sustaining profits as it aimed to expand and grow its brands globally.

INTRODUCTION

On October 7, 2021, India based Internet restaurant company Rebel Foods Pvt. Ltd (Rebel Foods), attained unicorn status with a $1.4 billion valuation as it raised $175 million in a Series F round of funding led by Qatar Investment Authority (QIA), the sovereign wealth fund of the State of Qatar.[1] Rebel Foods operated the largest number of Internet restaurants worldwide, having built 45+ brands (own + partners) across 10 countries globally. Delighted with the achievement, Piyush Kakkad, Chief Financial Officer of Rebel Foods, said, *"While we are excited about becoming the next unicorn, our focus continues to remain on improving customer experience the Rebel way. This round of funding will be re-invested in building our technology, increasing our global presence and also acquiring new brands. Rebel Foods is working towards an IPO in the next 18-24 months."*[2]

E-Procurement Through the Indian Government's Version of Amazon.com: GeM

*V Namratha Prasad**

The case talks about the Government of India (GoI)'s initiative to undertake e-procurement of goods and services for Central and State Government Organizations through the national public procurement portal (NPPP) – Government e-Marketplace (GeM). The GoI transformed legacy procurement systems through GeM, which used technology, analytics, and digitization of processes. The case provides details about the procedures of GeM's unified public procurement system. It also touches upon the benefits provided by GeM to both the buyers and sellers. In addition, the way the online, end-to-end marketplace-enabled inclusiveness and encouraged startups is briefly described. The case discusses in detail the issues preventing the wide scale adoption of GeM and the efforts being made by the GoI to make it popular. Can GeM emerge as the sole platform handling India's public procurement?

"... this (GeM) Business to Government (B2G)[1] platform, has eliminated multiple levels of manual, sequential verification and decision-making, leading to dramatic reductions in lead-time in government procurement."[2]

– Shanker Lal, Lead Procurement Specialist at World Bank's Governance Global Practice[3], in October 2018

"This portal (GeM) reflects the government's commitment for transparent and accountable system of public procurement."[4]

– Nirmala Sitharaman, Commerce and Industry Minister of India, in July 2017

INTRODUCTION

In October 2020, the Government of India (GoI) announced that its National Public Procurement Portal (NPPP) – called Government e-Marketplace (GeM) – was being integrated with its Central Public Procurement Portal (CPPP)[5]. It added that with the ongoing integration of GeM with the Indian Railway Electronic Procurement System and the Defence

Kerala Floods of 2018: Resilience in the Face of a Disaster

G V Muralidhara and Shwetha Kumari***

The case describes the resilience exhibited by the community during the 2018 Kerala floods which killed scores of people and forced thousands into relief camps. The case starts out with a background note on Kerala, a coastal state in the south-west of India. The state led in the service sector, tourism sector, and agriculture sector in India. It then provides details about the 2018 Kerala floods. The floods had detrimental effects on key areas of its economy, including agriculture and tourism. It then describes the rescue and relief efforts and the resilience exhibited by different sections in the state in overcoming the disaster. The case then follows the preparedness lessons learned from the 2018 Kerala floods. It ends with an insight into the challenges faced by Kerala in restoring and rebuilding the state and its economy after the 2018 floods.

INTRODUCTION

On August 21, 2018, Pinarayi Vijayan (Vijayan), Chief Minister of Kerala, a state in southwest India that had been battered by unprecedented rains and floods earlier that month, stated, "Kerala has set many examples for the world. We will certainly set another example of reconstruction and rebuilding."[1] In August 2018, triggered by the monsoon, Kerala witnessed the worst floods it had seen in a hundred years. The calamity affected all areas of the state, causing destruction that was beyond description. Over 400 people lost their lives and approximately 1.4 million people had to take shelter in relief camps. Tens of thousands of homes were destroyed due to the floods.[2] Further, colossal damage was caused to crops, roads, bridges, cattle stock, poultry, power installations, and water supply. The disaster had a far-reaching impact on the socioeconomic front, including on the agriculture and tourism sectors of the state.

However, amidst the horrors of the gushing waters and the raging rivers that washed away everything people had, surfaced many pictures of resilience, grit, and compassion. The Indian Army, Navy, Air Force, coastguard, aid agencies, national government, state government, local authorities, churches, temples, common people – from fishermen to students to judges – and children came out for rescue and relief work that contributed to saving many lives. A leading disaster management expert praised the rescue operation initiatives in the state and referred to Kerala as an outstanding model that had gathered the much-needed synergy of participants and

Automation at Tesla

Syeda Maseeha Qumer[*] and Debapratim Purkayastha[**]

The case discusses the automation strategy of Tesla, Inc (Tesla), the world's largest Electric Vehicle (EV) maker. Tesla vigorously pursued automation solutions to develop high-performance environment-friendly cars that were not only sustainable, but also superior to fossil-fuel alternatives, delivering massive savings in energy costs, performance, efficiency, and reliability. In 2017, Elon Musk (Musk), CEO of Tesla, focused on hyper-automation, including a robotic assembly line, to increase manufacturing speed and drive down costs. Tesla's Fremont manufacturing facility in California was heavily automated with hundreds of industrial robots being used for manufacturing, replacing many of the human workers employed there. Automation processes actually slowed down production at Tesla. Eventually, Musk admitted that his company had gone way overboard with automation and ultimately had to turn back to human assembly line workers to achieve the production targets of Model 3. Despite the setbacks, Musk stated in 2019 that automation would be the key to the company's future.

"When it comes to auto production, Elon [Musk] may have fallen in love with the wrong thing. He's fallen in love with robots and automation. There is a body of academic and practitioner research [on how automation is often contrary to the principles of lean production]. It appears [as] though Tesla has chosen to ignore it. Or perhaps Tesla is convinced it's out of date, in an age of better sensors and computers."[i]

– Max Warburton, Senior Research Analyst at investment research and institutional asset management company Sanford C Bernstein, in 2018

"Excessive automation at Tesla was a mistake. To be precise, my mistake. Humans are underrated,"[ii] admitted Elon Musk, CEO of world's leading electric vehicle (EV) maker Tesla, Inc. (Tesla) after the company missed its production targets for its electric sedan Model 3 in 2018. Musk, who blamed an overly automated production process heavily reliant on robots for the targets not being met said that Tesla's push to heavily automate the production line was a mistake as was the fact that the production system relied too much on automated machinery that was ill suited to certain precision tasks.

Founded in 2003, Tesla led the global EV car market by developing high-performance environment-friendly cars that were not only sustainable, but also superior to fossil-fuel alternatives, delivering massive savings in energy costs, performance, efficiency, and reliability. In keeping with Musk's long-term objective of building affordably priced family cars, Tesla unveiled its Model 3 – a low-priced, high-volume EV for the masses – in March 2016. In 2017, responding to the increasing demand for its lower-priced car, Musk announced ambitious production targets of 5,000 Model 3 vehicles per week. He insisted that Tesla could pull off this feat due to the hyper-automation of the assembly line. According to him, automation would enable Tesla to build vehicles better and faster, boost production, and drive down costs. Tesla's manufacturing facility in Fremont, California, was fully automated with little interaction from humans. The robots powered by Artificial

Kroger's Cloud Strategy: From Retailer to Technology Company?

V Namratha Prasad[*]

The case describes the various measures taken by the US retail giant The Kroger Company (Kroger) to use cloud computing to enhance the shopping experience of its customers. The case starts out by providing a brief history of Kroger that is considered to be an innovator and pioneer in the US food retail industry. It then delves into the details of the strategic partnerships that Kroger had with technology giants Google, LLC and Microsoft Corporation to develop retail innovations using their cloud platforms. The case also takes an in-depth look at the various new retail technologies that Kroger's in-house technology division developed and launched. Kroger's retail technologies not only disrupted the retail space, but were also expected to have extensive scope for commercialization. The implications of adopting innovative retail technologies for the company's financials and market position are also discussed in detail. Can Kroger successfully commercialize its retail technologies and eventually become a technology company that sells groceries?

"Kroger is a 140-year-old grocery store, and you don't stay around that long unless you're continuing to innovate. We had a big shift in cloud technologies. It was completely seamless. We were able to learn a whole bunch of new technologies and move to a new scalable platform..."[1]

– Jimmy Stewart, Senior Engineering Manager of Kroger, in April 2021

"We started to get interest in others about whether our solution is available, and that's when we had serious discussions about whether we can be a technology company that sells groceries, and really figure out how to leverage the technology that we are developing and that we have [intellectual property] on for others in the industry."[2]

– Annette Franke, Kroger Vice President of Customer Experience Network and COO of Sunrise Technologies, in March 2018

INTRODUCTION

In April 2021, the largest supermarket chain in the US, The Kroger Company (Kroger), announced that it had adopted the cloud monitoring capabilities of Dynatrace, Inc. (Dynatrace)[3]. Speaking about the need for the new solution, Jimmy Stewart (Stewart), Senior

Coca-Cola: Employing Business Intelligence to Transform Its Business

V Namratha Prasad and Koti Vinod Babu***

The case primarily discusses how the world's largest beverage company, The Coca-Cola Company (Coca-Cola), employed various Business Intelligence (BI) tools throughout its organization to improve its different business processes. The company's most successful adoption of BI technology was at its largest independent bottling partner Coca-Cola Bottling Co. Consolidated (CCBC), where manual reporting procedures had created various problems for the company. The case discusses in detail the adoption of Tableau Mobile Dashboards, a set of BI tools that served the needs of a variety of audiences and roles in CCBC. Coca-Cola used various other technologies that had close links with BI such as Business Analytics (BA), Artificial Intelligence (AI), and personalized data analytics. As the sales of sugary, carbonated drink products had begun to decline in recent years, Coca-Cola was depending on BI to help to produce and market healthier options such as orange juice.

INTRODUCTION

The world's largest beverages company, The Coca-Cola Company (Coca-Cola), employed various Business Intelligence (BI) tools throughout its organization. BI technology was used in one of the most remarkable ways at its largest independent bottling partner Coca-Cola Bottling Co. Consolidated (CCBC)[1], which had been beset with major issues due to manual reporting procedures.

With manual reporting procedures, the staff of CCBC did not have access to real-time sales and operations data. Consequently the company's processes slowed down. Besides, the business teams could not take effective decisions due to delays in reporting and this led to a lack of coordination between different departments. As a solution to the problem, Coca-Cola began implementing a set of BI tools in CCBC in the mid-2010s.

It adopted 'Tableau Mobile Dashboards' offered by Tableau Software, LLC[2]. Coca-Cola also used various other technologies that had close links with BI such as Business Analytics (BA), Artificial Intelligence (AI)[3], and personalized data analytics.

Analysts pointed out that BI had a direct impact on an organization's strategic and operational business decisions and also helped in fact-based decision-making using historical data rather than assumptions. The BI strategies implemented by Coca-Cola offered

E-Commerce Buying Behavior - Identifying Indicators

Sashikala Parimi[*]

Amit, a fresher working for a consultancy company, took up a task of understanding the e-commerce buying behavior in India. He wanted to understand if the time consumers spent on e-commerce websites had any influence on their buying decisions and the amount spent. He also wanted to check if the membership on the websites, like Prime membership provided by Amazon, had any impact on sales. He set about the task by collecting data from Kaggle. He drew all the relevant tables to represent the data. Amit had to analyze the tables to draw relevant conclusions.

INTRODUCTION

Amit, a fresh MBA graduate, had joined a consultancy firm as a fresher. The world-renowned consultancy had just entered the Indian market and was taking up new projects for its clients. Amit was asked to report to Richard, a partner with the firm, who looked after the e-commerce vertical for the consultancy.

One day Richard called Amit to inform him about a presentation that was due in about a month. An American e-commerce company was intending to enter India, and wanted to know the nuances of the Indian market. Richard asked Amit to give a one page report on the e-commerce scenario in India and the details of the major players by collecting data from secondary sources. Amit had about one week to prepare the report.

Amit started browsing through several databases and websites to prepare a report on the Indian e-commerce Industry. (Refer to Tables IA and IB for the report prepared by Amit)

Table I A

e-Commerce Industry in India
In 2018, the Indian e-commerce market was valued at $50 billion. By 2027, the market was expected to reach $200 billion. The growth in Indian e-commerce was projected to be the highest in the world. The potential for e-commerce in India was huge. India, a country with a population of over 1.3 billion as of 2020, was turning digital with the government's initiatives like Digital India and growing mobile penetration. The growth in e-commerce was triggered by digitization in India, which had led to the growth of internet and smartphone penetration along with low mobile data prices. Mobile data prices in India were the lowest in the world. While the global average price of 1 GB of data was $8.53, in India data was available at $0.09 per GB. In contrast, the average price of 1 GB mobile data in the US was $8.

Evolution of Data Analytics at 3M Compliance Department

Indu Perepu and Faria Zafar***

The Ethics & Compliance team at 3M was an independent function that reported directly to the Audit Committee of the 3M Board of Directors. This was to ensure autonomy in reporting so that the Ethics & Compliance team could act independently when compliance issues rose at 3M. The Ethics and Compliance team created reports to be presented to stakeholders for analysis. With business growing globally, so did the data handled by the compliance department. The department had learned well to change with time and adopt new technology as and when required. The data journey of the ethics and compliance department started with activity-based reporting and went on to increase its reach by creating dialogues with third party associates of 3M as well as employees of the company from various departments. Over a period of time, the reporting in the compliance department evolved from activity-based simple reporting to the use of predictive analytics for complex and more precise reporting and data analysis. Use of predictive analytics helped the department to leverage the humungous amount of compliance data in a proactive way, driving insights and improving performances of employees and departments.

"3M's ability to apply the sciences of big data, predictive analytics, AI, and IoT to transform business operations and create customer value will drive the organization as a leader far into the 21st century."

– Ed Abbo, President and CTO, C3 IoT[1]

"Great and enduring companies are driven by purpose, and built on a foundation of trust – trust from our customers, employees, partners, shareholders and communities. At 3M, we cannot break that trust – ever."

– Mike Roman, Chairman and Chief Executive Officer, 3M[2]

INTRODUCTION

The 3M Company (3M), a Minnesota, USA based corporation, had a presence in four business segments – Safety and Industrial; Transportation and Electronics; Health Care; and Consumer, as of 2020.

Shopify Helps Build Online Stores

Indu Perepu and Faria Zafar***

Ottawa, Canada-based Shopify, a cloud-based SaaS (Software as a Service) e-commerce solution provider, helped entrepreneurs, small to medium-sized businesses, and large enterprises to set up their e-stores. The company offered a web builder along with various templates, secure payment options, Search Engine Optimization, analytics, and many more features to facilitate the setting up of online stores. The Shopify web builder was user-friendly; even people with no coding or e-commerce experience could easily set up their online stores. Even though Shopify offered a feature-rich solution to e-commerce merchants, it was criticized for the cost that merchants had to incur to set up a website of their liking. Despite the cost concerns that many people had, Shopify was hosting close to 377,000 online stores by 2020 and boasted customers like Budweiser, the World Wildlife Fund, General Electric, Amnesty International, Tesla Motors, Encyclopedia Britannica, Foo Fighters, and GitHub.

"To me, a great company starts with a great product and ends with a great product. That's what I'm really excited about, and that's what I want to focus on."[1]

– Tobias Lütke, CEO and Co-Founder, Shopify

INTRODUCTION

Ottawa, Canada-based Shopify, a cloud-based SaaS (Software as a Service) e-commerce solution provider, helped entrepreneurs, small to medium-sized businesses, and large enterprises to set up their e-stores. The company offered a web builder along with various templates, secure payment options, Search Engine Optimization, analytics, and many more features to facilitate the setting up of online stores. The Shopify web builder was user friendly; even people with no coding or e-commerce experience could easily set up their online stores.

Shopify offered great scalability and reach to its customers because of which its customer list included not only small and medium companies but also large corporations like Budweiser, World Wildlife Fund, General Electric, Amnesty International, Tesla Motors, Encyclopedia Britannica, Foo Fighters, and GitHub.[2] By 2020, Shopify hosted close to 377,000 online stores.[3]

COMPANY BACKGROUND

Shopify Inc. was a platform using which anyone could set up an online store to sell their products ***(Exhibit I)***. It had customers in 175 countries from across the globe[4].

Flipkart's Move Towards Automated Supply Chain Management

V Namratha Prasad and Smita Ray***

The case talks about the adoption of automation technology by leading Indian e-commerce company Flipkart Online Services Pvt. Ltd. (Flipkart) in its supply chain to make its delivery process faster with fewer errors and improve its competitive strength. The case describes the circumstances that led Flipkart to adopt automation in its warehouse and order fulfillment operations. It then elaborates on the various measures taken by the company as a part of its automation implementation. The case delves into the impact of automation on the operational and financial performance of the company. It ends with a brief look at the future prospects of automation in the supply chain of e-commerce companies.

"The value proposition brought by GreyOrange automation solution was accuracy, repeatability and consistency. GreyOrange worked with us as a team and suggested a solution that was scalable."[1]

– V. Ramesh, Vice-President (Supply Chain Operations), Flipkart, in 2017

INTRODUCTION

In February 2018, India's largest warehouse robotics startup, GreyOrange Robotics Pvt. Ltd., (GreyOrange)[2] unveiled a new robotic system called Butler XL (*Refer to Exhibit I for categories of GreyOrange Butler robots*). The new system, to be deployed at warehouses, was expected to automate inventory storage (putaway) and order fulfillment. India's largest online store, Flipkart Online Services Pvt. Ltd., (Flipkart) had, in the mid-2010s, become one of GreyOrange's first clients after it secured a range of warehouse automation and order fulfillment systems from them. The new automation systems helped Flipkart achieve a range of benefits in its supply chain and placed the company at the forefront in adopting robotics enabled automation systems in India.

ABOUT THE COMPANY

Flipkart was registered in Singapore and was founded in October 2007 by Sachin Bansal and Binny Bansal (Binny). The company started its operations with the launch of books. Over

Hennes & Mauritz (H&M): High Cost of Fast Fashion

K B S Kumar and Indu Perepu***

Sweden-based Hennes and Mauritz (H&M), one of the leading fast fashion retailers in the world, was staring at an uncertain future in 2018. As of November 2017, the company had unsold stock worth $4.3 billion. With H&M's products not able to keep up with customers' expectations, inventory started to pile up. The company did not make any major changes to its supply chain for over two decades, and continued to produce in Asia without paying any attention to the changing trends in the fast fashion industry. Users said that the offerings from H&M had become dull and unfashionable. Though H&M went online in the late 1990s itself, it did not do much to develop its e-commerce capabilities. As a result, the company's unsold inventory swelled to 20% of its total sales. H&M resorted to markdowns, which adversely impacted its profits.

> *"The chain is becoming irrelevant because warp-speed, low-priced clothing is now ubiquitous and sales have moved online. H&M, the founder of fast fashion, is now too slow."*[i]
>
> **– Elizabeth Cline, Fast Fashion Author, and Expert**

INTRODUCTION

In April 2018, the world's second-largest fashion company, Sweden's Hennes & Mauritz (H&M), reported that it had about $4.3 billion (about SEK 33.7 billion) of unsold goods for the year ending November 31, 2017. The company announced that sales had also risen by just 4% compared to the previous year. H&M's CEO Karl-Johan Persson (Persson) said, "*Sales in many of our physical H&M stores were weak, particularly in mature markets where customers' new shopping behavior can be clearly seen in the form of declining traffic to stores and increased online shopping.*"[ii] The company had been facing problems for several quarters. Its stock had dropped by 43.6% between April 2017 and February 2018. (Refer to Exhibit I for Stock price Chart)

One of the most popular fast fashion retailers, H&M's sales grew rapidly from the late 1990s to the mid 2000s. It expanded its presence to countries across the world and had 4700 stores globally as of November 2017.

But the company started facing problems in 2016, as it lost out to more formidable competitors like Zara, and online stores like ASOS, which had made their supply chains agile and reduced their design-to-distribution supply chains to as little as ten days to two weeks.

H&M, on the other hand, had 80% of its clothes made in Asian countries, and so was not able to meet customers' expectations. It witnessed its biggest sales drop in the fourth quarter of 2017. The trend continued and reducing sales led to inventory piling up. At the same time, costs registered an increase, affecting the profit. Due to years

Nestlé India: Adopting a Regional Approach in Its Distribution Strategy

V Namratha Prasad and Koti Vinod Babu***

The case discusses the logistics and distribution strategy of Nestlé India Limited (NIL), the Indian subsidiary of the world's largest food and beverage company, Nestlé SA. The case gives a brief insight into the distribution structure of Nestlé, and the terms of operations it employed for its intermediaries. It then provides details about how technology helped NIL's outbound logistics system at NIL. The case moves on to discuss the possibilities of channel conflicts and stresses upon the need for NIL to strengthen its own distribution channel in order to avoid differences between prices of its products in different regions, product positioning, and promotional campaigns. The hyper local cluster approach of NIL is dealt with as well, wherein it divided India into various clusters and then crafted product placements, distribution, marketing, and promotions for each cluster. Suresh Narayanan, Chairman and Managing Director of NIL, was hopeful that NIL would continue to improve its distribution strategies to serve the Indian markets better.

"We would need to have distribution centres based more on location, consumption and the cheapest freight routes."[1]

– Suresh Narayanan, Chairman and Managing Director of Nestle India Limited in October 2017

INTRODUCTION

In July 2020, the Indian subsidiary of Switzerland-based Nestlé SA (Nestlé) and leading packaged food manufacturer, Nestlé India Limited (NIL), reported Rs 33,253 million in revenues for Q1 2020, as compared to Rs 31,493 million in the last quarter of 2019.[2] However, the company stated that its sales had been adversely impacted by the nationwide lockdown[3] imposed due to the Coronavirus pandemic (Covid-19)[4].[5] Suresh Narayanan (Narayanan), Chairman and Managing Director of NIL, said, "Our Company remained resilient in the first quarter, as the numbers indicate, and delivered volume and mix led growth."[6]

Popeyes Chicken Sandwich – A Marketing Triumph or a Supply Chain Disaster?

Indu Perepu and Faria Zafar***

The US-based Popeyes Louisiana Kitchen, Inc. (Popeyes), a chain of fast food restaurants, offered items like chicken, seafood, sandwiches, wraps, kids' meals, sauces, desserts, and beverages. Headquartered in Miami, Florida, Popeyes was founded in 1972 by entrepreneur and culinary innovator Al Copeland. On August 12, 2019, Popeyes added a temporary item to its menu – Fried Chicken Sandwich. Initially, the product received lukewarm response, until Chik-Fil-A, Popeyes' competitor, tweeted claiming its own chicken sandwich was the most authentic. Popeyes replied with a tweet, which started a tweet war between the two. Soon some other quick service restaurants in the US joined the fray. The Twitter war made the Popeyes Chicken Sandwich famous and pushed up their sales, so much that Popeyes' stock of two months finished by August 27 and it had to declare the sandwiches "Sold Out". It took the chain another two months to relaunch the chicken sandwich.

INTRODUCTION

On August 12, 2019, Popeyes Louisiana Kitchen Inc.[1] (Popeyes) added a temporary item to its menu – Fried Chicken Sandwich. A week after the launch, its competitor, Chick-Fil-A[2], put out a tweet in which it took a jab at Popeyes' new product while declaring its own sandwich as the original. This sparked a war of words on Twitter, with other fast food restaurants like Wendy's wading into the battle.

The resulting social media spat among these well known fast food chains rapidly went viral, creating hype about Popeyes' Chicken Sandwich. People started flocking to Popeyes outlets to try the most talked about chicken sandwich. Long queues of customers waited patiently for hours at these outlets to get hold of the sandwich. Popeyes' sandwich, which had received lukewarm reception on its launch, thus went on to become a trending item with just a tweet. Someone even offered to sell the $3.99 sandwich for $7000 on eBay.

On August 27, 2019, Popeyes sent out a message stating that the sandwiches had been "Sold Out" – it had run out of chicken to make the sandwiches. Since this was a temporary item, Popeyes had stocked just enough ingredients to last till the end of October, thereby making sure there wouldn't be left over ingredients with the restaurants. But the publicity over the chicken sandwich amplified the demand for it, in contrast to the demand forecasts done by Popeyes before the product was launched.

Burberry Burns Unsold Stock: Fashion's Dirty Open Secret?

Indu Perepu and Koti Vinod Babu***

In the annual report for the year 2017-18, UK-based luxury fashion giant Burberry Group PLC (Burberry) mentioned that it had physically destroyed surplus stock worth £ 28.6 million. Experts said that the company had destroyed excess stock to maintain its exclusivity, while Burberry maintained that it wanted to avoid its clothes falling into the hands of counterfeiters and grey marketers who could sell them at a discount, thereby devaluing the brand. The total value of goods destroyed by the label since 2013 was £90 million. The company faced a huge backlash from analysts and environmentalists for opting to incinerate the stock when it could have given it to charity instead or used it in some other way. The critics voiced their outrage on various social media platforms. Burberry eventually called off its policy of burning excess stock and pledged to instead recycle it.

"Some brands feel that they don't want their product to be seen, photographed, etc. on a group of people who might not be able to actually afford that brand. So, if they have excess stock, they may choose to destroy it rather than it going into an off-price outlet or being sold at a discount price or being in some other way moved into the [lower-price] marketplace." [1]

– Margaret Bishop, Professor at Parsons School of Design, in 2018

INTRODUCTION

On September 6, 2018, UK-based luxury fashion giant Burberry Group PLC (Burberry) announced that it would stop burning unsold clothes after it came in for severe criticism from industry analysts, environmentalists and consumers for resorting to such a practice. Burberry's annual report, released in June 2018, said, "The cost of finished goods physically destroyed in the year was £28.6million [about $37.8 million], including £10.4 million of destruction for beauty inventory."[2] The total value of goods destroyed by the label since 2013 was £ 90 million.[3] Burberry announced that goods including clothes, accessories, and perfume had been burned. However, it claimed that they had been destroyed not to maintain exclusivity but to prevent counterfeiting.

Burberry, founded in 1856, was a manufacturer, wholesaler, and retailer of luxury goods. It designed and manufactured ready-to-wear outerwear, fashion accessories, fragrances, sunglasses, and cosmetics, and sold them through a varied network of retail, digital, wholesale, and licensing channels.

Nestlé's Maggi Recall in India: A Reverse Supply Chain Ordeal

Manish Agarwal and Siddhartha Kushwaha***

The case discusses the challenges faced by Luca Fichera, Executive Vice-President (Supply Chain) of Nestlé India Limited (Nestlé), in dealing with the mandatory recall of Maggi noodles imposed on the company by the Food Safety and Standards Authority of India (FSSAI). Luca and his team faced a daunting task in completing the reverse distribution exercise of 400 million Maggi noodles packets in a country the size of India with all the complexities involved and that too within a very short planning horizon. The case helps students understand the structure of reverse and closed-loop supply chain and the challenges relating to the collection, transportation, warehousing, and disposal of the products.

"The recall process is complex and 'reverse distribution' in nature. There are many more costs involved, which include logistics, packaging, transport, handling, and storage, apart from other associated costs."[1]

– Luca Fichera, Executive Vice-President (Supply Chain), Nestlé India, June 2015

"....Recall is difficult to implement and it won't be efficient in rural areas...."[2]

– Abhneesh Roy, Associate Director at Edelweiss Securities, June 2015

INTRODUCTION

In the first week of June 2015, Luca Fichera (Luca), Executive Vice-President (Supply Chain) of Nestlé India Limited[3] (Nestlé), and his team of supply chain executives were facing the daunting task of temporarily halting the manufacture, distribution, and sales of Nestlé's popular instant noodles, Maggi (Maggi). The Food Safety and Standards Authority of India[4] (FSSAI) had issued an order on June 5, 2015, asking Nestlé to recall nine variants of Maggi from the Indian market. This forced Nestlé to immediately establish a reverse supply chain for the recall. Nestlé initially estimated that 27,420 tons of Maggie had to be recalled.[5] However, in November 2015, it reported that it had disposed of around 35,000 tons of Maggi.[6]

Security and Privacy Issues with Zoom

Sanjib Dutta and Smita Ray***

The case talks about the security and privacy issues faced by Zoom Video Communications, Inc. (Zoom) and the company's response. The case starts out with a brief history of Zoom. It then describes the growth of Zoom over the years. The case covers in detail the various security and privacy lapses at Zoom and the measures taken by the company to strengthen security and privacy features to ensure that such issues do not happen in the future. The case also touches upon the rise of various other video communications apps. Though Zoom had many competitors, users continued using it in spite of the security issues, which underlined its popularity with them. The outbreak of the Covid-19 pandemic presented an opportunity for Zoom to grow further, provided it took steps to avoid security lapses in future.

"In the beginning, we had the goal in mind of creating a communication tool that allowed participants to connect and share information easily and with the highest-quality from anywhere in the world. With the emergence in participants from both businesses and individual professionals, we know we've created the next evolution in cloud video collaboration that provides the ultimate affordable, unified, cross-platform meeting experience for everyone."

– Eric S. Yuan, CEO and Founder of Zoom Video Communications, Inc., in 2020[1]

"Zoom's recent privacy and security issues aren't any more significant than those facing any other tech company, and Zoom has quickly moved to correct each one of them. "The challenge Zoom faces is that they were a specialized niche company that was suddenly thrust into the role of a critical infrastructure provider overnight and they simply weren't ready for the intense level of scrutiny that they've received as a result."

– Mike Chapple, a Former Computer Scientist with the National Security Agency[2], in 2020[3]

"The unpreparedness of Zoom to handle this surge in traffic presents a very big opportunity for cyber theft."

– Swoyan Satyendu, Director of ODM Public School, India, in 2020[4]

737 MAX Crisis: Can Boeing Bounce Back?

Raghavendra Rao G N and G V Muralidhara***

On September 26, 2019, the National Transportation Safety Board (NTSB) in its report on Boeing 737 MAX aircraft raised a big question about the design approval process of Boeing and the certification process of the Federal Aviation Administration (FAA). NTSB had conducted a month-long investigation on the possible lapses in the design and approval of Boeing 737 MAX aircraft, following two aircraft crashes – one of Lion Air and another of Ethiopian Airlines that killed 346 people on board, both involving Boeing 737 MAX aircrafts. According to the results declared on January 29, 2020, Boeing announced its first annual loss since 1997 attributed to the 737 Max crisis. Boeing had put the total cost of 737 MAX crisis at $18.6 billion as on the day it announced the results. Boeing feared that the total cost would mount further as it did not include probable settlements against lawsuits from more than 100 victims' families from both the crashes.

INTRODUCTION

On September 26, 2019, the National Transportation Safety Board (NTSB)[1] in its report on the Boeing 737 MAX aircraft, raised a big question about the design approval process of Boeing and the certification process of the Federal Aviation Administration (FAA)[2]. NTSB had conducted a month-long investigation into possible lapses in the design and approval of the Boeing 737 MAX aircraft, following two air crashes involving the aircraft – one of Lion Air and another of Ethiopian Airlines – that killed all 346 people on board.

While the Lion Air flight crashed on October 29, 2018, the Ethiopian Airlines flight crash occurred on March 10, 2019. Even though the main cause for these two crashes was yet to be officially confirmed, Ethiopia's transportation ministry confirmed that the initial data recovered from the flight data recorder of Ethiopian Flight 302 showed *"clear similarities"* with the crash of Lion Air Flight 610. Post the second crash, aviation authorities and airlines around the world grounded Boeing 737 MAX passenger aircraft quoting safety issues.

Assuming there were similarities between the accidents, the Associate Administrator for Aviation Safety at FAA constituted a Joint Authorities Technical Review (JATR) to evaluate the certification process of the flight control system on the B737 MAX.

The Boeing 737 – a single-aisle aircraft family for short-to medium-range flights, entered service in February 1968 with Lufthansa. The first variant was a 737-100. The 737 families became the highest-selling commercial aircraft in the history of airplanes. The 737 families were being manufactured continuously since 1968 and the 10,000th aircraft rolled out on March 13, 2018. This family was the pride of Boeing until the developments in 2018 and 2019 raised several questions about its safety.

Namaami Gange: Rejuvenating the Holy River

Indu Perepu and Munmun Samantarai***

This case discusses the different projects taken up by various organizations in India to clean River Ganga and the challenges they faced. Represented as a goddess, Ganga in the Hindu religion is considered to be a holy river. The case chronicles the various events that resulted in the river becoming polluted. To clean the filth and garbage, many initiatives were taken by the Government of India over the years with huge amounts of money being spent. The Ganga Action Plans I & II failed drastically. In 2015, the ruling government under the leadership of Prime Minister Narendra Damodardas Modi (Modi) made attempts to rejuvenate the river with the 'Namami Gange' project. The estimated time frame for project completion was 18 years.

"From her origin till her final destination, Mother Ganga implores, beckoning her children from afar, to listen to her woes, my Son, my Child! Rid me off my filth, so all cleansed up I flow."[1]

–Narendra Modi, Prime Minister (India), in 2014

"Ganga is not merely a symbol of a religion. It is a symbol of holiness, culture and geography and most importantly it is one of the most powerful instruments of our economy,"[2]

– Arun Jaitley, Finance Minister (India), in 2015

INTRODUCTION

In May 2015, the National Democratic Alliance (NDA) government in India, led by Prime Minister Narendra Damodardas Modi (Modi) drew the ire of the Supreme Court of the country over slow progress of the Namami Gange project, aimed at cleaning and protecting river Ganga in a comprehensive manner. Slamming the government, the Supreme Court bench questioned, "You should be more keen than us...You said you are committed to this (cleaning the river). So, do you want to complete this task in this term or not?[3] Rejuvenating the Ganga and other important rivers was among the key promises in the Bharatiya Janata Party (BJP)[4] manifesto for the 2014 Lok Sabha elections. While filing his nomination as a BJP candidate from Varanasi, located on the banks of river Ganga, Modi promised to clean the holy river. Modi claimed, "I don't think anyone has sent me here, or I have come here. I feel Mother Ganga has called me to Varanasi."[5]

Aadhaar Data Leaks: How Secure Is the World's Largest Biometric Database?

Syeda Maseeha Qumer and Koti Vinod Babu***

This case discusses the security concerns over the Aadhaar card, a national identity project launched by the Government of India (GoI), which seeks to collect biometric and demographic data of residents of India and store this data in a centralized database. Using Aadhaar, a person's identity can be certified and authenticated in an easy and cost-effective way. Aadhaar has been linked to many GoI welfare schemes and is used as identity proof to open a bank account, get a passport, etc. However, there have been substantial deliberations over the privacy and security issues related to the Aadhaar project. Aadhaar is considered to be prone to possible system hacks, insider leaks, and tampering of authentication records and audit trails in the absence of proper security policies. There have been reports of Aadhaar breach in different regions of India and people are skeptical about its security. Even though the GoI is taking a lot of measures to safeguard Aadhaar data, there is a lot to be done to enhance the safekeeping of the data.

In March 2018, the Intelligence Bureau[1] (IB) reportedly informed The Ministry of Labour and Employment of India [1] that private data from one of the Aadhaar[1] seeding portals of the Employees Provident Fund Organisation[1] (EPFO) had been stolen by hackers, leading to a shutdown of the facility a month earlier. The data theft was from the EPFO's web portal, which helped subscribers link their provident fund accounts with their Aadhaar numbers. In a note to Dinesh Tyagi, chief executive officer (CEO) at Common Service Centre[1] (CSC) which was dealing with the Aadhaar seeding application, EPFO Commissioner V P Joy (Joy) wrote, "It has been intimated that the data has been stolen by hackers by exploiting the vulnerabilities in the website (aadhaar.epfoservices.com) of EPFO. The web portal has been closed one-and-a-half months back immediately after the possible data theft was reported to us during a process of routine security check. There was some problem in the application run by CSC and it is not related to our data centre that maintains the EPF accounts."[i] However, the Unique Identification Authority of India[2] (UIDAI) said that the website on which the data breach had allegedly taken place did not belong to it.

Aadhaar, a 12-digit identification number for Indian citizens, was provided by the UIDAI on behalf of the GoI. Aadhaar implementation was the largest biometric identification database system in the world, holding the data of about 1.2 billion Indian citizens. It was created after the biometric scan of the person concerned, i.e. a scan of his/her fingerprints and retina.

The Aadhaar card also included the address of the card holder overleaf and a Quick Response Code (QR code) which could be scanned digitally. The number served as proof of address and identity for citizens anywhere in India. However, reports emerged in the media in 2017 that the Aadhaar data had been compromised and hacked by certain people. But the

Passenger Data Breach at British Airways

Sanjib Dutta and Shubhanjali Chakravarty***

The case study walks us through the largest data breach in the history of the aviation industry, one which compromised the financial and personal data of 380,000 passengers in 2018. The data breach was a result of a cyber-attack on the website and mobile application of British Airways (BA), for booking transactions done between August 21 and September 5, 2018. Accepting the magnitude of the privacy intrusion, BA apologized to its customers and promised to reimburse them for any financial losses they had suffered due to the data breach. The case also highlights the importance of the airline's software and website being updated (last updated in 2012) at periodic intervals to save it from future hacks and the resultant data breach. It concludes with BA's attempt to save its brand image (as it is the largest international carrier of UK), and throws light on measures BA might adopt to tighten its IT governance, given the stringent European law.

"Delays, cancellations, data breaches and IT glitches (at BA) all point to systems failures at the company, which are all too easily linked back in stakeholders' minds to the company's internal focus on cost-cutting and efficiencies."[1]

– Alastair Pickering, Chief Strategy Officer at Alva Group[2], in 2019

"We are proud to fly more than 45m customers a year and, while challenges remain and change takes time to deliver in aviation, our customers are noticing the investments we are making."[3]

– Spokesperson at British Airways Plc. (BA) in 2019

INTRODUCTION

On July 8, 2019, British Airways Plc. (BA), the largest international carrier of the UK, was fined US$ 230 million by General Data Protection Regulation[4] (GDPR), the regulatory arm of the Information Commissioner's Office[5] (ICO), UK, for a grave passenger data breach. The data breach happened between August 21, 2018, and September 5, 2018, due to a malicious cyber-attack on the BA website. Alex Cruz (Cruz), CEO of BA, called the attack, *"Malicious and sophisticated, and it's the first time the airline's website had been hacked*

SAFe Implementation at LEGO

Indu Perepu and Faria Zafar***

Denmark-based The Lego Group (Lego) was a family-owned company well known for the eponymous LEGO blocks, interlocking plastic blocks which can be assembled to construct different objects. LEGO blocks were a hit among kids and adults, and LEGO experienced immense success during the 70s and the 80s. But things took a turn during the 90s, and Lego landed in troubled waters. There was growing competition from video games, automated toys and the internet. The toy market was changing fast with new games coming in the market frequently. To cope with the dynamic market, Digital Solutions (DS) department at LEGO also expanded. DS was involved in the creation and maintenance of online digital games. To streamline the operations and collaborations, DS implemented SAFe. This new initiative motivated the employees to work better and also helped LEGO in achieving its core values. Implementing SAFe brought many benefits to DS. Teams were less dependent on each other to complete their own tasks, thus saving a lot of time. This also improved the ability of DS to meet their commitments on time. There was better synchronization among teams with reduced redundancy of tasks.

"Only the best is the best."

– LEGO Group Motto by Ole Kirk Kristiansen[1]

INTRODUCTION

Denmark-based The LEGO Group (LEGO), a family-owned company well known for the eponymous LEGO blocks, found itself in troubled waters in the 1990s. The toy market was changing rapidly and LEGO was facing growing competition from video games, automated toys, and the internet. New games were frequently being introduced in the market.

LEGO blocks – reusable interlocking plastic blocks that could be assembled to construct different objects – were equally popular among children and adults and enjoyed immense success in the 1970s and 1980s. But with the growing competition, the company found the going tough in the 1990s. It realized that its employees would have to be innovative to adapt to the fast changing world. Also, the company needed to adopt a dynamic culture to achieve its core values, "imagination, creativity, fun, learning, caring, and quality."

To cope with the dynamic market, the Digital Solutions (DS) department at LEGO was expanded. DS was involved in the creation and maintenance of online digital games. To streamline the operations of the department, in 2015 DS implemented Scaled Agile Framework SAFe[2] – a set of organization workflow patterns for implementing Agile practices at enterprise scale. DS introduced changes at all levels of the development process – team level, between different teams, and at the business planning and management level.

Botched Up Operational Revamps at ASOS

Indu Perepu[*] and Faria Zafar[**]

ASOS, a British online retailer launched in 2000, sold clothes and other fashion accessories. Its clientele were primarily in the age group of 20-30. In July 2019, ASOS issued a profit warning, stating that the profits would be a third lower than what was expected in the year. This was the third profit warning in seven months, the first coming right before Christmas in 2018, after which the company lost 60% of its value. These profit warnings were issued after problems erupted during ASOS's migration to an automated warehouse system in its Berlin warehouse. The other issue ASOS faced at the same time was at its Atlanta warehouse where the company said it had failed to effectively plan the expansion of its global presence.

"Online-only retailers have caused a revolution in the supply-chain business, pushing up standards in order to keep customers coming back."[i]

– Nick Robertson, Founder, ASOS

"The major overhaul of our infrastructure has been bumpier and taken a lot longer than we originally anticipated. We acknowledge that this is a failure in execution."[ii]

– Nick Beighton, CEO, ASOS

INTRODUCTION

In July 2019, the-UK based online fashion and cosmetics retailer, ASOS plc (ASOS), issued its third profit warning in a span of 7 months. After the first warning in December, the company had lost 60% of its market value. The problems at the company were a result of its failure to effectively implement operational initiatives to improve business. Two of its warehouses – at Berlin and Atlanta, where an operational overhaul was taking place – had failed to live up to expectations.

ASOS had always believed in investing in technology to offer its customers a perfect shopping experience. Its warehouses were all automated with state-of-the-art technologies. The Berlin warehouse, also known as Eurohub 2, was one of ASOS's largest warehouses, holding around 70% of its stock. To improve the efficiency of the warehouse ASOS planned to automate it using the newest technologies. Unfortunately for the company, the process did not go as planned. The implementation ran into trouble, affecting the order fulfillment process and warehouse management at Eurohub 2.

The warehouse at Atlanta was the newest addition to ASOS's facilities outside the UK. ASOS underestimated the import issues in the USA and could not get as much of its stock into the US as it had planned to because of compliance issues. ASOS being a famous brand had huge demand in the US. Soon after its launch, it was flooded with orders. The demand for ASOS products was much more than it had expected[iii]. But due to stock unavailability, the orders could not be fulfilled, resulting in a significant dispatch backlog.

Implementation of Odd-Even Scheme for Private Cars in Delhi – A Pilot Study on Pollution Control

P Sashikala[*] and G V Muralidhara[**]

This case study discusses the implementation of Odd-Even scheme for cars in Delhi, India, on a pilot basis with the aim of controlling pollution. On December 4, 2015, the Delhi government led by Chief Minister Arvind Kejriwal, announced that the odd-even rule would be implemented from January 1, 2016, for private cars in Delhi, the capital city of India, as a pilot study for a period of 15 days. According to the announcement, private vehicles would be allowed across the city based on their registration numbers. For example, if a vehicle's registration number ended with an odd digit, it would be allowed on the roads on odd dates such as January 1, 2016, while an even number vehicle would be allowed on even dates.

INTRODUCTION

On December 4, 2015, the Delhi government led by chief minister, Arvind Kejriwal (Kejriwal), announced that the odd-even rule would be implemented from January 1, 2016, for private cars in Delhi, the capital city of India, as a pilot study for a period of 15 days. According to the announcement, private vehicles would be allowed across the city based on their registration numbers. For example, if a vehicle's registration number ended with an odd digit, it would be allowed on the roads on odd dates such as January 1, 2016, while an even number vehicle would be allowed on even dates [1]

The government's announcement came in the wake of a statement made by the Delhi High Court on December 3, 2015, that air pollution levels in the city were alarming and living in the city was like living in a gas chamber[2]. The court expressed unhappiness over the increased levels of pollution in the city as the PM 2.5 levels[3] had crossed 60. Further, the Delhi High Court had received certain affidavits with regard to pollution in the city. One of the affidavits was from the Delhi traffic police, filed on December 3, 2015, which stated that there were 14 places in Delhi where pollution levels were high due to heavy vehicular traffic. These locations were on the road from Indian Institute of Technology (IIT) flyover to Panchsheel, Ashram and the stretch from Gurgaon to Dhaula Kuan (Ref to Exhibit I).

According to a study conducted by Greenpeace India, children in the city were at risk even indoors. Sunil Dahiya, a Greenpeace campaigner, made a statement that schools in the city

Mitsui Adopts Collaboration Tools Offered by Microsoft

Indu Perepu[*] and Faria Zafar[**]

In 2016, Mitsui & Co. (Mitsui), a general trading company headquartered in Tokyo, Japan, experienced its first ever consolidated loss. This loss prompted the company to devise a Medium-Term Management Plan in 2017 to deal with these challenges. The plan focused on four key initiatives to be achieved by 2020, which were based on the two pillars of "work-style innovation" and "digital transformation." Mitsui wanted a platform for communication and collaboration that could link the information and technologies of its employees working in 66 countries and regions around the world. For the purpose, it used various teamwork and collaboration tools provided by Microsoft and saw positive results in the organization.

INTRODUCTION

In 2017, Japan-based Mitsui & Co. Ltd. (Mitsui), one of the largest trading companies in the country, was selected by Japan's Ministry of Economy, Trade and Industry (METI) and the Tokyo Stock Exchange (TSE) as a 'Competitive IT Strategy Company'. This award came in recognition of its efforts to utilize information and communication technology to raise corporate value in the medium- to long-term and strengthen competitiveness.[1]

The recognition was a result of Mitsui's digital transformation. The company initiated a transformation after experiencing its first ever consolidated loss in 2016. It strengthened its management base and evolved its innovation functions with a focus on digital transformation. By building IT infrastructure that combined a cloud authentication platform based on the Microsoft Azure Active Directory with a suite of collaboration tools like Microsoft Teams and SharePoint Online, Mitsui significantly enhanced the output of its daily business. It introduced work style innovations like reinvigorating communication, promoting knowledge use and sharing, and moving to paperless operations.

The company also saw improvements in its financial records after facing a loss of ¥83.4 billion[2]. In 2017, the company had a profit of ¥306.1 billion[3], which rose to ¥418.5 billion in 2018[4].

ABOUT MITSUI & CO.

Mitsui & Co., Ltd., one of the largest sogoshosha (general trading companies) in Japan was founded in 1947 as Daiichi Bussan Kaisha, Ltd. In 1959, it merged with some other trading companies and renamed itself as Mitsui & Co., Ltd.

Shadowfax's SuperApp: Accelerating Growth of On-Demand Delivery Marketplace in India

Shubhagata Roy[*] and Benudhar Sahu[**]

The case is about India's leading crowdsourced logistics platform Shadowfax Technologies' (Shadowfax) launch of the SuperApp, a single delivery platform for riders and sellers. Shadowfax provided an on-demand hyperlocal delivery service for its clients, including restaurants and retailers across the country. It had a crowdsourced network of active delivery partners to deliver goods and services for the businesses. The company's technology platform connected delivery executives to the e-commerce companies and businesses. Shadowfax launched a delivery app called SuperApp to address the challenges faced by delivery executives in accessing a number of partners on different platforms. The company believed that riders could have access to all companies through one app, instead of registering themselves individually with each company. The app not only made the process of accessing all companies convenient and time-saving for the delivery partners, it also empowered them to access multiple opportunities, such as daily payouts and financial benefits like loans and insurance, on a single platform. With the launch of the SuperApp, Shadowfax was able to provide last-mile logistic solutions to business partners and become the all-in-one solution of the on-demand delivery marketplace for enterprises.

INTRODUCTION

On October 2021, Shadowfax Technologies, India's leading crowdsourced logistics platform, announced the launch of its SuperApp, a single delivery platform for riders and sellers. Shadowfax was a provider of an on-demand hyperlocal delivery service for restaurants and retailers. Founded in 2015, the startup operated a technology platform that connected delivery executives to e-commerce companies and small and medium businesses in the cities across the country. The platform had a crowdsourced network of about 100,000 active delivery partners who registered on the platform to deliver goods for the company. Most of the prominent Indian brands in food, grocery, e-commerce, and healthcare depended on Shadowfax for their on-demand deliveries.

Shadowfax designed the SuperApp taking into account the challenges faced by the delivery partners in accessing a number of partners on different platforms. With the launch of the SuperApp, Shadowfax aimed to accelerate the growth of the delivery partners by empowering them to access multiple opportunities on a single platform. The company claimed that the SuperApp would be India's first delivery app that offered access to the maximum number of companies on the same platform. This made the process of accessing all companies convenient and time-saving for the delivery partners.

SuperApp benefited riders who would be able to leverage on the daily payouts and exciting offers in addition to getting financial benefits like loans and insurance. The app also offered a personalized engine to sellers who could upsell and cross-sell their products.

India's Quest for Green Energy: Kamuthi Solar Project

G V Muralidhara and Alok Kavthankar***

On September 22, 2016, Adani Green Energy opened the world's largest single location solar power plant in Kamuthi village in Ramanathapuram district of the southern Indian state of Tamil Nadu. The 648MW power plant with an outlay of $680 million was completed in less than a year. This was a significant achievement given the scale of the project. Though the Kamuthi project was completed within record time, it had to deal with its share of challenges. The project faced several logistical challenges owing to its remote location as well as the delays caused by unseasonal torrential rains.

INTRODUCTION

On September 22, 2016, Adani Green Energy opened the world's largest single location solar power plant in Kamuthi village in Ramanathapuram district of the southern Indian state of Tamil Nadu. The 648MW[1] power plant with an outlay of $680 million was completed in less than a year. This was a significant achievement, considering that the largest solar project in the world at a single location till then was in California, US, and it had taken 3 years to complete (Refer Exhibit I for important solar power installations around the world). Gautam Adani, the company's chairman, said the Tamil Nadu plant "reinstates the country's ambitions of becoming one of the leading green energy producers in the world". The Government of India had a vision[2] to set up 100 Gigawatts (GW)[3] of solar capacity in the country by 2022. The 648 MW project was a big leap toward achieving India's Vision 2022.

Adani Green Energy was a part of the Adani Group (Adani) of companies. Established in 1996, , Adani was a $10 billion diversified group in 2016 with interests in power, transmission, distribution, and logistics. It entered the solar power business in 2014 and had around 2GW of solar assets. This made it one of the top players in the Indian solar energy market, which had recently witnessed a boom owing to the bottoming of solar hardware prices and the government's ambitious plans. In 2011, Adani had installed the largest solar power plant in Gujarat, India. The 40MW plant was completed in a record time of 165 days.

BACKGROUND NOTE

The government of Tamil Nadu had launched a solar energy policy in 2012. The vision was to develop 3000 MW of solar energy by 2015. The policy called for development of 1,000 MW of utility-scale, rooftop, and renewable energy certificate (REC) projects. Some of the

Nandu's Foods: Using Technology to Build an Integrated Omnichannel Meat Brand

Jitesh Nair and Bitra Vasudev***

The case describes how Narendra K Pasuparthy (Narendra), an IT employee who had returned from the US, used technology as an enabler to build Nandu's Foods Pvt. Ltd. (Nandu's). Nandu's, the Bengaluru-based retail arm of the Nanda Group, offered antibiotics, steroids, chemicals, and hormone-free hygienic and fresh poultry meat to consumers. Narendra found that the Indian meat industry was fragmented and meat retailing was unorganized and done through butchers. He identified an opportunity as there was consumer demand for good quality, fresh, and nutritious poultry meat in India. The technology strategy adopted by Nandu's included investing in business analytics, cloud-based technologies, machine learning, and artificial intelligence for better data-based decision making and inventory management. Nandu's also planned to raise funds from private investors for its pan-India scale-up.

"At Nandu's, we look at technology as the catalyst that has helped us, as poultry farmers, to take our produce directly to the end consumer. Technology adoption has been our biggest facilitator in transforming from a B2B business to a B2C business. It gave us the confidence to operate retail stores across Bengaluru as well as venture into e-commerce."[1]

– Narendra K Pasuparthy, CEO and Founder of Nandu's, in December 2020.

INTRODUCTION

Nandu's Foods Pvt. Ltd. (Nandu's), a Bengaluru-based meat start-up and the retail arm of the Nanda Group[2], grew 200% every year between 2018 and 2021. In April 2021, the company registered revenue of around INR500 million[3] and claimed to be profitable at an operational level. Nandu's offered healthy, hygienic, fresh, and high-quality poultry meat that was free from antibiotic residue, steroids, chemicals, and hormones. Nandu's was a fully integrated farm-to-fork[4] meat retail brand that followed a hyperlocal[5] and omnichannel[6] sales strategy.

Data Breach at MobiKwik

Syeda Maseeha Qumer and Syeda Ikrama***

The case is about the data security breach at digital payment platform MobiKwik. In early March 2021, the data of nearly 110 million users of the mobile wallet was reported to be on sale on a hacker forum on the dark web. The dataset included details of KYC documents, Aadhaar card and credit card details, and mobile phone numbers linked to the MobiKwik app. The breach was first exposed by an independent security researcher Rajshekhar Rajaharia. However, MobiKwik denied that any such breach had occurred and stated that it was fully compliant with all applicable data security laws. It blamed users instead for their data ending up on the dark web. The company even targeted the cybersecurity experts who brought the hack to light. The evidence of the hack, however, was hard to ignore, and the breach had serious implications both for the company and its customers. Following the data breach allegations, the Reserve Bank of India (RBI) ordered a forensic data security audit of the company's systems by a certified auditor. The MobiKwik data breach turned the spotlight on data privacy and the need for strict laws to penalize entities involved in data breaches.

In March 2021, India-based digital payment platform MobiKwik System Pvt. Ltd. (MobiKwik) reportedly fell victim to one of the largest data breaches in Indian history. Allegations surfaced that the personal data of nearly 110 million of its users had been breached and had been put on sale on a hacker forum on the dark web. The data included Aadhaar card, credit and debit card details, GPS locations, bill payment history, and mobile phone numbers linked to MobiKwik wallet, etc. However, the fintech startup denied that any data breach had taken place but stated that it was investigating the matter.

Founded in 2009 by Bipin Preet Singh (Singh) and Upasana Taku (Taku), MobiKwik was one of the leading fintech platforms in India operating businesses in consumer payments, financial services, and payment gateways. As of March 2021, its payments network was one of the largest in India with 120 million users, 3 million merchants, and 300+ billers (*See **Exhibit I**).* The market valuation of MobiKwik was $414 million as of March 2020. [i] The total funding received by the fintech platform as of June 2021 was $197.5 million[ii] and some of its major investors were Sequoia Capital[1], American Express Ventures[2], and MediaTek Ventures.[3] In fiscal 2020, MobiKwik's revenue was Rs.3,790 million (*See **Exhibit II & III**).*

On February 8, 2021, a hacker by name "ninja_storm" joined Raid Forum, a platform for sharing data leaks. A few days later, on February 24, 2021, the hacker posted on the forum about the data breach with the subject *"BIG DATA LEAK of one of top 3 financial services company from India – 7TB"*. The hacker did not reveal the name of the company and wrote that he was looking for buyers. When some viewers demanded proof of the data leak, the

NFC - Mobile Payment Services: Is India Ready for It?

Bijeta Shaw and G V Muralidhara***

NFC mobile payment services, the latest technological development in mobile payment services, was launched by ICICI Bank in India in the year 2016. Though the new payment system had a lot of potential and would benefit consumers in several ways, its adoption was very low. The adoption and acceptance of an innovation depends on the consumers as well as the factors which motivate them to use it or inhibit them from doing so. In the case of NFC-mobile payment services too, the motivating factors included the ability to use smartphones, and the facts that it was time-saving, transactions were secure, people could carry less cash, and it was convenient. The factors inhibiting adoption of NFC-mobile payment services included consumers being reluctant to use the mobile mode of payment, lack of NFC-chip installed in POS machines, and lack of awareness programs. Since the NFC mode of payment could be beneficial on several counts, the government needs to take several initiatives to educate the consumers about the processes and benefits of NFC-mobile payment services. This could encourage them to adopt it.

"We are delighted to introduce a contactless mobile payment solution that will allow cashless payments using just smart phones, thereby eliminating the need to carry cash or debit and credit cards. We expect this to be a big game changer in the Indian payment industry, as it will transform the smart phone into a virtual wallet"[1]

– Rajiv Sabharwal, Executive Director, ICICI Bank, in 2016.

INTRODUCTION

On March 15, 2016, ICICI Bank launched India's first contactless mobile payment solution called NFC-mobile payments[2] (near field communication). NFC, a communication medium, enabled exchange of data between two devices with NFC chips installed in them when the devices were placed within a few centimeters of each other[3]. With the help of Host Card Emulation (HCE) technology, a 'virtual' card with a different card number for debit and credit card would be stored in the customer's smartphone and the details stored in the bank server cloud[4]. Customers could initiate payments from their NFC-enabled smartphones by waving the phone within a distance of 4 cm from a contactless NFC-enabled point-of-sale (POS) terminal secured by a one-time encrypted password. This contactless mobile payment worked through a magnetic field and did not need the internet. It was thus considered highly secure as no sensitive information was saved on the smartphone.

Use of Data-Driven Decision to Increase Market Share Through Reference for a Multi-Brand Automotive Dealership

Samyadip Chakraborty and Vaidik Bhatt***

ABC automotive is one of the largest automobile dealers in south Gujarat. ABC automotive was experiencing increasing losses due to fall in sales of cars and other accessories along with decreasing pay-out in finance and insurance of newly sold car. Abhishek Bansal, an analyst, identified the issues and presented a report to the board with recommendations on how to arrest the loss. The board worked on the strategy, which helped ABC automotive to regain its market share and prevent losses.

INTRODUCTION

It was a rainy day in July and Abhishek Bansal (Bansal), a dynamic data analyst working for one of the big automotive dealerships, was crunching Sales & Marketing data for a quarterly review meeting. He was looking at each detail – whether it was inquiry, lost sales, discounts, bookings, retails, accessories sales, insurance, RTO, finance; or stock, booking cancellation, competition, or market share.

He suddenly observed that from April 2017, sales of one of their prestigious brands had fallen significantly and that the company was losing a large amount of revenue because of that.

ABC Automotive Group

ABC Automotive Group (ABC Automotive) was one of the largest groups for automobile dealerships in Gujarat. The group was an official dealer and authorized SSS (Sales, Service, Spare Parts) partner for different OEMs (Original Equipment Manufacturers) operating from India. The group was founded in January 2010 through the backward integration of several dealerships at several locations.

After successfully completing 18 years in automobiles, Ketan Desai, Chairman of ABC Automotive sought to take the performance of the company to the next level. He aimed to secure and retain the All India No 1 position in each of the evaluation criteria for dealerships laid down by the OEMs. This necessitated a professional set-up and professionals driving the dealership's operations as per the OEMs' specified norms. To make the organization process and system driven, he formed a private limited company in 2010 under the name ABC Automotive Group Private Ltd.

De-Risking Automobile Industry from Natural Disasters

G V Muralidhara and Manish Agarwal***

In recent years, natural disasters have become more common all over the world. People have suffered a lot due to earthquakes, floods, cyclones, droughts, and heavy snowfall, among other calamities. These natural disasters have claimed thousands of human lives and affected various industries. One such natural calamity was faced by Chennai, one of the largest hubs of the Indian automobile industry, in December 2015 when heavy rainfall, which broke a 114-year record, killed hundreds of people and displaced about two million. The automobile industry was devastated by the Chennai flood and suffered a loss of about Rs. 150 billion. The crisis served as an eye opener to the automobile industry. Industry players have to now re-plan their strategies and think of how to de-risk themselves from such natural disasters.

"The impact on the whole ecosystem – car manufacturers and component makers – will be really significant."[1]

– Abdul Majeed, Automotive Head at PwC, December, 2015

INTRODUCTION

In December 2015, for the first time in their history, automobile companies in and around Chennai were forced to close down their plants for 3-7 days because of the unprecedented rainfall on December 1-2, 2015. Within 24 hours, Chennai was battered by a torrential downpour, the heaviest the city had seen since 1901.[2] The rain brought Chennai airport and the metro to a halt; schools and colleges were closed, trains stopped running; and all modes of communication including mobile phones and the internet were disrupted *(See Exhibit I)*. The Associated Chambers of Commerce and Industry of India (ASSOCHAM) estimated financial loss of Rs. 150 billion due to the rainfall and floods in Chennai and other parts of Tamil Nadu.[3] Small and Medium Enterprises (SMEs), the IT-ITES industry, and the automobile industry were badly affected by the heavy rainfall and the resultant floods.

Chennai, one of the largest automobile hubs in India, suffered a loss of Rs.1.8 billion for each unproductive day during the flood. According to the 'Society of Indian Automobile Manufactures' (SIAM), an automobile industry body, due to the flood, several days of automobile production had been lost which would further delay retail sales and exports.

Debacle of Google Glass

Syeda Maseeha Qumer and Benudhar Sahu***

This case deals with the debacle of Google Glass, a wearable technology device launched by technology giant Google. Google Glass failed to capture the smart eyeglass technology market segment and found it difficult to sustain itself in the long run. The failure of the device was a major debacle for Google. Google launched its ambitious Google Glass Explorer program with the objective of building on the concept of projecting digital information into the wearer's field of vision. Critics pointed out that Google had made the mistake of launching the prototype product without assessing customer feedback and promoted it as a consumer device instead of targeting the B2B audience, and said this was the reason for its failure. Besides, its poor quality battery, bulky design, product flaws, and privacy concerns seemed to be the major challenges for Google Glass in a diversified competitive market. However, the company committed to continuing the project by launching its new enterprise edition of Glass in 2016.

On January 19, 2015,[1] US-based tech giant Google Inc.[2] (Google), took the tech world by surprise when it withdrew its smart glass, Google Glass, from sale in the markets. The company also discontinued the Explorer Program under which users such as gadget enthusiasts and software developers, whom Google called Explorers, purchased the device for RS.1,500 and gave the company valuable insights into the usage of the Glass as its beta testers. According to Adrian Hon, CEO and founder of Six to Start[3], "Even if Google didn't admit it, it was clear from the start that Google Glass was not consumer-ready. Google should have managed expectations by presenting it as a developer prototype instead of showing it off at fashion events and selling it for £1,000."[4]

A California-based company, Google was founded in 1998 by Larry Page and Sergey Brin (Brin). It provided internet-related services and products including web-based search, cloud computing, software applications, online advertising technologies, mobile operating systems, consumer content, enterprise solutions, and hardware products. Google forayed into the wearable technology segment by introducing the Google Glass Explorer program in 2012[5] with the objective of building a head-mounted wearable computer that delivered hands-free information to users through voice command.

Asian Paints: Technology as an Enabler in Reimagining the Value Chain

Jitesh Nair and Bitra Vasudev***

The case study describes how Asian Paints Limited (Asian Paints) used IT systems to help reinvent itself consistently over the last 4 decades. It touches upon the various initiatives taken by Asian Paints to offer support to dealers and retailers during the COVID-19 pandemic such as sanitizing dealer premises free of charge and extending credit facilities. The case also covers the future plans of Asian Paints to continue investing in Artificial Intelligence and Machine Learning to improve operations and customer experience.

"Profitability across businesses has been well supported by a good sales mix and some excellent work in cost optimization & sourcing measures pursued strongly through innovation programs."[1]

– Amit Syngle, MD & CEO, Asian Paints Limited, in 2021

"It's crucial in the paint product category to ensure service levels at the dealer counters and availability of the range of SKUs. We've enabled optimized shipment creation and tracking to ensure high order fill rates. Our SAP HANA platform-based solution reinvented our order servicing by empowering the sales team with timely information about the current stock, and the distribution team about inventory levels and possible SKU shortages."[2]

– Harish Lade, Vice-President, Supply Chain, Asian Paints Limited, in 2018

INTRODUCTION

Asian Paints Limited (Asian Paints), an Indian multinational paint company headquartered in Mumbai, reported a 62.28 per cent increase in its consolidated profit to Rs.12.65 billion for the third quarter ended December 31, 2020, as against a profit of Rs.779 billion during the same period of the previous fiscal. Revenue from operations was Rs.68.86 billion, up 25.43 per cent, as against INR54.90 billion reported in the same period of the 2019-20 fiscal despite market challenges in the backdrop of the COVID-19 pandemic. *"Never has supply chain visibility been central to our existence as it has been in the last 3-4 months (May-Aug 2020),"*[3] said Harish Lade, Vice President – Supply Chain, Asian Paints.

Data Security Breach at Virgin Media

Syeda Maseeha Qumer[*]

The case discusses the data security breach at UK-based telecom and Internet service provider Virgin Media Inc. (Virgin Media). On March 5, 2020, the company published a statement on its website stating that one of its marketing databases containing the personal details of about 900,000 existing and potential customers had been left unsecured online since April 2019 and had been accessed without its authorization. Though the company was taking several steps to prevent such data leaks in future, it remained to be seen whether it could fix its reputation. Virgin Media's CEO Lutz Schüler apologized for the breach, but was that enough to regain the trust of customers?

"This recent breach highlights once again the challenges that Internet Service Providers (ISP) face to protect sensitive customer data [...]. However, it's surprising that it took Virgin Media ten months to detect and patch the flaw. In simple terms, these types of breaches occur because many organisations still lack adequate monitoring and controls to automatically detect and proactively respond to servers & applications misconfiguration before damage has been caused."[i]

– Marco Essomba, founder of cybersecurity firm iCyber-Security in 2020

INTRODUCTION

On March 5, 2020, UK-based telecom and Internet service provider Virgin Media Inc. (Virgin Media) disclosed that it had suffered a data security breach after it was found that Virgin Media's marketing database containing the personal details of about 900,000 customers had been left unsecured online since April 2019, accessible to anyone without any authentication being required. Virgin Media maintained that the compromised information was mostly limited to contact and product data and did not contain financial information or passwords. According to the company, the incident occurred as a result of the database being incorrectly configured by a staff member. *"We immediately solved the issue by shutting down access to this database, which contained some contact details of approximately 900,000 people, including fixed line customers representing approximately 15% of that customer base. Protecting our customers' data is a top priority and we sincerely apologize."*[ii] said Lutz Schüler (Schüler), CEO of Virgin Media.

However, TurgenSec[1], an Information Security start up that first discovered the unguarded database online and alerted Virgin Media's security team, said that it was "disingenuous" for the company to claim that only "limited contact information" had been breached.

* Assistant Professor, IBS Hyderabad (Under IFHE – A Deemed to be University u/s 3 of the UGC Act, 1956), Hyderabad, Telangana, India. E-mail: maseehaqumer@ibsindia.org

Slack Enterprise Collaboration Software

Indu Perepu and Faria Zafar***

US-based Slack Technologies Inc. owned a proprietary business communication platform – Slack. The goal of this tool was to improve productivity in everyday office tasks through an organized and easy-to-use communication and collaboration system. Slack provided teams with real-time messaging and file sharing for one-to-one and group conversations. It also integrated with dozens of popular services such as Twitter, Trello, Asana, Google Docs, MailChimp, Stripe, Zendesk, etc. Thus, Slack made collaboration and communication among teams much easier. As of 2021, Slack was being used by almost 77% of Fortune 100 companies. It was also used by NASA in their project to send robots to Mars. At the same time, the tool was also criticized for negatively impacting the productivity of employees in large organizations due to over-dependency and over usage of the tool.

INTRODUCTION

US-based Slack Technologies Inc. owned a proprietary business communication platform, Slack. The goal of this tool was to improve efficiency in the office by making work days more productive through fewer meetings and emails. Slack provided teams with real-time messaging and file sharing for one-to-one and group conversations. It also integrated with dozens of popular services such as Twitter[1], Trello[2], Asana[3], Google Docs[4], MailChimp[5], Stripe[6], Zendesk[7], etc. This made collaboration and communication among teams much easier.

Slack also synced across devices on its smartphone app as well as its website. Since its launch, it had become a favourite collaboration tool among teams. It was used by almost 77% of Fortune 100 companies[8]. It was also used by NASA in its project to send robots to Mars[9].

Inside Amazon: Chaotic Storage System

J Prince Vijay and G V Muralidhara***

This case is about the US-based online retailer Amazon.com Inc (Amazon). It illustrates the Amazon fulfillment center's storage system and contemplates its storage practices, which are in total contrast to the traditional practices of storing products by characteristics and attributes. The case also highlights the advantages and disadvantages of Amazon's practices of storing its products by available shelf or storage space, though a few products are exempt from the rule. This presents a picture of 'organized' confusion to anyone who steps into Amazon's warehouse. However, Amazon has been largely successful in redefining the way the products were effectively stored and retrieved in the warehouse. This case discusses the critical success factors that help operations managers to develop a decision framework for a warehouse storage system in the supply chain context.

INTRODUCTION

US-based Amazon.com Inc. (Amazon), one of the largest online retailers in the world, had gained popularity for its unique warehouse practices. Traditionally, companies stored similar products together based on predefined product characteristics and attributes. For example, books were stored separately from toys. Each product category had its own fixed shelf or storage space. However, this conventional practice was challenged by Amazon's warehouse storage practices. At Amazon, the products were randomly stored in any empty shelf space in the warehouse. At first look, this appeared to be chaotic storage. For example, products such as books, toys, apparel, electronic devices, all were placed next to each other in the same shelf space. At Amazon it was not necessary to share the product characteristics while storing the products; instead, the basic requirements such as size, dimensions, temperature, and humidity, became more important.

AMAZON'S STORAGE PRACTICES

Warehouse Storage System

Amazon was founded by Jeff Bezos in 1994 as an online bookstore. Over the years, it expanded to several countries[1] and was selling more than 2 billion products as of 2014. For the year ending December 2014, Amazon recorded revenues of $88.99 billion. Over the years, Amazon built giant warehouses, also known as fulfillment centers, for storing the products. All the products that Amazon sold were brought to these warehouses, sorted, and then sent to the customers[2]. The warehouses were strategically located near shipping points across the world. They were massive in size, occupying an area of about 1.2 million square meters, and over 65,000 people worked in them.

* Assistant Professor, Department of Operations and IT, IBS Hyderabad (Under IFHE – A Deemed to be University u/s 3 of the UGC Act 1956), Hyderabad, Telangana, India. E-mail: jpvijai@ibsindia.org

** Director, IBS Bangalore (Off Campus of IFHE), Karnataka, India. E-mail: muralidharagv@ibsindia.org

[1] As of 2015, Amazon had presence in the USA, Canada, the UK, Ireland, France, Germany, Spain, Italy, India, China, Japan, the Netherlands, Australia, Brazil, Japan, and Mexico.

[2] Apart from its own products, the warehouse facilities of Amazon were used to sell the products that belonged to third party sellers through Amazon.

Teabox – Disrupting the Tea Industry in India

Shankha Sengupta and Faria Zafar***

India-based online seller of tea, Teabox, disrupted the 200-year-old Indian tea industry and changed the tea supply chain from a long 5 step process to a leaner 2 step process. Teabox vertically integrated the tea manufacturing process and was directly involved in the process right from manufacturing the tea to selling it to customers. In the process, Teabox emerged as the only vertically integrated tea business in the world.

INTRODUCTION

India-based online seller of tea, Teabox was founded by Kausshal Dugarr (Dugarr) in 2012. Dugarr wanted to sell the tea fresh and not after it was dried and packed into teabags, as was being sold in supermarkets. He said, "Tea is an agriculture product. You would not want your fruits and vegetables, six months, three months old, and if you are having it that old, it needs to be stored and preserved well. That meant rethinking the entire supply chain."[1] Teabox vertically integrated the tea manufacturing process and was directly involved in the process right from manufacturing the tea to selling it to customers. Teabox emerged as the only vertically integrated tea business in the world.

ABOUT TEABOX

Dugarr, a fourth generation tea entrepreneur, came from a family that had been in the tea business for more than 80 years. He grew up on tea estates and started his mornings drinking tea made of freshly plucked leaves. As he grew up, he realized that other tea lovers did not get to enjoy tea like he did, as they got the tea only 6 months after it had been plucked. Moreover, it would have been stored and distributed in a manner which was inefficient.

Dugarr graduated from Singapore Management University and tried his hand at businesses related to luxury limousine and electronic waste. But success eluded him in those ventures. He then worked with KPMG for two years and learnt the nuances of corporate finance. He returned to India in 2010 and joined his brother who was in the tea export business. He found the tea business had not seen much innovation and was still following centuries-old practices. Feeling strongly that it was necessary to modernize the way tea was distributed, Dugarr then started a website, Darjeelingteaexpress.com, through which he started selling tea online.

He attracted funds from Accel and changed the name of Darjeelingteaexpress.com to Teabox. The corporate office of Teabox was located in Bengaluru.

Dugarr sourced the tea from local plantations within India. It was then sent to cold storage within 48 hours of production, where it was vacuum-packaged. He slowly moved from traditional tea to tea bags, green tea, and other varieties of tea.

Jaypore – From Artisans to E-Shops

Indu Perepu and Faria Zafar***

Jaypore E-Commerce Pvt. Ltd. was an e-commerce platform through which Indian artisans and independent producers could sell their handcrafted products. It sourced its products like apparel, jewelry, lifestyle accessories, and home decor from a large number of artisans, craft cooperatives, etc. from all across India. Apart from having an online presence, Jaypore also opened a few offline stores. The handloom and handicraft industry has been the backbone of India's rural economy for many years, but it was highly unorganized and fragmented. Jaypore's way of business worked towards bringing in quality and pricing standards to handcrafted products.

INTRODUCTION

Jaypore E-Commerce Pvt. Ltd (Jaypore), an India-based online retailer,sold premium curated handcrafted products from top-end brands such as Ritu Kumar[1] and Shades of India. It also sold traditional products such as Kashmiri Kani shawls and paithani saris, painstakingly woven by weavers.It sold everything from jewelry to apparel to home decor and furniture.

The company sourced products directly from artisans and craftsmen and sold them at a small margin. Jaypore focused on providing quality products to its customers rather than offering discounts on products. It created a niche and loyal customer base for itself since its launch in 2012.

Motivated by the positive response from customers, the company moved to offline stores. By 2020, it had opened 3 stores across India. Jaypore used a mix of technology as well as unique handcrafted quality products to capture customers in a highly fragmented Indian Handicraft Industry.

Jaypore

Jaypore E-Commerce Pvt. Ltd. was an e-commerce platform through which Indian artisans and independent producers could sell their curated products online. It was founded in 2012 by Puneet Chawla[2]and Shilpa Sharma[3] in Delhi, India.[4] Jaypore received initial funding from angel investor Haresh Chawla and Aavishkaar Venture Fund.

Supply Chain Issues at Adidas

Indu Perepu and Nagendra Kumar MV***

In 2018, despite knowing about the growing demand requirements for its mid-range apparel products in the North American market, the management of Adidas failed to source the required products from its suppliers spread across the Asian region on time. Adidas outsourced its manufacturing requirements across the globe to different partners. The present case provides an insight into the concept of responsive supply chains, their needs and their features. It also illustrates how Adidas' production processes were unable to meet the demand, and the initiatives taken by the company to ensure that the products reached the customers on time.

INTRODUCTION

After seeing a double-digit growth in sales during the fiscal year 2018 in North American markets, the world's second largest sporting goods manufacturer, Adidas Group Company (Adidas), found itself facing a huge challenge in meeting the growing demand for mid-ranged apparel in these markets, due to a supply chain bottleneck. In its annual report, Adidas announced that it would miss the 2019 growth targets due to problems related to its supply chain, According to Chief Executive Officer Kasper Rørsted (Kasper), the capacity problem in the manufacturing plants was expected to create a loss of around $225 million to $450 million[1]. "We have an excess demand that we can't cover due to inefficient capacity at our manufacturing plants. It's predominantly related to apparel and it's predominantly related to North America in the first two quarters,"[2] said Kasper.

Despite the supply chain issues, the management of Adidas projected a 5% to 8% growth in sales during the fiscal year 2019. "Right now there is no way of mitigating it, but if you look at the overall outlook we're still looking at a 10-14% net earnings growth, which is very strong, and taking the margin to 11.5% in 2019, which was the original target for 2020, so we're pretty much one year ahead of our plan and our targets for 2020,"[3] said Kasper.

The problem was mainly attributed to the approach the company followed to improve its market share in North America. Adidas had a low market share in the US compared to its competitor, Nike Inc. "Since our strategic position was smaller, we decided build the brand at the top, then move into the midtier," said Kasper.[4] In the process of gaining an upper hand, Adidas established wholesale relationships to sell the mid-priced apparel range, leading to a spurt in demand. The production processes were unable to meet the increased demand.

Ford Motor Company Re-Engineers Procure-to-Pay Process

Indu Perepu and Faria Zafar***

The period between 1980 and 1982 saw a recession in the US, which also caused trouble to the American automobile industry. Ford Motor Company was affected as well by the slowdown. The situation triggered a search by Ford executives for ways to reduce overhead and administrative costs. The executives at Ford realized that they had a large headcount in their accounts payable department, and the procure-to-pay process for purchase orders was also very error-prone. To make the department lean and the process more accurate, the company decided to bring about a radical change in the process by re-engineering the entire system. Ford introduced invoiceless processing in procure-to-pay process, which was simple and also reduced discrepancy errors in invoice clearance. Through the new system Ford was able to reduce the headcount by 75% and also improve vendor relations.

INTRODUCTION

The period between 1980 and 1982 saw a recession in the USA, which hurt the American automobile industry hard. American automobile corporation Ford Motor Company was affected as well by the slowdown. The situation triggered a search by Ford executives for ways to reduce overhead and administrative costs. Executives at Ford realized that they had a large headcount in their accounts payable department and that the 'procure to pay' process for purchase orders was also extremely error prone. To make the department lean and the process more accurate, the company decided to bring about a radical change in the process by re-engineering the entire system.

Ford introduced 'invoiceless processing' in the procure to pay process, which was simple and also reduced discrepancy errors in invoice clearance. Through the new system Ford was able to reduce the headcount by 75% and also improve vendor relations.

FORD MOTOR COMPANY

Ford Motor Company, an American automotive corporation, was founded by Henry Ford along with 11 associate investors in the year 1903.[1] The company manufactured passenger cars, trucks, and tractors as well as automotive parts and accessories. It was headquartered in Dearborn, Michigan. Ford had dealers and distributors in five geographical segments across the world: North America, South America, Europe, the Middle East and Africa, and Asia-Pacific.[2]

Microsoft SQL Server-Based OLAP Technology at Raiffeisen Bank International

Indu Perepu and Faria Zafar***

Raiffeisen Bank International AG (RBI), an Austrian Bank headquartered in Vienna, was one of the most preferred banks in Austria as well as Central and Eastern Europe and Asia. The bank was dealing with a humongous amount of data of its customers. Frequently this data was also used to create reports for analysis and evaluation of business. The bank was therefore using business analytics tool – Online Analytical Processing (OLAP) for its reporting and analysis purpose. The bank was using OLAP with IBM Cognos. Over a period of time, increase in number of customers also increased the data, and so did their business requirements which called for more refined analytical reports. The bank wanted a sophisticated and powerful Business Intelligence (BI) tool, but at the same time wanted to keep its costs low. So the bank decided to use Microsoft OLAP tool, which would expand the existing reporting and analysis instead of completely replacing the existing system of business intelligence analysis. Microsoft OLAP tool proved quite beneficial to the company. The reporting and analysis became precise as all unwanted data was filtered in early stages of analysis. Removal of unwanted data also made reporting process more flexible, as employees were now able to select the data required for their reports instead of getting the entire database to go through.

"IT must reposition itself as an advice and service facility for operating departments."

– Richard Reiling, Head BI Development, RBI IT[1]

INTRODUCTION

Raiffeisen Bank International AG (RBI), an Austrian Bank headquartered in Vienna, was one of the most preferred banks in Austria as well as in Central and Eastern Europe and Asia.

The bank dealt with a humongous amount of data pertaining to its customers. This data was also frequently used to create reports for analysis and evaluation of business. The bank was therefore using the business analytics tool Online Analytical Processing (OLAP) ***(Exhibit I)*** for its reporting and analysis purposes. It was using OLAP with IBM Cognos. ***(Exhibit II)***

By 2019, the company had 46,873 employees and offered its services to close to 16.7 million customers through 2000 business outlets.[2]

Over a period of time, an increase in the number of customers also led to an increase in the data and also to the bank's business requirements, which called for more refined analytical reports. The bank wanted a sophisticated and powerful Business Intelligence (BI) tool while

Analytics of Overbooking

L Shridharan and Debapratim Purkayastha***

Julie Andrews (Julie), Marketing Manager of a medium-sized airline, had been tasked with finding out the extent of overbooking the airline could permit on one of its flights. The young airline's CEO, Steve Jackson (Steve), wanted to get this right so that the airline would not find itself in the kind of situation United Airlines Limited (UAL) faced in April 2017 when a passenger was forcibly deplaned, leading to a huge backlash against the airline.

INTRODUCTION

Julie Andrews (Julie), Marketing Manager of *Topaz Air,* had been tasked with finding out the extent of overbooking Topaz should permit on one of its flights. *Topaz Air* was a young airline and its CEO, Steve Jackson (Steve), wanted to get this right so that the airline would not have to face situations like the one in which United Airlines Limited (UAL) found itself in April 2017. The problem was that Julie was not quite sure how best to go about this exercise.

BACKGROUND NOTE

Overbooking was a common practice in the airline industry. Airlines sold more tickets than there were seats. It was a strategy to ensure a full plane and maximize profits in case passengers did not turn up for a flight. When they did, airlines typically offered them travel vouchers to encourage some passengers to give up their seats. Each airline had its own system and procedure for deciding whom to bump. Some airlines chose to bump the passengers who paid the lowest fares, while some chose the last passengers to check in.

This issue of overbooking came into the limelight when 69-year-old David Dao (Dao) was forcibly deplaned by security officers from a fully booked United Express flight on April 9, 2017, in Chicago. Dao, bound for Louisville, Kentucky, had already boarded and was seated. At this point, the airline wanted a few fliers to voluntarily give up their seats to make room for four crew members who needed to fly to Kentucky on work. When no one volunteered, gate agents invoked the airline's involuntary denial-of-boarding process. The computer algorithm chose Dao. The ordeal started for Dao when he refused to give up his seat to accommodate some crew members. In the melee that followed, Dao suffered significant concussion and a broken nose and lost two of his front teeth. The incident, captured on video by some fellow passengers, prompted widespread outrage and snowballed into a public relations disaster for the airline. In the immediate aftermath of the incident, UAL's stock reportedly dropped 1.1% and the airline lost $255 million in stock market value. UAL had to issue an apology and the matter was settled with Dao for an undisclosed amount.[1]

Lululemon Athletica: An Ethical Fashion Brand?

Indu Perepu and Munmun Samantarai***

Lululemon Athletica (Lululemon), a Canada-based sports and yoga wear retailer, was founded by Dennis Chip Wilson (Wilson) in 1999. Lululemon's products, which were premium priced, gained popularity among yoga practitioners and other fitness-conscious people. As of 2014, the company operated through 254 stores across the world. Since its inception, Lululemon has emphasized sustainable business and ethical operations. The company projected its sustainability vision as elevating the world from mediocrity to greatness by embracing social, environmental, and economic health in every part of its organization and its global communities. But over the years, it became mired in several controversies, ranging from false claims about the presence of seaweed in its clothing, to the presence of lead in some of its products, transparent yoga pants, etc., which made even loyal customers shy away from the brand.

Does it sound like the values of yoga to you? It may. That's your choice. But I strongly suspect that the overwhelming majority of Lululemon customers and ambassadors haven't thought into the politics of the company they're supporting. But we have an obligation to do so. We're in the middle of a crisis that turns on the question of whether we need to reform or let the forces of unrestrained corporate capitalism run completely unchecked..."

– Carol Horton, Professor and Author of Race and the Making of American Liberalism[1]

INTRODUCTION

Canada-based yoga-inspired apparel company, Lululemon Athletica Inc., (Lululemon), was founded in 1998 by Canadian businessman, Dennis 'Chip' Wilson (Wilson). It stocked yoga and fitness apparel including shorts, pants, jackets, etc. As of 2014, the company operated through 254[2] stores. These outlets were spread across Canada, the U.S, New Zealand, Hong Kong, the U.K., and Australia. Apart from its own showrooms, Lululemon products were sold across many fitness centers.[3]

The company was founded on the vision of 'Elevating the world from mediocrity to greatness'. Since its inception, the company had positioned itself as a responsible company, manufacturing products that were environment friendly and making efficient use of energy. Its mission was to be a "community hub to provide guests with the knowledge, tools, and the components needed for people to live longer, healthier, and more fun lives."

Global Water Challenge: Dilemma of Building Strategic Social Partnerships

D Satish and Nagendra Kumar M V***

Global Water Challenge (GWC), a social service organization, is playing a crucial role by collaborating with various governments, non-governmental organizations, business entities, and other social service organizations that are investing in Water, Sanitation, and Hygiene (WASH) projects in order to achieve the Millennium Development Goals (MDGs). The primary objective of GWC is to ensure universal accessibility to WASH facilities across the globe by encouraging member organizations and improving the sustainability of investments in the WASH sector. By end-2016, GWC associated with over 50 organizations and was operating in 200 countries across the world. By leveraging on technology and expertise, it has been successful in fostering collaborations and identifying innovative solutions in the WASH sector.

"Safe drinking water and adequate sanitation are crucial for poverty reduction, crucial for sustainable development, and crucial for achieving any and every one of the Millennium Development Goals,"

– Ban Ki-moon, UN Secretary-General[1]

Global Water Challenge (GWC), a US-based non-profit water access and advocacy organization, is playing a crucial role in improving the sustainability of investments in Water Sanitation Hygiene (WASH) projects. Its approach of forming partnerships and collaborations had resulted in identifying and innovating sustainable solutions in the planning and implementation of WASH projects. GWC focused on addressing various operational, technical, and financial challenges facing the WASH sector, and provided consultancy and advocacy services to the partnering organizations to invest in potential projects.

The projects planned and implemented by GWC addressed several socio-economic and environmental issues, helping over one million people across the world gain access to sustainable WASH facilities[2]. *"The record of the Global Water Challenge speaks for itself, at a time when 'collaboration' is a buzzword, GWC is showing how it's really done, effectively bringing together business, civil society, and local communities around the world for lasting impact,"* said MR Rangaswami, Founder of the Corporate

The WeWork Fiasco

Sanjib Dutta[*] and Shubhanjali Chakravarty[**]

WeWork Inc. (WeWork), US's leading commercial real estate company offering co-working space, was founded by Adam Neumann (Neumann) and Miguel McKelvey (McKelvey) in 2010. By 2019, WeWork had expanded to 847 international locations. It was valued at $47 billion in August 2019. WeWork filed for its first IPO with the Securities and Exchange Commission (SEC), US, on August 14, 2019. The filing invited a scrutiny of the company's financial statements and revealed that WeWork had suffered consecutive losses from 2016 to 2018. In 2016, WeWork suffered a loss of $430 million upon revenue of $436 million. In 2017, its loss was $890 million upon revenue of $886 million, and in 2018, it suffered a loss of $1.61 billion upon revenues of $1.81 billion. Subsequently, WeWork's valuation fell to $10 billion in September 2019 due to apprehensions among its investors. The scrutiny further revealed its co-founder and CEO Neumann's extravagant lifestyle. Neumann was compelled to step down from his position as CEO in September 2019.

"We have a history of losses and, especially if we continue to grow at an accelerated rate, we may be unable to achieve profitability at a company level (as determined in accordance with GAAP) for the foreseeable future.[1]

– Adam Neumann, CEO and Cofounder of WeWork Inc., in August 2019

"Maybe the core problem with WeWork is that its business model has less potential than people thought, maybe the lenders are realizing it has unattractive technology-company aspects (high risk, few tangible assets) and the equity investors are realizing it has unattractive real-estate-company aspects (big, annoying physical footprint)."[2]

– Josh Barro, Journalist and Business Columnist, New York Magazine, in September 2019

INTRODUCTION

In September 2019, the valuation of WeWork Inc. (WeWork), US's leading commercial real estate company which offered co-working office space, fell from a projected $47 billion in early 2019 to $10 billion. The steep fall in valuation came within weeks of WeWork filing its IPO paperwork with the Securities and Exchange Commission (SEC) on August 14, 2019.[3] The company's valuation further decreased to $8 billion by the end of October 2019. The fall in valuation was an aftermath of a scrutiny of the company's financial statements after it filed for

Volkswagen: Defeat Device Scandal

D Satish and Manish Agarwal***

On January 4, 2016, the United States Department of Justice filed a civil case on behalf of the United States Environment Protection Agency (EPA) against Volkswagen AG (VW) for violating the Clean Air Act (CAA). The complaint alleged that VW had installed illegal defeat devices in about 600,000 of its diesel vehicles in the US which impaired EPA's emission test system and the vehicles caused emissions that exceeded EPA's standards, resulting in air pollution. The scandal dragged VW into the worst crisis it had faced in its 78-year history. It not only brought down VW's stock price drastically but also raised the possibility of the automobile major having to pay out billions of dollars as fines and penalties. The scandal cast a shadow on the reputation of the company, known for selling some of the world's most luxurious and best-selling brands. VW saw a massive drop in sales post the scandal.

"From the very start I have pushed hard for the relentless and comprehensive clarification of events. We will stop at nothing and nobody. This is a painful process, but it is our only alternative. For us, the only thing that counts is the truth. That is the basis for the fundamental realignment that Volkswagen needs. The Board of Management of Volkswagen AG deeply regrets this situation and wishes to underscore its determination to systematically continue along the present path of clarification and transparency." [1]

– Matthias Müller, CEO of Volkswagen AG, November 2015

On January 4, 2016, on behalf of the United States Environment Protection Agency[2] (EPA), the United States Department of Justice filed a civil case against Volkswagen AG (VW) for violating the Clean Air Act (CAA). The complaint alleged that VW had installed illegal defeat devices in about 600,000 of its diesel vehicles in the US which impaired EPS's emission test system and that VW's vehicles actually produced higher emissions than the legally approved limit in US. This not only resulted in harmful air pollution but was responsible for killing people prematurely John C. Cruden, Assistant Attorney General of the Justice Department's Environment and Natural Resources Division, said, *"The United States will pursue all appropriate remedies against Volkswagen to redress the violations of our nation's clean air laws alleged in the complaint."*[3]

Azim Premji Foundation: A Philanthropic Initiative to Improve Indian Rural Primary Education (A)

K B S Kumar and Indu Perepu***

The case elaborates on Indian business tycoon, investor, and philanthropist Azim Premji's (Premji) philanthropic initiative – the Azim Premji Foundation (APF) – which envisioned transforming the Indian primary education sector. The case also throws light on the persona of Azim Premji – the values, beliefs, principles, and practices which shaped him into a successful entrepreneur and a passionate philanthropist. However, the task was a mammoth one and the road ahead was replete with challenges – systemic, administrative, involving people, etc. Though the primary education sector in India attracted substantial donor interest, it was known for the low quality of its outcomes due to inherent problems. While Premji along with his associates worked relentlessly towards the mission, how far they would succeed in achieving the ambitious targets remains to be seen.

"The reason I give money away is because it is the right thing to do. There is so much poverty and misappropriation of funds and so many people are majorly disadvantaged."[i]

– Azim Premji, Chairman, Wipro Ltd., in 2015

"I have always felt this overwhelming feeling that I have been unduly, unjustifiably privileged to lead this life to have this much wealth in a place like India. I struggle with it. And therefore since I was 16, I've felt a strong obligation to give it away."[ii]

– Rishad Premji[1], Chief Strategy Officer, Wipro Ltd., in December 2012

INTRODUCTION

On January 8, 2016, business tycoon, investor, and philanthropist Azim Premji (Premji), Chairman of the Azim Premji Foundation[2] (APF) and Chairman of Indian IT behemoth Wipro Ltd., was named the most generous Indian by Hurun Research Institute[3] for the third time in a row. This was in recognition of the generous amount he had donated to fund the pioneering work he had been carrying out in the Indian primary education sector. APF, aided by a generous contribution in excess of $4 billion from Premji, had reached out to more than 350,000 schools across 8 states in India. Through the initiative, Premji sought to address and improve the fundamental issues that crippled the Indian primary education sector.

Azim Premji Foundation: A Philanthropic Initiative to Improve Indian Rural Primary Education (B)

K B S Kumar and Indu Perepu***

The case elaborates on Indian business tycoon, investor, and philanthropist Azim Premji's (Premji) philanthropic initiative – the Azim Premji Foundation (APF) – which envisioned transforming the Indian primary education sector. The case also throws light on the persona of Azim Premji – the values, beliefs, principles, and practices which shaped him into a successful entrepreneur and a passionate philanthropist. However, the task was a mammoth one and the road ahead was replete with challenges – systemic, administrative, involving people, etc. Though the primary education sector in India attracted substantial donor interest, it was known for the low quality of its outcomes due to inherent problems. While Premji along with his associates worked relentlessly toward the mission, how far they would succeed in achieving the ambitious targets remained to be seen.

INTRODUCTION

In 2013, Indian business tycoon, investor, and philanthropist Azim Premji (Premji), Chairman of the Azim Premji Foundation (APF), donated 12% of his stake in Wipro Ltd.[a] – amounting to more than $2.2 billion – toward education-focused activities.

APF was created in 2001 after Premji zeroed in on the primary education sector for his social initiatives, as he felt that primary education was fundamental to all other levels of education and had the maximum potential to contribute toward bridging the economic divide in the country. The main objective of APF was to create a direct impact on the education sector and to enable a large positive multiplier effect in society.

In the first fifteen years of its journey, APF contributed to the primary education sector through multiple interventions that included curriculum development, teacher education, school leadership development, designing alternative examination systems, and conducting serial experiments with technology. It designed and promoted digital learning resources in 18 native Indian languages, which were accessed by around 30,000 schools across 16 states in the country. It introduced incentive programs like the Learning Guarantee Program (LGP), Child Friendly School Initiative (CFSI), and School Health Project to enhance the primary schooling experience for the students as well as the teachers. The initiatives created a noticeable positive impact on overall learning levels, attendance levels, and drop-out levels[1].

In 2010, APF established the Azim Premji University (APU) with the purpose of making significant contributions through education. APU had two motives: creating education professionals and nurturing in-service professionals. Its courses and curricula were so

Facebook Inc.: Navigating Data Privacy?

Jitesh Nair and Barnali Chakroborty***

The case describes the various data privacy issues related to Facebook and the approach taken by the company to ensure that its reputation and brand image are not diluted. The case also touches upon the rising concerns from various quarters and how Facebook planned to look at ways to move away from these concerns.

"Privacy does not come from monopoly. Facebook's data breach problems are the inevitable result of monopoly, in particular the knowledge that it can heap endless abuses on its users and retain them."[1]

– Cory Doctorow, European Affairs Coordinator, the Electronic Frontier Foundation (EFF)[2], in April 2021

"The easiest way to boost security would be to change your Facebook password but it is always a good idea to sift out old data, make more things private and even purge out connections."[3]

– Jake Moore, Cybersecurity Specialist at ESET, in April 2021

"Technology does not need vast troves of personal data, stitched together across dozens of websites and apps, in order to succeed. Advertising existed and thrived for decades without it."[4]

– Tim Cook, CEO, Apple Inc., in January 2021

INTRODUCTION

In April 2021, it was revealed that the personal data of 533 million Facebook users had been leaked in a data breach search from the website 'HaveIBeenPwned'. This website was owned by Troy Hunt, an Australian web security consultant, who was also Microsoft's Regional Director and MVP (Most Valuable Professional). The data breach involved Facebook users from 106 countries including over 32 million in the US, 11 million in the UK, and 6 million in India. The data records included their full

Patients or Guinea Pigs? Egypt's Experience with Roche

K B S Kumar and Indu Perepu***

The case brings into focus gross ethical violations in the drug trials conducted by Switzerland-based pharmaceutical major F. Hoffmann-La Roche AG (Roche), in Egypt. Healthcare in Egypt was predominantly driven by private hospitals, owing to the precarious condition of the public healthcare infrastructure and the regulatory frameworks that had crippled the government healthcare system. The poor penetration of insurance coverage made it necessary for many Egyptians to pay out of their own pockets for healthcare. Economic deprivation and lack of insurance coverage left many patients in Egypt with no option but to agree to participate in drug trials, predominantly conducted by transnational companies like Roche. The nascent stage of the Egyptian laws around the clinical trials had largely failed in observing and ensuring adherence to the laws concerned with human trials.

In 2016, 23% of the total pharmaceutical drug trials in Egypt were conducted by F. Hoffmann-La Roche AG (Roche) – a Swiss multinational healthcare and pharmaceutical company[1]. However, the drug company's single-minded focus on getting the trials done cost-effectively, took a toll, under the supervision of liberal and lenient authorities, on the ethical standards expected during the trials.

Healthcare in Egypt was predominantly driven by private hospitals, owing to various factors that had crippled the government healthcare system. Also, the insurance penetration rate in Egypt was as low as 1%[i], which meant that most Egyptians had to pay out of their own pockets for healthcare. In 2016, 72% of all disease expenses in Egypt were borne by the patients themselves. More than a quarter of Egyptians were poor and food insecurity was widely prevalent in the country. Pharmaceutical companies, in the name of drug trials, had been found to have persuaded people from these vulnerable classes to volunteer for their drug trials, in the process, ignoring legal and ethical norms.

For many patients in Egypt who were suffering from economic deprivation and lack of insurance coverage, agreeing to participate in the drug trials was the only option. In the European countries, experimental treatments were conducted only after the prescribed drugs and treatment had failed to show results. However, European pharmaceutical companies were found to be violating this requirement in Egypt.

The treatment-naive population[2], which was economically deprived, was offered only experimental treatment in the form of drug trials, so that there would be a high likelihood of the results being reliable while the research sponsor had enough leeway to evade its ethical responsibilities.

Social Initiatives at Thermax Ltd.

Sudeepta Pradhan and Debapratim Purkayastha*******

In India, the Companies Bill, 2013, mandated that firms spend 2% of their average net profits on corporate social responsibility (CSR) activities. Going beyond the mandated 2%, Thermax spent about 3% of its net profit on CSR activities. Among its various activities, it set up a model school to provide free education to underprivileged children to train them in non-formal education, mentor adolescents for personality development and career counselling, etc. It developed workplace safety policies and practices at its manufacturing locations and offices. Employees were encouraged to report unsafe conditions and incidents. It had a Leadership Development Program that focused on developing leaders through various programs. Thermax supported human rights and labor rights as prescribed by the law, and all its vendors were required to follow the labor laws applicable in the country of operation.

"There are enough causes staring at us in India, like malnutrition, women's empowerment, rural development and even city planning. I can't think of a single area where we cannot contribute."[i]

– Anu Aga, Director, Thermax Limited

The introduction of the new Companies Bill, 2013, in India, brought in several reforms in the Indian corporate sector. The law mandated firms to spend 2% of their average net profits on corporate social responsibility (CSR) activities (Refer to Exhibit I)[ii]. According to industry observers, this had twofold implications: increase in spending on development projects, and more transparency and accountability on the part of firms. Only a few firms in the Indian scenario met the 2% criterion, while a handful of them had a structured CSR program[iii]. Indian firms had moved away from 'chequebook philanthropy' to spending more (and in different ways) on stakeholders or rural and semi-urban populations that were affected by factories in their vicinity. A few companies like Thermax Limited (Thermax) took on the task of moving beyond their functional imperatives. As the company's business involved wastewater treatment, solar power, and reducing carbon footprints, Thermax avoided spending on widely spent causes such as environment and alternative energy. "*We didn't want to link our CSR activities to our work..... we wanted to look at areas completely de-linked from our business, like education and skill-building*,"[iv] stated Manabedra Nath Sanyal (Sanyal), manager, outreach programs, at Thermax. In the year 2014-15, Thermax spent about 3% of its net profit on CSR activities and invested Rs.[1] 240 million on education and other development projects in the previous six years.[v]All this was done at a time when the new bill was being criticized by several groups[vi] such as corporations, tax advisers, lobby

Revlon – Blending Social Responsibility with Business, Successfully!

Madasu Bhaskara Rao[*] and Pulaparthi Mallika Rao[**]

Revlon is a global color cosmetics, beauty tools, hair color, skincare, fragrances, anti-perspirant deodorant and beauty care products company that produces and markets Almay and Revlon brand makeup and beauty tools. Its vision is "Glamour, Excitement and Innovation through high-quality products at affordable prices." The case deals with how the power of passion, the power of innovation, and the power of motivation can drive not only corporate growth, but also lead to social good. Revlon's marketing manager demonstrates that aligned partnerships with meaningful insights can present significant opportunities for organizations to propel their business along with helping communities around us. The case presents ample opportunities for an exciting discussion on how motivated managers can drive innovation and sustainable business growth.

"CSR is not a cosmetic; it must be rooted in our values. It must make a difference to the way we do our business."

– **Phil Watts, Group Managing Director Royal Dutch/Shell Group**

Revlon, an American multinational company headquartered in New York City, was founded in 1932. Its product line included cosmetics, skin care, fragrance, and personal care products. In 2018, Revlon launched a campaign that turned the spotlight on farming women, portraying the many roles played by them during the drought in Australia that year. '#BoldMatters', the campaign promoted by Revlon, promised to donate $2 from every Revlon Super Lustrous lipstick sold, to 'Drought Angels', a small charity organization.

#BoldMatters was purpose driven and focused on important issues relevant to Australian farming women. The campaign spotlighted Jacqui, a mother of three, farmer, and vet, who explained the different roles she played as a woman. Channel T created this three minute ad film that led to a hugely successful campaign for Revlon.

Amy Kingon Smith[1], Marketing Manager – Revlon & Portfolio Brands, at Revlon Inc., Australia, said in a statement in October 2018, "Aligned partnerships present a significant

Mitsubishi Fuel Economy Scandal

Syeda Maseeha Qumer and Koti Vinod Babu***

This case discusses the scandal in which Mitsubishi was accused of cheating on mileage tests for its models eK wagon and eK Space light passenger cars and the Dayz and Dayz Roox vehicles produced for Nissan. Later, it also admitted that its models sold over the previous 10 years were affected by the fuel economy scandal. As a consequence, President Tetsuro Aikawa said he would step down, taking responsibility for the mileage scandal. The company would post a $480 million special loss for the fiscal year 2016-17 to pay compensation to customers for the years of cheating on fuel economy tests. Mitsubishi's employees opined that the scandal was the result of the company's narrow-minded corporate culture focused on its financial interests and that it had not learnt any lessons from its earlier scandals. The analysts opined that the company covered up safety problems and overlooked customer complaints about unsafe vehicles.

A SCANDAL UNRAVELS

In a shocking admission, Tokyo-based automaker Mitsubishi Motors Corporation (Mitsubishi) said in June 2016 that 20 of its models sold over the previous 10 years were involved in the fuel economy scandal in which the company was embroiled. Earlier on April 20, 2016, Mitsubishi had acknowledged that it had fabricated fuel economy data for 625,000 cars sold in Japan. The company admitted that its engineers had deliberately manipulated the mileage data of the cars. It said that the inaccurate tests involved 468,000 Dayz, Dayz Roox vehicles produced for Nissan Motor Co.[1] (Nissan) and 157,000 of its own-brand eK wagon and eK Space light passenger cars.[i] These four models were made to look 5 to 10 percent more fuel efficient than they would be in real world driving conditions. According to media sources, Mitsubishi joined the list of carmakers such as Hyundai Motor Company[2] (Hyundai) and Kia Motors[3] (Kia) who had manipulated testing or reporting of the fuel economy of their models. Hyundai and its Kia affiliate agreed to pay $350 million (£244m) in 2014 to the US government for overstating the fuel economy ratings of their vehicles.[ii]

Mitsubishi's president, Tetsuro Aikawa (Aikawa) apologized at a news conference in Tokyo for the fabricated data and said, "I'm truly sorry that customers were led to buy vehicles based on incorrect fuel-efficiency ratings. All I can do is apologize."[iii] Accepting accountability for the scandal, Aikawa announced his resignation effective from June 24, 2016. The revelations cost the company about 35%, or JPY[4] 303 billion ($2.8 billion), of its market value.[iv] Aikawa

Mondelez India Foods in Troubled Waters

Sanjib Dutta and Smita Ray***

Mondelez India Foods Pvt Ltd (MIFL), the confectionery giant, was known for its brands Cadbury and Oreo, among others, in India. In March 2021, the Central Bureau of Investigation (CBI) filed a case against MIFL for claiming unlawful tax exemptions for its factory built in Himachal Pradesh, India. During the process of investigation, MIFL paid $13 million in civil penalties, a fine of Rs.0.34 million in unpaid taxes, and Rs.0.23 billion as penalty. Even though the CBI registered a First Information Report (FIR) against MIFL and booked 12 individuals, including two Central Excise officials, and imposed a fine of Rs.2.41 billion on it, MIFL did not admit to the charges against it. The company said its executives had acted in good faith based on legal advice for availing of tax exemptions.

"A compliant and ethical corporate culture, which includes adhering to laws and industry regulations in all jurisdictions in which we do business, is integral to our success. We firmly believe that the decision to claim excise tax benefit is valid and that our executives acted in good faith and within the law in the decision to claim excise benefit in respect of our plant in Baddi."[1]

– A Spokesperson of Mondelez India Foods Pvt Ltd, in 2016

"Cadbury officials paid bribes, misrepresented facts and manipulated records to fraudulently avail area-based exemption benefits (Central Excise and Income Tax) in Baddi, Himachal Pradesh, knowing fully well that they were not entitled to avail area-based tax exemption benefits".[2]

– Officials of Central Bureau of Investigation (CBI), Government of India, in March, 2021

INTRODUCTION

In March 2021, confectionery giant and chocolate manufacturing firm Mondelez India Foods Pvt Ltd (MIFL) (earlier Cadbury India Limited (CIL)) was charged with a bribery case filed by the Central Bureau of Investigation (CBI)[3] for claiming unlawful tax exemptions for its factory built in Himachal Pradesh, India.

The CBI in its report said that MIFL had misrepresented facts to avail of area-based tax exemption benefits worth Rs.2.41 billion for its new unit in Baddi, Himachal Pradesh, even before the unit had come into existence. Rather than expanding production by creating a unit

Johnson & Johnson's Talcum Powder Controversy: Putting Profits Before Consumer Safety?

G V Muralidhara and Hadiya Faheem***

This case discusses the controversies faced by American multinational pharmaceutical, medical devices, and consumer packaged goods manufacturer Johnson & Johnson (J&J). The company had been facing issues since 2014 when Chicago-based law firm, Moll Law Group filed its first lawsuit on behalf of its client, Barbara Ross (Ross), a woman in Chicago who had been diagnosed with ovarian cancer. Ross believed that her cancer was due to her daily use of J&J's Baby Powder and Shower to Shower. The law firm filed a complaint in the US District Court for the Northern district of Illinois alleging that J&J had already known or should have known about the potential risks associated with the use of its products and against its negligent practices in failing to warn the consumers.

In May 2016, a St. Louis[1] jury ordered American multinational pharmaceutical, medical devices, and consumer packaged goods manufacturer Johnson & Johnson (J&J) to pay $55 million in damages in a lawsuit filed by a woman who claimed that the company's talcum[2] powder-based products had caused her ovarian cancer.[3] This was the second lawsuit J&J lost in 2016. Earlier in February 2016, J&J was ordered by another St. Louis court jury to pay $72 million in damages to the family of a woman in Alabama, who passed away from ovarian cancer. Despite paying two hefty compensatory damages, the company maintained that its products were safe and announced plans to appeal against the recent decision.

Founded in 1886, J&J started selling first aid kits in 1888. In 1894, the company launched its Baby Powder. The product, which contained 99.8 percent talc, was sold in a metal tin under the label 'for toilet and nursery'. Though the Baby Powder was initially launched for babies, J&J began persuading women to use the product in the early 1900s. In 1913, the company came out with advertisements that included a tagline, 'Best for Baby, Best for You.' Because of this, generations of women got into the habit of using the powder considering it to be safe as the company claimed it to be a safe product for even babies. In the 1980s, J&J told the New York Times magazine that around 70 percent of its Baby Powder was used by adults.

Kailash Satyarthi –Voice of the Innocent

D Satish and Nagendra Kumar M V***

Satyarthi, the first Indian origin citizen to win the Nobel Peace Prize, had been working tirelessly for the elimination of child labor and for the protection children's rights. He was instrumental in freeing more than 84,580 child laborers, in India and in many other countries. His activities also resulted in governments brining out crucial legislations, which include Right to Education Act and Child Labor (Prohibition and Regulation) Act. The case study goes behind the personality of Satyarthi and gives insights into how he became a globally prominent child right activist.

"I represent here the sound of silence. The cry of innocence. And, the face of invisibility. I have come here to share the voices and dreams of our children, our children, because they are all our children."

– Kailash Satyarthi, At the Nobel Prize Winning Ceremony[1]

INTRODUCTION

On October 10, 2014, the Norwegian Nobel Committee announced that the Nobel Peace Prize for the year 2014 was being awarded jointly to Indian child rights activist Kailash Satyarthi (Satyarthi) and Pakistani child rights activist Malala Yousufzai. Announcing the award, Thorbjørn Jagland, Chairman of the Norwegian Nobel Committee, said, *"There is a global movement now to work against child labor and [for] right to education. We want to recognize persons who are behind it, promote them and give them more strength"*[2]. The Nobel Prize brought Satyarthi, whose work had not been known widely till then, into the limelight not only in India but all around the world. Satyarthi had made immense contributions to addressing the issues and challenges confronting children across the world. He believed the lack of concern for the well-being of children would have serious consequences for the growth prospects of all nations. Satyarthi wanted everyone to be compassionate about the sufferings of the children. It was this "Globalization of Compassion" that would provide equality, freedom, and justice to children the world over, he said. *"I call upon all the governments, intergovernmental agencies, businesses, faith leaders, workers, teachers and NGOs, and each one of us, to put an end to all forms of violence against children,"* said Satyarthi[3].

BACKGROUND

Satyarthi was born into a conservative family on January 11, 1954, at Vidhisa, Madhya Pradesh, India. He had a decent and normal childhood. He was an ardent follower of

Copyright Infringement War Between Britannia and ITC

V Namratha Prasad and Koti Vinod Babu***

The case talks about the legal tussle between leading Indian food companies, Britannia Industries Limited (BIL) and ITC Limited (ITC). In recent years, the two companies had accused each other of infringing on their product packaging trademark to cause a loss of goodwill and confuse prospective buyers. The case provides in detail the various accusations of one party and the counters from the other party. It also briefly mentions the reasons for the two companies' indulging in such a tussle. The case highlights the importance of trademark laws and the actions to be taken in case of infringement, apart from emphasizing the marketing ethics to be followed.

In December 2020, one of India's leading food companies, Britannia Industries Ltd (BIL)[1], filed two cases against rival multinational conglomerate company ITC Limited (ITC)[2] in the Delhi High Court (DHC) alleging that ITC had infringed its product packaging trademark and passed off[3] its product as that of BIL. BIL alleged that ITC's packaging for its freshly launched 'Veda Digestive' and 'Sunfeast Farmlite 5-Seed Digestive' biscuits were 'deceptively similar' to BIL's 'NutriChoice Hi-Fibre' and 'NutriChoice Digestive' biscuits. *(See **Exhibit I**).*

BIL filed two applications against ITC seeking an interim injunction to restrain it from manufacturing or selling biscuits in the impugned packing, pending disposal of the present suit. BIL also sought directions against ITC, claiming that it had caused loss to its goodwill by selling biscuits in similar packaging.

In its suit, BIL submitted that it had registered its trademark on September 11, 2020, and had been using that trademark on its digestive biscuits since 2014. On the other hand, ITC did not have any registered trademark with respect to the disputed packaging. Infact, ITC had launched the 'Sunfeast Farmlite 5-Seed Digestive' biscuits, in the impugned pack on September 28, 2020. BIL submitted visual proof that prior to adopting the impugned packing, ITC had been marketing its contentious products in a different packaging. On these grounds, BIL further contended that ITC had deliberately changed its pack to resemble that of BIL's products and thus encashed on the goodwill toward BIL and its reputation.[4] *(See **Exhibit II**)*

Google India's 'Internet Saathi' Initiative: Promoting Internet Literacy Among Rural Women

Syeda Maseeha Qumer and Benudhar Sahu***

In July 2015, Google launched 'Internet Saathi,' a technology-enabled program, to foster internet literacy among women in rural India in association with Tata Trusts & Intel. The joint initiative aimed to bridge the technology-gender divide in India in general and generate awareness among the rural women of the benefits of the Internet in their lives in particular. As part of the program, Google designed cycling carts (Internet bicycles) fitted with computer equipment which would help the rural women of the Internet in their villages. The program involved the deployment of 1,000 Internet bicycles in the rural areas of three states of India on a pilot basis to enable easy Internet access to the women before it was scaled up to cover other parts of the country. The Internet carts engaged the rural women through awareness creation and training on the benefits and use of Internet, so that they would be able to use it independently.

On July 3, 2015, the Indian arm of technology giant Google Inc., Google India, launched an initiative called 'Internet Saathi' (Internet Friend) to empower rural women and their communities in India by enabling them to use the Internet in their daily lives. Under the initiative, Google India sought to create awareness among the women about the Internet and its benefits and to train them on how to use it in their day-to-day life. The program, initiated by Google India in collaboration with the Tata Trusts[1] and Intel Corporation[2] (Intel), aimed to bridge the technology gender divide which put rural Indian women at the risk of being left behind as the world around them reaped the benefits of the Internet. Commenting on the initiative, Sandeep Menon, country marketing director, Google India, said, "In India, 30 per cent of total Internet users are women. While in urban areas the growth rate of women coming online is more than that of men (60 per cent versus 44 per cent), in rural areas women are lagging behind (27 per cent versus 56 per cent). Therefore, we are trying to educate these rural women about the benefits and advantages of being able to use the Internet."[3]

Ethics and Transparency as Vital Organizational Touchstones: The Case of ExxonMobil in Liberia

Indu Perepu[*]

The case describes how the US-based oil ExxonMobil acquired an oil block in Liberia, a war-torn African country, by bribing officials. The block itself was the subject of a major controversy as it was owned by politicians and ministers in the country. The issue was brought out by an advocacy group, leading to a probe by the government.

INTRODUCTION

In April 2018, George Weah (Weah), President of Liberia, a West African country, ordered a probe into a $120 million acquisition of offshore drilling block – Oil Block 13[1] – by US-based oil major Exxon Mobil Corp (Exxon). The probe came in the aftermath of a report by advocacy group Global Witness, which showed that Exxon had acquired the block in 2013 through a structured deal involving Canada-based oil company Canadian Overseas Petroleum Ltd. (COPL) in order to skirt US anti-corruption laws, as the ownership of the block was controversial. It was also alleged that Exxon had bribed six officials who approved the deal, including the son of a former president[2], through the Liberian oil agency National Oil Company of Liberia (NOCAL).

Block 13 was owned by Broadway Consolidated/Peppercoast (BCP), whose owners included local ministers who had allegedly taken ownership by illegal means while in public office in 2005. According to Global Witness, "Exxon knew its purchase might enrich these former politicians. The company also knew the oil block had originally been awarded to BCP after Liberia's oil agency paid bribes. Despite these corruption red flags, Exxon didn't walk away from the deal. Instead, it engineered a plan to skirt U.S. legal exposure, using the Calgary-based COPL as a go-between to purchase the block,"[3]

Exxon, however, claimed that the agreement was in accordance with the prevailing anti-graft laws. It claimed, "(the company is) confident that the agreement complies with local Liberian law and international anticorruption laws. ...Exxon Mobil has an unwavering commitment to honest and ethical behavior wherever we do business. We have a longstanding commitment to compliance with the U.S. Foreign Corrupt Practices Act and the anticorruption laws of the countries and territories in which we do business."[4]

* Assistant Professor, IBS Hyderabad (Under IFHE – A Deemed to be University u/s 3 of the UGC Act 1956), Hyderabad, Telangana, India. E-mail: indup@ibsindia.org

[1] Block 13 is located 18 miles offshore Liberia's central coast. It spans over 2500 kilometers.

[2] People who received the money included former Finance Minister Amara Konneh, former Justice Minister Christiana Tah, former Lands and Mines Minister Patrick Sendolo, former National Investment Chairman Natty Davis, former National Oil Company of Liberia (NOCAL) CEO Randolph McClain, and former NOCAL Board Chair Robert Sirleaf

Malala – A Fight for a Noble Cause

D Satish and Nagendra Kumar M V***

After surviving an attack on her life from Taliban, Malala intensified her efforts to fight for children's rights and girls' education. In her endeavor to achieve the objectives, she had been awarded the Nobel Peace Prize award for the year 2014. This case therefore focuses on the life and work of Malala and provides a discussion point on the management concepts of motivation and leadership.

"This is a second life; this is a new life. And I want to serve. I want to serve the people. And I want every girl, every child, to be educated."

– Malala, In an Interview after Taliban Attack[1]

On December 10, 2014, Malala Yousafzai (Malala) became the youngest person and the first Pakistani to receive the Nobel Peace Award. She received the award along with Indian child rights activist Kailash Satyarthi[2]. Speaking at the event, Malala described herself as a committed and stubborn person aiming to look at a world where every child would have access to quality education, every woman would have equal rights, and where there would be peace in every corner of the world. She also spoke about the passion young girls had for education in her region. She said in a simple yet strong message: *"We had a thirst for education, because our future was right there in that class room, we would sit and learn and read together."*[3] Malala had a lot of dedication and motivation towards education and believed it was a boon to all human beings, especially children.

In her childhood days, Malala and her friends used to decorate their hands with mathematical formulas and equations using henna[4] instead of drawing flowers and patterns, thus they showed their passion for education. Recalling various events and incidents in her life and in the lives of various other girls across the world, Malala proudly announced that she was the representative of 66 million girls in the world who were deprived of education opportunities[5]. She endeavored to raise her voice against the inequalities suffered by girls.

In Search of Synergies: Tata Steel's Acquisition of Bhushan Steel

*Swarup Kumar Dutta**

The case describes how Tata Steel went for the acquisition of Bhushan Steel. The process of acquisition is discussed in detail. Unlike many cases which focus on the details of the M&A process, valuation parameters and the cost of acquisition, the present case attempts to understand the situation from the point of synergistic benefits that could be reaped by both the entities. It attempts to understand the various benefits that can be attained based on a good understanding of the various types of synergies that companies look forward to in an acquisition and how it can help in developing a competitive advantage. While many cases dwell on potential synergies in abstract terms, the current case tries to unfold the four major types of synergies that companies look forward to in an acquisition. It also analyses the future challenges that Tata Group would have to meet while seeking to address the question of how the company would maintain its growth in an emerging market like India in the long term.

INTRODUCTION

Tata Steel Limited (TSL), a part of the widely-diversified Tata Group and a public limited company engaged in the business of manufacturing steel, offers a wide range of steel products. These include a portfolio of high value-added downstream products such as hot rolled coils/sheets, cold-rolled coils/sheets, mild steel galvanized plain/corrugated/colour-coated coils/sheets, steel billets, and bars and rods. It was is a major producer of ferrochrome products. Being a major player in the steel industry, TSL has an installed crude steel production capacity of 27.5 million tons per annum (mtpa), of which 13 mtpa was in India and the remaining was spread across mainly Europe and South-East Asia.

Bhushan Steel Ltd was one of the top players in the Indian steel industry[1]. It had a history of more than 27 years in steel making, and as of 2020, it was India's third largest secondary steel producing company[2] with a steel production capacity of 5.6 million ton per annum. Being a significant player in the secondary market, the company had built up a strong portfolio of products and was the largest manufacturer of auto grade steel in India.

OVERVIEW OF THE STEEL INDUSTRY

In FY17, steel production and consumption were going up across the world. In FY16, production and consumption were at 1689 and 1587 million tons, China being the highest producer (49.2% of worldwide production) and consumer (46.4% of worldwide consumption). India's biggest steel maker, Tata Steel, was the tenth biggest producer of steel in the world with a capacity of 24.49million tons as of 2016.

It had slipped from the fifth position that it had occupied after acquiring London-based Anglo-Dutch major Corus in 2007 because of consolidation in the steel industry worldwide thereafter. (Refer to Exhibit-I for Top Steel Makers by Tonnage). India, the third-biggest unrefined steel maker, had delivered 104.98 million tons (MT) of completed steel while rough steel creation during FY18 was 102.34 MT.

Financial Analysis of Bajaj Auto Limited

Richa Gupta and Manish Agarwal***

Bajaj Auto Ltd. was the largest exporter of two-wheelers and the fourth-largest two-wheeler player in the Indian market. In FY19, the company exported over 2 million motorcycles, three-wheelers, and its new quadricycle the QUTE, to more than 79 countries. It recorded an increase of 16.45% in PAT from FY18 to FY19. The case study elaborates on the background of Bajaj Auto and highlights its financial performance. It also provides a note on the Indian automobile industry. It enables students to analyze the financial performance of Bajaj Auto Ltd. through Ratio analysis, Common Size, and Common Base, and the DuPont model and helps them analyze the Degree of Operating Leverage of the company.

"Financial statement analysis projects are often assigned as an opportunity for students to synthesize and apply course material at the end of accounting or finance courses."[1]

– B Kern, 2000

INTRODUCTION

On December 9, 2019, Sunil Sharma (Sharma), an analyst with Marvel Touch Research (MTR), a financial services provider based in Delhi, India, was in his office waiting for Hari Das Prasad (Prasad), a junior analyst with the company. Just the previous day, Sharma had been asked by his boss to evaluate the Indian two-wheeler industry and submit his report by December 20, 2019. Sharma was worried about completing the work on time as there were only a few days left for the deadline. He therefore decided to ask Prasad to help. Sharma identified the top companies[2] in the Indian two-wheeler industry and asked Prasad to evaluate these companies and submit his work by December 13, 2019.

In keeping with what Sharma had suggested, Prasad decided to divide his work into small sections and to complete the evaluation of one company a day. That would help him complete his work on time. He began by getting an understanding of the Indian two-wheeler industry.

A NOTE ON THE INDIAN TWO-WHEELER INDUSTRY

As of the year 2019, the major part of the global two-wheeler market was concentrated in the Asia Pacific region, mainly in India and China. Some of the major players in the global two-wheeler market were Bajaj Auto Limited (Bajaj Auto), Harley-Davidson, Inc. (Harley-Davidson), Hero MotoCorp Ltd. (Hero MotoCorp), Honda Motorcycle and Scooter India Private Limited (HMSI), Jiangmen Dachangjiang Group Co., Ltd., Lifan Industry Co., Ltd. (Lifan), Loncin Holdings, Ltd (Loncin), Luoyang Northern Enterprises (Luoyang), Suzuki Motor Corporation (Suzuki), and Yamaha Motor Company Limited (Yamaha).

Nykaa IPO: Will It Translate the Beauty and Personal Care Market Opportunity into Big Profits

C Padmavathi and Benudhar Sahu***

The case is about the IPO of Indian cosmetic e-retailer Nykaa E-Retail Private Limited (Nykaa). Nykaa, a leading specialty beauty and personal care (BPC) retailer, offered a wide range of beauty, fashion, and other luxury products across its website, mobile apps, and offline stores in the country. With the growth of the BPC industry in the country, Nykaa became one of the fastest growing brands and a preferred destination for consumers to shop for luxury products through the digital platform. After establishing a strong footprint in makeup and skincare online delivery space, Nykaa decided to go public to build itself into a more sustainable organization. On October 28, 2021, it launched its public issue to raise more than Rs.53,520 million. The price band for the offer was fixed at Rs.1,085-1,125 per equity share. The IPO comprised fresh issue and offer for sale shares. The company planned to use the proceeds of the IPO to meet debt obligations and capital expenditure requirements, fund expansion of operations in growing markets, and for general corporate purposes. On the last day of the issue, November 01, 2021, the IPO was subscribed 81.78 times as the offer received bids for 2165.9 million equity shares as against the IPO size of 26.4 million equity shares. Considering the potential growth of the BPC market in the country, Nykaa's future prospects looked good and its IPO seemed pretty attractive.

CASE

On November 01, 2021, the initial public offering (IPO) of Indian cosmetic e-retailer Nykaa E-Retail Private Limited was subscribed 81.78 times as the offer received bids for 2165.9 million equity shares against the IPO size of 26.4 million equity shares.[1] Nykaa was founded in 2012 by Falguni Nayar with the objective of building a multi-brand Omnichannel beauty-focused retail business in the country. It was the leading specialty beauty and personal care (BPC) retailer that offered a wide collection of beauty, wellness, and fashion products and other luxury products across website, mobile apps, and offline stores. Gradually, it became one of the fastest growing fashion brands in the country and a preferred destination for consumers to shop for luxury and prestige products through digital platforms.

After establishing a strong presence in makeup and skincare online delivery, Nykaa decided to go public to build itself into a more sustainable organization. The Nykaa IPO was opened for bidding on October 28, 2021, with subscriptions proposed to close on November 01, 2021. The IPO comprised a fresh issue of equity shares worth Rs.6,300 million and an offer for sale (OFS) of 41.9 million equity shares by the promoter and existing shareholders.[2] The online beauty product seller fixed the price band for the offer at Rs.1,085-1,125 per equity share as the company wanted to raise more than Rs.53,520 million through the public

Financial Statement Analysis of Shree Cement Limited

Sanjib Dutta and Manish Agarwal***

The case study highlights the financial performance of Shree Cement Limited and the Indian cement industry. The case provides sufficient information to conduct a ratio analysis of Shree Cement Limited and compare it with the Indian cement industry ratios provided in the case study. Additionally, it helps to analyze the financial performance of SCL through common size analysis, common base analysis, and DuPont analysis.

"Accounting reports are an important source of information for managers, investors, and financial analysts. Ratios are the usual instruments for extracting this information. They are supposed to remove the effect of size from accounting variables and to highlight noteworthy features of the firm, such as profitability or liquidity."[1]

– Duarte Trigueiros, Professor of Business Studies, University of Lisbon, 1994

INTRODUCTION

On Saturday, October 19, 2019, Shree Cement Limited (SCL), one of the leading Indian cement companies in terms of capacity, reported a five-fold jump in its net profit in the second quarter of FY19-20 as compared to 2QFY18-19. The net profit increased from Rs. 637.70 million in 2QFY18-19 to Rs. 3.13 billion in 2QFY19-20. In the same period, the total income also increased from Rs. 29.07 billion to Rs. 30.63 billion.[2]

The jump in its financial performance was reflected in the share price of the company when the stock market reopened after the weekend holidays and a holiday for elections in the western Indian state of Maharashtra. The share price increased by 4.50% compared to the previous trading day, Friday, October 18, 2019. It was the second-highest intraday jump in the share price from a closing price of Rs. 18,661.20 on Friday to a closing price of Rs. 19,501.40 on Tuesday, October 22, 2019.

Rashmi Nigam (Rashmi), fund manager and founder of Millennium Investment Management (MIM), an investment firm based in Mumbai, India, who had never invested in any cement company, was interested in knowing more about SCL and the Indian cement industry. She called Anjali Kumari, an analyst with MIM, and asked her to look into the past performance of SCL before she, Rashmi, took any decision about investing in it.

The Vedanta Limited Delisting Fiasco

Sanjib Dutta[*] and Manish Agarwal[**]

The case study discusses the delisting attempt of Vedanta Limited (VL) by Vedanta Resources Limited (VRL), the majority shareholder and parent company. The whole delisting process went through smoothly, but due to issues like offer price and unconfirmed bids, it failed. The case discusses these issues as well as other issues such as unpaid dividends to VL shareholders and the sudden asset write-offs by the management. The case follows the delisting process from the initial proposal to the final fiasco. It helps students not only to understand the nitty-gritty of share delisting regulations but also realize how companies respond when they trade below their intrinsic value in turbulent times.

"The promoters are trying to take advantage of the present crisis, depressed prices and testing the wisdom of harried investors that are wounded badly."[1]

– J N Gupta, Founder, Stakeholders Empowerment Services (SES)[2], September 2020

On October 10, 2020, Vedanta Resources Limited (VRL), a diversified mining company based in London, UK, announced that it was unable to collect the number of shares required to delist its Indian subsidiary Vedanta Limited (VL). In a statement, VRL said, *"Launching the delisting bid to garner approximately 134 crore shares was indeed a mammoth task. We saw enthusiastic participation by our shareholders that took us within striking distance of our goal, short by only 7 percent."*[3]

One of the objectives of delisting VL was to help shareholders of the company to encash their shares in the volatile market conditions. However, the promoters of VL were not successful in delisting the company. The failure of the voluntary delisting of VL came as no surprise to experts. Many of them had even earlier raised their voice about the delisting offer price, dividend payment issues, VL's assets write-offs, and issues relating to unconfirmed bids. It was yet to be seen how the promoters of VL would react to the various issues raised by the experts during the delisting process and what their next steps would be after the delisting fiasco.

ABOUT VEDANTA RESOURCES LIMITED

VRL was incorporated in April 2003 as Angelchange Limited (Angelchange), a private company. Volcan Investments Limited (VIL) was the parent company of VRL. Later, in June 2003, Angelchange changed its name to VRL. The company became a public listed company in November 2003 and was renamed Vedanta Resources Plc. Over the period, the

Banyan Investment – Creating an Optimal Portfolio for a Client

P Bhanu Sireesha and Manish Agarwal***

This case presents the dilemma faced by Rishabh Bansal, Senior Research Analyst at Banyan Investment Private Limited, in suggesting a risk and return trade-off for a new client. The case provides enough scope to discuss and understand the concept as well as the measurement of risk and return for various securities and portfolios. It further helps in understanding the Efficient Frontier, Capital Market Line, and construction of optimal portfolio using real data from the National Stock Exchange. This case provides sufficient data and helps learners to understand how to construct the minimum risk portfolio that generates the required expected return after considering the given constraints.

"So many people are infatuated with the equity markets, but to earn that return you'd have to accept a lot of risk."[1]

– John Puchalla, Senior Economist at Moody's[2], June 2002

"Assets with higher returns invariably carry with them stomach-churning risk, and safe assets almost always have lower return."[3]

– William J Bernstein, American Financial Theorist, 2002

Rishabh Bansal (Rishabh), senior research analyst at Banyan Investment Private Limited (Banyan Investment), was upset after receiving a public warning from M. Pashupatinath Reddy (Reddy), head of Equity Research. Reddy had taken serious objection to Rishabh's risk-return trade-off analysis for a client seeking long-term growth across several capital market instruments. *"The analysis was not only misplaced but totally miscued with the assumptions going completely haywire"*, Reddy told Rishabh sharply. Rishabh had been a star performer in the team, having had six promotions over the last 3 years. So, what had gone wrong with his risk-return trade-off analysis and what could he do to salvage his reputation?

Fortunately for Rishabh, an opportunity soon arose for him to regain Reddy's trust when a new deep-pocket client approached Banyan Investment. The new client wanted to invest US$1-5 million in the Indian market on the basis of expert advice from Banyan Investment. The client had already selected five stocks from five different industries and wanted to generate at least 12% annual compound expected return. Rishabh and his team now had to develop an optimal portfolio of given stocks to generate the desired returns for the client.

Syska Participating in India's Carbon Finance Based Rural Lighting Scheme

M Rana Pratap[*] and Koti Vinod Babu[**]

The case discusses the particulars of the unique Public Private Partnership (PPP) between public sector entity Convergence Energy Services Limited (CESL) and India-based lighting solutions company Syska LED (Syska), to supply 10 million LED bulbs in the rural areas of India. This PPP was undertaken to support the Government of India's 'Gramin Ujala Scheme' (GUS), a customized program for rural India under which LED bulbs would be provided to people in these areas for Rs.10 – making them the lowest priced LED bulbs in the world. CESL offered Syska co-investment on a revenue-sharing basis – where the costs and profits involved in LED distribution would be shared equally. The GUS was expected to claim carbon credits and sell them through an open process, the proceeds of which were to be shared equally by CESL and Syska. The scheme was the first social program in India to be financed entirely through carbon credits. Can this particular PPP serve as a template for more private players to collaborate with the government towards the common goal of climate change mitigation?

"Government is working tirelessly to ensure optimal electricity supply and proper lighting in rural parts of the country. As a leading brand of India, Syska is pleased to find mechanisms that enable private sector players to join hands towards larger common objectives such as energy conservation, climate change mitigation and business models for enabling such basic services as good quality lights at price points that are affordable for rural India. We look forward to a long and fruitful partnership."[1]

– Rajesh Uttamchandani, Director of Syska LED, in April 2021

In April 2021, India-based lighting solutions company Syska LED (Syska), a subsidiary of Indian conglomerate SSK Group Limited[2] *(See **Exhibit I**)*, won the uniquely structured tender floated by public sector entity Convergence Energy Services Limited (CESL) *(See **Exhibit II**)* to supply 10 million Light-Emitting Diode (LED)[3] bulbs for the rural areas of India. CESL agreed to procure seven million 12-watt LED lamps and three million 7-watt LED lamps from Syska. It was in March 2021 that Raj Kumar Singh (Singh), Union Minister of State (Independent Charge), Ministry of Power and Ministry of New and Renewable Energy, launched the '*Gramin Ujala Scheme*' (GUS), a customized program for rural India that provided LED bulbs in rural areas for Rs[4].10 – making them the lowest priced LED

Vedanta's Open Offer

Sanjib Dutta and Manish Agarwal***

This case examines Vedanta Resources Limited's (VRL) desperate attempt to acquire its Indian subsidiary Vedanta Limited (VL). VRL first went in for delisting of VL in October 2020. But after that proved unsuccessful, it went in for a voluntary open offer in January 2020. However, investors tendered only 57.49% of the 651 million shares which VRL intended to buy through the open offer. Although the open offer was not successful, it did help VRL to increase its stake in VL. Though, VRL was still a long way from having the 90% stake which was mandatory under the law for it to delist VL. This is a unique case where the parent company was desperately looking to acquire its cash-rich operating subsidiary but was unable to do so as it was offering a price lower than the shareholders of VL expected. It remains to be seen what steps VRL takes in the future to acquire and delist its profitable subsidiary.

"Even if investors want an exit, they can offload their shares in the open market. Fundamentally, I do not think the open offer will push up the share price in the stock market as the quantum of share the promoter is buying back is much less compared with the floating stock."[1]

– Shriram Subramanian, MD, InGovern Research Services, March 2021.

INTRODUCTION

In October 2020, Vedanta Resources Limited (VRL), a diversified mining company from London, UK, made an unsuccessful attempt to delist its profitable and cash-rich operating Indian subsidiary Vedanta Limited (VL) from the Indian stock market *(Refer to **Exhibit I** to know more about VRL and VL)*. The attempt failed as VRL received fewer bids (1.25 billion shares) than needed (1.34 billion shares[2]) at its offer price of Rs. 87.50 per share while VL's per share market price was around Rs. 120 and the majority of shareholders were tendering their shares at Rs. 320 per share.

Experts believed that if VL's delisting succeeded, it could improve VRL's liquidity position. Moody's report, published in October 2020, stated that VRL had about US$15.5 billion in debt and half of the debt was due by March 2022. Kaustubh Chaubal, Vice President and Senior Credit Officer with Moody's, said, *"Without [VL] operations of its own, VRL as the holding company needs to refinance debt maturities at a time of tight capital market liquidity, putting undue pressure on key subsidiaries to upstream cash."*[3]

1 Suresh P Iyengar, "Vedanta Open Offer Begins on March 23 at Revised ₹235/share," www.thehindubusinessline.com, March 17, 2021.

2 According to the Indian delisting regulation, a delisting offer will be successful only if the minimum number of shares are tendered by the shareholders. As per the law, VRL needed at least 90% of the then outstanding shares of VL, i.e., 1.34 billion shares, to successfully delist VL from the stock exchanges.

Valuation Challenges of Impossible Foods

D Satish[*]

Impossible Foods, a US-based maker of plant-based meat, managed to raise $700 million in the pandemic year 2020. In just 10 years of inception, it had managed to raise $1.5 billion from the likes of Bill Gates, Khosla Ventures, UBS, Temasek, and a host of celebrities including Serena Williams and Jay Z, who bet on plant-based meat, which they believed would revolutionize the environmentally unsustainable meat-based food industry. Its rival, Beyond Meat, launched its IPO in May 2019 and saw its valuation soar. Impossible Foods, on the other hand, seemed to be in no hurry for a public issue and raised record private investments in 2020. The case study captures the growth story of Impossible Foods and puts the reader in a position to understand the market structure of the plant-based food industry, competition among players, and the challenges faced by Impossible Foods. It helps the reader to better analyze the valuation challenges of a pioneering start-up in a nascent industry.

"We are not so brazen as to believe that we can perfectly calibrate valuation; determining risk and return for any investment remains an art not an exact science"[i]

– Seth Klarman

INTRODUCTION

In November 2019, Impossible Foods, a plant-based meat burger maker headquartered in Redwood City, California, was in talks with investors to raise funding of between $300 million and $400 million, which it hoped would double its $2 billion valuation reported in May 2019. Its rival, Beyond Meat, saw its valuations triple in the same period after its IPO in May 2019. Beyond Meat was valued at $4.8 billion in November 2019. The global market for meat substitutes generated revenue of $4.2 bn in 2018 and was expected to grow $6.1 bn by 2023 as more customers turned vegan or cut down on their meat consumption.[ii]

Though Impossible Foods managed to secure $500 million in a Series F funding in March 2020 from investors, including celebrities, and a further $200 million in a Series G funding from New York-based technology focussed investment fund, Coatue, in August 2020, some experts raised questions on whether the plant-based meat market was overhyped. According to some analysts, these start-ups were using their first mover advantage to try and revolutionize the meat-based products. Analysts felt that due to the tripling of Beyond Meat shares post its IPO, there was a lot of *"dumb money"* that would flow into these start-ups but there would be a correction soon, leading to a fall in valuations which would be problematic to both the start-ups as well as the investors.[iii]

It had been seen in the year 2019, that companies such as ride-hailing firms Uber Technologies and Lyft Inc were not able to replicate the high valuations attained during fundraising rounds in the stock market. In September 2019, office-sharing company WeWork, which was valued at $47 billion in private fundraising rounds, saw its valuation drop to below $10 billion, forcing it to postpone its scheduled IPO.

A Portfolio Restructuring Dilemma♦

*Manish Agarwal**

Kapil Shah (Kapil) started investing in the share market in his mid-twenties and has seen some ups and downs over a decade. Kapil then decided to overhaul all his existing stock positions on the increasing prospects of the National Democratic Alliance coming to power in India in May 2014. On the election results day – May 16, 2014 – he bought 10 stocks to ride the possible development wave agenda of the new government. However, by the end of February 12, 2016, his portfolio had generated a return of only 1.96%. Things became tough for Kapil as repayment for a loan fell due on August 22, 2016. He wanted someone's help to ensure he generated good returns from his portfolio so that he could repay the loan by liquidating a part or even his complete stock portfolio.

"If I were on a desert island and allowed just one investment tool...it would be the chart."[1]

– Anthony Bolton, Investor, and Fund Manager, July 2017

"The essence of technical analysis is to identify markets that have a temporary imbalance of buying and selling pressure, and to limit our trading to those environments."[2]

– Adam H Grimes, Trader, Analyst, and System Developer

INTRODUCTION

Kapil Shah (Kapil), a 35-year-old working professional, was looking for advice from technical analysis experts for his stock portfolio. Kapil wanted to restructure his portfolio by exiting stocks with poor returns and buying new ones with potentially high returns, so that he could generate good returns from his portfolio, which he planned to liquidate wholly or in part to meet his future financial needs. Having received some advice from an expert, Kapil was in a dilemma regarding what to do. Who can help him in taking the decision?

KAPIL's STOCK PORTFOLIO

Kapil had started investing in the stock market in his mid-twenties. At that time, he used to invest in any stock only after doing thorough fundamental analysis. He took every detail of a prospective company's future and management into consideration. Typically, he went through five-year financial data and tried to find out the different margins and the returns trend of the company under consideration in addition to industry growth prospects. He paid special attention to what the management had promised and what they had delivered.

Challenges of Consortium Lending – The Case of Bhushan Steel

D Satish and Suryanarayan Mohapatra***

The case deals with the difficulties faced by a consortium of banks in arriving at a consensus on dealing with bad loans. Citing the example of Bhushan Steel Limited that availed finance to the tune of Rs. 400 billion from 51 lenders, the case highlights the issues and challenges associated with joint lending. The substantive focus of the case is how a large group of lenders with divergent views, came together and dealt with the problem loans of crisis-ridden Bhusan Steel Limited.

We have talked to the Consortium leader, Punjab National Bank as well as other banks, including private lenders. We will try to bring in a management agency, which will look at the day-to-day running of Bhushan Steel. This is a very good quality asset, it is running properly and we don't want it getting into any kind of trouble"[1] .

– Arundhati Bhattacharya, Chairperson, State Bank of India, August 9, 2014

"Even if the consortia agreed, there are different stages. First, the lenders have to agree. There has to be consensus among all the members on the issue of a managing agency. It's not that appointing a managing agency will solve Bhushan Steel's problems overnight."[2]

– Nitin Johari, Director (finance), Bhushan Steel Limited, August 18, 2014

INTRODUCTION

On August 3, 2014, Bhushan Steel Limited (BSL) made it to the news for all the wrong reasons when its Vice Chairman and Managing Director, Neeraj Singal (Singal), was arrested by the Central Bureau of Investigation (CBI) for allegedly offering a bribe of Rs. 5 million to Sudhir Kumar Jain (Jain), chairman and managing director (CMD) of Syndicate Bank, a public sector bank. Jain was also arrested for allegedly accepting the bribe[3].

A group of commercial banks and financial institutions led by Punjab National Bank (PNB) had a combined exposure of Rs. 400 billion approximately to BSL in the form of term loan (Capital expenditure) and working capital finance[4]. The company reported a huge loss during the financial year 2015. The falling business of the company and the bribe-for-loan scandal involving the company's vice chairman, prompted State Bank of India (SBI), one of the joint lenders to the company, to suggest appointment of a third party management agency to monitor its operations. But for this proposal to be adopted there was a need for a consensus among the joint lenders. The lending banks, which were already struggling to cope with

Warehouse Receipts Financing (B)

Manisha Singh, Sharon K Jose** and Manish Agarwal****

This case discusses the journey of a Trader from a Middleman to a Service Provider and how he did this by tapping the Commodity Derivative Market in India. Through protagonist Kundan Shah (Kundan), a trader from Punjab, India, the case draws attention to the importance of Warehouse Receipts under the inventory financing system. It also brings to light the different players of the collateral management system, their roles and responsibilities, and their importance in the entire inventory financing scheme.

"If agriculture is to contribute to the development of the economy, and farmers are not to be left behind, then agriculture needs a proper credit system. Postharvest credit in the form of warehouse receipt finance has proved to be a critical component for agriculture sector growth in emerging economies. Efficient warehouse receipt finance allows farmers to avoid selling directly after harvest, when prices are depressed. It encourages storage by reducing the cost and by increasing liquidity in entire commodity chains, which in turn reduces price volatility. By giving farmers access to a new financing tool, it enhances their ability and incentives to invest in production."[1]

– By Frank Hollinger, Lamon Rutten, and Krassimir Kiriakov in 2009

INTRODUCTION

Kundan Shah (Kundan) a small-time trader (middleman/intermediary for agricultural commodity) in Hoshiarpur, Punjab, made a decent living by procuring food grains from farmers, storing them in a warehouse, and selling them at market-based prices at which he could make profits. However, with various financing and storing options[2] becoming available to the farmers, it was growing increasingly difficult for Kundan to procure the food grains. The profit margin for traders/ middlemen like him had already become low because of the financing options available to the farmers, and it was further going down year after year with less procurements. Farmers like Manjeet Singh[3] were exploring other options like storing their produce in a certified warehouse and using the warehouse receipt for financing their working capital needs. Government initiatives for providing liquidity to farmers or

SpiceJet in Financial Distress

Pranati Mohapatra[*]

This case depicts the financial crisis faced by low-cost Indian carrier SpiceJet Airlines Ltd in 2014. The popular domestic carrier had come to a near collapse mid-2014 due to its inability to meet the working capital needs. In the September quarter of FY 2014-15, though operational performance had improved comparatively, the accumulated losses, negative net worth and huge amount of pending liabilities created an immense cash flow pressure on the Company. Many times, the airline was forced to ground. There seemed no hope for the airline. The banks and financial institutions were reluctant to lend money to SpiceJet, especially after the Kingfisher debacle in 2012. Ultimately, the airline had to arrange a large amount of fund to survive. This case can be used to teach various aspects of financial performance analysis and financial management.

"As irate passengers queue up outside airport counters across the country demanding refunds for cancelled flights, SpiceJet Ltd, India's second largest budget airline, appears to be in a deep dive into a life-threatening death spiral."

- **India Today, Dec18, 2014**[i]

INTRODUCTION

On December 17, 2014, SpiceJet Airlines Ltd (SpiceJet), the Indian low-cost carrier canceled almost all its flights till late afternoon, due to oil companies denying fuel on credit to the cash stripped airline.[ii] [iii] On December 16, 2014, the company had faced the same problem in Mumbai, Delhi, and Hyderabad airports.[iv] Since mid-2014, the oil companies had put SpiceJet on a cash-and-carry agreement[1].[v] The airline was not only facing a challenge in getting oil supply, but was also warned by Airport operators that it would be put on the cash and carry mode unless it cleared pending dues.[vi] The airline had delayed payments to oil companies, airport operators, tax authorities, lessors, lenders, and employees as well and was desperately seeking funds to run its daily operations. According to an estimate by aviation consultancy services firm CAPA, "*SpiceJet requires at least $300 million (INR 19,000 million) to stabilize and recover.*"[vii]

COMPANY BACKGROUND

Headquartered in Gurgaon, Haryana, SpiceJet was primarily involved in the business of providing air transport services for passengers and cargo. The company had been operating as a low-cost carrier (LCC) in India since May 23, 2005.[viii] SpiceJet's mission was to become India's preferred LCC, delivering the lowest air fares with the highest consumer value, to price sensitive consumers.[ix] As of April 2013, the company had grown to become the third largest airline in the country, next only to Indigo and Jet Airways, in terms of domestic market share *(Refer to Exhibit I)*. It operated a fleet of 58 aircraft across various routes in

Divi's Laboratories' Market Capitalization

Indu Perepu and Nagendra Kumar M V***

On December 17, 2020, Indian pharma company Divi's Laboratories (Divi's) achieved a market capitalization of Rs. 1 trillion, gaining a position among the top listed companies in the country, and becoming the second Pharma company to achieve this remarkable feat. In terms of revenue generation, Divi's stood at the 12th position among pharma companies. Its stable business model, and the growing demand for the products and services offered by Divi's placed it in a strong position in the global Active Pharmaceutical Ingredient (API) segment and in Contract Research and Manufacturing Services (CRAMS). To fulfil the growing demand for APIs and CRAMS, the management had invested in expanding the capacity of manufacturing units and establishing new plants. The investors and analysts were bullish about the stock price given the positive forecast for Divi's. The present case study can be used to discuss the concept of market capitalization, factors that contribute to the growth of market prices of a share, market capitalization, and investment decisions.

On December 17, 2020, India-based pharmaceutical company Divi's Laboratories Limited (Divi's) entered the elite club of companies with a Rs. 1 trillion[1] market capitalization in the Indian stock exchanges (BSE and NSE). Divi's was the second Pharma company in India after Sun Pharmaceutical Industries (Sun) to across the Rs. 1 trillion benchmark[2]. Sun was valued at around Rs.1.4 trillion in December 2020, and Divi's was valued at Rs. 1.01 trillion on the December 17, 2020, with a market price of Rs. 3,847.90 per share, surpassing its previous highest price of Rs. 3,763.40 recorded on December 10, 2020. *(Refer to **Exhibit I** for List of the Companies having Market Capitalization of above Rs. 1 Trillion in India).*

The feat crowned what had been a remarkable financial year for Divi's. During the first three quarters of the financial year 2020-21, its stock price had increased by 109% in comparison with an increase of 13% of the S&P BSE Index, and an increase of 60% in the S&P BSE Health Care Index *(Refer to **Figure I** for Trend in Stock Price of Divi's during the financial year 2020-21)*. The growth in its stock price was attributed to the growing demand for medicines and healthcare and safety products due to the Covid-19 pandemic.

Figure I

Trend in Stock Price of Divi's during the financial year 2020-21

Hero Motor Corporation Limited – Profitability Analysis

Indu Perepu and Nagendra Kumar M V***

Hero Motor Corporation Limited (Hero) is a leading India-based two-wheeler manufacturer with operations across different countries. Despite having a market share of above 50% in the motorcycle segment, the company was facing a challenge in the scooter segment and the premium motorcycle segment. The management of Hero has been cautious and has made plans according to the changing market requirements to sustain its market share and improve overall profitability. The present case study provides scope to analyze the trend in the overall profitability of Hero using profitability ratios, and can be used to determine the growth rate of Hero for the fiscal year 2018-19.

INTRODUCTION

Hero MotoCorp Limited (Hero), a leading two-wheeler manufacturer in India, had a market share of above 50% in the Indian two-wheeler market during the fiscal year 2017-18. Hero manufactured motorcycles, scooters, and two-wheeler spare parts and engines. As of 2019, the company operated in India and across 36 countries directly and through subsidiaries and joint ventures.

Hero was the top player in the motorcycle segment and was in the third position in the scooter segment in India. As a result of changing market dynamics like the growing trend of "Scooterization[1]" and automatic scooters and the popularity of premium motorcycles[2], the volume gap between entry-level motorcycles[3] and scooters had narrowed down to 4% during the year 2017-18.

The share of automatic scooters, which was 20% in the year 2011-12, had been observed to have increased to 33% during the fiscal year 2017-18. At the same time in the motorcycle segment, vehicles with 100cc engine capacity, which accounted for a 49% market share in the year 2011-12, declined to 33% during the fiscal year 2017-18.

Despite facing tough competition in the scooters and premium motorcycle segment, Hero recorded sales of around 7.6 million motorcycles and scooters during the fiscal year 2017-18. It started the new fiscal year 2018-19 with expectations of sustaining and improving growth in overall sales *(Refer to Table-I for Comparative Profit and Loss Account for the Years 2016-17 and 2017-18).*

* Assistant Professor, IBS Hyderabad (Under IFHE – A Deemed to be University u/s 3 of the UGC Act 1956), Hyderabad, Telangana, India. E-mail: indup@ibsindia.org

** Senior Research Associate, IBS Hyderabad (Under IFHE – A Deemed to be University u/s 3 of the UGC Act 1956), Hyderabad, Telangana, India. E-mail: nagendra@ibsindia.org

[1] Growing demand for scooters and scooters replacing motorcycles is called scooterization.

[2] Premium segment motorcycles are those that cost above Rs.0.1 million and have advanced features in terms of looks and engine capacity.

[3] Entry level segment motorcycles cost between Rs.0.06 million and Rs.0.075 million and have nominal features in terms of looks and engine capacity.

Reining in Black Money - Will the Indian Government Fulfill Its Promise?

D Satish[*], *Nagendra Kumar M V*[**] *and Manish Agarwal*[***]

In the year 2014, the National Democratic Alliance (NDA) in its election manifesto promised to bring back the black money stashed abroad in tax havens, and promised to initiate measures to curb the malaise of black money in India. NDA, after forming government, formed a Special Investigation Team (SIT) and enacted the Black Money Act that aimed to curb black money generation in the country. However, there has been no substantial progress in either curbing black money or in getting back the money stashed in tax havens. The case study gives a brief preview into the level of black money of Indians, the steps taken by the government of India and the challenges faced by the Indian government in its efforts to bring back black money. The case gives scope for discussing whether the Indian government would be able to fulfill its election promise.

INTRODUCTION

On May 11, 2016, the Ministry of Finance, Government of India (GoI), announced that in the previous two years (since 2014), the GoI had unearthed indirect tax evasions to the tune of Rs. 500 billion and had been able to trace Rs.210 billion of undisclosed income[1]. The Narendra Modi-led National Democratic Alliance (NDA) government had promised in its election manifesto in the year 2014 that it would unearth the black money stashed abroad and take measures to curb the malaise in the country. Since the NDA government had won the elections in the year 2014, the GoI had initiated several measures to fulfill its promise. It had constituted a Special Investigation Team (SIT) and passed a bill "The Black Money (Undisclosed Foreign Income and Assets) and Imposition of Tax Act, 2015" *(Refer to Exhibit – I for Key Provisions of the Black Money Act)* to overcome the challenge of curbing and recovering black money.

"The government has taken sustained steps for curbing black money, which includes enactment of a new Black Money Act with strict penalty provisions and new income disclosure scheme formulated for domestic black money," said an official of Ministry of Finance[2].

According to a statement from the Ministry of Finance, the initiation of the measures also resulted in the seizure of Rs. 39.63 billion worth of smuggled goods in the past two years (2014-16)[3]. In addition to these measures, the GoI was also contemplating on coming up with measures like the introduction of a cashless economy to weed out black money. However, despite focusing on curbing black money, the GoI was facing criticism that it had

Liquidity Analysis of Vodafone Idea Limited

D S Prasad[*]

Arun and Akshit, two students studying finance, had been given an assignment by their professor to analyze the liquidity position of India-based telecom company Vodafone Idea Limited (VIL) for the financial years 2019-20 and 2018-19. In his briefing, the professor told them that the liquidity position of a company can be determined by analyzing various components of current assets and current liabilities. Arun and Akshit started identifying the current assets and current liabilities of VIL in order to analyze the short term liquidity of the company. However, after identifying and classifying the current assets and current liabilities, they were not clear how to go about determining the liquidity. They needed to understand the criteria to be considered and the process to be followed in determining the liquidity position of the company. The present case study can be helpful in discussing the concept of short term liquidity, various ratios, and the criteria to be considered in analyzing and determining the short term solvency of a company.

INTRODUCTION

Arun and Akshit, two students studying finance, had been given an assignment by their finance professor to analyze the liquidity position of India-based telecom operator Vodafone Idea Limited (VIL). They started out by learning more about VIL. They understood that VIL was one of the leading telecom companies in India and had been among the top three players in the telecom sector in the country. Arun and Akshit continued to read up on the company and they discussed the services offered by VIL. They also took a look at the company's annual reports. The two students then started identifying the components relevant for calculating the liquidity position of the company. As they had been told by the professor during class that the short term liquidity position of a company was determined based on the current assets and current liabilities, they decided to focus on identifying and classifying VIL's current assets and current liabilities.

Arun set about identifying and classifying VIL's current assets, while Akshit focused on identifying and classifying current liabilities. Arun identified the trade receivables of Vodafone Idea Limited (VIL) for the financial year 2019-20 as unsecured. These were again sub divided into two categories – billed and unbilled. He also observed that a provision of Rs. 12,849 million had been made during the year toward an allowance for doubtful debts (Refer to Table-I for Composition of Trade Receivables of VIL for the financial years 2018-19 and 2019-20). Arun identified too that cash and cash equivalents comprised cash and cheques in hand and balances with banks in the form of current accounts and fixed deposits (having a maturity of less than 3 months).

Tata Consultancy Services: Managing Liquidity Risk

Nagendra Kumar M V * *and P Bhanu Sireesha*** **

The risk management committee at multinational information technology service and consulting company Tata Consultancy Services Limited (TCS) – is responsible for framing the financial risk management policy of the company. Liquidity risk management forms a part of the overall financial risk management. In managing liquidity, the risk management committee, in addition to focusing on managing various current assets and current liabilities, also takes into consideration the cash flows generated from operations. The case study provides scope to analyze the composition of current assets and current liabilities of TCS for the financial years 2018-19 and 2017-18. It also helps in understanding the liquidity risk management at TCS using liquidity ratios.

INTRODUCTION

The financial year 2018-19 saw an increase in the total value of current assets and current liabilities of India-based multinational information technology service and consulting company Tata Consultancy Services Limited (TCS) as compared to the previous year 2017-18*(Refer to Exhibit-I for the Composition of Current Assets and Current Liabilities of TCS)*. Inventories included the cost of raw materials, sub-assemblies and components consumed, and cost of equipment and software licenses obtained by the company to execute its operations. During the same period, the total value of inventory declined from Rs. 27,000 million (2017-18) to Rs. 22,700 million (2018-19) *(Refer to **Table I** for the total closing value of Inventory)*.

Table I
TCS - Closing Inventory

(Amount in Rs. Millions)

Particulars	2018-19	2017-18
Raw materials, sub-assemblies, and components	90	250
Finished goods and work-in-progress	-	-
Goods-in-transit (raw materials)	-	-
Stores and spares	10	10
Total	100	260

Source: TCS Limited Annual Report (2018-19)

The current investments of TCS included investments in mutual funds, government bonds and securities, certificates of deposit, etc. During the financial year 2018-19, the certificates of deposit were valued at Rs. 4900 million. Also, of the total value of current investments, Rs.1210 million and Rs. 420 million were related to the investments of trusts and the TCS Foundation. They were held for specific purposes *(Refer to Table II for Current Investments of TCS)*.

Dr. Reddy's Laboratories' Profitability – An Overview

Indu Perepu and Nagendra Kumar M V***

The management of India-based pharmaceutical company Dr. Reddy's Laboratories observed that the company had not fared as expected in the fiscal year 2017-18 as a result of increasing competition in the global markets – particularly the US market – challenges in complying with international regulatory controls, and the changing dynamics of the Indian market. The management intended to keep a close watch on the changing market dynamics and to implement strategies to improve revenue share. At the same time, it was also focusing on reducing unnecessary costs and expenses to achieve its objectives of improving profitability for the fiscal year 2018-19. The present case study provides information regarding the various sources of revenue and income of the company and the expenses it incurred to analyze the profitability position of the company using key profitability ratios like gross profit ratio, operating profit ratio, and net profit ratio and also to figure out the impact of tax on the net profit available to the shareholders.

INTRODUCTION

Dr.Reddy's Laboratories (DRL)[1], a leading Indian pharmaceutical company, offered various pharmaceutical products and services categorized as Global Generics (GGs), Pharmaceutical Services (PSs), and Active Pharmaceutical Ingredients (APIs). Besides this, the company was also in possession of various Proprietary Products (PPs), and offered Customized Pharmaceutical Services (CPSs) and Biologics. The operations of the company were wide-spread across the country (India) and also globally[2].

During the fiscal year 2017-18, the management observed that the company had not fared as well as expected. The main reasons were the changing dynamics of the global pharmaceutical markets, especially the US market. The US market accounted for around 42% of the total sales volume of DRL while around 52% of the sales of DRL's GGs were from the US markets.

The US markethad remained volatile for three years (three years before the financial year 2017-18) due to increasing competition from the big players, regulatory challenges, and pricing challenges. The DRL management had observed that the average price decline in generic drugs was not only higher, but was also increasing year after year.

The company operated through various subsidiaries and joint ventures in different markets across the world, and hence the management had been cautious about DRL's performance amid volatile market conditions. The consolidated revenues of the company for the fiscal year 2017-18 declined by 0.5% over those of the previous year (2016-17), and the standalone revenues declined by about 7% during the year 2017-18 over those of the the previous year.

Flipkart – The Story of India's Biggest Private Funding

K B S Kumar and Indu Perepu***

The case captures the various episodes in the story of funding of India-based e-commerce company Flipkart, which stood as the highest valued venture-capital-backed company in the country. The case briefly narrates the beginning of the Indian e-tail giant, and focuses exclusively on its funding episodes. The case broadly captures the initial years and the growth years of Flipkart and elaborates on the types of the funding sources Flipkart chose through its expansion. The case discusses Flipkart's tactics of dealing with competition and its expansion into fashion retail zone. The case also brings into light the challenges Flipkart faced for being reportedly over-valued.

"We were not thinking about numbers then, but we knew something big can be built out of ecommerce."

– Binny Bansal and Sachin Bansal, Founders, Flipkart

"When ecommerce companies build scale, cost comes down. Companies that can handle scale and reduce costs over time will win."

– Sachin Bansal, Co-Founder Flipkart

INTRODUCTION

In July 2015, India-based e-commerce company Flipkart raised $700 million in its 12th round of funding, which took its value to $15 billion[1]. Since its inception in 2007, Flipkart had raised a total of $3 billion from its 12 rounds of funding (*Refer to Exhibit 1 for Flipkart's Funding Rounds,*) that encompassed 16 investors. This was the biggest private funding in India and one of the biggest globally.

Flipkart, which started off as an e-commerce company that sold books, had scripted a promising growth story in the 9 years of its existence. It had drawn the attention of investors through its burgeoning customer base, technological agility, efficient supply chain cycles, diverse merchandise, and consistent customer satisfaction. With a clear vision and a strong strategy of building scale, Flipkart created agile systems around the model that offered a tough fight to its peers like Amazon and Snapdeal.

However, having raised $3 billion through the private equity funding[2], Flipkart faced immense pressure from the investors amidst rumors of the firm being over-valued.

THE BEGINNING

Flipkart was launched in the Indian e-commerce industry in 2007. Sachin Bansal and Binny Bansal – both alumni of IIT-Delhi[3], 2005 batch – quit their jobs after a brief stint of

Operational Performance of Cipla Limited - An Overview

Indu Perepu and Nagendra Kumar M V***

Cipla Limited is a leading Indian pharmaceutical company operating in India and across the world either directly or through subsidiaries or joint ventures. From being a domestically focused company in the early 1990s, Cipla has transformed itself into a multinational company with its share of revenues from international operations increasing from10% in the early 1990s to 60% during the fiscal year 2017-18. The management of the company initiated several measures to transform its business operations to meet the ever-changing market dynamics in India and across the globe. Of the major objectives Cipla planned to achieve during the fiscal year 2018-19, improving its operational performance was one key short-term motive. The present case study helps in assessing the trend in the operational performance of Cipla using profitability ratios.

Cipla Limited (Cipla), an Indian multinational pharmaceutical and biotech company, offered over 1,500 generic drugs covering 65 categories of treatments related to respiratory, cardio-vascular, arthritis, diabetes, etc. The company had developed around 50 dosage forms[1] for different categories of treatments, ranging from a simple dosage to higher forms with focus on affordability and quality of the products.

Cipla manufactured its own brands through 44 state-of-the-art manufacturing facilities in India and across the world. In addition, it was associated with several international companies, along with whom it manufactured various products in different regions and also operated through licensing.

Cipla, whose domestic revenues accounted for a share of around 90% of the total revenues in the mid 1990s, managed to improveits share of revenues from international markets to 60% by the year 2018.

The management of Cipla initiated several measures to make it a company of international repute. The management invested in Research and Development activities and in infrastructure development for the development of new drug delivery systems, facilating API[2] and formulation developments. It also focused on leveraging new technologies.

Between 2013 and 2018, the company's focus was on improving its performance and strenghtening its position in both the domestic and international markets. "A few years ago, we had planned that 2017 would be a year of streamlining Cipla's business model and identifying our core businesses and strengths. We then planned for 2018 to be a year of consolidation." Said Y.K.Hamied (Hamied), Chairman, Cipla Group[3].

Warehouse Receipts Financing (A)

Manisha Singh[*], *Sharon K Jose*[**] *and Manish Agarwal*[***]

Warehouse receipt financing (pledge financing) is a relatively new concept in India. Although it has been growing steadily, its outreach is still not significant enough to impact the lives of farmers in India. This case attempts to highlight the importance and benefits of warehouse receipt financing for farmers through the story of its protagonist Manjeet Singh, a small farmer from Govindpur village in Punjab, India. It compares all the agri-financing options available to him. After studying those options, the students can discuss their relative merits and demerits. It also brings to light the plight of farmers in India who, in spite of having bumper crops, do not have storage options easily accessible, leading to crop damage and wastage and subsequently to income not commensurate with crop production.

"Warehouse Receipts (WRS) are documents issued by warehouses to depositors against the commodities deposited in the warehouses, for which the warehouse is the deposit bailee. This gives depositors the confidence that their commodities will be stored with guaranteed quality and quantity. These are negotiable instruments that can be traded, sold, exchanged, and used as collateral to support for short term financing."[1]

– Devajit Mahanta, Vice President, Benz Com Consulting Pvt. Ltd., India, 2012

INTRODUCTION

Manjeet Singh (Manjeet), a wheat farmer in Govindpur village in Punjab, India, had a small piece (approx. 10 acres[2]) of cultivable land[3], with good yield per hectare, thanks to the HYV[4] seeds (PBW 660 – quality good for chapati-making) that he used. Manjeet sold his surplus crop in the *mandi*[5] even if the prices were not attractive because he had to pay back the loan he had taken from the local moneylender for the seeds and fertilizers. He had no option but to rely on moneylenders as he was not sure of other formal sources of agricultural credit like banks, cooperatives, etc. Storing his crop in a certified warehouse for selling at attractive prices in the future was difficult too, as the nearest warehouse was far away from Govindpur. And Manjeet was not the only one facing issues such as accessibility to agricultural credit, storage availability, and logistics. Most farmers in his village had to grapple with the same challenges.

The harvest for Manjeet meant there was enough to feed his family of six and a surplus that he could sell. He was able to build some savings in this way. But with two growing children and aging parents, his financial needs were growing too, and he was forced to look for other

Cash Flow Analysis of Vodafone Idea Limited

M V S Kameshwar Rao and Nagendra Kumar M V***

This case is a discussion between a professor and his class of budding financial analysts, where the professor responds to a query on financial distress. The case is built on the premise that a historical and trend analysis of Cashflows can provide some significant clues about a forthcoming distress, especially based on "Cash Losses". As a contemporary example and to integrate theory and practice better, the professor chooses Vodafone Idea Limited's financial distress to convey the concept, and uses the building of cash flows statement (as per the IndAS-7 guidelines) to sensitize the students to the various channels of cashflows that can make or mar a company's financial future.

INTRODUCTION

As part of the course on Corporate Valuation, a professor of a B-School referred to the concept of corporate distress and alerted the bright young future financial analysts of his class to keep the concept in mind while doing a valuation of any company. As a person who encouraged learning through questioning, it was natural for the professor to encounter a scenario like the following:

Students: Sir! What are the tell-tale signs of a company going to be bankrupt in the near future?

Professor: Of the many signs, consistent "cash losses" of a company in a "well-to-do" industry, might be a tell-tale sign of a company heading toward bankruptcy. This happens because the companies in distress believe that it is a temporary phenomenon and a little infusion of debt funds or a soft loan can help them tide over the distress and return to the profit path.

Students: Sir, why is there so much of emphasis on Cash in Finance, when we are bombarded with Book Values in Accounting?

Professor: Good you raised that question. Every discipline of knowledge which emerges as an accepted practice is built on a set of premises and is designed to provide information to a desired group of stakeholders. Accounting is built on the premise that a company is a going concern, and hence there is no urgency to always reflect economic reality in the financial statements. "Historical Values" and "Book Values" are good enough. Accountants are expected to report "the allocation of the capital infused by the investors into various assets", whereas finance professionals are more concerned with the, "Value of wealth of the investors." I do not need to assert that value of wealth is best measured in terms of its purchasing power. Cash is the most liquid and readily acceptable form of purchasing power.

Students: Sir, then what are "cash losses", and where do we find them? We understand there is an income statement and it gives us the profit or loss of a company for a particular year. But could you explain cash losses?

Professor: Absence of cash profits, in spite of high book profits, and book losses with cash profits have always intrigued many a non-accountant about the principles underlying the

Analysis of Liquidity Position - Maruti Suzuki

Indu Perepu and Nagendra Kumar M V***

The trainees of an investment advisory company were given the financials of Maruti Suzuki India Limited for the financial year 2017-18 and asked to analyze financial position. Before the trainer could get down to the actual analysis procedure, one of the trainees expressed concern over the composition of the company's current assets and current liabilities. The trainer then constituted the trainees into groups and assigned each group the task of observing different components of current assets and current liabilities. The case study provides scope to analyze the company on its liquidity position, and the impact of composition of current assets and current liabilities on the liquidity position of the company.

During the financial year 2018-19, a trainer at an investment management company provided the financials of Maruti Suzuki India Limited (Maruti) to the trainees. Giving details of the company, he said as of 2018, Maruti was the biggest car manufacturer in India with about a 50% share in the passenger car market segment. He also said that during the financial year 2017-18, the company had sold around 1,779,574 vehicles, and recorded a total revenue of Rs 840.39 billion (US$13.04 billion). He added that the company was also planning to enter the electric vehicle segment by 2020 and was field testing the vehicles.

After briefing the trainees about the company, the trainer asked for their opinion on Maruti's financial position. The trainees glanced through the financials to assess the financial position of the company. In the meantime, one of the trainees raised a doubt regarding the liquidity position of the company. He pointed out that the company's total current assets were less than the current liabilities *(Refer to Exhibit-I for the Composition of Current Assets and Current Liabilities of Maruti for the Financial Years, 2017-18 and 2016-17).* The trainer taking note of the observation, asked the trainees to prepare a variation statement to identify changes in current assets and current liabilities during the financial year 2017-18. The following *Table-I* was prepared, showing variation in the composition of current assets and current liabilities. The trainees observed that the total composition of current assets had declined by 9.74%. At the same time, the composition of current liabilities increased by 16.75% during the year 2017-18.

Table I
Current Assets and Current Liabilities Variation Statement for the year 2017-18
(Base year:2016-17) *(Rs. in millions)*

Current Assets	**2017**	**2018**	**Increase/Decrease**	**% Change**
Inventories	32,622	31,608	(1,014)	(3.11)

Liquidity Analysis of Cipla Limited

Indu Perepu[*] and Nagendra Kumar M V[**]

On the request of the manager of a leading bank, the credit evaluator at the bank analyzed the liquidity position of India-based pharmaceutical company Cipla Limited (Cipla) for the financial year 2017-18. He was required to provide inputs on the liquidity position of the company, so as to consider the possibility of a credit facility being extended to it. The case study provides information about the composition of current assets and current liabilities of Cipla and their nature. It helps to calculate, analyze, and interpret the liquidity position of the company using liquidity ratios: Current ratio, Quick ratio, and Cash ratio.

INTRODUCTION

During the first quarter of the financial year 2018-19, the manager of a leading bank working in its corporate division asked his credit evaluator (CE) to submit a report on the liquidity position of Cipla Limited (Cipla)[1]. The CE then started glancing through the reports submitted by Cipla. Initially, he focussed on the current assets and current liabilities of the company *(Refer to Exhibit-I for the Composition of Current Assets and Current Liabilities of Cipla for the Financial Years 2017-18 and 2016-17).*

He prepared a statement to understand the overall variation in the current assets and current liabilities position for 2017-18 compared to the previous year *(Refer to Table-I for the Variation statement of Current Assets and Current Liabilities of Cipla for the Financial Years, 2017-18 and 2016-17).* It was observed that while there was a significant increase in all the components of current assets and current liabilities, there was a minor decline in the case of financial liabilities (2016-17) by 1.73%.

Table I: Current Assets and Current Liabilities Variation Statement for the Year 2017-18 (Base year:2016-17)

(Rs. In millions)

Particulars	2016-17	2017-18	Increase/Decrease	% change

Liquidity Assessment of Infosys Limited

P Bhanu Sireesha[*] and Nagendra Kumar M V[**]

This case provides scope for assessing and analyzing the liquidity position of Infosys Limited during the fiscal year 2018-19, and also helps to understand the perception of the management on the liquidity position of the company. The short-term liquidity position of the company can be assessed by analyzing various components of current assets and current liabilities using liquidity ratios. The case also provides scope for a discussion on the broader perspective of liquidity management at software companies.

Addressing shareholders in the company's annual report, for the fiscal year 2018-19, Salil Parekh, CEO of India-based Information Technology services company Infosys Limited (Infosys), said, *"Our digital capabilities helped increase client relevance, we built business model resilience, and increased the stability on our business"*[1]. Leveraging on its digital capabilities, Infosys came up with a four-pronged strategy that would help it to further strengthen its business relevance to clients, as well as help them to create more value for their services *(Refer to **Table-I**)*. The significant preference given to clients' requirements proved to be stable and consistent in generating revenues from the existing client base.

Table I

Components of Infosys Four-pronged Strategy

Component	Description
Scale Agile Digital	Invest in digital capabilities and priority services
Energize the core	Infuse AI and automation leveraging **"Infosys NIA"***
Reskill our People	Reskill talent at scale for us and our clients
Expand Localization	Hire locally in markets; local delivery and training
* *an artificial intelligence tool*	

Source: Infosys Limited Annual Report (2018-19)

As per information given by the Infosys management, around 97.3% of its consolidated revenues had been generated from existing clients during the fiscal year 2018-19 *(Refer to **Table-II**)*. Besides, Infosys had added another 345 new clients with the support of the existing subsidiaries, thereby increasing its client base to around 1,279 by the end of the fiscal year 2018-19.

Table II

Clients' Segmentation Based on Revenue Generation

Clients' Category	2017-18	2018-19
100 million dollar +	20	25
50 million dollar +	57	60
10 million dollar +	198	222
1 million dollar +	634	662
Total	909	969

Merger of SBI and Its Associates: Challenges Ahead

D Satish and Manish Agarwal***

In mid-2016, the Indian government approved the merger of State Bank of India (SBI), the largest bank in India, with its 6 associate banks. This merger created a banking powerhouse with a balance sheet size of Rs. 37 trillion. On one side the merger brought many opportunities to SBI, especially in the area of increasing operational efficiency, while on the other hand, it also throws up some challenges, especially in the form of NPA management and HR issues, which it has to overcome quickly to realize the benefits of the merger. The case provides sufficient scope to discuss the challenges faced to ensure the success of the merger.

In June 2016, the Indian government approved the merger of six banks[1] with the State Bank of India (SBI), the largest bank in India. The banks to be merged were State Bank of Bikaner and Jaipur (SBBJ), State Bank of Travancore (SBT), State Bank of Mysore (SBM), State Bank of Patiala (SBP), State Bank of Hyderabad (SBH) and Bharatiya Mahila Bank (BMB). This merger would create a banking power house with a balance sheet size of Rs.[2] 37 trillion.[3] While speaking on the importance of the merger, Arundhati Bhattacharya (Bhattacharya), Chairperson of SBI, said, *"Currently, no Indian bank features in the top 50 banks of the world. With this merger, some visibility at global level is likely to increase. Customers of associates and subsidiaries of the Bank will also be beneficiaries."*[4] On the other hand, credit rating agency Moody stated that the merger would have very little impact on the assets quality, capitalization, and financials of SBI as the bank already fully owned SBH and SBP and held a majority stake in other associate banks.

ABOUT SBI AND ITS ASSOCIATES BANKS

SBI, a multinational, public sector bank, came into existence in 1921 when three presidency banks[5] were amalgamated to create the Imperial Bank of India which later became SBI in 1955. In 1959, eight banks became associate banks of SBI under the State Bank of India (Subsidiary Banks) Act, 1959. In 1963, two of the associate banks were merged to form SBBJ. In 2008, State Bank of Saurashtra became the first associate bank to be merged with SBI. Later, in 2010, State Bank of Indore, another associate bank, merged with SBI.[6]

Personal Financial Planning for Dr. Srivastava

D Satish and Manish Agarwal***

The case study discusses the financial planning of a high networth individual (HNI), Dr. Vimal Kumar Srivastava. Dr. Srivastava was looking for a financial advisor who could help him develop a strategy for his business plan, savings, investments, and retirement from government service. He also wanted the advisor to evaluate his current financial status and prepare a financial plan for him for the next nine years keeping his requirements in mind. The case study provides material for a discussion on 'Personal Financial Planning' for HNIs, including 'Client Profiling'.

"When creating a financial plan, you start off by identifying goals. However, each goal needs to be achievable in the context of the individual's situation. This phase of the financial plan serves as a type of reality check, which takes into consideration the individual's resources available to achieve their desired financial goals."[1]

– Marius Bester, Advisory Partner,
Citadel Investment Services Limited[2], July 2014

INTRODUCTION

Wealth management is a special field of financial services provided by financial institutions and professional firms to High Networth Individuals (HNIs). All monetary matters of the HNIs are handled by the service provider (advisor). The wealth management advisor provides services such as portfolio management, retirement planning, estate planning, business succession planning, taxation advice, legal service, trust management, investment management, and risk management. In essence, under wealth management, all financial services come in a single basket and are customized according to the client's request. Wealth management not only captures opportunities but also preserves, grows, and transfers wealth.

In the first decade of the 21st century, wealth management was a relatively new concept in India. A booming Indian economy, large FDI investments, increase in real estate prices, high paying jobs, and the significant growth in the stock market had not only boosted per capita GDP and living standards but also changed the lifestyle of the average Indian. As a result, the number of HNIs had been increasing each year in India.

One such HNI was Dr. Vimal Kumar Srivastava (Dr. Srivastava), who was confused about his financial plan and his commitments.

Short-Term Liquidity – An Insight into Hero Motor Corporation Limited

Indu Perepu and Nagendra Kumar M V***

In March 2018, Hero Motor Corporation Limited, Chairman Pawan Munjal briefed the stakeholders of the company on the future challenges and opportunities before the company. He spoke about HMCL's strategy to expand its market position in the scooter and premium motor vehicle segment during the fiscal year 2018-19. The investors of the company went through the financial statements with a specific focus on the short-term solvency of the firm, which would be an indicator of the efficiency of the operations during the year and which could help them in taking a suitable decision on the investment position they should take in the company for the financial year 2018-19. The case study provides information necessary to calculate and interpret the liquidity ratios of the company and derive a conclusion on the efficiency operations during the financial year 2017-18.

In March 2018, Pawan Munjal (Pawan), Chairman of India-based Hero MotoCorp Ltd (HMCL), the largest two wheeler manufacturer in the world, addressed investors and touched upon the initiatives taken by the management during the fiscal year 2017-18 to meet the ever-changing industry requirements. Amid growing challenges in terms of regulatory criteria – becoming compliant with Bharat Stage (BS) IV standards[1] by April 01, 2020; investing in the development of new technologies; and needing to diversify to meet the increasing competition – the management of the company had been positive and clear in its objectives of meeting shareholders' expectations, he said. Pawan also expressed confidence about the growth of the Indian automobile industry in future and hoped that its share would increase to 12% of the Gross Domestic Product (GDP) by the year 2026. However, he was of the view that in order to maintain the vibrancy of the overall industry environment in the coming years, efforts had to be made to sustain and improve the market position of the company.

Along with a clear long-term focus, the management of the company had short-term plans for the fiscal year 2018-19 to improve its growth in scooters and premium motorcycles. The investors after taking note of the views and opinions expressed by the chairman, were keen on looking at the financials of the company for the fiscal year 2017-18 to take a stand on their investment position for the next financial year, 2018-19.They began looking at the improvements in the short-term liquidity position of the company during the year through a variation statement *(Refer to Table-I for the Variation statement of current assets and current liabilities).*

It was observed that there was an increase in the inventories and total financial assets position during the year, and also a significant increase in other current liabilities (Refer to

TCS: The Most Valuable IT Services Company in the World

Sanjib Dutta and Manish Agarwal***

The case study discusses India's leading IT services company – Tata Consultancy Services Ltd. – becoming the most valuable IT services company in the world in October 2020, surpassing Accenture Plc (Accenture) in terms of market capitalization. This case is mainly useful in understanding market capitalization and various related concepts. It helps in understanding the significance of market capitalization, its determinants, and how to calculate market capitalization and free-float market capitalization of any public listed company with real data.

"We are proud and excited to embark on the next phase of our growth, building on our beliefs, and harnessing the passion, dedication and strength of our 469,000 associates who are the true custodians of Brand TCS."[1]

– Rajashree R, Chief Marketing Officer,
Tata Consultancy Services Ltd., January 2021

INTRODUCTION

On October 8, 2020, Tata Consultancy Services Ltd. (TCS), India's leading IT services company, became the most valuable IT services company in the world surpassing Accenture Plc (Accenture). TCS's market cap stood at US$144.73 billion whereas Accenture was valued at US$143.4 billion on NASDAQ[2] *(Refer to **Exhibit I** for graph related to market cap of both companies)*.[3] Analysts stated that the share price of TCS had gone up due to its better than expected financial performance in the second quarter of the financial year 2021 and the announcement of Rs. 160 billion worth of share buyback. Experts opined that there was a possibility that TCS might lose its leading position to Accenture if the company was unable to sustain its performance in the post-COVID period.

ABOUT TCS

TCS, a multinational Indian IT services company, was the largest IT services company in India with revenue of US$22 billion in FY20, a growth of 5.3% on a year over year (YoY) basis. The net income also increased by 1% from US$.49 billion in FY19 to US$4.54 billion

Inventory Management Dilemma at Super Cement

Garima Sisodia and Manish Agarwal***

The case discusses the inventory management issues faced by Super Cement Private Limited (Super Cement). It starts with the dilemma faced by S Lakshmi, founder of the company. Lakshmi was concerned with the rising cost of maintaining inventory, especially limestone, the main raw material used in producing cement. She wanted to optimize the cost of inventory for the company. She was also concerned about the gap between the time the order was placed for limestone and the time it was received. She called Minal, Finance Manager with Super Cement, and asked her to come up with a solution for various issues related to inventory management at Super Cement. The case helps students understand various concepts related to inventory management like how to calculate Economic Order Quantity (EOQ), Modified EOQ, re-order point, and safety stock.

"The basic financial inventory management aim is holding the inventory to a minimally acceptable level in relation to its costs. Holding inventory means using capital to finance inventory and links with inventory storage, insurance, transport, obsolescence, wasting and spoilage costs. However, maintaining a low inventory level can, in turn, lead to other problems with regard to meeting supply demands."[1]

– Michalski Grzegorz, Assistant Professor, Economist, and Researcher, at Wroclaw University of Economics, Poland, July 2008

In early FY19, S Lakshmi (Lakshmi), founder of Super Cement Private Limited (Super Cement), called A Minal (Minal)[2], Finance Manager of the company, to discuss the inventory management issues that Super Cement was facing. Lakshmi was worried about the limestone[3] inventory and wanted Minal to manage the inventory in such a way as to optimize the cost structure of the company. Lakshmi was also worried about the time gap between an order being placed and the limestone being received. She felt the delay might interrupt cement production and affect the business of the company. She felt it was imperative that Minal lost no time in fixing the inventory management issues at Super Cement.

A NOTE ON INDIAN CEMENT INDUSTRY

In 2019, India was the second largest producer and consumer of cement in the world after China with an installed capacity of around 500 Million Tonnes Per Annum (MTPA).[4] But, per capita consumption of cement was just 210 Kilogram (Kg.), the lowest among

Weighted Marginal Cost of Capital for Tecnet Steel Limited

Garima Sisodia and Manish Agarwal***

The case study discusses the various sources of capital available to the Tecnet Steel Limited (TSL) such as common equity, preference equity (convertible preference shares and irredeemable preference shares), and debt (bank loan, non-convertible debentures, and deep discount bond). The student is expected to put herself/himself in the shoes of a financial analyst and calculate the cost of each component of TSL's capital and help the management of TSL to select the right project among the various options available by comparing the ROI of each project and the WMCC of TSL, which keep changing with the size of investment required.

"The study of capital structure attempts to explain the mix of securities and financing sources used by corporations to finance real investment."[1]

– Stewart C. Myers, 2001

As of March 31, 2019, Tecnet Steel Limited (TSL) was a fully integrated mid-size player in the Indian steel industry. TSL was certified by the International Standards Organization (ISO) for its quality and environmental management standards.

TSL was founded in the steel city of Bokaro then part of the Indian state of Bihar[2] in 1980 by the Goyal family who hailed from Jaipur, Rajasthan. The company set up its first steel plant in 1983. Over a period of time, TSL showed tremendous growth. By the end of FY19, it was present in various activities across the entire spectrum of steel production which included manufacturing pig iron, cold-rolled coils, precision tubes, black pipe, cable tapes, tor steel, and alloy steel wire rods.

The company enjoyed a good long-term and short-term credit rating from CRISIL Limited[3] (CRISIL) and CARE Ratings Limited[4] (CARE). While CRISIL gave it a CRISIL AA and CRISIL A2 rating for the long-term and short-term, respectively, it got a CARE AA and CARE A2 rating from CARE for the long-term and short-term, respectively.

In August 2019, after a gap of almost three years, TSL wanted to raise further capital keeping its capital structure unchanged *(Refer to **Table I** for TSL's existing capital structure).*

Importance of Savings and Pension Scheme for Old Age

Kaushik Bhattacharjee and Munawar Sayyad***

The case study discusses Indian pension schemes and the importance of savings for elderly people. It helps in understanding the factors necessary for the proper management of the funds available during one's lifetime and how to properly utilize the funds. The case ponders on the sum of money an aged person would require to survive during crises like the Covid-19 pandemic. The importance of taking inflation into consideration while calculating the returns of the planned investment by an individual is discussed as also the fact of possible shifting of the poverty line during a crisis. The case underlines the importance of proper investment in helping to plan better management of expenses in life.

INTRODUCTION

Ravulamma who is 58 years old lives alone in Mokila village in the Ranga Reddy district of Telangana state. She has only one son and he lives in another state and does not provide for her in any way. The family lies below the poverty line. The number of people below the poverty line increased in India during the Corona Virus pandemic by 75 million (7.5 crore), as per a report published by Pew Research Centre. During such critical times, people like Ravulamma survive because of the old age pension provided by the government. But, is this pension enough to meet even her basic needs? Could she have saved enough money earlier in her life? Ravulamma who is from the village, worked up to 55 years of age as a daily labourer for construction companies. But with age, she found that she should could no longer do that kind of work. She had been working as a daily labourer since 2000 and her income was Rs. 4000 per month on an average from 2000 to 2018. She saved around Rs 2000 per month but she did not know how to invest it in such a way that her life could become easier. By mid-2010, she had total savings of Rs. 80,000 which she could have invested but there was no one to guide her or advise her about where to invest. She purchased gold worth Rs 20,000 and spent the remaining amount. Had she invested the remaining amount in fixed deposits, the Postal Savings Scheme, Systematic Investment Plans (SIPs), Recurring Deposit or Mutual funds *(Exhibit IV)*, she would have saved a considerable amount. Ravulamma requires around Rs. 5,500 per month for her expenses, but receives a pension of only Rs. 2000, so she falls short by Rs. 3,500. If she had made proper investments using her savings she would not have found herself in such a situation. She could have invested and withdrawn some amount based on her needs, though she would have had to incur some charges for a premature withdrawal in the fixed deposit schemes. She could also have invested in the portfolio of schemes listed in *Exhibit IV*. What are your suggestions for her?

TASK AT HAND

When we look at the current scenario of elderly people living below the poverty line, there are many who are helpless and are not able to meet their basics needs – food, clothing, shelter, and health. The daily increase in prices has led to inflation. Inflation can be defined as a persistent rise in the general price of goods and services of common or daily use — such

Liquidity Analysis of Dr.Reddy's Laboratories

Indu Perepu and Nagendra Kumar M V***

In April 2018, the Financial Manager of Dr. Reddy Laboratories (DRL), wanted to understand the liquidity position of the company for the financial year 2017-18 before the operations for the financial year 2018-19 commenced. He held discussions with the management accountant of the company to find out about the composition of various current assets and current liabilities, so as to come to a conclusion about the decisions to be taken with respect to the company's operations for the financial year 2018-19. The present case study provides information for analyzing and interpreting the key liquidity ratios; current ratio, quick ratio, and cash ratio, which will be helpful in understanding the liquidity position of the company.

In April 2018, the financial manager (FM) of India-based pharmaceutical company Dr. Reddy's Laboratories (DRL)[1] wanted to take a call on the liquidity position of the company before going ahead with the operations for the financial year 2018-19. He glanced through the current assets and current liabilities composition of the company *(Refer to Exhibit-I for the Composition of Current Assets and Current Liabilities of DRL for the Financial Years 2017-18 and 2016-17).* He then asked the management accountant of the company to prepare a variation statement comparing the current assets and current liabilities of the financial year 2017-18 with those of the the previous year 2016-17. The management accountant submitted the following statement.

Table I: Current Assets and Current Liabilities Variation Statement for the year 2017-18 (Base Year: 2016-17)

(Rs. In millions)

Particulars	2016-17	2017-18	Increase/Decrease	% Change
Current Assets				
Inventories	18,097	18,568	471	2.60
Financial Assets	58,770	60,599	1,829	3.11
Other Current Assets	9,071	11,218	2,147	23.67
Total Current Assets	85,938	90,385	4,447	5.17
Current Liabilities				
Financial Liabilities	38,042	43,089	5,047	13.27
Provisions	2,084	1,734	(350)	(16.79)
Other Current Liabilities	2,454	2,376	(78)	(3.18)
Total Current Liabilities	42,580	47,199	4,619	10.85

Revising Budget Targets – Role of Accounting

Indu Perepu and Nagendra Kumar M V***

Anand Vihar Food Processing Limited (AVFP) is in the business of exporting processed poultry meat to Oman, the Maldives, and Japan. After discussions with the marketing department on the company's progress in terms of achievement of export targets during the third quarter of the financial year 2019-20, the top management wanted to revise the export targets for the last quarter of the fiscal year. Based on the instructions of the top management, the marketing department revised its requirement to achieve the set targets and sent communications to each department associated with it. Each department in turn sent its requirement for the financial approvals to the accounts department. The present case study provides scope for a discussion on the process of financial decision making and the role of the accounting process in providing the requisite financial information for each department.

INTRODUCTION

At the end of the third quarter of financial year 2019-2020, the management of food processing company Anand Vihar Food Processing Limited (AVFP) conducted a review meeting of the Marketing department to find out the status of export targets to be achieved for the financial year ending the next quarter *(**Exhibit-I** Export Targets for the Financial Year 2019-20)*. Based on the information provided by the marketing department, the management of AVFP took note of the growing demand for the company's products at the international level. The management gave the marketing team revised targets to increase sales by another 5%.

After receiving the instructions from the top management, the marketing team calculated the revised targets and also made a list of the additional resources they would need to achieve the revised sales targets. Once it had prepared the revised figures, the Marketing department sent the proposals on the revised budgeted sales targets to the Procurement & Processing department, Human Resource department, and the accounting department *(Refer to **Exhibit-II** for the Proposals sent by Marketing department to achieve the Revised Export Targets)* for approval and objections, if any, to increase the production target as per the revised plan.

BACKGROUND

AVFP specialized in the export of edible poultry meat. It was established in the year 2013, and had since expanded its market base and the export of its poultry meat. As of 2019, it exported the meat to three countries – Oman, Maldives, and Japan. The sales and profits of AVFP had improved consistently and were projected to grow at an annual growth rate of 10% to 15% in the coming years *(Refer to **Exhibit-III** for the Profit and loss account of AVPL since 2013 till 2019)*. Before the commencement of the financial year every year, the management convened a planning meet to fix the sales targets for the next financial year.

The operational structure of AVFP comprised three core departments – Procurement & Processing department, Human Resources department, and the Marketing department. The accounting department supervised the operations of all three departments. The accounting department was also responsible for the management of financial resources. Every year after

Should Cairn India Merge with Vedanta?

G V Muralidhara and Hadiya Faheem***

This case discusses whether Vedanta Resources plc (Vedanta Resources), India's biggest diversified natural resources company, should merge two of its businesses — India's largest private miner, Vedanta Ltd. (Vedanta), and oil and gas exploration and production firm, Cairn India Ltd. (Cairn India). The move was intended to cut debt at Vedanta and simplify the group structure of Vedanta Resources. Where Cairn India was concerned, the deal would help diversify earnings from oil and gas to electricity and an array of commodities from copper to zinc to aluminum. The shareholders of Cairn India would also gain from Vedanta's asset base and output-increase forecast compared to Cairn India's moderate output-growth plan. The deal came in for severe criticism from the minority shareholders of Cairn India.

In June 2015, India's biggest diversified natural resources company, Vedanta Resources plc (Vedanta Resources), announced its plans to merge two of its businesses – India's largest private miner, Vedanta Ltd. (Vedanta), and oil and gas exploration and production firm, Cairn India Ltd. (Cairn India). The merger through a Rs. 146.12 billion all-share deal would create India's largest diversified natural resources company.[1] The move was intended to cut debt at Vedanta and simplify the group structure of Vedanta Resources.

In September 2013, Vedanta Resources merged its various subsidiaries such as Sesa Goa, Sterlite Industries, Madras Aluminium Co, Sterlite Energy, and Vedanta Aluminium into one entity – Sesa Sterlite (Refer to Figure I for holding structure of Vedanta Resources). In February 2015, Sesa Sterlite was renamed Vedanta Ltd., to have better alignment with the Vedanta group. On March 31, 2015, the 58.9 percent stake in Cairn India purchased by Vedanta Resources in 2011 was transferred to Vedanta.[2]

Evaluation of Mutual Funds by Technical Analysis

Manish Gupta and Ankit Rohilla***

This case is about the evaluation of mutual funds through technical analysis by an intern for HCL Infosystems Ltd. Some parameters were mentioned by the authors like market risk and fund volatility. In the company, the management was inclined to invest in debt funds. However, in mutual funds there are hybrid funds with combinations of equity and debts. The intern finds there is huge potential in other mutual funds that are hybrid in nature. Therefore, the readers of this case are expected to suggest two mutual funds – one a debt fund and the other an equity fund – with a weekly dividend pay-out.

"Employees first, customer next policy gives very first right to HCL employees and current stakeholders of company in every offerings."

– **Shiv Nadar, Founder and Chairman**

"We have recently celebrated 40 years of excellence of HCL Corporation and still we are a young company with great minds and young leaders."

– **Shiv Nadar, Founder and Chairman**

"In last 40 years, Great challenge was to create value for the shareholders and HCL always do that by achieving targeted milestones and have footprint across the globe with outstanding C-SAT."

– **SG Murali**, Ex-Group CFO

INTRODUCTION

Ankit Rohilla (Rohilla), an intern at HCL Infosystems Ltd., India, had been given an assignment by his company guide – to come up with recommendations relating to the company's mutual fund investments. Rohilla had only 12 weeks in which to do this but he decided to take it up as a challenge and prove his mettle. Though the work had been given to an intern, the company guide was serious about it and wanted Rohilla to figure out an optimal investment strategy in mutual funds. Rohilla was aware of the significance of the assignment and hoped he would be able to find a solution. To achieve it within the time limit, Rohilla decided to divide his internship goal into different phases and started working on it. As his company guide had suggested, he began by getting an understanding of the company and about mutual funds in general.

ABOUT THE COMPANY

HCL Infosystems Ltd. (HCL Infosystems), a part of HCL Enterprise. started by producing micro-computing calculators back in the year 1976. It developed the first indigenous micro-computer in 1978, at around the same time as Apple did and three years before IBM's PC was developed.

Hindustan Zinc Declares Highest Interim Dividend in 12 Years

Manish Agarwal[*] and Sanjib Dutta[**]

The case discusses Indian mining major Hindustan Zinc Limited's announcement of interim dividend in 2020, its highest ever dividend in 12 years since 2007. The case study helps to understand factors that should be evaluated by the board while considering a dividend payment. It also helps to understand various concepts of dividends, including ex-date, record date, dividend yield, and dividend payout ratio, among others.

Any excess cash should be distributed to its shareholders. [1]

– By Arun Misra, CEO, Hindustan Zinc Limited, October 2020

INTRODUCTION

On October 20, 2020, Hindustan Zinc Limited (HZL) announced its second quarter (ended on September 30, 2020) results and a 1065% interim dividend on a face value of Rs. 2 per share.[2] The company had reported a 25% jump in revenue Year over Year (YoY) and a 42% increase compared to the previous quarter. EBITDA (earnings before interest, taxes, depreciation, and amortization) had also increased 39% YoY and 85% Quarter over Quarter (QoQ). However, Profit after Tax (PAT) had fallen by 7% from Rs. 20.81 billion in Q2FY20 to Rs. 19.40 billion in Q2FY21 due to a higher depreciation amount, financial cost, and high tax rate. The fall in PAT had resulted in a 7% drop in Earnings Per Share (EPS) which had gone down from Rs. 4.93 per share in Q2FY20 to Rs. 4.59 per share in Q2FY21 *(Refer to **Exhibit I** for the quarterly performance of HZL).*[3]

Experts stated that to compensate for the fall in EPS, HZL had announced the interim dividend of Rs. 21.30 per equity share. This was the highest ever interim dividend in 12 years since 2007.[4] Before this, HZL had given a dividend of Rs. 16.50 in May 2020 *(Refer to **Exhibit II** for interim dividend issued by HZL).* The ex-date and the record date for the dividend were October 27, 2020, and October 28, 2020, respectively.[5] The total dividend amount was around Rs. 90 billion, which was about 50% of the cash balance.

Options Strategies for a Volatile Market

Kanaiyalal Parmar, Manish Agarwal** and Kaushik Bhattacharjee****

Meghna, a trader at Wellvet Partners, a financial services provider, needed to plan and implement option strategies for volatile markets. In consultation with Aruna, Senior Options Strategist, she planned to use Nifty March 2020 options to trade option strategies for volatile markets. India VIX (Volatility Index), a proxy of stocks return volatility traded on NSE, rose by 70% during the fourth week of February. This added to her confidence that the market was going to be volatile and Nifty would move by at least 10% in either direction in March 2020. However, Aruna warned her that the market could turn out to be stable instead and she should, hence, assign equal probabilities to volatile and stable markets while choosing an option strategy.

"Trading options is about more than just being bullish or bearish or market neutral. There's volatility. Stronger or weaker directional biases. Whatever (be) the scenario, you have the choice of a logical options strategy that can be risk-defined, capital efficient, and/or have a higher probability of profit than simply buying or shorting (the) stock."[1]

– T.J. Neil, Sr. Trading Specialist, Trade Wise Advisors, TD Ameritrade in October 2020

INTRODUCTION

It was the last week of February 2020 and the Indian stock market was plummeting like other stock markets around the world. Aruna Golwalkar (Aruna) – senior strategist at Wellvet Partners (Wellvet), a financial service provider, called up her team member, Meghna Kansal, (Meghna) – a trader who had joined the risk management and derivative strategy department of Wellvet in January 2015. They discussed the Indian as well as global stock markets, as markets around the world had dropped sharply in the last week of February after the outbreak of the novel coronavirus (COVID-19). They also discussed how to use various options strategies over the coming days to profit from the high volatility. After a lot of brainstorming about stock market conditions, Meghna was given the task of looking at the market conditions and developing appropriate option strategies within a couple of days. They decided to take a position in option strategies using the options traded on Nifty[2] available on the National Stock Exchange of India[3] (NSE) and to hold it through March 2020.

A NOTE ON WELLVET PARTNERS

Wellvet was started by Vipul Rana, a serial entrepreneur, and Narayan Maheshwari, a trader and stock market influencer, in 2011. The firm was based in Mumbai, Maharashtra, a state in western India. Over a period of time, Wellvet grew into one of the leading financial

Lakshmi Vilas Bank and DBS Merger

Indu Perepu and Nagendra Kumar M V***

During the last week of November 2020, the Government of India (GoI) approved the merger of Lakshmi Vilas Bank (LVB) with Singapore-based DBS Group Holding's Indian subsidiary, DBS Bank India Limited (DBS). This was the first time in the history of banking in India that a local bank was being merged with a foreign bank. By initiating the merger proceedings of LVB with DBS, the Reserve Bank of India set a benchmark and, in the process, safeguarded the Indian banking system by allowing banks that were struggling financially to receive investment from strong foreign banks. The present case study can be used to discuss the concept of moratorium period, Prompt Corrective Action, challenges Indian banks face, and the operational challenges that foreign banks in India are confronted with.

On November 26, 2020, the Union Cabinet chaired by the Prime Minister of India, Narendra Modi, approved the merger of Lakshmi Vilas Bank (LVB) with Singapore's leading Banking Group, DBS Group Holdings (DGH). DGH acquired control over LVB through its wholly-owned subsidiary DBS Bank India Limited (DIL). Prior to the approval of the Union Cabinet, on November 17, 2020, the Reserve Bank of India (RBI) imposed a moratorium period of 30 days on LVB due to its poor financial condition.

Once the news of imposition of moratorium was out, agitated depositors began withdrawing their money, thereby affecting the liquidity position of the bank. In order to prevent further damage to the shareholders and to protect the interests of shareholders, the RBI imposed restrictions on the operations of LVB until the process of merging with DBS was initiated formally. During the moratorium period, limits were imposed on the withdrawal of deposits by LVB's depositors. Each depositor was permitted to withdraw only Rs.25,000 irrespective of the number and amount of deposits they held. However, there was an exception made to this condition –when the depositors had to meet medical expenses, educational expenses, marriage expenses, etc., they were permitted to withdraw more than the specified amount of Rs.25,000, but not exceeding Rs. 0.50 million, on submission of the required documents. Each deposit was insured to the limit of Rs.0.50 million under the Deposit Insurance and Credit Guarantee Corporation (DICGC), which was applicable in case of liquidation of the bank.

During the month of September 2019, the RBI put LVB under the Prompt Corrective Action (PCS) framework for the violation of PCA threshold limits *(Refer to **Exhibit 1** for PCA Matrix – Areas, Indicators and Risk Thresholds)*. The main reason for the problems at LVB was its venturing into financing large scale businesses. Though the primary focus of LVB was to meet the financial requirements of small-scale industries, after 2010, it shifted its focus to financing large-scale business organizations. The bank was hoping that loans to huge organizations would be risk free and also yield a handsome income. Thus, between 2010 and 2017, LVB's loan size grew by four times. The total money it loaned was Rs.50 billion as of 2017. But as several companies were unable to pay back the loans, the bank's burden started to increase and it incurred losses of Rs.6.5 billion for the quarter ending March 2018.

Wipro Limited's Buyback of Shares in 2020

Sanjib Dutta and Smita Ray***

The case talks about the reasons for Wipro Ltd. (Wipro) deciding to buyback its shares. The case starts out with a brief history of Wipro. It outlines the buyback history of the company and its financials. The case also covers in detail the impact of the share buyback on the share price of Wipro. It concludes by detailing the benefits of share buyback for retail investors.

"The announcement to buyback equity shares is part of our philosophy to deliver consistent returns to shareholders."[1]

– Jatin Dalal, Chief Financial Officer, Wipro Limited in October, 2020

INTRODUCTION

In October 2020, Wipro Limited (Wipro), an Indian multinational corporation in the IT services space, announced a buyback of 238 million shares from existing shareholders on a proportionate basis through a tender offer[2]. Out of these shares, the company aimed to buy back nearly 35 million shares from retail investors valued at less than Rs 0.2 million.

Wipro's decision to buy back shares was driven by its desire to push up the share price of the company and return the surplus cash in bank balances to the shareholders.[3] Through the buyback, Wipro aimed to reduce the total number of outstanding shares and enhance the earnings per share (EPS)[4].

Wipro offered an arbitrage opportunity for investors who held Wipro shares worth up to Rs 0.2 million as on the record date for the buyback. The offer was reserved for 15% of retail investors. Analysts were in favor of the buyback of shares, especially for retail investors.

1 "Wipro Q2 results: Net profit declines 3% YoY; firm announces Rs 9,500 crore share buyback," www.economictimes.indiatimes.com, October 13, 2020.

2 Tender offer refers to a public, open offer or invitation (usually announced in a newspaper advertisement) by a prospective acquirer to all stockholders of a publicly traded corporation (the target corporation) to tender their stock for sale at a specified price during a specified time, subject to the tendering of a minimum and maximum number of shares.

3 As of March 2020, Wipro's cash balance was Rs. 104.44 billion.

4 Earnings per Share (EPS) refers to the monetary value of earnings per outstanding share of common stock for a company. It indicates how much money a company makes for each share of its stock, and is a widely used metric to estimate corporate value.

Apex Industries (A)

Anita C Raman and Manish Agarwal***

The case provides an overview of Apex Industries which established itself from a small firm in 2010 to one of the leading players in the contract manufacturing space. In 2021, it was selected by Vedanjali Limited (Vedanjali), one of the leading Ayurvedic and natural products brands, for an annual supply of 20 million units of Triphala Juice in one-liter bottles for 10 years starting from April 2022. Vedanjali wanted the bottles to be priced at Rs.145 per bottle. Jitin and Kamlesh, co-founders of Apex Industries, have to decide whether to accept Vedanjali's offer on the basis of various Capital Budgeting techniques. From the case, students are expected to understand the concepts of Operating Cash Flow (OCF), Terminal Cash Flow (TCF), Net Cash Flow After Tax (NCFAT), and Net Present Value (NPV). The case would also help Finance students to hone their Excel skills.

INTRODUCTION

On April 15, 2021, Jitin Prakash Arora (Jitin) and Kamlesh Nand Pandey (Kamlesh), co-founders of Apex Industries, and various department heads including Sudhir Kumar Kansal (Sudhir), Head of Finance; Vishal Batra (Vishal), Head of Productions; Narotham Reddy (Narotham), Head of Operations; and other key people of the company were sitting in the conference room discussing the project offer they had received from Vedanjali Limited (Vedanjali). The task before Jitin and Kamlesh was to decide whether to accept the Vedanjali Project or reject it.

ABOUT APEX INDUSTRIES

Jitin and Kamlesh had started Apex Industries in 2010. They set up their factory in an industrial area of Greater Noida. The company started with the production and distribution of daily use products such as phenyl, toilet paper, paper napkins, floor cleaner, toilet cleaner, and utensil cleaner liquid and bar. In 2013, Jitin and Kamlesh decided to expand the business into ayurvedic and natural products as the demand for natural products was on the rise. Initially, they decided to launch a chemical-free version of their existing products.

Later, in 2015, Apex Industries completely moved into production and distribution of natural products and increased its product line by including products like natural hair shampoo, natural bathing soap, and similar other products. In 2017, Jitin and Kamlesh expanded their factory and production capacity and hired talent from leading business schools around the country. On the advice of their board of directors, Apex Industries entered into the contract manufacturing[1]

Cash Flow Analysis of HDFC Bank

D Sreenivasa Chary and Nagendra Kumar M V***

HDFC Bank Limited (HDFC) is a leading private sector bank in India. During the year 2020-21, the bank earned revenue of Rs.15,58,852.736 million, while its consolidated profit before tax was Rs.427,725.836 million after adjusting for expenses. The present case study can help in analyzing and understanding the cash flows from the operating, investing, and financing activities of a banking company. The case study can also be used to understand how to determine the amount of total cash and cash equivalents generated during the year.

INTRODUCTION

HDFC Bank Limited (HDFC), a leading banking and financial services company in India, headquartered in Mumbai, Maharashtra, was founded in the year 1994 as a subsidiary of the Housing Development Finance Corporation. HDFC was the largest private sector bank in terms of assets and market capitalization as on March 31, 2021. It was also the fifteenth-largest employer with around 120,000 employees. HDFC offered various types of banking services and products, which included wholesale banking and retail banking services, as well as treasury services, auto loans, housing loans, two-wheeler loans, personal loans, etc. For the year 2020-21 (April 2020 to March 2021), HDFC's total income stood at Rs. 1,558,852.736 million.

Of the total income, the interest income was Rs.1,285,523.933 million and other income was Rs. 273,328.803 million (Refer to Table-I for the Income Break up of HDFC for the financial year 2020-21).Expenditure in the form of interest and other operating expenses stood at Rs. 592,475.799 million and Rs. 350,012.568 million respectively.

Table I

Income Break-Up of HDFC Bank for the financial year 2020-21

Particulars	**Amount Rs. (in millions)**
INTEREST EARNED	
Interest / discount on advances / bills	1,022,991.272
Income from investments	232,116.170
Interest on balance with RBI and other inter-bank funds	24,143.004
Others	6,273.487
Total Interest Income (A)	**1,285,523.933**
OTHER INCOME	
Commission, exchange and brokerage	180,245.945

Equitas Small Finance Bank – IPO

Indu Perepu and Nagendra Kumar M V***

The case study discusses the Initial Public Offering (IPO) of Equitas Small Finance Bank (Equitas). Small Finance Banks are growing popular in the Indian financial markets as they cater to the underserved and unserved customer segment. The present case study can be used to discuss the scope of small finance banks in India, the IPO and its process and eligibility, and the grey market and the grey market premium.

INTRODUCTION

On October 20, 2020, Equitas Small Finance Bank (Equitas), the wholly-owned subsidiary of Non-Banking Financial Company (NBFC) Equitas Holdings Limited (EHL), announced the launch of its Initial Public Offering (IPO). The Equitas IPO was the third IPO from a Small Finance Bank (SFB) in India, the first two being AU SFB and Ujjivan SFB. Valued at Rs. 5180 million, the Equitas IPO comprised approximately 156 million shares, of which 84 million shares were offered directly to the public, while the remaining 72 million shares were related to Offer For Sale (OFS) by the promoters and were not a source of finance for the company. The main aim of the Equitas OFS was to achieve a dilution of the promoter's share in the overall share capital as per the Reserve Bank of India (RBI) guidelines. Prior to the announcement of the IPO, Equitas had raised Rs. 1400 million through the sale of 42.3 million shares.

There was a reservation of Rs. 510 million (159,37,500 shares) for subscription by eligible EHL shareholders, and up to Rs. 10 million (312,500 shares) for subscription by eligible employees of Equitas. The net public offering included 35% reserved for retail investors, 50% reserved for Qualified Institutional Buyers (QIBs), and 15% reserved for Non-Institutional Investors (NIIs). The total equity shares of Equitas were 105,34,54,144. While 95.49% (10,059,43,363) was held by EHL, the remaining was held by the public.

The offer was made at a price band of Rs. 32 to Rs. 33 per share, and each individual investor could purchase a lot of 450 shares, up to a maximum of 13 lots for each individual shareholder. At the lowest price, Equitas was expected to raise Rs. 5104 million, and at the highest price band it was expected to raise Rs. 5176 million. The primary objective of the IPO was to augment the Tier-1 capital base of the bank to meet its future capital requirements, as well as future expansion and regulatory requirements.

As per CRISIL ratings, Equitas was the largest SFB in India in terms of banking outlets and the second largest bank in terms of Assets under Management and total deposits. As on June 30, 2020, Equitas had 856 banking outlets and 322 ATMs across 17 states in India. It had a market share of 16% in terms of assets under management among small finance banks in India.

The business of Equitas was primarily targeted at serving the financial requirements of the unserved and underserved segments of the population by providing housing finance, vehicle finance, and MSME financing. The housing finance comprised 42% of the total asset base,

Valuing of Fixed Assets – The Consistency Concept

Indu Perepu and Nagendra Kumar M V***

Alekhya, a young entrepreneur who had successfully run a cotton bags manufacturing unit for five years, decided to expand the business by making an additional investment in the plant and machinery of the company. She approached the bank which had given her a loan to start the business for an additional loan and submitted the necessary documents. However, the bank rejected the loan request stating that the valuation of the plant and machinery looked inconsistent. The present case study provides scope for a discussion on the concept of consistency in the accounting process and how it facilitates the decision-making process by ensuring the reliability of accounting information.

INTRODUCTION

On April 1, 2013, Alekhya, a budding entrepreneur, started a manufacturing unit called 'Alekhya Manufacturing Limited' (AML) to make environmental friendly cotton carry bags. These bags were sold under the brand 'Go Green'. With the ban on single use plastic bags being implemented in several cities across India there was a huge demand for environment friendly shopping bags. There were not many companies making such bags. So Alekhya's venture picked up quickly and her business operations were highly successful *(Refer to **Exhibit-I** for Trends in Revenue and Profit Margins of AML)*. At the end of the fifth year i.e. on March 31, 2018, she wanted to upgrade the existing plant and machinery and so applied for a bank loan and submitted the necessary documents.

However, the bank did not approve the loan stating that the value of Plant and Machinery had not been presented properly. It asked for a clarification from AML *(Refer to **Exhibit-II** for the Value of Plant and Machinery Presented by AML)*.

BACKGROUND

Alekhya, daughter of successful businessman Arindam Chaudary, was inspired by the success of her father's business ventures, and decided to start her own business venture after completing her studies. She understood the scope of eco-friendly products while doing a summer project in her college and tried to learn more about eco-friendly manufacturing with the help of her faculty. She decided to start a manufacturing concern to make environmentally sustainable cotton bags.

Alekhya submitted her Detailed Project Report to the faculty at the entrepreneurship development center at her college. After receiving the necessary guidance and inputs from the faculty, she submitted her report to a nationalized bank for approval of a bank loan. The bank after a preliminary assessment of her report, agreed to provide the necessary finance for her to start the venture. She received financial support of Rs.2.5 million from the bank for launching her business operations. She also invested another Rs. 0.50 million given by her

Accounting Dilemma of Shreya Singhal

K Rajyalakshmi[*]

The case study discusses the dilemma faced by Shreya Singhal, a B. Tech graduate, who started her sole proprietorship business of Office Equipment and Supplies with capital of Rs. 150,000 and a bank loan of Rs. 100,000. Later, her close friend also joined her business with an equal amount of capital. At the end of the first month of her business, she decided to do a transactional analysis for the business translation that occurred during the month. However, Shreya's other friend Namitha, who was a Master in Commerce, suggested her to keep a proper book of accounts for her partnership business. Namitha's suggestions left Shreya in a state of confusion. Her first dilemma was the kind of organization she was running and the second was about which accounting method she should use: accounting equation method or a traditional accounting method and whether the resultant financial performance and financial position would be the same in both the methods

"Don't ever let your business get ahead of the financial side of your business. Accounting, accounting, accounting. Know your numbers.[1]

– Tilman Fertitta, Businessman and Television Personality, December 2016

In July 2021, Shreya Singhal (Shreya), a B. Tech graduate from one of the reputed engineering colleges in Hyderabad, Telangana, started her Office Equipment and Supplies business after COVID-19 turned the job market sluggish and scuttled her chances of finding a decent job. Shreya started the sole proprietorship business with an investment of Rs.150,000 from her savings. She also took loans from HDFC Bank based on a written guarantee provided by her father. In the very first month of operations, she made the following transactions:

- July 1, 2021: Shreya took a bank loan of Rs. 100,000 from HDFC Bank at an interest rate of 12% per annum.
- July 2, 2021: She purchased a computer, printer, and other related items from Ramdas & Sons for Rs. 65,000 and made a partial payment of Rs. 15,000 by cheque.
- July 4, 2021: Shreya withdrew Rs. 9,500 from the bank account to incurred day to day business expenses
- July 5, 2021: She purchased electrical equipment and lighting fixtures from ABC Ltd. for Rs. 15,000 and paid installation charges of Rs. 800 by cash.
- July 6, 2021: She bought equipment costing Rs. 4,500 from MCS Ltd. and Rs. 250 was paid by them as railway freight
- July 7, 2021: She purchased stock from Deenanath & Sons for Rs. 8,500 in cash and received the goods the same day.

Devi's Dilemma – Uncertainty in Revenue Recognition

Indu Perepu and Nagendra Kumar M V***

Devi, a young and enthusiastic fashion designer, started a boutique called Devi Fashions (DF) after graduating with a degree in fashion designing. Within a short span of time, DF became hugely popular among urban college students, working women, and premium segment customers, for its unique, customized, and fashionable contemporary as well as traditional wear. Overwhelmed by the success of the business, Devi wanted to launch new models during the third quarter of the financial year 2019-20, based on the expected revenues for the quarter. However, she was in a dilemma about estimating the actual revenues. The present case study can be used to discuss the criteria of uncertainty in revenue recognition process, and how it impacts revenue generation in accounting. The Accounting Standard-9 (Revenue Recognition) provides guidelines for the recognition of revenue when there is uncertainty in the revenue recognition process.

INTRODUCTION

Devi, the sole-owner of Devi Fashions, was happy looking at the success of her boutique. She sold clothes for three types of customers – college students, working women, and customized segment aimed at targeting premium segment customers. All three categories of business were generating sufficient revenues. In order to expand her business and offer new models, Devi was planning to look at the expected sales for the third quarter of the financial year 2019-20.

Based on her experience, she estimated revenue of around Rs.300,000 from the first category of customers, around Rs. 500,000 from the second category of customers, and around Rs.10,00,000 from the third category of customers. However, a level of uncertainty prevailed when it came to accounting for the actual revenues. She was unable to determine the actual revenues realized, and the criteria she needed to follow to estimate the revenues.

BACKGROUND

Devi, a student of fashion designing, started the boutique, Devi Fashions (DF), in the year 2015, after graduating from a leading fashion technology institute. She designed stitched and semi-stitched casual and formal wear in traditional and contemporary styles. Besides, catering to the tastes and preferences of college students and working women, Devi also targeted premium overseas customers through online channel. Since its inception, DF had gained immense popularity among women opting for casual, formal, and occasional clothing.

In a short-span of time, DF had gained popularity among the college students and working women opting for casual and formal wear, due to affordable prices, high quality and contemporary designs. The customized segment was challenging for Devi, and she has to focus on building relationship with the premium segment customers to meet their ever changing tastes and preferences.

Share Buyback at TCS

Indu Perepu and Nagendra Kumar M V***

The case study can be used to discuss the concept of share buyback and the advantages and limitations it holds for companies and shareholders. It can also be used to understand the motive behind the companies going in for a share buyback, the different modes of share buyback, and the impact of share buyback on the market price of the share. The context provided in the case from the perspective of Tata Consultancy Services (TCS) can be used to discuss these aspects and can be helpful in understanding the practical implications of share buyback.

INTRODUCTION

On October 7, 2020, leading Indian multinational Information Technology giant Tata Consultancy Services (TCS) announced a buyback of 5.3 crore (53 million) equity shares, equivalent to 1.42% of its total paid-up capital. The total value of the buyback was estimated to be Rs.160,000 million at a price of Rs. 3000 per share, a 10% premium on the closing price. The announcement of the buyback had a positive effect on the market price of the share. A day after the announcement – on October 8, 2020 – the stock price of TCS increased over its previous day closing price of Rs.2737 by. 137.60, and the stock traded at a value of Rs.2875.

However, despite the announcement of a buyback offer, market participants and analysts said the percentage of shares that TCS was buying back was lower than they had expected. The market participants had expected a buyback of 1.7% of the total paid-up capital of the company.

The buyback announced during the second quarter of FY 2020-21, came at a time when the revenue and profit margins were showing favorable signs for the financial year. During the second quarter, the revenues were Rs. 401,350 million, an increase of 4.7% sequentially. The revenues in dollar terms increased by 7.2% and stood at $5.42 billion. This marked a strong revenue growth and margin expansion, which TCS expected would continue for the remaining two quarters of the year. The company had already announced salary hikes effective from October 1, 2020.

While TCS announced the return of capital to shareholders through a share buyback, the biggest beneficiary of this move could be Tata Sons, which held 72% in TCS. Tata Sons, which needed funds to buy back the 18.4% stake held by the Shapoorji Pallonji Group (SPG), was expected to receive Rs.11,500 crore in the deal. SPG had announced its intention to separate from the Tata Group, and the money from the share buyback was expected to partly fund this exit.

Previously, TCS had gone for a series of buybacks in 2018 and 2017. In the year 2018, it bought back 7.61 crore shares valued at Rs. 160,000 at Rs. 2100 per share. On the latest share buyback, Deepak Shenoy, Founder of Capital Mind, noted, "Whatever amount they would have otherwise distributed as a dividend, they are just using that amount to use in a

WhatsApp Pay in India

Indu Perepu and Nagendra Kumar M V***

On November 6, 2020, leading messaging app WhatsApp, owned by the US-based Facebook Inc., entered the digital payments ecosystem in India by launching its Unified Payment Interface (UPI) based mobile payment option, WhatsApp Pay. UPI has revolutionized the payment ecosystem in India with the interoperability feature that enables money transfer between different bank accounts. The UPI based ecosystem is dominated by Google Pay and PhonePe with a combined market share of 80%. WhatsApp entered the space with significant challenges in terms of restrictions on number of users and number of transactions. The present case study can be used to discuss the concept of UPIs, third party mobile applications, the digital payments ecosystem in India, and the Digital India Initiative.

INTRODUCTION

On November 5, 2020, WhatsApp the popular messaging app owned by the US-based Facebook Inc., launched its online digital payment services in India[1]. The National Payments Corporation of India (NPCI) had granted approval to WhatsApp to launch its payment services on the Unified Payments Interface (UPI). The UPI payment architecture developed by NPCI enabled transfer of money through third party payment apps. Usually, the third party payment apps enabled transfer of funds through their inbuilt wallet option. This meant that money could be transferred only when the sender and the receiver had the same wallet account. However, the UPI-based transfer system enabled the third party mobile apps to transfer the money using UPI to multiple bank accounts. Within a short span of time, the mobile apps developed on the UPI interface grew highly popular in the online payments ecosystem in India. The mobile payment apps popular in India were Google Pay, PhonePe, and Paytm.

WhatsApp had been testing its online payment system since 2018. Initially, the beta version had been tested on a sample of one million. After a testing period of two years, NPCI had granted approval to WhatsApp Pay to launch its operations in a graded manner. Initially, the payment option on WhatsApp could be offered to 20 million people. NPCI insisted that WhatsApp work in association with multiple banks. WhatsApp decided to offer its online payment system to its users on a first come first served basis, and began working in association with five prominent banks – ICICI Bank, HDFC Bank, Axis Bank, State Bank of India, and Jio Payments Bank.

The UPI payments ecosystem was dominated by Google Pay and PhonePe with a combined share of 80%. The introduction of a UPI-based payment system also disrupted the wallet-based money transfer. The wallet payments were subjected to a small transaction fee, while the UPI based payment option was free.

US Under President Donald Trump: A Protectionist Nation?

G V Muralidhara[*] and Geeta Singh[**]

The case discusses the US economy under President Donald Trump and the decisions taken by him after assuming office. It explores the impact of the policies launched by Trump. Various analysts and economists opined that his policies would lead to making the US a protectionist nation. Many feared that Trump's policies would isolate the country from the rest of the world, which could be harmful for the US and for the world as a whole. There were experts who believed that Trump's policies pointed to the growing wave of protectionism across the globe, which could shrink the size of global trade and economy. There was growing skepticism among analysts of the successful implementation of Trump's policies and plans.

"Since assuming office, Mr. Trump has waged war on intelligence agencies, immigrants from Muslim countries, the federal judiciary, "professional protesters," Barack Obama, Mexico, Australia and, above all, the media, the very "enemy of the people.""[1]

– Tim Wu, Professor, Columbia Law School, 2017

INTRODUCTION

In January 2017, two Iraqi refugees, Hameed Khalid Darweesh and Haider Sameer Abdulkhaleq Alshawi, were detained at New York's John F. Kennedy International Airport. The reason? They belonged to Iraq.[2] Darweesh had worked in Iraq for the US government for 10 years while Alshawi was coming to join his wife who worked for a US contractor. The detention was a result of a ban imposed on seven Muslim-majority countries by the US President Donald Trump (Trump), barring their citizens from entering the US. This travel ban caused chaos and massive protests. Many green-card holders and human rights and activists' groups and organizations filed lawsuits against the travel ban that they alleged was unconstitutional.

The travel ban was one of the many policies introduced by Trump after he became the 45th President of the US in January 2017. Trump ordered a repeal of existing policies like Obamacare, froze regulations which were pending final approval, temporarily suspended premium processing for H-1B visas, etc. He also ordered that a concrete wall be built against neighboring country Mexico.

Trump's policies were met with mixed reactions from analysts and economists from across the world. Some appreciated Trump's initiatives to repeal Obamacare; others were skeptical about the smooth running of these policies. Trump, during the 2016 Presidential election campaigns, had promoted slogans of 'Make America Great Again' and in this direction, he ordered immigration reforms, which he said were being introduced to protect the country and enhance national security. However, major outsourcing and IT companies condemned such

Intel Corporation's European Union Antitrust Case

Debapratim Purkayastha and Hadiya Faheem***

The case discusses the eight-year-long battle between the world's largest semiconductor company, Intel Corporation (Intel) and the European Union (EU). In 2009, the European Commission (EC) had imposed a €1.06 billion fine on Intel for violating the antitrust policies of the EU. The EC alleged that Intel had abused its monopoly in the computer microprocessors market by coercing manufacturers to purchase all their chips from Intel instead of rivals such as Advanced Micro Devices (AMD). After the EC handed down the fine on Intel, in 2014, the chipmaker appealed to the General Court, stating that the fine was huge. However, in June 2014, the General Court upheld the €1.06 billion fine against Intel stating that the penalty was proportionate to Intel's anticompetitive practices. In August 2014, Intel appealed to the Court of Justice of the European Union (CJEU), the EU's top court, to overturn the General Court's decision. In September 2017, the CJEU ruled that the General Court could re-examine the fine against the company.

"This decision is the right one for business, consumers, and E.U. antitrust law and policy. Exclusivity rebates are no longer considered in the E.U. as inherently anticompetitive. The bottom line for Intel is that Intel lives to fight another day."[i]

– Dave Anderson, an antitrust partner in the Brussels office of the law firm, Berwin Leighton Paisner, commenting on the Court of Justice of the European Union's (CJEU) ruling ordering the General Court to reexamine Intel's appeal against EU fine, in September 2017

"It forces the Commission to be as economic in its approach in other cases as it did in Intel. This is encouraging for Qualcomm and Google."[ii]

– Rein Wesseling, a partner at law firm Stibbe, commenting on CJEU's ruling in favor of Intel, in September 2017

In September 2017, the Court of Justice of the European Union (CJEU), the European Union's[1] (EU) top court, ordered the General Court[2] to re-examine the €1.06 billion fine levied on Intel Corporation (Intel), the world's largest semiconductor company.[iii] In 2009, Intel was fined by the European Commission[3] (EC) for alleged anticompetitive practices.

Brazil's Economic Crisis: A Tough Road Ahead

Indu Perepu and Benudhar Sahu***

The case discusses the two-year economic recession (2015-2016) in Brazil which hit Latin America's largest economy hard. The economic crisis and political corruption aggravated the situation in the country, leading to a sharp contraction of the economy in 2015-16. The case discusses the economic and political reasons that led to the crisis in Brazil. The deterioration in Brazil's economic situation led to credit rating agencies' downgrading the recession-hit nation's sovereign debt status to 'junk' with a negative outlook. Despite political instability and degenerating economic conditions in the country, Brazilians remained optimistic that their economy would improve.

INTRODUCTION

In 2016, Brazil's economy shrank by 3.6%, reflecting its worst annual performance since 1981.[1] This followed a full year of recession in 2015 that hit the South American country's economy hard. The economic crisis, coupled with the country's political crisis, contributed to a sharp contraction of the Brazilian economy. Brazil saw a deterioration in its fiscal condition due to the combination of economic stagnation, growing inflation, political instability, public sector incompetency, and a widening budget deficit. Its economic situation had deteriorated to such a degree that credit rating agencies demoted the country's sovereign debt to junk status in 2015 and 2016. Moreover, corruption and the political instability resulted in a significant drop in investor confidence and had a devastating effect on the Brazilian economy. Most investors felt insecure about investing in the country until evidence of its stability surfaced. The biggest challenges for Brazil at this time were identifying and eliminating fraud and corruption. Although these challenges were considerable, Brazilians remained optimistic, expecting the country's economic situation to improve in 2018.

After taking over as President of the country in 2016, Michel Temer (Temer)[2], former Vice President of the country, promised to pull Brazil out of recession and take it into a new future. He passed a law to reel in public spending and proposed some reforms to improve the economy. But like his predecessors, Temer faced allegations of corruption and that led to his growing unpopularity in the country. With his low approval ratings and the opposition within the Congress[3], it would be difficult for Temer to pass the reforms ahead of the presidential election bid in 2018, experts said. Since the country's economic crises were caused by the errant economic policy at home, the road to recovery would be a long one, they observed. Against this backdrop, steering Brazil back to a positive growth trajectory was expected to be an arduous task for Temer.

Govt-RBI Tiff: Is There a Middle Way?

G V Muralidhara and Shwetha Kumari***

The case describes the tiff between India's central bank, the Reserve Bank of India (RBI), and the Indian government over the autonomy of the central bank. India had witnessed innumerable tiffs between the government and the RBI since its establishment in 1935. It then describes the spat between Urjit Patel (Urjit), former governor of the RBI; Viral Acharya, Deputy Governor of the RBI; and Arun Jaitley (Jaitley), Minister of Finance, India. Further the case provides details about the threat of invocation of Section 7 of the RBI Act by the Indian government. Next the case talks about reasons for the rift between the RBI and the government. the two major contentious issues were transfer of surplus reserves and relaxing of norms for weak banks. The case ends with an insight into various steps taken by the two to resolve the issues.

INTRODUCTION

On October 26, 2018, Viral Acharya (Viral), Deputy Governor of the Reserve Bank of India (RBI), India's central bank, brought a dispute between the RBI and the Indian government out into the open when he made a fiery speech at the AD Shroff Memorial[1] Lecture. Viral stated, "What matters is the effective independence with which these powers (vested in the Acts governing the RBI or any central bank) can be exercised in practice." He added, "Governments that do not respect central bank's independence will sooner or later incur the wrath of financial markets, ignite the economic fire and come to rue the day they undermined an important regulatory institution."[2] The speech followed tough posturing by the government, warning that it would invoke the dreaded Section 7 of the RBI Act under which it could hold consultation or issue directions to the RBI.

India had witnessed innumerable rows between the RBI and the government since the RBI was established on April 1, 1935. Of these rows, the Raghuram Rajan-Arun Jaitley and the Chidambaram-D Subbarao war of words had been the most prominent. However, the 2018 spat between Urjit Patel (Urjit), then governor of the RBI, Viral, and India's finance minister Arun Jaitley was unparalleled and it brought out into the open the fractured relationship between the RBI and the government.

The row between Urjit and the government started within a month of his taking over as the RBI governor when in November 2016, the prime minister demonetized the old INR 500 and INR 1000 notes. The RBI had to bear the brunt of the criticism against the botched and delayed execution of re-monetization. However, the real blame game started with the $2

Macy's – On a Quest to Regain Momentum

Indu Perepu[*]

In August 2016, US-based department store retailer Macy's announced that it was closing down 100 of its more than 700 stores. This was in addition to the 40 stores it had closed during the year. This came in the aftermath of six quarters of drop in same store sales, and dwindling profits, amidst a changing environment, growing competition, and changing consumer preferences. In such a scenario, the company announced the closure of stores whose annual net sales was estimated at $1 billion. While a debate was raging about whether closure was the right move, Macy's announced that its CEO who had steered the company for 13 years would step down, and a three-decade company veteran Jeff Gennette (Gennette) would take over as the new CEO. Gennette was inheriting a company facing challenges from all the sides – dwindling sales and share value, falling same store sales, competition, changing customer preferences, an industry that was facing an upheaval, and a legacy that he had to carry forward.

"*Macy's has been so successful for so long with its core format that it blinded them to the ways that consumer shopping behaviors were changing.*"[1]

– Craig Johnson, President, Customer Growth Partners, a Research firm.

HOW TO RE'STORE'?

On August 15, 2016, US-based department store retailer Macy's[2] announced the closure of about 100 of its full-line stores (equal to 14% of its stores). The announcement came after the company declared quarterly sales of $5.86 billion for the second quarter ending July 2016, a drop of 4% compared to the prior-year period. The profits declined from $217 million to $9 million and same store sales fell by 2% from the earlier year quarter. The profit, according to analysts, was not enough to sustain a business of that scale. Earlier, in May 2016, Macy's reported its steepest quarterly sales decline since the Great Recession[3]. *(Refer to Exhibit I for Macy's Quarterly Financial Details).*

The closure of 100 stores was in addition to the 40 stores that had been closed in early 2016. In a statement, the company said, "The closings will allow Macy's to operate fewer stores and concentrate its financial resources and talent on our better-performing locations to elevate their status as preferred shopping destinations."[4] Analysts observing the trend said the company was trying to become nimble in a market that was growing highly competitive amidst the growing clout of online retailers. Citi analyst Paul Lejuez said, "Although this is

India's Loan Waiver Culture: Is It Bad Economics?

G V Muralidhara and Geeta Singh***

The case discusses the culture of debt waiver and relief in India, its history, and implications. In April 2017, the government of Uttar Pradesh, one of India's highly indebted states, waived huge amounts of farmer loans. Following this, farmers in other states started demanding similar waivers, and some states experienced protests and violence. The Indian agriculture sector with its complete dependency on the monsoons, poor and outdated technologies, and negligible development, was facing a tough time. Farmers in parts of the country were burdened by heavy loans which they could not repay. As a result, there were many cases of farmer suicides. While some state governments tried to help the farmers with loan waiver schemes, others took it as an opportunity to achieve electoral gains.

"Higher capital investments in agriculture adequately backed by water and power supplies over a longer period will bring greater economic stability to small and marginal farmers. Any crop loan waiver is not a lasting solution. It helps farmers get rid of debt but doesn't increase his repaying capacity when he goes for his next crop loan. Instead of a one-time crop loan waiver, which will certainly give us political mileage, our policies are to free farmers from the vicious cycle of debt."[1]

– Devendra Fadnavis, Maharashtra Chief Minister, 2017

"Waivers undermine an honest credit culture... It leads to crowding-out of private borrowers as high government borrowing tend to (impose) an increasing cost of borrowing for others. I think we need to create a consensus such that loan waiver promises, otherwise sub-sovereign fiscal challenges in this context could eventually affect national balance sheet."[2]

– Urjit Patel, Governor, Reserve Bank of India, 2017

INTRODUCTION

On June 01, 2017, farmers in two of India's largest states – Madhya Pradesh (MP) and Maharashtra – *(Refer to Exhibit I for Map Of India)* began protests over a wide range of issues concerning their livelihood. Both these states were ruled by the Bharatiya Janata Party (BJP), considered to be a pro-farmer party.[3] Among other things, the farmers in MP were demanding a minimum support price (MSP)[4] for their farm produce.[5] The agitated farmers

Britain After Brexit: An Uncertain Future Ahead

G V Muralidhara[*] and Geeta Singh[**]

The case discusses Britain's exit from the European Union (Brexit) and its impact on Britain and the EU. The case explains the two aspects of the referendum and the final result when Britons voted to exit the EU. Brexit was expected to affect various sectors of Britain including trade, manufacturing, FDI, immigration, and financial services. Analysts feared that Brexit might lead to disintegration of the EU in the long run. Further, post Brexit, the EU and Britain, would be entering into new agreements whose terms and conditions were yet to be decided. It remained to be seen how well Britain would perform after exiting the bloc and how member countries of EU would cope with Brexit. Only the coming years would reveal how well Britain and the EU would handle the challenges facing them post Brexit. The case poses the question whether Brexit signaled a move by countries toward protectionism and away from globalization.

"We are living through an important moment in our country's history. Following the referendum, we face a time of great national change. And I know because we're Great Britain, that we will rise to the challenge. As we leave the European Union, we will forge a bold new positive role for ourselves in the world, and we will make Britain a country that works not for a privileged few, but for every one of us. That will be the mission of the government I lead, and together we will build a better Britain."[i]

– Theresa May, Prime Minister, the United Kingdom, 2016

INTRODUCTION

In October 2016, the major economic indicators of Britain's economy performed worse than expected while losing momentum with the weaker pound and higher inflation. All the sectors of the economy were affected. On June 23, 2016, the people of Britain voted to exit the EU with the "Leave" side winning by 52% to 48%, making the nation the first country to separate itself from the Union.

The referendum was not a one-day process but a culmination of several years of disagreement and criticism by the people of Britain to push the government to go in for voting to decide on exiting the EU. Though the results came as a shock to many Britons, there was no reversal of the decision. Soon after the referendum result was out, the then Prime Minister, David Cameron, stepped down from his position. This sent shockwaves through the country's political system and its economy. On the one hand, all sectors of Britain from trade and manufacturing, financial services, to foreign direct investment were affected by the country's decision to leave the EU. On the other, member countries of the bloc were trying to understand the probable consequences of Britain's exit.

Analysts, experts, and economists from across the world remained divided on how Britain's exit would impact the country and the EU. While some believed that it was a fresh move for the UK to regain its waning hold on the world market, others opined that the country would soon be entering into a recession or a near recession phase. Likewise, the impact of Britain

Cannabis Glut in Canada

Indu Perepu and Benudhar Sahu***

The case is about the cannabis glut in Canada that led to a price drop and excess supply after the drug was legalized in the country for recreational use in 2018. By July 2019, only 4% of the total cannabis inventory had been sold in the country, raising concerns of oversupply. Further, the cannabis companies had more unfinished products than finished products in their inventories. An oversupply of cannabis in the country led to a dramatic price drop. Oversupply and cash crunch issues forced many of the Canadian cannabis producers to report a profit decline, and some filed for bankruptcy protection. The case discusses how the legal cannabis market in Canada is still maturing, highlighting the trial- and- error dynamic of moving to a market equilibrium.

INTRODUCTION

In May 2020, the Canadian Imperial Bank of Commerce[1] (CIBC) slashed projections for Canada's recreational cannabis market for 2020 by 26% to C$2.5 billion, down from the earlier estimation of C$3.4 billion[2] due to the COVID-19[3] pandemic. Since Canada had legalized cannabis for recreational use in October 2018, the industry had been plagued by supply issues and high prices due to government regulations, tax burden, and a compilation of complex security requirements that made the black market more attractive to price-conscious consumers. While cannabis sales increased after legalization, the inventory continued to grow much faster, resulting in a supply glut. As of March 2019, around 80% of Canada's cannabis inventory was unfinished – meaning that the raw cannabis product remained unprocessed, and so could not be packaged and made ready to sell.[4] Only 4% of the cannabis products produced in Canada were sold in July 2019; the rest were stored in warehouses.[5] Overproduction and competition with the illicit market impacted cannabis prices.

Rising stockpiles forced licensed producers to slash their per-gram prices in an attempt to compete more effectively with the black market. For the first time since legalization, the average price of legal cannabis fell 5% to C$10.12 per gram in the third quarter of 2019 from C$10.65 per gram in the previous quarter.[6] Later, legal cannabis prices in Canada soared due to the limited volume of finished products, while the price in the black market was

FDI in India: Single-Brand and Multi-Brand Retail

G V Muralidhara and Sonali Nagpal***

The case discusses the Foreign Direct Investment (FDI) reforms in the Retail sector in India. In 2015, changes made in the retail sector aimed at further relaxing and simplifying the process of foreign investment in the country. It talks about the history of FDI in retail, followed by the first change in the retail sector in 1997, when FDI up to 100% was allowed under the government route in cash and carry (wholesale) trade. The impact of the change was positive and led to a series of reforms over the years. The FDI changes in 2012 in single brand and multi-brand were termed as major changes in the retail industry. These reforms led to a transition in the retail industry in India. While the 1990s were dominated by mom-and-pop stores, various international brands like Gap, Zara, Fendi, Giorgio Armani, Versace, DKNY, Diesel, etc. had established a presence in the country by 2016.

"The government's decision on liberalizing FDI policy is a welcome step and is part of improving ease of doing business." [1]

– Shaktikanta Das, Secretary, Department of Economic Affairs, November 2015

INTRODUCTION

On November 10, 2015, the Narendra Modi[2]-led NDA[3] Government announced 'Big Bang Reforms' that eased Foreign Direct Investment (FDI) norms across 15 sectors [4] in India. The changes in various sectors aimed at further relaxing and simplifying the process of foreign investment in the country. The Retail Sector, one of the 15 sectors, accounted for over 10 per cent[5] of the country's Gross Domestic Product (GDP) and around 8 per cent[6] of the employment in India's economy as of 2015.

During the 1950s, post independence, when India's economy was agrarian in nature and industrial development was in the nascent stages, the economy depended on external sources of finance and foreign capital was encouraged, though with caution, by the government, The most important change in the FDI policy happened during the 1990s when the government announced liberalization, privatization, and globalization reforms. The reforms allowed

Tejas Express: Indian Railways' Leap Towards Privatization?

Namratha V Prasad and Koti Vinod Babu***

The case discusses in detail the decision of the public sector undertaking, Indian Railways (IR), to go in for a limited form of privatization by allowing another entity to operate one of its premier trains, the Tejas Express (TE), between New Delhi and Lucknow. While IR remained in charge of the physical infrastructure, the services aspect was given over to its wholly-held subsidiary, The Indian Railway Catering and Tourism Corporation (IRCTC). The case ends with the question of whether it is possible to successfully privatize the largest public service in a vast country like India and what the repercussions of such a move are likely to be.

"[The government's plan] is something which can be done only in stages. What was being done on an experimental basis was the right way to go about it. The most complicated aspect is how they [private players] will use the railway tracks to run trains without interfering in the current state of affairs."[1]

– Madan Sabnavis, the Chief Economist of CARE Ratings[2], in November 2019

"So, in four to five years, we will be able to run trains according to demand. There will be no waiting lists. But that will also mean that a large number of new trains will be required. The role of the private trains comes in here."[3]

– Vinod Kumar Yadav, Chairman of Indian Railway Board, in September 2019

INTRODUCTION

In October 2019, the Indian Railway Catering and Tourism Corporation (IRCTC), a subsidiary of Indian Railways (IR), announced that a premier private train called the Tejas Express (TE) that it operated between New Delhi and Lucknow had made a profit of around Rs[4].7 million and revenue of nearly Rs.37 million through ticket sales, in the first month of its operations.[5]

The TE group of fully air-conditioned trains were India's first semi-high speed trains and were introduced in 2017. 'Tejas' meant 'sharp' and 'brilliance' in many Indian languages.

Lakshadweep's COVID-19 Controlling Strategy – 'Zero Cases Out of Million'

Indu Perepu and Nagendra Kumar MV***

It was in mid-July 2020 that the devastating effects of the COVID-19 virus were being felt across the world and in India, affecting a large number of people. Almost every state and union territory in India was affected by the spread of virus, with hundreds of deaths being reported every day. In such a situation, one territory under the administration of the Indian Government, Lakshadweep Islands (Islands), was unique. The islands reported zero COVID-19 cases, even as cases in the rest of the country had reached one million. Though the Islands had certain geographical advantages compared to the other territories, what made Lakshadweep achieve such a feat was the steps followed by the administration of the Islands in designing and implementing its strategy by assessing the strengths and weaknesses in the Islands, and coming up with strategies to control the spread of virus.

INTRODUCTION

Lakshadweep Islands (Islands), an archipelago of 36 islands situated off the south western coast of India, at a distance of 220 km to 440 km from Kerala (a state in India) in the Arabian Sea *(Refer to **Exhibit-I** for the Geographical Location of Lakshadweep Islands),* achieved the remarkable feat of being COVID-19[1] free during the third of week of July, 2020 even as the rest of India and the world at large were witnessing the devastating effects of the pandemic. At a time when India was recording hundreds of thousands of positive COVID-19 cases every day, and every state and union territory was recording an increasing number of cases, the Islands recorded zero cases.

In the second week of July 2020, the administration of the Islands sent a letter to the Union Home ministry requesting permission to begin the academic year on the Islands. This was stark contrast to the rest of India *"as all the other states were in a dilemma whether to re-open the schools and colleges"*. Experts noted that the move to reopen schools exhibited the confidence that the administration had in the measures it had taken to control the spread of the virus.

The administration took simple and timely measures suited to the local conditions and the geographical factors (not being connected to the rest of the country) and these helped in it being free of COVID-19.

BACKGROUND

The traces of the COVID-19 virus were first identified in Wuhan City in the Hubei Province of China in mid week of December 2019. It was officially communicated to the China office of the World Health Organization (WHO) on December 31, 2020, that cases with pneumonia like symptoms had been detected among 44 people and that 11 of them were critical and 33 patients were stable. The health officials reported that the reason for the cases was yet to be detected. Officials of the WHO closely monitored the situation and issued a technical note on

India's Surrogacy Bill: Whose Womb Is It Anyway?

G V Muralidhara[*] and Geeta Singh[**]

The case discusses the Surrogacy (Regulation) Bill 2016 of India passed by the Union Cabinet in August 2016. The bill had several provisions which aimed at putting an end to the perceived exploitation of women belonging to the poorer sections in the country who had been forced to become surrogates. Another main objective of the proposed law was to protect the rights of surrogate mothers and the children born out of surrogacy. The Surrogacy Bill allowed only married heterosexual couples to have a child through surrogacy, while restricting the number of surrogate children they could have to one. It barred singles, homosexual couples, widows and NRIs from opting for surrogacy. Though the bill intended to safeguard poor women, it did not touch on many important issues which required immediate attention from the Government of India. Analysts, doctors, and industry experts from across the country believed that the Indian surrogacy industry was booming and needed regulation. However, by banning commercial surrogacy, the bill took away a major source of livelihood of many women, while dashing the last hopes of many infertile couples in India and abroad to have children.

"This (bill) is an attempt to stop commercial surrogacy. It has been approved by the Cabinet. It will now go to the Parliamentary Standing Committee. Interactions will take place and suggestions will come to the government. We will take note of them.... Proven exploitation (of women) has been there, children have been abandoned and there was no regulation. We have tried to come out in that direction."[i]

– J P Nadda, Union Health Minister, India, 2016

"Regulations are important. But surrogate mothers often come from a strata of society where they can neither go to another person's house to do dishes nor stand in a red light area. For such women, surrogacy is a means to earn a livelihood ... I think it should be made commercial, but with very tight regulations. Middlemen should be removed but the surrogate mother must be paid a compensation."[ii]

– Dr Abha Majumdar, Obstetrics and Gynaecology, 2016

INTRODUCTION

From a woman expecting a baby for a US-based NRI family to another waiting to deliver twins for an Indian couple and to many other women in different stages of pregnancy, the surrogacy bill passed by the Union Cabinet of India in August 2016 came as a massive shock.[iii] The proposed new law on surrogacy would push many such women into a legal grey zone.

Managing COVID-19: The Kerala Model

Sanjib Dutta and Anil Anirudhan***

The case is about the Government of Kerala's (GoK) fight against the novel Coronavirus disease (Covid-19). In January 2020, Kerala became the first state in India to be affected by the Covid-19 disease. The Kerala model is discussed in detail and provides an insight into the working and effectiveness of the crisis management undertaken by the GoK. The Kerala model received accolades both at the national and international level and many other states in India were poised to implement the model. The case ends with the future plans of the GoK and its efforts to bring normalcy back to the state.

"What matters most is what we do. You can't win a football game only by defending. You have to attack as well. Asking people to stay home and other physical distancing measures are important to slow down the spread of the Corona virus and buy time, but they are defensive measures. To win, we need to attack the Corona virus with aggressive and targeted tactics – testing every suspected COVID19 case, isolating and caring for every confirmed case, and tracing and quarantining every close contact"[1]

– Tedros Adhanom Ghebreyesus, Director General, World Health Organization, in March 2020

"Fighting an epidemic like corona requires scientific temper, humanism and a spirit for inquiry and reform. Superstition, credulity, emotionalism and irrationalism will derail the whole process by dispiriting and discouraging the experts and health activists who try hard to resolve the threat scientifically. In Kerala, we have initiated stringent police action against those who attempted to spread stupidity in the face of virus scare. That was among the main reasons why Kerala made some early advantages in checking the spreading of the virus."[2]

– KK Shailaja, Minister for Health and Social Justice, Government of Kerala, in March 2020

"If the curve stays flat, Kerala will be a shining example for the world in managing Covid. Tired of reading about S. Korea and other examples of how to manage the pandemic"[3]

– Anand Mahindra, Chairman, Mahindra Group, in April 2020

INTRODUCTION

On April 13, 2020, the Finance Minister of Kerala, a state in the southern part of India, stated that the number of active cases of the novel Coronavirus disease (Covid-19) had begun to decline, indicating a flattening of the state's Covid-19 curve. With three cases in February

Spotify – Price Discrimination

Indu Perepu and Benudhar Sahu***

The case is about the price discrimination strategy followed by Sweden-based music streaming platform service, Spotify Technology S.A. (Spotify). The online platform offered digital audio content and allowed users to search for an artist and listen to music, create playlists, and share them with others. Customers could access Spotify's library of millions of songs by signing up with the platform for free. Spotify adopted a freemium pricing model where it offered basic functionality for free, but charged for product- specific benefits. While Spotify was a free streaming service, consumers needed to pay for additional features such as advertisement-free streaming and offline music downloads. This has become a dominant business model to acquire and retain users on the platform.

INTRODUCTION

At the end of 2019, Swedish audio streaming company Spotify Technology S.A. (Spotify) reported 271 million monthly active users worldwide, up 31% year-over-year.[1] Spotify, a software program, allowed users to download and stream a huge selection of music on their computers at home. It worked through a large collection of music, millions of tracks that users could search for and play using the free Spotify software. The company's revenue streams included its paid subscriptions, advertisements, and downloads. Spotify's freemium model[2] with a free version of its streaming service, it persuaded a majority of its users to subscribe to the platform. At the same time, it attracted users through its paid subscription Spotify Premium that removed the play time limit as well as the ads that came with its free version. In 2014, Spotify launched the family version of the premium plans to enable account sharing among family members. At the same time, the company introduced a discounted premium subscription program for students. It offered ad-free and offline listening to students for $4.99 a month. The discount could be used by the students for twelve months at a time and they could reapply the offer each year for a total of three renewals.

Spotify used several pricing strategies to bring as many consumers as possible onto its platform. It believed that its pricing plan could benefit the company by offering a bundle of accounts to different types of consumers. Spotify's prices differed across countries. Also, the prices it charged differed for different consumers depending on the features offered in the subscription plan. While Spotify's differential pricing seemed justified, it needed to work out monetization strategies taking into account its increasing sales and marketing costs, analysts said. Given its market position in the music streaming world, the company would have to follow a cautious growth strategy in addition to a pricing strategy to sustain its growth, they said.

Sterlite Copper Plant Shutdown – Protecting Environment vs. Generating Employment

KBS Kumar, Sanjib Dutta** and Anil Anirudhan****

The case explains the events that led to the closure of the Sterlite Copper (Sterlite) plant in Thoothukudi in the Indian state of Tamil Nadu. Massive protests by anti-Sterlite activists against the alleged environmental hazards caused by the Sterlite plant culminated in the death of 10 people in police firing and eventually led to the Tamil Nadu state government shutting down the Sterlite plant. The case highlights the flouting of environmental rules and regulations by Sterlite. The impact of the environmental pollution caused by the Sterlite plant on air, water, and land is explained with the help of various reports and studies conducted by environmental agencies. The case also points to the fact that Sterlite was contributing to the development of the area by generating employment opportunities and providing a livelihood to thousands of people.

"Every industry, small or big, has faced the wrath of activists in some way or the other. In the past too, other companies like Tata, Maruti, and Hindalco have faced such events. Unfortunately, misinformation spread by vested interests gets taken on the face value by the public at large, leading to such incidents."[1]

– Anil Agarwal, Founder and Chairman, Vedanta Limited, in May 2018

"The martyrs have done it. We have set an example to the rest of the country of how we can drive out the corporates who are here in the name of development, but minting money at the expense of our lives and livelihood. We have written history."[2]

– Fatima Babu, Leader, Anti-Sterlite Movement, in May 2018

INTRODUCTION

On May 22, 2018, Sterlite Copper (Sterlite), the copper manufacturing plant of Vedanta Limited in Thoothukudi in the Indian state of Tamil Nadu, was shaken by a massive protest. The protestors, who maintained that the copper plant was polluting the environment, were livid over the proposed expansion of the plant's second unit, which was expected to double production capacity per year.

The massive gathering of over 200,000 protestors was the culmination of 100 days of protest against the proposed expansion. The local administration took steps like imposing Section

Venezuela: Reeling Under Hyperinflation

Manisha Singh and G V Muralidhara***

On December 3, 2016, Venezuela, once Latin America's richest country, entered the record book of historical events to become the 57th country in the economic history of the world to have experienced hyper-inflation. Its central bank reported the highest-on-record inflation of 180 per cent and 240 per cent in 2015 and 2016 respectively. The country was facing the world's worst ever economic disaster. The citizens were suffering from food shortages, hunger, death due to lack of medicines, and escalating homicide rates, which were turning the nation into the second most violent country in the world outside of open war. None of the steps taken by the government headed by President Nicolás Maduro to control inflation, like implementing price control or fixing currency exchange rates, were effective in improving the situation. It remained to be seen how Venezuela would come out of this economic crisis.

"The country is facing an unprecedented economic collapse, caused by political mismanagement exacerbated by low oil prices"

– Jean-Philippe Pourcelot, Venezuela economist, Focus Economics, in 2017[1]

INTRODUCTION

On December 3, 2016, Venezuela, once Latin America's richest country, entered the record book[2] of historical events to become the 57th country in the economic history of the world to have experienced hyper-inflation[3]. Its central bank reported the highest-on-record inflation of 180% and 240% in 2015 and 2016 respectively[4]. The country was facing the world's worst ever economic disaster. The citizens were suffering from food shortages, hunger, death due to lack of medicines, and escalating homicide rates[5], which were turning the nation into the second most violent country in the world outside of open war. There was no sign of improvement in the year 2017 either; in fact, it was worse than 2016. The opposition party (Congress) in Venezuela claimed that the inflation level had risen further to almost 800% between the end of 2016 and the beginning of the year 2017[6]. According to IMF projections,

Rythu Bandhu Scheme – A Welfare Program to Support Farm Investment in Telangana State of India

Sanjib Dutta and Anil Anirudhan***

The case is about the Rythu Bandhu Scheme (RBS) launched by the Telangana State Government (TSG) in India. RBS, a scheme providing financial support to farmers, and the Rythu Bhima Scheme, an insurance scheme for farmers, were selected for presentation at the international seminar at the Food and Agricultural Organization's headquarters in Rome in 2018. The case explains the features of the RBS and the mode of implementation. The main objectives of the scheme were to increase agriculture production and protect farmers from private money lenders. Even though the scheme benefitted most of the farmers, tenant farmers were left out of the benefits of RBS. The question is, does continuation of the RBS lead to an increase in agriculture production and help the farmers in overcoming agrarian distress?

"Farmers every year face lot of difficulties and hardships to mobilize investment for agriculture. If for any reason they fail to get proper crop, then they lose all the investment. This pushes them to financial troubles. To overcome all these problems the Government has decided to give them investment support."[1]

– K Chandrashekhar Rao, Chief Minister, Telangana State, India –in April 2018

"Rythu Bandhu Scheme at the cost of state exchequer is benefitting landlords who have large land parcels in acres and travel in SUVs to receive cheque. The money should reach people/farmers who need it."[2]

– Krishank, Spokesperson, Telangana Congress Party, India –in July 2018

INTRODUCTION

On November 18, 2018, the Telangana State Government (TSG) announced that its two innovative farmer welfare schemes, the Rythu Bandhu Scheme (RBS) and the Rythu Bhima Scheme (Insurance Scheme) had been selected for a presentation at the international seminar of the Food and Agricultural Organization (FAO) held on November 21-22, 2018, at its headquarters in Rome[3] *(Refer to **Figure I (a)** for RBS and **figure I (b)** for RBS Insurance Scheme logos).* The seminar titled "International Symposium on Agricultural Innovation for Family Farmers" was organized under the aegis of the FAO of the United Nations Organization, and featured 20 success stories in agricultural innovation across the world *(Refer to **Exhibit I** for Objectives of Rythu Bandhu Scheme).*

The Mundra Project: Tata Power's Mega Headache

Manish Agarwal and Geeta Singh***

This case is about the challenges faced by the Tata Power due to Tata Mundra Project, a coal-based power plant project, in India. Mundra project was set up with the objective of providing low-cost electricity across the country. Tata Power was well-known for its ethical stance and corporate social responsibility, but it faced unprecedented challenges regarding its Mundra project. The project soon came to the verge of shut down, faced with criticism on economic, social and environmental fronts.

"Tata bills itself as a company that takes care of people, but this power project has caused such massive damage to the community's health and livelihood that their public image has come into question. If this is the most ethical corporation in the country and the negative impacts are so bad, imagine how much worse plants from other companies are."[i]

– Soumya Dutta, National Convener of Bharat Jan Vigyan Jatha

INTRODUCTION

In April 2017, India's apex court, the Supreme Court, ruled that Coastal Gujarat Power Limited (CGPL), a key subsidiary of Tata Power Company Limited (Tata Power), could not charge compensatory tariffs from consumers. The ruling nullified earlier orders of the Appellate Tribunal for Electricity (APTEL) and the Central Electricity Regulatory Commission (CERC). The Supreme Court verdict came as a shock to Anil Sardana (Sardana), the then Managing Director of Tata Power who was already dealing with the huge accumulated loss of more than Rs.60 billion in the company's popular Ultra Mega Power project - Mundra project.

Setup with the objective of providing low-cost electricity across the country, Tata Mundra Project soon came on the verge of shut down. After the Supreme Court verdict, Sardana found himself left with only a few options – to appeal to the Supreme Court to reconsider its decision, to sell 51%[1] stake in CGPL for just Rs.1 to one of the largest procurers of power and retaina 49% stake to operate the plant under the Operation & Management (O&M) contract, or to renegotiate with electricity procurers on the tariff, and last, he could forget the equity investment in the project and hand the project over to the lenders. Analysts were concerned about the long-term viability of the project; they believed that Mundra project was failing to sustain itself and it needed immediate rescue.

ELECTRICITY PROBLEM IN INDIA

In 2015-16, India became the fastest growing economy in the world with GDP growing at 7.6%. However, this growth rate was based on infrastructure that was unreliable and insufficient because of less than the required investment in it. The power sector was one of the key components for the growth of any country. By the end of July 2017, India had the third largest power generation capacity with a total installed capacity of 330,153.65 Megawatt [MW] and the fourth largest number of electricity consumers in the world.[ii] However, per capita power consumption was just 1,075 kWh–the lowest among the BRICS

New Equilibrium Price of Eggs in US

Indu Perepu and Benudhar Sahu***

The case is about the new equilibrium price of eggs in the US in 2019. The 2015 outbreak of avian influenza caused a shortage of eggs in the country, leading to record high egg prices. But the high prices did not sustain for long and plunged in 2016 and 2017. The poultry industry saw some moderate recovery in egg prices in 2018, before they fell again in November 2018. The fall continued during the year 2019 with egg prices falling so low that they did not even cover the cost of production. The lower price was a reflection of the oversupply conditions prevailing in the US egg market since early 2018. The absence of a trade agreement between the US and other countries for the export of eggs and a global egg glut further aggravated the situation, creating the possibility of more price volatility issues in the coming years. The question is, will the egg prices fall further due to excess supply? Also, where are the declining egg prices headed? Is there a possibility of price recovery as the demand for eggs remains strong?

INTRODUCTION

In October 2019, the average retail price for a dozen "regular" eggs in the US was $1.12, down 11.6% from a year earlier, when it was $1.25. The demand for eggs in the US had grown over a number of years except in 2015, when there was an outbreak of the highly pathogenic avian influenza[1] (HPAI) that took the lives of about 12% of the US table-egg[2] laying birds due to disease and culling.[3] With the huge disruption in the market caused by the HPAI outbreak, the prices of eggs in the market soared. After that, the US egg industry started increasing production, leading to egg prices stabilizing in the country. However, the egg prices saw some recovery in 2018 along with high demand and sale of table-eggs due to the changing retail scenario in the country. Supermarket retailers started selling eggs in their stores to increase foot traffic. Higher demand also increased egg production in the country. With the steady expansion of egg production, the supply of eggs outpaced demand and this impacted the egg prices. This trend continued in 2019. Egg prices dropped to below the cost of production around April 2019.[4]

The US egg industry was faced with oversupply. With production and supply of eggs in the country exceeding demand, there was a steep fall in prices. To take advantage of the market demand for cage-free eggs,[5] many farmers went in for rearing cage-free birds in 2019. This resulted in the production of cage-free eggs exceeding demand, leading to the eggs having to be sold at a loss. At the same time, conventional eggs were also selling at a low price, leading to a situation where the market was flooded with eggs. Some analysts said the

Managing COVID-19: The Odisha Model

Sanjib Dutta and Smita Ray***

The case talks about the Government of Odisha's (GoO) management of the crisis arising out of the COVID-19 pandemic. The case starts out with a look at the GoO management of earlier disasters and the lessons learnt which stood it in good stead during the COVID-19 crisis. Odisha's crisis management model during the COVID-19 pandemic included use of IT, strict social distancing, setting up of exclusive COVID hospitals, ensuring community participation, and focusing on the livelihood of the people. All these measures helped the state to contain the spread of the virus. The case also talks about the challenges ahead for the Government such as inward migration, which might lead to a spike in COVID-19 positive cases in future.

"We are faced with a threat that does not discriminate between developed and under developed countries, democratic and non-democratic countries. Rich and poor societies are equally vulnerable. The experience of China, Singapore and Italy has given us a learning on what to do and what not to do. I must confess the entire world is on a learning curve about handling this disaster."

– Naveen Patnaik, Chief Minister of Odisha, in 2020[1]

"One of the things that are different about Odisha government tackling COVID-19 is the discipline because of the long political stability."

– Subroto Bagchi, Odisha's Chief Spokesperson on COVID-19, in 2020[2]

INTRODUCTION

By May 15, 2020, the state of Odisha (formerly Orissa) in eastern India had reported 611 COVID-19 positive cases, far lower than the number of cases in its bordering states, West Bengal and Andhra Pradesh. Odisha also had just 3 deaths due to the virus compared to 215 in West Bengal and 48 in Andhra Pradesh *(Refer to **Exhibit I**)*. The doubling rate of COVID -19 positive cases in Odisha was more than 30 days, a parameter on which it performed better than other states. Odisha's efficient management of the crisis won it appreciation from the Government of India (GoI).

Exhibit I

COVID – 19 Cases in Odisha vs. Neighboring States

State/UT	Confirmed Cases	Recovered	Deceased
Odisha	611	158	3
West Bengal	2377	768	215
Andhra Pradesh	2205	1192	48

Shift in Global Steel Demand: Impact on ArcelorMittal

Indu Perepu and Benudhar Sahu***

The case is about the world's leading integrated steel and mining company, Luxembourg-based ArcelorMittal's troubles amid a shift in global steel demand. The year 2019 was challenging for the global steel industry as it affected steel production across the world (except in China). Steel demand in the rest of the world contracted due to slumping demand from automakers, slow global economic growth, trade tensions, and geopolitical issues across the world. Lower steel prices and higher raw material costs affected the global steelmaker ArcelorMittal in terms of its profitability. The company saw a fall in steel demand in its core markets such as the US and Europe, driven by macro headwinds, including depressed manufacturing activity and continued weakness in the automotive industry.

INTRODUCTION

On February 6, 2020, Luxembourg-based multinational steel manufacturing corporation ArcelorMittal S.A (ArcelorMittal) registered an increase of 10%[1] in its share price after reporting that its net debt had fallen to $9.3 billion in 2019[2], thus presenting an optimistic outlook for steel demand in 2020. Since 2006, the global steel giant had grown rapidly through consolidation with a number of significant acquisitions, and become the world's largest steel and mining company. Apart from concentrating on becoming a supplier of quality steel products in all major markets, ArcelorMittal also put considerable emphasis on growing its mining business.

Following two years of strong growth in 2017 and 2018, the global steel industry entered a slowdown in 2019. For the year 2019, while global steel production increased 3.4% year-over–year to reach 1,869.9 million metric tons, steel demand fell all over the world, except in China *(See **Exhibit I** for Annual Crude Steel Production)*. In the rest of the world, steel demand dropped due to uncertainty, trade tensions, and geopolitical issues that had repercussions on investment and trade.[3] Moreover, the poor performance of the manufacturing sector, particularly the auto industry, had brought down the demand for steel in many countries. ArcelorMittal also bore the brunt of the challenging environment the sector found itself in.

The market conditions in the first half of 2019 were tough, and ArcelorMittal's profitability suffered due to lower steel prices and higher raw material costs. After reporting a net loss of $539 million for the third quarter of 2019 – its second consecutive quarterly loss in the year – the steelmaker cut its forecasts for steel demand in the US and Europe, its main markets. It said that contraction in steel demand in Europe would continue due to the sluggish auto sector and slowing construction. During the fourth quarter of 2019, market conditions remained challenging, leading to a slump in the company's sales revenue by 15.34% year-over-year and a widening of its net loss *(See **Exhibit II** for ArcelorMittal's Financial Highlights)*. For the year 2019, the company reported a net loss of $2.5 billion as against a profit of $5.1 billion the previous year. ArcelorMittal was optimistic about its growth and expected the global demand for steel to grow in its core markets in 2020, according to its

Application of Margin Trading Rules: A Dispute at National Stock Exchange♦

B Brahmaiah and G V Muralidhara***

This case discusses a dispute relating to a transaction between a client and a trading member of the National Stock Exchange, India (NSE). The client had filed an appeal on the quantum of award passed by the arbitration panel for consideration by the appellate tribunal of the NSE. The Appellate Tribunal had to determine whether there had been any lapses on the part of the arbitrators in applying the margin trading rules of the exchange while analyzing the matter, determining the case and passing the award. Based on that, it had to decide whether to set aside the award passed by the arbitration panel or uphold it. The issue before the panel of arbitrators was whether or not to entertain the claim of the client about application of margin trading rules of NSE appropriately by the arbitration panel while determining the quantum of award.

INTRODUCTION

On May 15, 2016, Nature Investments (Nature) filed an application with the Appellate Tribunal of the National Stock Exchange (NSE) *(see Exhibit-I),* Hyderabad Regional Center seeking a review of the award passed by the panel of arbitrators on Nature's claim against Perfect Stock Brokers Pvt Ltd (Perfect). Nature, a Hyderabad based partnership firm involved in trading and investments in securities, claimed Rs.7,456, from Perfect as against the award of Rs.1,230,231 passed by the panel of arbitrators. The claim was with reference to a disputed transaction unilaterally carried out by Perfect on the National Stock Exchange (NSE).

Perfect was a registered trading member with the NSE, the leading stock exchange in India. Incorporated under the Companies Act, 1956, it was one of the leading stock broking companies in India. Perfect had evolved from a standalone brokerage firm into a multiproduct and service company over a period of 50 years. It provided a comprehensive gamut of financial advisory services to institutional and individual clients. With a team of dedicated experts and a nationwide distribution network of branches, franchisees, and associates, the range of services it offered included broking, investment banking, corporate advisory and portfolio management services.

Nature contended that the award passed by the arbitration panel did not take into account the margin trading rules of NSE appropriately while determining the quantum of award. The panel of arbitrators had passed the award on the doctrine of Estoppel[1] ignoring margin trading guidelines and collaterals, it said.

♦ This case study is developed based on an actual arbitration case at NSE. However the names of entities and individuals have been changed.

* Professor, Department of Finance, IBS Hyderabad (Under IFHE – A Deemed to be University u/s 3 of the UGC Act 1956), Hyderabad, Telangana, India. E-mail: brahmaiahb@ibsindia.org

** Director, IBS Bangalore (Off Campus of IFHE), Karnataka, India. E-mail: muralidharagv@ibsindia.org

[1] Estoppel is a legal principle that prevents a party from denying or alleging certain factors owing to that party's previous conduct, allegation or denial. The rationale behind Estoppel is to prevent injustice owing to inconsistency.

BCCI's Tryst with Article 12: The IPL Saga

G V Muralidhara and Sanu Rani Paul***

After liberalization, especially with the coming of IPL, BCCI emerged as the single largest and richest sporting body in India as well as in the world. It controls the game of cricket associations in India at all the levels and also makes rules and regulations touching entire aspects of the game of cricket in India. Despite this, there are meager checks on the BCCI, and it has led to corruption and it eventually tainted the reputation of the game of cricket in India. Several appointments and award of franchise for IPL were done in an arbitrary manner. The funds to various state governments were also given in a discriminatory manner.

INTRODUCTION

On January 22, 2015, the Supreme Court of India, in its decision on an appeal filed by the Board of Cricket Control in India (BCCI) against an order given by the High Court of Bombay, said while BCCI did not come under of ambit of 'State' under Article 12 of the Constitution,[1] it did fall within the purview of Article 226.[2] The appeal arose out of a Public Interest Litigation (PIL) filed by the Cricket Association of Bihar (CAB) before the High Court of Bombay. While considering the Public Interest Litigation on July 30, 2013, the Court had ruled out the possibility of bringing the BCCI within the purview of Article 12 in a PIL filed under Article 32.[3] The decision given by the Supreme Court was viewed by legal circles as a laudable one since it recognized the public functions performed by the Board. However, it also attracted criticism for having narrowed down the scope of 'State' under Article 12 of the Constitution. A body brought under the purview of 'State' was bound to comply with the fundamental rights given under Part III of the Constitution of India.

BCCI was formed in December 1928 as an unregistered association and in the year 1940, it was registered under the Societies Registration Act of 1860. Later, with the enactment of the Tamil Nadu Registration Act, 1975, BCCI came to be registered under the Tamil Nadu Societies
Registration Act. Internationally and nationally, the wide popularity of the game of cricket

1 Article 12 defines 'State' for the purpose of enforcement of fundamental rights under Part III of the Constitution as "in this part, unless the context otherwise requires, the State includes the government and the parliament of India and the Government and the Legislatures of each of the States and all local or other authorities within the territory of India and under the control of the Government of India."

2 Article 226 Power of the High Courts to issue certain writs: (1) Notwithstanding anything in Article 32 every High Court shall have the powers, throughout the territories in relation to which it exercises jurisdiction, to issue any person or authority, including in appropriate cases, any Government, within those territories directions, orders or writs, including writs in the nature of *habeus corpus*, *mandamus*, prohibition, *quo warranto* and *certiorari*, or any of them, for the enforcement of any of the rights conferred by Part III and for any other purpose.

3 Article 32 Remedies for the Enforcement of Rights conferred by this Part: (1) The right to move Supreme Court by appropriate proceedings for the enforcement of the rights conferred by this Part is guaranteed (2) The Supreme Court shall have power to issue directions or orders or writs, including writs in the nature of *habeus corpus*, *mandamus*, prohibition, *quo warranto* and *certiorari*, whichever may be appropriate, for the enforcement of any of the rights conferred by this Part.

US-India Solar Trade Dispute

G V Muralidhara and Hadiya Faheem***

The case discusses the solar dispute between the US and India. It was reported that in 2010 India had launched the Jawaharlal Nehru National Solar Mission (JNNSM) – the national solar power program in India– under which the country aimed to produce 20,000 megawatts (MW) of solar power by 2022. Since India did not have the capacity to manufacture the required equipment, it had to source solar equipment from other countries. However, in February 2013, the US filed a complaint with the World Trade Organization (WTO) dispute panel stating that India's domestic country requirements (DCR) accorded less favorable treatment to imported solar modules and cells. In February 2014, the US filed another case against India when it began Phase II of the JNNSM emphasizing on DCR. The US stated that India had violated Article III: 4 of the General Agreement on Tariffs and Trade (GATT) by not giving national treatment to imported products. In addition to this, the US also stated that India had violated the WTO agreement on Trade-Related Investment Measures (TRIMs), which prohibited the imposition of local content requirements.

"The United States strongly supports the rapid deployment of solar energy around the world – including in India. But discriminatory policies in the clean energy space in fact undermine our efforts to promote clean energy by requiring the use of more expensive and less efficient equipment, raising the cost of generating clean energy and making it more difficult for clean energy sources to be competitive."[1]

– Michael Froman (Froman), US Trade Representative, in February 2016

INTRODUCTION

On February 24, 2016, the US won a ruling against India at the World Trade Organization (WTO), the global trade body, after it challenged the rules on the origin of solar modules and solar cells used in the Jawaharlal Nehru National Solar Mission (JNNSM) – the national solar power program in India. After giving its ruling, the WTO in a panel report stated, "The DCR measures are inconsistent with Article 2.1 of the TRIMs (Trade-Related Investment Measures) Agreement and Article III:4 of the GATT 1994, and are not covered by the derogation in Article III:8(a) of the GATT 1994; and are not justified under the general exceptions in Article XX(j) or Article XX(d) of the GATT 1994."[2] The US Trade Representative's office termed the ruling as a crucial victory that would speed up the process of providing solar energy across the world and also support solar-energy jobs in the US.

India launched the JNNSM in 2010 with the stated aim of producing 20,000 megawatts (MW) of solar power by 2022.[3] Since India did not have the capacity to manufacture the

Ambassador – Riches to Rags: Is Competition the Culprit?

V Padmavathi and G V Muralidhara***

The case describes the transformation of the market structure of Indian Automobile industry from 1897, when the first motor car ran on Indian roads, to 2016. With the economic liberalization in India and easing of licensing system during the 1990s, the automobile market opened up to new players. Ultimately, Ambassador, the monopolist till the 70s that had a major market share till the 90s was forced to close down in 2014, while failing to compete with the new entrants.

INTRODUCTION

In 2014, the iconic Ambassador car, a product of Hindustan Motors Ltd., (which was carrying forward the legacy of Morris Oxford) which had dominated the Indian car market for decades, ceased to exist.[1]

From 1958 to the early 1980s, the Ambassador had enjoyed a near monopoly in the Indian passenger car market with over a 70% market share. But in March 2014, its market share slipped to a mere 0.12%[2] and the company ultimately decided to suspend production on May 25, 2014. Fiat, the maker of the Premier Padmini car, the only competitor for the Ambassador in the 1970s and 80s, had also stopped production of the Padmini in 1999. However, even as old models such as the Ambassador and the Premier Padmini were seeing a downhill journey, the market for cars in India was growing steadily.

The economic liberalization in the 90s and the consequent lifting of entry barriers to multinationals, including automobile manufacturers, increased disposable incomes, and a rise in the standard of living with the growth of the middle class in the country, brought about a sea change in the automobile market in India. The number of cars sold in the country went up from 1,209,876 vehicles in the year 2004-2005 to 3,072,651 vehicles in the year 2013-2014. Automobile production in India including passenger cars recorded a growth of 8.68% in FY 2014-15, with a production of 23,366,246 vehicles in FY 2014-15 as against 21,500,165 vehicles in FY 2013-14[3].

The Automotive Mission Plan *(AMP)* of 2016–2026 envisaged that by 2026, India would stand first in the world in the production and sale of small cars and third in passenger vehicles and heavy trucks, with all of it adding up to a contribution of 12% to the National GDP.[4]

The 'C' Factor: Cement Industry in India – Unhealthy Oligopoly and Controls

Laila Memdani and V Padmavathi***

The case describes the cartelization of cement companies in India. The Competition Commission of India (CCI), in January 2017, levied a penalty of nearly Rs. 2.06 billion on seven cement companies on charges of cartelization. The penalty levied was 0.3% of last three fiscal years' average turnover at the seven companies: Shree Cement Ltd, UltraTech Cement Ltd, Jaiprakash Associates Ltd, J.K. Cement Ltd, Ambuja Cements Ltd, ACC Ltd and J.K. Lakshmi Cement Ltd. The firms were found indulging in bid rigging in cement procurement tender by the Haryana government for supplying cement to state departments, boards and corporations. The CCI noted in its 120-page order that the anti-competitive activities of the companies had led to the cancellation of the tender and forced the Haryana government to start the process afresh. This had caused delay in timely supply for the execution of public infrastructure projects and overrunning of costs.

INTRODUCTION

On March 9, 2018, the Union Minister for Industries, Nitin Gadkari, warned the Cement and Steel Companies cartels which had created unwarranted price increase, when all other costs remained same as well as Technology was helping to reduce cost of production.

In January 2017, the CCI levied a penalty of nearly Rs.2.06 billion on seven major cement companies on charges of cartelization[1]A penalty of 0.3% on the turnover of the preceding 3 financial years was levied on these companies – Shree Cement Ltd., UltraTech Cement Ltd. (Birla Group), Jaiprakash Associates Ltd. (JP Gaur Group), J.K. Cement Ltd. (Singhanias Group), Ambuja Cements Ltd. (Lafarge Group), ACC Ltd. (Lafarge Group), and J.K. Lakshmi Cement Ltd. (Singhanias Group). These companies were alleged in bid rigging of a tender floated by the Director Supplies & Disposals, Haryana, in the year 2012, for procurement of cement to be supplied to Government Departments/Boards/Corporations in the State of Haryana.

The CCI noted in its 120-page order that the anti-competitive practices of the companies had led to the cancellation of the tender and forced the Haryana government to start the process afresh. This had caused a delay in the timely supply of material for the execution of public infrastructure projects and a cost overrun. The cement manufacturers filed separate appeals before the Competition Appellate Tribunal (CAT) against the CCI order.

CEMENT INDUSTRY IN INDIA

Cement is a mixture of compounds consisting mainly of silicates and aluminates of calcium, formed out of calcium oxide, silica, aluminum oxide, and iron oxide. It is considered a preferred building material and is used worldwide for all construction works such as housing

Huawei – Caught in the Crosshairs of the US-China Trade War?

Anil Anirudhan and Sanjib Dutta***

The caselet is about the dilemma faced by the Chinese telecom equipment manufacturing company Huawei Technologies Co. (Huawei) due to the sanctions imposed on it by the US, the UK, and other countries. The ban on Huawei's telecom equipment was due to security issues that arose as the company had its headquarters in China and it was supposedly under the control of the Chinese government and therefore bound by the Chinese government's rules and regulations. While security was one of the issues, trade disputes, protectionism, and unfair trade practices also had a role to play in the sanction. The case deals with the reasons for the ban on Huawei and its impact on the development and implementation of 5G technologies across the world. The trade war between the US and China is discussed along with analysts' comments on the ban on Huawei.

"Following US sanctions against Huawei and updated technical advice from our cyber experts, the government has decided it necessary to ban Huawei from our 5G networks. No new kit is to be added from January 2021, and UK 5G networks will be Huawei free by the end of 2027. This decisive move provides the industry with the clarity and certainty it needs to get on with delivering 5G across the UK,"[1]

– Oliver Dowden, Secretary of State for Digital, Culture, Media, and Sport, UK Government July 2020

"We would never compromise or harm any country, organization, or individual, especially when it comes to cyber-security and user privacy protection."[2]

– Press release, Huawei Technologies Co., July 14, 2020

"The tide is turning against Huawei as citizens around the world are waking up to the danger of the Chinese Communist Party's surveillance state."[3]

– Mike Pompeo, US Secretary of State, July, 2020.

INTRODUCTION

On July 14, 2020, Oliver Dowden (Dowden), UK Secretary of State for Digital, Culture, Media, and Sport, announced that telecom companies in the UK were barred from purchasing new 5G equipment from the Chinese company Huawei Technologies Co. (Huawei) from January 2021.[4] As part of the ban, the UK Government also instructed the telecom companies to completely remove already installed 5G equipment from Huawei from their mobile networks by the end of 2027.

Chennai Airport's Flooding Crisis – The Rising Issues and Challenges

G V Muralidhara and Nagendra Kumar MV***

In the month of November, 2015, Chennai International Airport (CIA) was affected severely due to floods in Chennai. Despite facing the impact of Nature's fury, the management of the Airport and Airports Authority of India had been criticized for constructing a runway bridge over the Adayar river. This case study therefore focuses on highlighting the objectives and events that had happened before initiating the construction of the bridge and provides scope to discuss the role and responsibilities of the governments, public servants and business organizations, in developing and implementing business plans and economic policies having less impact on the environment.

INTRODUCTION

During the month of November 2015, operations at the Chennai International Airport (CIA) were suspended for more than a week due to flooding of the nearby Adyar river (river)[1]. Within 24 hours of the flooding, the whole airport was inundated, and aircrafts, passengers, and the staff[2] were stranded (Refer to Exhibit-I for Images of Flooding Crisis at CIA).

CIA was affected previously during floods in Chennai in the year 2005 (Refer to Exhibit-II for the Location of CIA). Experts observed that over the years, the situation had not improved much. They blamed the authorities and management for lack of understanding in managing the risk and pointed out that they hadn't learnt any lessons from their previous experience.

Construction of a runway bridge over the river was considered to be one of the reasons for the flooding of the airport[3] (Refer to Exhibit-III for the Satellite Image of CIA's Runway Bridge). Despite several warnings and objections raised by the experts about the possibility of flooding, the construction of runway bridge was started in 2009, and became operational in 2014.

BACKGROUND

CIA was established in the year 1950 and was the first international airport in India to receive the ISO-9000-2001 certification[4]. As on February 12, 2014, CIA was serving 27 international and 7 domestic passenger airliners, 11 cargo services, 11 chartered flights, and also the Air Force and Coast Guard[5]. To meet the increasing rate of passenger movement, the

India of the Future: Global Manufacturing Hub or Global Innovation Hub?

G V Muralidhara and Hadiya Faheem***

This case discusses the 'Make in India' initiative announced by the Prime Minister of India, Narendra Modi (Modi), in September 2014. The initiative aimed to make India a global manufacturing hub, encouraging domestic companies as well as Multinational Corporations (MNCs) to manufacture their products in India. While this initiative aimed to give India global recognition, it also sought to create employment opportunities for India's youth. With the Make in India initiative, the government of India (GoI) aimed to transform India — a nation comprising farmers, IT professionals, and call center employees — into a manufacturing hub. The GoI pledged to train around 500 million people in manufacturing by 2022. While India was trying to push the country as a global manufacturing hub, countries like China were making significant investments to progress the country's innovation base.

In September 2014, the Prime Minister of India, Narendra Modi (Modi), announced the 'Make in India' initiative to make India a global manufacturing hub and encourage domestic companies as well as Multinational Corporations (MNCs) to manufacture their products in India. While this initiative aimed to give India global recognition, it also sought to create employment opportunities for India's youth. With the Make in India initiative, the government of India (GoI) aimed to transform India – a nation comprising farmers, IT professionals, and call center employees – into a manufacturing hub. The GoI pledged to train around 500 million people in manufacturing by 2022.[1]

In the past, several challenges had inhibited the GoI from growing India's manufacturing sector. Some of these were lack of trained labor, stringent labor laws, and lack of infrastructure. Unlike China, which had flexible labor laws, India's labor laws were restrictive, hurting investments in the manufacturing sector. For example, the Industrial Disputes Act (1947) had rigid provisions such as mandatory and prior approval from the government being required in the case of retrenchment, layoffs, and closure of industrial establishments employing more than 100 workers. The Trade Union Act allowed even outsiders to be union office bearers, leading to strikes and lockouts without any legitimate grievances. While this hurt the investors' faith, it also restricted the growth of the economy, resulting in rising unemployment.

Poor infrastructure was also a major deterrent for foreign investment in India. According to Shishir Sinha (Sinha), research analyst for Frontier Strategy Group, a consulting firm focused on emerging markets, "Even though companies would enjoy manufacturing in India given its large base of low-cost labor and engineers, it still takes way too long to acquire land, it is difficult to hire and fire labor, the taxation differs too much across the various states, and lack of infrastructure make the overall cost of producing much higher. We need to see fundamental actions from the government to see action from the private sector."[2] In

Subway's Bread Loses 'Staple Food' Status in Ireland

K S Venu Gopal Rao and Smita Ray***

The case is about the legal dilemma Subway faced on the status of its bread in Ireland. The Supreme Court of Ireland had passed the judgement that Subway's bread could not be categorized as staple food because of its high sugar content and so it would not be eligible for VAT tax exemption. The case deals with the legal battle between the tax authorities of Ireland and the Subway franchise which had filed the case for tax exemption. A brief history of the company along with details of its operations in Ireland are put forth in the case. The case next discusses the court verdict and the opinions of the experts and dieticians on the sugar content in Subway's breads. The case ends with the future plans of Subway to deal with the verdict of the court and to continue with its recipe for the baking of its signature breads. It remains to be seen whether consumers will continue to flock to Subway's stores to indulge in its sandwiches despite the court ruling.

"There's nothing wrong with burgers and sandwiches, but I think there's always tweaks that you can make them a bit healthier... Small changes in a food that's eaten very frequently can add up."

- Linda Van Horn, chief of nutrition, Department of Preventive Medicine at Northwestern University, Feinberg School of Medicine, in 2020[1]

"The argument depends on the acceptance of the prior contention that the Subway heated sandwich contains 'bread' as defined, and therefore can be said to be food ... rather than confectionery. Since that argument has been rejected, this subsidiary argument must fail."

- Ireland's Supreme Court, in October, 2020[2]

INTRODUCTION

In October 2020, Ireland's Supreme Court ruled that the bread served at Subway – a leading fast food restaurant franchise of the US – could not be defined as bread because of its high sugar content.[3] The verdict came in response to an appeal made in 2011 by Bookfinders Ltd (Bookfinders), Subway's Irish franchisee, to consider Subway sandwiches as a staple food and exempt it from Value Added Tax (VAT)[4].

Understanding Crude Oil Demand

Laila Memdani and V Padmavathi***

A normal demand curve shows a definite inverse relationship between the market price of a product and the quantity demanded of that product, other factors held constant. But there have been situations in the crude oil market in which there was a positive relationship between the market price and the quantity consumed. Moreover, the responsiveness of change in the quantity demanded of oil in the market was not uniform with the change in price. The demand for oil is mostly derived from other factors such as increased incomes and the availability of cost-effective substitutes.

"If you want your energy bills to go up, you should support an ever-greater dependence on foreign oil, because the ... demand in China and India is growing, and the price of oil ... will go sky high."[1]

– Al Gore, Vice President, United States – 1993-2001

INTRODUCTION

In a report published in January 2019, Wood Mackenzie,[2] a global research and consultancy group, commented that with a consumption of 245,000 barrels per day (bpd), India's crude oil demand was 14 per cent of the global demand, the second highest demand globally behind the US and ahead of China.[3]

In August 2018, the Organization for Petroleum Exporting Countries (OPEC[4]) projected that India's oil demand would rise by 5.8 million bpd by 2040, accounting for about 40% of the overall increase in global demand during the period. Analysts were of the opinion that the crude oil market in India, at times, showed a positive relationship between the market price and quantity consumed, defying the law of demand where there was a definite inverse relationship between the market price of a product and the quantity demanded of that product, other factors held constant. Moreover, the change in quantity demanded of oil in the market was not uniform with the change in price. In addition, there were factors other than

The Maggi Ban in India

Sridevi D Shet and G V Muralidhara***

On August 13, 2015, the Bombay High Court struck down the nationwide ban imposed on Nestlé Maggi instant noodles by FSSAI. The Court directed Nestlé to have fresh safety tests conducted on the product before bringing it back to the market. Nestlé was asked to provide samples of each variant of Maggi instant noodles for fresh test to three labs in Punjab, Hyderabad, and Jaipur. The results of the fresh tests conducted at the three labs went in favor of Nestlé. As a Consequence, Nestlé India resumed selling Maggi noodles in the month of November 2015. FSSAI challenged the lifting of the ban on the noodles in the Supreme Court of India. The Bombay High Court had erred in allowing Nestlé itself to pick the Maggi samples for the fresh tests instead of appointing a neutral authority to select the samples. FSSAI was of the opinion that the ban on Maggi should continue until a neutral agency picked the samples and had the tests performed again.

INTRODUCTION

On August 13, 2015 the Bombay High Court struck down the nationwide ban[1] imposed on Nestlé Maggi instant noodles by FSSAI[2]. The Court directed Nestlé to have fresh safety tests conducted on the product before bringing it back to the market[3]. Nestlé was asked to provide samples of each variant of Maggi instant noodles for fresh test to three labs in Punjab, Hyderabad, and Jaipur[4]. The High Court ruled that if even after the fresh tests, the lead content was found to be in excess of the permissible limit, then Nestlé would not be allowed to manufacture and sell Maggi noodles in India. The results of the fresh tests conducted at the three labs went in favour of Nestlé. As a consequence, Nestlé India resumed selling Maggi noodles in the month of November 2015.

FSSAI challenged the lifting of the ban on the noodles in the Supreme Court of India[5]. Stating that the Bombay High Court had erred in allowing Nestlé itself to pick the maggi samples the fresh tests instead of appointing a neutral authority to select the samples. FSSAI was of the opinion that the ban on Maggi should continue until a neutral agency picked samples and had the tests performed again.

ABOUT NESTLÉ

Nestlé S.A., a multinational company headquartered in Switzerland, was the largest food and beverage company in the world in terms of revenue.

Nestlé India Ltd (Nestlé) was a subsidiary of Nestlé S.A., incorporated in the year 1956. It had its head office in Gurgaon, Haryana. The first production unit of Nestlé was set up in 1961 at Moga in Punjab. By 2006, it had expanded to 7 manufacturing units and four branch

Performance Appraisal at Microsoft Corporation: When Employees Don't Want to be Ranked

Ginni Chawla[1], *Snehashish Tanya*[2], *Ayesha Aggarwal*[3], *Purnima Jain*[4], *Preeti Anjali Barwa*[5] *and Abha Pilli*[6]

An effective review system significantly affects employee satisfaction, trust, productivity, and motivation. The present case study compares two performance review systems incorporated by Microsoft Corporation in the years 2000 and 2013 respectively, and describes how the two systems affected individual employee behavior and productivity as well as employee behavior in a team. The case also underscores how a performance review system may affect stress levels and result in a struggle for resources at managerial levels. The case study has been developed using secondary sources of information. It exhibits that it is possible to devise a review system that punishes employees even when they are working hard and performing well, whereas a good review system should offer employees opportunities to learn and grow, increase productivity, and help develop healthy interpersonal relations at the workplace. To what extent a good review system must be subjective and the degree to which it should be objective is indeed an interesting and worthy field of study. The present study offers several questions to consider when devising a new performance review system or refining an existing one. The study, in particular, helps examine in depth the issues associated with implementation of a forced distribution and subjective methods of employee appraisal respectively.

INTRODUCTION

Multinational technology corporation Microsoft Corporation has an unprecedented impact on the world over the years. From Bill Gates to Satya Nadella, Microsoft has defined social change and international affairs. The "do more" company (as present CEO Satya Nadella called it) is a force with a deep influence on organizations, people, and communities.

Headquartered in Redmond, Washington, Microsoft is known for developing and selling its operating system and other computer related software and services. Founded by Bill Gates and Paul Allen in 1975, it grew into a Fortune 500 firm which led the revolution in technology that radically reshaped world affairs and social interaction.

In 2000, Steve Ballmer replaced Bill Gates as the CEO. He was not popular with Microsoft employees who pointed out that before him, there had been hardly any layoffs, and salary

Championing Diversity at Workplace: The Case of Total South Africa

*K B S Kumar**

In July 2019, Total South Africa, a subsidiary of France-based energy conglomerate Total SA, announced that it had secured Level 1 in Broad-Based Black Economic Empowerment rating. This was a culmination of more than 15 years of a dedicated transformation strategy that sought to bring about changes in ownership to include more blacks, introduce skill development programs for employees, procure from companies owned by blacks, and build sustainable access to the economy for black people in South Africa. The case discusses in detail the discrimination that was prevalent in South Africa during the apartheid era and the changes that successive governments have brought about to eliminate inequality among the people and help them get better livelihoods. It also discusses different policy initiatives that Total South Africa implemented.

Total South Africa is proud to be recognized as one of South Africa's Top Employers by the Top Employer Institute for three consecutive years, which gives testament to the fact the company values all its employees for their contribution towards the success of Total South Africa and rewards them for their hard work and commitment.

– Total South Africa

INTRODUCTION

In July 2019, South Africa-based energy company Total South Africa[1] announced that it had secured the Level 1 rating in Broad-Based Black Economic Empowerment. This was a culmination of more than 15 years of a dedicated transformation strategy to make its business more inclusive. The strategy included changes in its ownership structure to include more blacks; skill development programs for employees from marginalized communities; procurement from companies which were owned by blacks; and building sustainable access to the economy for black people in South Africa.

Apartheid came to an end in 1994 in South Africa after years of struggle. After that, successive governments worked to bring about the economic transformation of the marginalized black population and years of effort culminated in the formulation of a policy called the Black Economic Empowerment (BEE) in 2003. Later on, to improve the focus of BEE, a new modified initiative called Broad-Based Black Economic Empowerment (B-BBEE) was implemented. The objective of the initiative was primarily to assess and evaluate business enterprises – the extent to which they observed inclusive practices in their day-to-day business.

Total, which entered South Africa in 1954, continuously strove toward development of the local people. It was the first company to start service stations in predominantly black neighborhoods. As soon as B-BBEE was introduced, Total South Africa started making changes in the company

Policy Changes at United Airlines: Can It Make the Skies Friendly Again?

Indu Perepu[*] and Munmun Samatarai[**]

This case discusses Chicago-based United Airlines, Inc., (United) and the change in policies announced by the company that was aimed at improving customer experience. The changes came in the wake of the infamous passenger dragging issue on one of its flights that landed the company in PR fiasco. The case provides the details of the incident and the chaos that followed. The authorities jumped into action when a lawsuit was initiated by Dao against the company. Thereafter the company was forced to revisit its policies and make amendments to ensure such incidents do not occur in future.

"It is our specific objective to try to make traveling a little bit easier and better in the friendly skies."[1]

– Oscar Munoz, Chief Executive Officer, United Airlines, in 2017

"I think United, as a company that serves people and employs many people, realizes that mistakes occurred, took accountability and is acting on it. I think it's too early to say it is enough."[2]

– Jennifer Wilson-Buttigieg, co-owner of Valerie Wilson Travel and chair of ASTA's Corporate Advisory Council, in 2017

In April 2017, United Airlines, Inc., (United), based in Chicago (US), announced some policy changes aimed at improving customer experience. The changes came in the aftermath of a widely reported incident in which a passenger was dragged off an overbooked plane in April 2017. A video that went viral showed a passenger being forcibly removed from a flight to accommodate a crew member. In the process, the passenger was injured. This sparked a debate over passengers' rights.

The incident badly dented the image of United, one of the largest carriers in the US. While lawmakers condemned the act and demanded a probe, social media users expressed discontent with the company and raised questions about the common practice of overbooking on flights. Several voices called for a boycott of the airline. Not only in the US, but in China too, United witnessed a similar agitation as the passenger dragged out was of Chinese origin and there were allegations of racism made against the airline.

The irresponsible responses from the company and its CEO, Oscar Munoz (Munoz), only added fuel to the fire. The airline supported the action taken by the staff and Munoz put the

Australian Identity and Cricket (A): Building the Winning Culture

N S Sudesh and Saradhi Gonela***

Australians identify themselves with cricket to such an extent that the captain of Australian Cricket team is considered to be the most important person, next only to the Prime Minister. The pressure of losing a match is unbearable for the Australian cricket team. The team was always ahead of their opponents in strategy and preparation before a match. In addition to this, the team was intimidatingly aggressive on the field. Ruthless cricket was ingrained into every Australian player at a very young age. Over a period of time, the opposition teams demonstrated superior skills on the field. Also, as the intimidation tactics of the Australian cricket players were deciphered, opponents started paying back in the same coin, leaving little edge to the Aussies.

INTRODUCTION

Australia had been the dominating force in world cricket for a long time in history. The Australian team had won against all countries and in all countries. The cricketing super stars from Australia were revered and feared equally for their commitment on the field. From Don Bradman to Shane Warne, from Richie Benaud to Brett Lee, all of them were fearless cricketers who could win matches for Australia. What made these cricketers so committed that they simply hated losing a match, was the realization that cricket in Australia had never been a game played at leisure. Cricket, in many ways, represented the spirit of Australia and reflected the Australian way of life. However, the team's performance slipped during the late 1970s and the early 1980s due to a rebel cricket series, the World Series Cricket, that attracted big names from the national team, severely depleting the talent available. From the mid-1980s, the administrators deliberately cultivated a distinct cricketing culture to rebuild the team's attitude and help it regain its winning streak. The process benefited the Australian cricket as the team's ascendance reached its zenith during the early 2000s, as Australia won 10 consecutive series between 2000-01 and 2003-04. Notwithstanding the results, experts questioned a) if victory at any cost was justifiable? b) could the victories be attributed to the culture alone, undermining talent in the team? and c) how far could this culture be prolonged?

AUSTRALIAN IDENTITY AND CRICKET

According to historian Geoffrey Blainey (1966), Australia had been cursed by the 'tyranny of distance'. Australia, a British colony, was used for relegating convicted prisoners to the wilderness, instead of their being given the death penalty. One of the first such penal colonies – New South Wales, a state in southern Australia – was established in 1788. By the time convict transportation ended in 1868, over 160,000 convicts had been shipped to Australia.[1] Later,

Hilton Hotels: Diversity and Discrimination

Indu Perepu[*] and Rupali Chaudhuri[**]

The case is about the diversity initiatives by Hilton Hotels, one of the world's largest hotel companies. Hilton claimed to have a very sound diversity program and had won many accolades for its diversity initiatives. But over the years, it faced a number of lawsuits and negative press regarding discrimination both from customers and employees. These raised serious questions about the practices the company followed. With the motto 'We Are Hilton, We Are Hospitality', all the team members played a pivotal role in shaping the workforce at Hilton Hotels. Its workforce comprised people from different cultures and backgrounds who came together to create the element of hospitality for its guests. Understanding the unique needs of the guests, owners, suppliers, and partners helped the hotel to gain a competitive advantage. The case describes how some employees felt privileged and valued to come and work with Hilton and how a section of employees felt undervalued. A few customers too had complaints about having been humiliated and their dignity violated.

"*Our goal is to be the most hospitable company in the world and the most inclusive place to work. Empowering a diverse workforce is fundamental to our success*"

– Matthew W. Schuyler, Chief Human Resources Officer, Hilton[i]

"*Diversity is our future, is part of our legacy and is fundamental to our Success.*"

– Christopher J Nassetta, President & Chief Executive Officer[ii]

INTRODUCTION

In 2019, US-based global hospitality company, Hilton Worldwide Holdings Inc. (Hilton), popularly known as Hilton Hotels, found itself in the top spot on the 2019 Fortune 100 Best Companies to Work for List.[iii] In 2018, Hilton had been at the 33rd position in the top 100 best companies to work for in the Great Places to Work for List. In 2018, it was the third consecutive year Hilton had made it to the top list. An impressive 96% of employees surveyed claimed that Hilton was a great place to work with and 97% employees stated that they felt proud to say they worked at Hilton. *(Refer to **Exhibit I** for Best workplace list).*

As Christopher J Nassetta, (Nassetta), President and Chief Executive Officer, said, "We know that our people are our greatest asset, and we are committed to showing them this same hospitality by creating an environment where they can thrive and be at their best every day. From back-of-house, to front desk, to our corporate offices – our Team Members are the heart of our success, and I'm incredibly proud of each and every one of them."[iv]

Hilton was able to differentiate itself from its peers in the global hospitability industry by its unique employee centric HR practices. These practices made the company one of the most preferred employers. The company won many accolades from industry leaders. Its workforce comprised people from different cultures and backgrounds who came together to create the element of hospitality for its guests. Hilton claimed to have a very sound diversity program and had won many accolades for its diversity initiatives. But, over the years, it faced a

Pope Francis – A Radical Reformer: Rebranding the Church

G V Muralidhara and Hadiya Faheem***

The case discusses the efforts of the Pope of the Roman Catholic Church, Pope Francis, to rebrand the traditional Roman Catholic Church. Ever since Pope Francis, born as Jorge Mario Bergoglio, was elected as the 266th Pope of the Roman Catholic Church on March 13, 2013, he had been making efforts to reposition the church. He wanted to make the Catholic Church an inclusive institution, and toward this end, he encouraged priests to be more welcoming towardS single parents, divorced couples, and gay people – groups which till then, had been shunned by the 2,000-year-old Church.

"Pope Francis has the opportunity to overhaul the church attitudinally with a focus less on sin and more on love, less about judgment and admonition. And this begs a question: Will there be any other way for the church going forward? It's hard for me to imagine things going back [to the prior way of doing things]."[1]

– Robert Draper, a best-selling author and a writer for the *New York Times* Magazine and National Geographic, in September 2015

REVOLUTIONIZING THE CHURCH?

April 2016 witnessed the release of a much-anticipated new document, '*Amoris Laetitia*' (meaning Joy of Love) from the Vatican in which Pope Francis, the current Pope of the Roman Catholic Church, stated his desire for the Catholic Church to be an inclusive institution. He encouraged priests to be more welcoming toward single parents, divorced couples, and gay people – groups which had been shunned by the 2,000-year-old Church. In the document, known as an apostolic exhortation, Pope Francis while rejecting the notion of same sex marriage outright, welcomed divorced and remarried couples stating that they should not be judged, discriminated against, or excluded from Church life. He also encouraged priests to be kind while considering whether such Catholics could receive Holy Communion[2].

Ever since Pope Francis, born Jorge Mario Bergoglio, had been elected as the 266th Pope of the Roman Catholic Church on March 13, 2013, he had made efforts to reposition the Church. He chose the name Pope Francis in honor of Saint Francis of Assisi. In his first year as the Pope, he released his first apostolic document, known as 'Evangelii Gaudium'

The Grim(m) Story: Far from a Fairy Tale

Syeda Maseeha Qumer and Debapratim Purkayastha***

The case highlights the tragic case of Stefan Grimm (Grimm), a medical professor at Imperial College London (ICL) with a strong publication record, who committed suicide in September 2014, reportedly after being under intense and sustained pressure from his superiors over his failure to meet research funding targets. Grimm apparently left behind an email that accused his superiors of bullying through demands that he garner research grants worth £200,000 every year. In the months leading up to his death, Grimm was under intense pressure to perform or face redundancy. He is reported to have felt let down by ICL because he felt that he did not receive sufficient support from management despite having a strong publication record.

Stefan Grimm (Grimm), a 51-year-old professor of toxicology in the Department of Medicine, Imperial College London (ICL), was found dead in his home in Northwood, Middlesex (London), on September 25, 2014. An inquest into his death found that Grimm had committed suicide as he was struggling to fulfil the metrics of his professorial post at ICL in the months leading up to his death. Grimm, a successful researcher who had done pioneering work in the field of cancer, was allegedly under intense pressure from his superiors to perform after he failed to secure higher research grants. He was placed on informal performance review and was reportedly warned that his job would be at risk unless he met his performance targets. In an email that surfaced a few weeks after his death, Grimm wrote, *"Why does a Professor have to be treated like that? The reality is that these career scientists up in the hierarchy of this organization only look at figures to judge their colleagues, be it impact factors or grant income.[...]. One of my colleagues here at the College whom I told my story looked at me, there was a silence, and then said: "Yes, they treat us like sh*t".*[i]

ICL is a science-based university with a global reputation for excellence in teaching and research. Grimm was a distinguished professor who dedicated his career to deciphering the molecular mechanisms involved in apoptotic cell death[1] and development of anti-cancer genes. He had a good publication record with 50 publications to his credit and more than 3000 citations in top-ranked journals as of August 2014. Grimm was talented, hardworking, and a passionate scientist. He was described by his colleagues as an inspiration to other staff members at ICL and a caring mentor dedicated to his students.

In the wake of Grimm's death, James Stirling (Stirling), Provost of ICL, ordered an internal review of its staff policies and set up a review panel which recommended several changes including improved support to staff facing performance management. According to the review panel, Grimm was under informal management procedures and had not been given

Personality-Based Hiring – Bridgewater's Success Mantra

Jitesh Nair[*] *and Bitra Vasudev*[**]

The case focuses on the unique personality-based hiring process followed at the hedge fund Bridgewater Associates (Bridgewater). The case describes the rationale given by Ray Dalio (Ray), the founder of Bridgewater, for adopting such a rigorous hiring process that lays emphasis on the values of an aspiring candidate and his/her abilities over traditional finance background. He sought brilliant people who graduated from world-class universities, had outstanding track records and shared Bridgewater's values of excelling through thoughtful disagreements. The case also gives readers a glimpse of the extraordinary work culture at Bridgewater that is based on a set of principles propounded by Ray facing near bankruptcy in 1982 due to a wrong prediction of the debt crisis. These principles, which were diligently followed by Ray, became the foundation for the company's work culture, especially its decision making that was based on the principle of 'believability weighing' decision making.

"There are two things I look for when assessing people. First, do we share similar values of producing greatness through thoughtful disagreement? Then I look at the skills we need."

– Raymond Dalio, Founder and Chairman of Bridgewater Associates, in 2016

"In order to have the most successful relationship -- whether it is a marriage or an organisation-- there has to be an idea meritocracy".[1]

– Raymond Dalio, Founder and Chairman of Bridgewater Associates, in 2017

INTRODUCTION

Raymond Dalio (Ray) founded Bridgewater Associates (Bridgewater), a hedge fund,[2] in 1975 in New York City. The company registered devastating losses in 1982 that almost led to its closure. However, it managed to pull itself back from the brink and grew to become the world's largest hedge fund with $160 billion[3] in assets in 2020 and nearly 350 institutional investors[4] from around the world. These included central banks, sovereign wealth funds,

Experian: Predictive Workforce Analytics for Employee Retention and Human Resource Planning

Debapratim Purkayastha[*] *and Munmun Samantarai*[**]

Dublin-based Experian plc was facing a high attrition rate since 2016. With every 1 percent turnover increase, the company was losing nearly $3 million. Due to manual workforce management methods, the company was unable to identify the root cause of the attrition. Thus, HR specialists at Experian decided to get a better view of the workforce by applying data and technology to its HR strategy. Being a data driven company, Experian's HR specialist used in-house predictive modeling technology to strategically analyze employee data and came up with an innovative solution called predictive workforce analytics. This case discusses how the implementation of predictive workforce analytics yielded favorable results for Experian. As of 2019, the company's global attrition rate decreased by 4 percent, saving the company C$14 million in a period of two years. Experian then started providing its solution to other businesses houses.

"We have a well-established methodology to building analytical insight models in other industries which could equally apply to the HR sector. We were confident that with our expertise and data assets we could create a solution to move the needle on employee retention, create a more fulfilling working culture and save a great deal of money."[i]

– Olly Britnell, Global Head of Workforce Analytics and HR Strategy, Experian

"*The Workforce Analytics solution has saved us millions, but most importantly it's become the backbone of how we make the best decisions for our people. We're now better able to anticipate and predict what our employees value and that's helped us to retain talent that keeps Experian innovating. Our own success has been the catalyst to make this solution available to other businesses and I'm confident they'll start to reap the same rewards.*"[ii]

– Mark Wells, HR Director, Experian

In 2019, Dublin-based Experian plc, a multinational consumer credit reporting company, launched a new analytical tool known as predictive workforce analytics.[iii] According to the company, this analytical method had emerged as a game changing solution to Experian's workforce attrition problem. Though Experian was known for its employee oriented policies, it had been struggling with a high attrition rate since 2016. Employee attrition had resulted in the company losing key talent across the organization and also increased recruitment costs. With every 1 percent turnover increase, the company was losing nearly $3 million in terms of profit.[iv] HR specialists at Experian couldn't figure why people were leaving the organization because they didn't have relevant data that could provide a multidimensional view of their workforce. As Experian's workforce methods at that time were manual, the

Organizational Redesign at Vodafone Idea Limited

Jitesh Nair and Balaswamy Pasala***

The case study focuses on the integration efforts undertaken following the merger between Idea Cellular (Idea) and Vodafone India (Vodafone) in August 2018 that resulted in the formation of Vodafone India Limited (VIL). In 2017, the Indian mobile industry witnessed hyper competition with the entry of Reliance Jio Infocomm Limited (Jio) that offered extremely low-priced plans. To face the onslaught from Jio, the existing telecom operators went into consolidation mode. Idea and Vodafone decided to come together and announced a merger agreement on March 20, 2017. VIL focused on accelerated integration with a very clearly defined five-pillar strategy. This formed the blueprint under which several strategic initiatives were taken to improve its revenue, profitability, and competitive position in the marketplace.

"As India's leading telecom operator with two popular and loved brands, the company has the scale and resources to ensure sustainable customer choice and introduce new technologies"[1]

– Balesh Sharma, CEO of Vodafone Idea, in August 2018

"The company believes the Centre (Government of India) is looking at a 'comprehensive solution' for the sector with an aim to restore the industry's health Secondly, they have said to us that they want to see three private players and one public sector player in this sector"[2]

– Ravinder Takkar, CEO, Vodafone Idea in November 2019

INTRODUCTION

The merger of India's third largest mobile telephony company, Idea Cellular (Idea), with the second largest mobile operator in the country, Vodafone India Limited (Vodafone), announced in March 2017, gave rise to a new company Vodafone Idea Limited (VIL). The deal valued at around $23 billion led to the creation of the world's largest telecom operator and the leading communications provider in India 'with almost 400 million customers, 35% market share, and a 41% revenue market share'[3].

Post-merger, all the products and services of VIL were offered under the Vodafone and Idea brands which were complementary in nature. VIL offered Voice and Data services across the 2G, 3G, and 4G platforms, enterprise services, and other value added services (VAS), including short messaging services, digital services, content, IoT, and enterprise solutions.

A Bridge to Stockholm: Tech Mahindra's Tryst with a Swedish Customer

G N Raghevendra Rao and G V Muralidhara***

This case study discusses the experience of an Indian IT outsourcing and consulting company –Tech Mahindra (TechM) Limited – with a Swedish customer. It discusses the challenges faced by the company, based in Pune, India, in executing a project on account of cultural gaps. The NC project, started in May 2012, faced several challenges at the beginning on the cultural and execution fronts. Raghav, the project manager who had been given this challenging task by Dinesh, had overcome these initial hiccups and made steady progress to reach a level where the client was satisfied with TechM's service delivery.

INTRODUCTION

On February 23, 2016, Dinesh, the delivery manager of Tech Mahindra Limited's (TechM) Saab India Technology Centre (SITC) at Hyderabad, India, was reviewing the progress of manufacturing support – NC and CMM programming project (NC project). He was happy to note that the project team had received a customer rating of 5/5 from a demanding client like Saab, the Swedish defense and aerospace major, and that the rating had gone up from 2.5/5 to 5/5 in 3 years.

Dinesh started thinking about how the learning from this project could be institutionalized and how the stopgap arrangements made by TechM to meet the stringent requirements of Saab could be built into the company culture.

TechM, an Indian multinational providing services across the globe in the areas of engineering, information technology (IT), networking technology solutions, business process outsourcing (BPO), and telecommunications, headquartered at Pune, India had an IT and engineering development collaboration with Saab.

The NC project, started in May 2012, had faced several challenges at the beginning on the cultural and execution fronts. Raghav the project manager who had been given this challenging task by Dinesh, had overcome these initial hiccups and made steady progress to reach a level where the client was satisfied with TechM's service delivery.

At the same time, the project had to incur additional costs to overcome certain systemic issues relating to working practices which could not be billed to the client. Now the challenge for Dinesh and Raghav was to institutionalize the learnings from this project so that such problems would not recur in future projects. Also, they had to work out a way by which the additional costs being incurred on the project could be eliminated by building a culture of "DO IT RIGHT THE FIRST TIME".

BACKGROUND

Mahindra British Telecom (MBT) was incorporated in 1986. MBT was awarded with ISO 9001 certification by BVQI in 1994. In 1995 MBT established its UK branch office to

Employee Downsizing at OYO in 2020

Sanjib Dutta and Smita Ray***

The case talks about the restructuring initiatives launched by OYO Rooms (OYO) as part of its new strategic objectives for 2020, which included employee downsizing. The case starts out with a brief history of OYO. It then describes OYO's growth over the years and its rising operating expenses and employee benefit expenses which made it necessary for it to take certain measures to remain afloat. These included employee restructuring initiatives such as layoffs in early 2020. The case describes in detail the layoff process and the separation package and outplacement support services provided by OYO to employees who were let go. It also captures the dissatisfaction of the employees who complained of lack of transparency in the downsizing process. The case also describes how the outbreak of the corona virus in China made matters worse for OYO, leaving it with no option but to lay off employees in China and Japan. It also briefly describes the various steps initiated by the company to simplify the work culture and make OYO a better place to work.

In our previous phase, we added a lot of properties to our platform and built the brand and mindshare. Our first focus of 2020 is growth with profitability."[1]

– Ritesh Agarwal, Founder and Chief Executive Officer (CEO), OYO Rooms, in 2020

"[I] have learnt a lot at OYO and that learning has helped me crack lots of interviews and get a job. If there is ever an opportunity to rejoin OYO, I will be very happy to join back"[2]

– Former Business Development Manager, OYO Rooms, in 2020

INTRODUCTION

In March 2020, India-based OYO Rooms (OYO), a provider of budgeted hotels, received a capital infusion of about $807 million from SVF India Holdings[3] and RA Hospitality[4]. Also in March 2020, the company declared a reduction in its global workforce by about 5,000 to bring it down to 25,000, a 17% fall from the 30,000 employees it had in January 2020. Along with this restructuring initiative, the company also announced that it would improve its relations with hotels and put in place a strong corporate governance practice. Commented Ritesh Agarwal (Ritesh), Founder and Chief Executive Officer (CEO), OYO, "*By the time our restructuring process is complete, OYO will have over 25,000 employees worldwide.*"[5]

Vizag Gas Leak Tragedy: Is LG Polymers to Be Blamed for Negligence?

M Showry[*] and Koti Vinod Babu[**]

The case is about the factors that led to the leak of poisonous styrene gas from the LG Polymers India Pvt Ltd (LGPI), Visakhapatnam (Vizag) plant on May 7, 2020, and its repercussions on the plant and its surroundings. Twelve persons, including a minor, were killed and several hundreds fell ill after inhaling the poisonous chemical following the gas leak at the plant at R R Venkatapuram, near Vizag. The investigation by the National Green Tribunal and special committees set up by the Government of India found that the vapor leak occurred due to self-polymerization of the styrene monomer and a lack of proper maintenance of the plant by LGPI. LGPI was also accused of running the plant without proper environmental licenses. It has to be seen what kind of action plan the Indian Government will come up with to make hazardous industries like chemical industries adhere to the Occupational Safety, Health and Working Conditions Code 2020 to stop such disasters recurring in the future.

INTRODUCTION

Twelve persons were killed and several hundreds fell ill in the early hours of May 7, 2020, when toxic styrene gas ***(See Exhibit I)*** leaked out of the LG Polymers India Pvt Ltd's (LGPI)[1] Vishakapatnam (Vizag) plant located on the outskirts of the coastal city of Vizag in the southern Indian city of Andhra Pradesh. The plant was owned by LG Chem Ltd.[2] (LG Chem), South Korea. The incident brought to mind the horrors of the 1984 Bhopal gas leak tragedy[3] that killed thousands and left thousands of others affected.

The gas leak triggered panic and chaos among the citizens of Vizag. People living within a 5 km radius of the plant suffered several ill effects, raising fears of a serious industrial disaster. Rescue teams, the Andhra Pradesh government, and LGPI took several measures to bring normalcy back to the area. Committees which investigated the incident later, accused LGPI of negligence and of poor maintenance of the plant.

1 LG Polymers India, earlier known as Hindustan Polymers, was established in 1961 in Vizag, Andhra Pradesh, and manufactured polystyrene and its co-polymers, used to make plastic products In 1997, LG Chemical, South Korea took over Hindustan Polymers and renamed it LG Polymers.

2 LG Chem Ltd., referred to as LG Chemical, is the largest Korean chemical company based in South Korea. It is a supplier of petrochemicals ranging from basic distillates to specialty polymers. The company had eight factories in South Korea and a network of 29 business locations in 15 countries as of 2020.

3 In the early hours of December 3, 1984, Methylisocyanate gas leaked from a plant owned, managed, and operated by Union Carbide India Limited in the central Indian city of Bhopal. According to the Indian government, approximately 5,200 people died and several thousand others suffered permanent or partial disabilities from the incident.

Twitter's Onboarding Program: 'Yes-to-desk'

Prerna Chhetri and Balaswamy Pasala***

The case 'Twitter's Onboarding Program; 'Yes-to-desk' describes the 'Yes-to-Desk' onboarding program developed by Twitter. The case touches upon the objectives of the program and the need to ensure that new hires had a seamless transition to the organization and their new role. The case discusses Twitter's hiring process to recruit the best talent that comprised three rounds of interviews, including recruiter screening, phone interviews, and on-site interviews, to obtain the right talent. Next, the case describes in detail the various features of 'Yes-to-Desk' program, which included team lunches, happy hours, on-the-job training and continuous feedback. The case also focuses on the impact of Twitter's onboarding program Yes-to-Desk which became one of the most recognized onboarding programs for the new employees. Then it focuses on how Twitter also rolled out 'Inclusive Hiring Principles' with campus and virtual tours and events. The case ends with Twitter's continued focus on improving the way it onboarded new employees even during the Covid-19 pandemic so that every new employee felt included right away even in a remote working environment.

"Twitter has one of the best employee onboarding processes out there which motivates bright-minded individuals to work at Twitter. This is why their business has continued to improve over time".[1]

– Tim Rolle, Managing Editor, Money Midnight, in June 2021

"Until the applicant pool for open roles looks more like the communities we serve, we need to meet candidates from diverse backgrounds where they are."[2]

– Twitter Inclusion & Diversity Report 2020

INTRODUCTION

Twitter, an American technology company, reinvented how employees were onboarded with its 'Yes-to-Desk' program that was designed to ensure that new hires would be able to make a seamless transition to the organization and their new roles. This process was aimed at providing a happy experience for new employees from the moment they said 'yes' to the job offer until they sat at their 'desk' for the first time.

Twitter believed that employee onboarding was critical to its overall business growth and success. It therefore decided right at the time the company was founded to build an onboarding program. Twitter followed an efficient and effective hiring process to recruit the best talent as it aimed to continue building up its ability to scale as an organization.

Performance Appraisal Process at Larsen & Toubro Construction

Manish Gupta, Debapratim Purkayastha** and Sheel Mehta****

This case is about the performance appraisal process at Larsen & Toubro Construction. India's largest construction organization and also ranked among the world's top 30 contractors. The case describes the appraisal process and recounts the predicament faced by an intern, Sheel, who was given an assignment to propose improvements in the new performance appraisal system. Armed with the information she had collected about the ongoing and the previous performance appraisal process, Sheel was required to identify areas for improvement and also propose changes to the performance appraisal process that would overcome concerns, if any, with the current system.

It was the summer of 2019. Sheel Mehta (Sheel) was on her first day of internship at Larsen & Toubro (L&T) Construction. She had just come to know of her assignment and it left her with mixed feelings of joy, curiosity, and anxiety. Even before her communication with her assigned mentor at L&T, Sheel had come prepared, having studied the different job positions that the company offered. In April 2018, the company had put in place a new performance appraisal system and Sheel was given the strategic assignment of proposing improvements in it. She knew she would have to study the existing performance appraisal process and the previous one thoroughly before proposing any suggestions or recommendations. Sheel had butterflies in her stomach, but she soon composed herself to focus on the task at hand. As she began, she was beset with doubts and questions. At one point, she even considered asking her mentor for help, but she soon decided against it as she did not want to lose the chance of impressing her mentor.

ABOUT L&T

L&T was one of the largest multinational firms and a leading construction company. The company was founded in 1938 in Mumbai, India, as a representative of Danish manufacturers of dairy equipment. The company grew rapidly over the years and expanded globally into more than 25 countries in Asia, Africa, North America, Oceania, and Europe. In terms of total income, L&T grew from Rs.[1] 1019.75 billion in March 2016 to Rs.1410.07 billion in March 2019. The net profit nearly doubled from Rs.55.34 billion in March 2016 to Rs.102.37 billion in March 2019 *(See Exhibit I)*.

Digitalization and People-Oriented Production Systems at BMW

Jitesh Nair and Balaswamy Pasala***

The case focuses on the role of technology and digitalization in enhancing job satisfaction and productivity with reference to the older workforce in the manufacturing sector. Bayerische Motoren Werke AG (BMW) was worried about its aging workforce. This was a cause for concern as older employees reported sick more frequently and for longer durations and had to work harder to achieve the same output as younger employees on the production floor. Sacking or reallocating older employees was not an option for the company because of the lack of young workers in Germany. Besides, BMW believed that its older workers were worth retaining for their maturity, extensive knowledge, reliability, and skills, and that they would remain productive and happy if they were provided on-the-job aids that made demanding and repetitive assembly line work less tiring and more convenient.

"We regard the successful implementation of an ergonomically optimized human-robot cooperation in series production as a major step toward future automotive engineering and the world of Industry 4.0 adding that 'collaborative robots enable us to create new forms of design in the process layout."[1]

– Stefan Bartscher, Head of Innovation Management, BMW Research and Innovation Center, in 2013

"If Germany can't deal successfully with an ageing workforce, then its productivity and innovation are at stake"[2]

– Hannes Zacher, Professor of Work and Organizational Psychology, University of Leipzig, in 2019

According to business intelligence portal *Statista*, the average age of Germany's population was 46 years as of 2015. This was a steep increase from 40 in 2000 and 34 in 1970.[3] A study by the Bertelsmann Foundation[4] calculated that by 2020, three workers would support every person in Germany aged over 65, but this would become one-to-one by 2035.[5]

Airbnb's Approach to Layoff During the COVID-19 Crisis

Jitesh Nair and Balaswamy Pasala***

The case describes Airbnb's compassionate approach toward employees who had to be laid off due to the ongoing Covid-19 pandemic. The company had forecast a 50 percent reduction in revenues for 2020 and despite raising $2 billion in capital in April 2020 reached the decision to lay off 1,900 employees globally or 25% of its 7,500 entire workforce in May 2020. The case looks at the guiding principles that the co-founder Brian Chesky had put in place to ensure that Airbnb started the process of layoffs based on the new focused business strategy built on a sustainable cost model.

"I am truly sorry. Please know this is not your fault. The world will never stop seeking the qualities and talents that you brought to Airbnb...that helped make Airbnb. I want to thank you, from the bottom of my heart, for sharing them with us."[1]

– Brian Chesky, Co-Founder and CEO Airbnb, in 2020

The outbreak of the novel corona virus disease in early 2020 devastated the travel businesses globally. Airbnb, an online marketplace which let people rent out their properties or spare rooms to guests and took a commission for every booking, too was not spared. Airbnb's business was hit hard and the company forecast a 50 percent drop in its revenue for the year 2020 over that of 2019.

In response, the company raised $2 billion in capital in two tranches on April 6, 2020, and April 15, 2020, through debt, equity, and a line of credit to provide additional cash during the economic slowdown caused by the pandemic. As a last resort to reduce its costs during the pandemic, Airbnb decided to layoff 1,900 employees – 25% of the 7,500 employees it had globally.

What stood out was the manner in which the management team informed its employees of its plans. Although the news of such a mass layoff was painful for everyone, the company remained committed to diversity, communicated transparently, and offered support and benefits to those let go that included a severance package, healthcare and mental support, and assistance finding new work. Airbnb spent $250 million on this initiative.[2]

BACKGROUND

Airbnb, Inc. was an online marketplace for house owners or house tenants to rent out spare rooms, empty apartments, tree houses, castles, and villas to the general public. It did not own

Labor Unrest at Tata Motors Plant and the Long-Term Wage Settlement Agreement

Sanjib Dutta and Anil Anirudhan***

The case is about the long-term wage settlement agreement entered into between the workers union and the management of Tata Motors at its Sanand Plant, Gujarat, on June 9, 2017. The reason for the strike by the workers is described in detail. The long-pending issue of a wage hike and the suspension of some of the workers due to indiscipline provided the trigger for the flare-up and the strike by the employees. After a long period of negotiations between the workers union, the management, and the representatives of the Labor Department of Government of Gujarat, a long-term wage settlement agreement was finally reached.

"Tata Motors shares cordial working relationships with workers and members of its internal union. We have strived to resolve the Long Term Settlement (LTS) issue and today are delighted to have resolved the matter for a long term, ensuring our business operations' competitiveness on one hand and taking care of the well-being of our shop floor colleagues on the other. Moreover, the union which has been recently formed, is very supportive in ensuring workmen derive maximum benefits through this wage settlement."[1]

– Gajendra Chandel, Chief Human Resource Officer, Tata Motors Limited, in June 2017

"We have had several meetings this week with Tata officials and finally resolved our wage hike issue amicably. The agreement is till 2020, post which we would need to revise the agreement. While we had been in agreement in most other issues, only the distribution had remained a bone of contention which is now resolved."[2]

– Hitesh Rabari, President, Bharatiya Kamdar Ekta Sangh, in June 2017

INTRODUCTION

On June 9, 2017, Tata Motors Limited (Tata Motors) headquartered in Mumbai, India, announced that it had signed a long term wage settlement (LTS) agreement with the workers union at its Sanand plant, Gujarat, India. The wage settlement agreement was for a period of five years from October 2015 to September 2020 and the total wage package of Rs.16,000 per month for each permanent employee was to be uniformly distributed during the LTS period.[3] The wage agreement included a performance linked payment on the basis of productivity of the employees, safety of the plant resources, and quality of workmanship.

RMSI: A 'Dream Company to Work For'

Jitesh Nair and Balaswamy Pasala***

The case study describes the various employee benefits, health and wellness; and performance and career management programs that led to RMSI Pvt. Ltd. (RMSI) consistently being ranked as one of the best companies to work for since 2003. The company's practices were acknowledged time and again by the media and the industry in the form of several awards for over a decade. RMSI was listed in the IDC-Dataquest India's Top 20 Best IT Employers survey for four years in a row from 2003 to 2006. It was ranked No. 1 in the 'Great Places To Work' study three years in a row from 2007 to 2009. Also, it was ranked the best company to work for in India as per the 2015 study conducted by the Great Place To Work Institute and The Economic Times, a leading financial daily in India. In 2019, it was recognized as one of the top ten 'Great Places to Work' by 'Aon Best Employers India – 2019' study that covered more than 125 organizations across industries in India.

"As an organization, we have always believed in empowering our people and nurturing their aspirations and talents to maximize value creation for all our stakeholders. Being chosen as a people-centric organization for the fourth consecutive year is a manifestation of RMSI's belief that our people are our greatest asset."[1]

– Neerja Verma, Senior Vice President, HR, in 2006

"Like many here, I have been in this company for a long time. It's not easy to make that transition from an employee to a promoter. But when you realise that your organisation values you, then the commitment grows and there is no looking back."[2]

– Gagan Jyot, Senior Vice-President, HR, in 2019

INTRODUCTION

In 2019, RMSI Pvt. Ltd. (RMSI), a global provider of geospatial and engineering solutions, was recognized as one of the top ten 'Great Places to Work' by the 'Aon Best Employers India – 2019' study that covered more than 125 organizations across industries in India. Joint managing director, cofounder and CEO of the company, Anup Jindal (Jindal), said, "*This award is a manifestation of our commitment towards instilling a core values driven culture and building an environment that encourages creativity, innovation and entrepreneurship. It is recognition of our belief that our employees are our greatest asset.*"[3] The company's practices were acknowledged time and again by the media & industry in the form of several awards for over a decade. RMSI was listed in the IDC-Dataquest India's Top 20 Best IT Employers survey for four years in a row from 2003 to 2006. It was ranked No. 1 in the

Sohan Roy's Innovative Employee Benefits and Efficiency Improvement Initiatives at Aries Group

Jitesh Nair and Balaswamy Pasala***

The case describes the various initiatives of Aries Group founder and CEO Sohan Roy (Roy) that were instrumental in the Aries Group becoming the leading design/inspection firm in the Middle East and growing into a consortium of 56 companies in 16 countries by 2020. Roy's initiatives focused on Model Management Principles and Efficiency Management Systems that helped the management and employees become more committed, valued, responsible, efficient, and productive. The case also describes Roy's holistic employee benefit programs for the staff, their children, spouse, and parents, including paying salaries to employees' wives, allocating 50% of the company profit to employees, introducing pension plans for employees' parents, and several other welfare schemes. A look at the Group's growth plans follows.

"Our goal is to ensure whatever the husband now earn as salary, incentive, bonus or as shares, 25 per cent should go to wife. All this is without affecting his current salary."[1]

– Sohan Roy, Founder and CEO of Aries Group, in January 2021

"We reduced our operating costs substantially by shifting our staff to remote working and readjusting projects. Some team members were also asked to take leaves to keep the operations running. Thanks to these measures, we managed to avoid salary cuts for all employees until June. All of this wouldn't have been possible without our efficiency management system – EFFISM."

– Sohan Roy, Founder and CEO of Aries Group, in July 2020

INTRODUCTION

On February 3, 2021, Sohan Roy (Roy), founder and CEO of the Aries Group (Aries), a consortium of diversified independent firms headquartered in Sharjah, UAE, announced a regular home salary to the non-working wives of Aries' employees. Some of his earlier initiatives were pension for the parents of employees, pension for retired employees, 50% profit sharing with employees, and annual scholarships for employees' children who were studying. Roy's latest on-going project was an efficiency software system EFFISM (Efficiency Improvement System Management) that enabled every employee to document their daily tasks, leading to effective time management. It also helped the company in effective monitoring, delegation of tasks, and improving organizational communication and design.

Recruitment Woes at Leo Burnett

Pridhi Gupta, Niraj Chimote** and Debapratim Purkayastha****

This caselet is about the recruitment process at Leo Burnett. Leo Burnett is one of the leading advertising agencies worldwide, and has also secured a good position in the Indian advertising industry. The case describes in depth the recruitment process at Leo Burnett and the factors that are considered while hiring any candidate. It deals with the declining number of applicants at Leo Burnett for vacancies. As the company was experiencing high growth, the unfilled vacancies could put additional pressure on the existing team. Therefore, after an employee survey, the HR team identified factors that could have created the problem. The challenge before the team was how to improve the recruitment strategy and make the recruitment process more effective.

"The work of an ad agency is to warmly and immediately humanize deals with human needs."

– Leo Burnett

"Leo Burnett has had tremendous growth momentum which is reflected in both our new business wins and our stellar body of work. To keep up this momentum for the agency it is important to have a leadership team which echoes our new-age thinking and creative approach."[1]

– Dheeraj Sinha, Managing Director - India & Chief Strategy Officer, Leo Burnett South Asia, in January 2020

INTRODUCTION

Pridhi, a Human Resources (HR) intern at the Gurugram office of Leo Burnett, was thinking about how the recruitment process of the leading advertising agency could be made more effective. Leo Burnett had an elaborate talent acquisition process, but the problem, as the HR team had suddenly realized, was that they were unable to fill up some key positions. This, in turn, was putting pressure on the existing team in a company that was experiencing rapid growth. The HR team conducted brainstorming meetings and an employee survey to understand the reasons for its recruitment woes. After identifying the problem, the team went in for some quick fixes which seemed to have solved the problem.

Google's Hybrid Workplace Model and Location Based Pay

Jitesh Nair[*] *and Balaswamy Pasala*[**]

The case describes Google's plans for a 'hybrid workforce model' to attract more people to return to office and also to improve productivity. This was necessary since the annual employee survey 'Googlegeist' conducted in February 2021 indicated that more than 70 percent employees were unwilling to return to work and ready to forego the facilities offered at the workplace. This was because since remote work was announced in early 2020, most employees of Google got used to life without commutes and were able to spend more quality time with family. Google planned to create new office locations so that employees had greater location options to work close to home. The new work plan announced in May 2021 mandated about 60 percent of employees to come to office three days a week; another 20 percent would work in new office locations; and 20 percent would work remotely.

"I have no intention of returning to Seattle every day. I can go from meeting to meeting via video calls. Currently I manage 8 people in Cities that are divided into 5 time zones. Why should I be in the office?"[1]

– Justin Bigworth, director of engineering, Google, in May 2021

"Our campuses have been at the heart of our Google community and the majority of our employees still want to be on campus some of the time. Yet many of us would also enjoy the flexibility of working from home a couple days of week, spending time in another city for part of the year, or even moving there permanently. Google's future workplace will have room for all of these possibilities."[2]

– Sundar Pichai, CEO, Google, in May 2021

INTRODUCTION

Google LLC, (Google) was one of the first multinational companies to permit its employees to work from home when the coronavirus pandemic began in early 2020. In December 2020, however, in a memo to employees, Google CEO Sundar Pichai (Pichai) announced plans for a 'hybrid workforce model' for its employees. As per the pilot plan, employees needed to work a minimum of three days in office and the remaining two days remotely at home or wherever they worked best.[3] Google believed the hybrid workweek model was an

An Employee Engagement Model at Hindustan Petroleum Corporation Limited

Musarrat Shaheen and Shipra Srivastava***

Hindustan Petroleum Corporation Limited (HPCL), an oil and natural gas company which has many retail offices and depots all around India. The case revolves around the challenges faced by the human resource department of HPCL, examines the interventions and techniques needed to improve employee engagement for better performance management in the organization.

INTRODUCTION

Hindustan Petroleum Corporation Limited (HPCL) is an oil and natural gas company which has its headquarters in Mumbai and has many retail offices and depots throughout India and a few refineries. HPCL is known for working with the greatest efficiency in all its fields and for completing tasks within the timelines. The case revolves around the challenges faced by the human resource department of HPCL, where they had to analyze and find out ways to bring out interventions and techniques to engage employees and lead to effective and superior performance. The company has always kept its employees satisfied in all the aspects to keep them motivated and performing. But the human resource department was concerned about the most important asset of the company, the employee and their performance. They had a fear that the performance may go down owing to the dynamics and competition in the market. So, the experts look behind all the possible solution to bring the best possible engagement interventions for the employees.

The human resource department puts in a lot of effort to cope with the market changes such as process automation, customer delivery, and innovative marketing services. One of the ways to meet the changes is to keep the most viable resource i.e. employees productive and engaged. Hence, the human resource managers decided to work on further upgradation and improvement, of employee engagement strategies. But, owing to the continuous upgradation in the technologies and the techniques of handling it, the way of dealing with the employee engagement also needs to be innovative. The challenge was to identify the best alternative of making employees productive. It also requires coming up with quick improvisations of existing engagement techniques to make the employees more proactive and alert. The human resource department identified the differences between the existing productivity level and the expected level. In fact, the entire human resource department focused on molding the policy structure to bring about the desired increase in the productivity of the employees. The case revolves around new techniques that can be used to elevate employee engagement.

Bajaj Allianz – A Pioneer in Adopting Digital Technologies for Recruitment in the Insurance Industry

Jitesh Nair and Balaswamy Pasala***

The case study highlights the digital initiatives taken by Bajaj Allianz for the Human Resources function. It details how the joint venture company implemented automation and machine learning technologies in both its life (Bajaj Allianz Life-BAL) and non-life (Bajaj Allianz General Insurance Company - BAGIC) entities to make its recruitment process quick, seamless, and paperless. The case focuses on the robotic video interviewing function that was part of Tal.Port (an end-to-end automated Talent Acquisition platform) implemented by BAGIC that made the company more agile in the dynamic insurance industry. It also looks at 'i-RECRUIT', a first-of-its-kind mobile application designed for insurance agent on-boarding introduced by BAL.

"I'm happy to see the evolution of i-RECRUIT app over the year, and how it has enabled us to set yet another benchmark within the Indian life insurance industry. This simple to use app, designed for the Agency channel, has helped us make our Insurance Consultants recruitment process quick, seamless and paperless. This has helped us half the overall on-boarding time, which we have successfully translated into enhanced productivity for our Insurance Consultant & Sales Manager."[1]

– Manish Sangal, Chief Distribution Officer – Retail, Bajaj Allianz Life, in April 2018

"Taking Human Resources digital is as important as introducing digital services to our customers. In this era of Artificial intelligence and BOTS, we feel it is critical that HR should take the digital leap ahead as well, and I feel we have made assertive strides in the right direction."[2]

– Tapan Singhel, MD & CEO, Bajaj Allianz General Insurance, in May 2018

Bajaj Allianz, a joint venture between Bajaj Finserv Limited (formerly part of Bajaj Auto Limited), owned by the Bajaj Group of India, and Allianz SE, a German financial services company, had implemented automation and machine learning technologies in both its life (Bajaj Allianz Life – BAL) and non-life (Bajaj Allianz General Insurance Company – BAGIC) companies. These initiatives helped the companies to speed up hiring and save time and costs as well as have the flexibility to recruit pan-India.

BAGIC opted for the 'Workforce of One' approach in 2018 and redesigned strategies for all its human resource functions to ensure that its employees were actively involved and

Can Amazon Overcome Workplace Stress Through Up-Skilling at Its Fulfillment Centers?

Jitesh Nair and Balaswamy Pasala***

The case study deals with the conditions at Amazon's workplace and the up-skilling initiatives it took as a means to improve its work culture. Amazon, in July 2019, announced that it would spend $700 million on up-skilling 100,000 of its employees in the US by 2025. This was nearly one-third of the US workforce. Up-skilling 2025 would provide new training opportunities as well as build on existing programs such as those offered by Amazon Technical Academy, Associate2Tech, Machine Learning University, Growing Career Choice, Amazon Apprenticeship, and Amazon Web Services training and certification to close the cloud skills gap in the industry.

"*Pressure, Pain, and Productivity at Amazon is an eye-opening report documenting the pain suffered by the Amazon fulfillment center workers who are forced to work at dangerous speeds to ensure the packages Americans order arrive quickly*"[1]

– Dr. David Michaels, Former head of the US Occupational Safety and Health Administration, in 2019

"Amazon has a well-documented history of mistreating and dehumanizing its workers in the U.S. and around the world"[2]

– Stuart Appelbaum, President of the Retail, Wholesale and Department Store Union (RWDSU), in 2019

"*The future of work is now and the challenge is not just adapting to new technologies, but adapting to the dynamism of the economy, which will only accelerate. Amazon is demonstrating the new role employers must play to counter that challenge, fostering a new relationship with workers where maintaining and growing their skills is an imperative for business success.*"[3]

– Jason Tyszko, Vice President at the U.S. Chamber of Commerce Foundation, in 2019

With more than 640,000 employees worldwide, Amazon[4] had been included in LinkedIn's Top Companies list for four years in a row – 2018, 2017, 2016, and 2015; ranked #2 in the

Competency Mapping Process at EcelonRitter Design & Engineering Consultancy♦

Sruti Dey Sarkar, Musarrat Shaheen** and Debapratim Purkayastha****

This case is about the competency mapping process at EcelonRitter Design & Engineering Consultancy (EDEC), a business vertical of one of the world's leading steel manufacturing corporations. Shreya, a management intern at the company, had been given the task of setting up a competency mapping process for a newly created vertical of the company. She was also asked to identify if there was any competency gap and suggest ways by which the gap could be filled. The case discusses the requirement of employees in the company, the dilemma over whether to recruit people for the new vertical from external sources or from among existing employees, how competency mapping can be used to solve the problem, and the consequence of not solving the problem. It also defines what competency mapping is and the steps required to create an effective competency mapping process and its benefits. It also discusses the challenges.

On February 2020, Shreya, an HR intern at EcelonRitter Design & Engineering Consultancy Private Limited (EcelonRitter), was tasked with putting in place a competency mapping process for a newly created vertical of the company. She found herself facing the task with mixed feelings of excitement, curiosity, and nervousness. Her prior education had made her conversant with different concepts in Management and Human Resource Management. However, now that she was getting an opportunity to apply these concepts, she felt a bit overwhelmed. The new vertical had been created to provide project management consultancy related services to the parent company and required resources with a very specific set of competencies. Identifying the existing resources in the company that possessed those competencies was the main objective. Shreya was also asked to identify if there was any competency gap and to suggest ways by which the gap could be filled.

BACKGROUND NOTE

EcelonRitter Design & Engineering Consultancy Private Limited (EDEC) was a business vertical of EcelonRitter Steel Corporation (EcelonRitter), one of the world's leading steel manufacturing corporations based out of Kolkata, a metropolitan city in eastern India. Since its inception, EDEC had acted as a resource base to cater to the engineering and consultancy needs of EcelonRitter plants located worldwide. EDEC was involved in the architectural, engineering, and other technical consultation activities of its parent company and did not provide services to any external client.

L'Oréal's FIT Culture App: A Culture Acclimatization Tool

Jitesh Nair and Balaswamy Pasala***

The case study deals with L'Oréal's efforts to integrate new employees into the company and its culture. In 2005, L'Oréal, developed a comprehensive on-boarding "Follow-Up and Integration Track (FIT)" program. This was a formal integration/induction program designed to help new employees learn to adapt to its culture. To better support and onboard its new employees all over the world and align itself with the digital learning trends of millennial employees, the company developed the FIT Culture App in 2017. The app was designed to assist its newcomers understand the unique company culture and key values through challenges, personal stories, and videos and was made available in 11 languages.

"Our objective with the Fit Culture App is to take our onboarding practices to the next level and to give each and every employee, from the moment they arrive, the keys to succeed in full alignment with company values such as multiculturalism, diversity and inclusion."[1]

– Laurent Reich, Director of International Learning Practice at L'Oréal, in June 2017

INTRODUCTION

In 2017, L'Oréal SA, the world's largest cosmetics company, digitalized its on-boarding system called the Follow-up and Integration Track (FIT) program and developed the FIT Culture App, the world's first mobile HR app. The app was designed to help around 10,000 new employees per year understand, decode, and master L'Oréal's culture within a month of joining the company.

L'Oréal S.A. was founded by Eugène Schueller in 1909. Headquartered in Paris, France, it operated in the beauty products, cosmetics, personal care, consumer products, luxury, and pharmacy segments. As of 2019, it was present in 150 countries and had 86,000 employees.

One of the primary areas of concern for L'Oréal's top management was integrating its new employees into the company and its culture. This was because the company had experienced a high employee turnover (nearly 15 percent) till 2004. In 2005, L'Oréal developed its comprehensive FIT program to ensure that the company engaged its staff at the earliest possible stage after joining[2]. It pursued this program till 2017 when the management found

Sales Force Compensation Best Practices at HubSpot

Jitesh Nair and Balaswamy Pasala***

The case describes how sales compensation plans that were at the heart of HubSpot's sales strategy, powered its growth from $0 to $100 million in just seven years of its founding. HubSpot believed that its sales compensation plan had to be simple and clear for sales representatives. It believed that greater impact could be realized only through properly aligning the compensation plan with revenue. The company also believed that it was important to immediately reward the sales team.

"When I look back on the various strategies I used to grow our sales force from zero to several hundred people, I realize that one of the biggest lessons I've learned involves the power of a compensation plan to motivate salespeople not only to sell more but to act in ways that support a start-up's evolving business model and overall strategy."[1]

– Mark Roberge, Advisor, Former Chief Revenue Officer, HubSpot, in 2015

INTRODUCTION

HubSpot, an American developer and marketer of software products for inbound marketing, sales, and customer service, was founded by Brian Halligan and Dharmesh Shah in 2006. Its revenues grew to $100 million within just seven years of its founding. The increase in revenues was attributed to the best practices in hiring and training and the compensation plans created for the sales teams at HubSpot by Mark Roberge (Roberge) who joined the company as Vice President, Sales, in 2006.

Roberge believed that sales compensation plans should be at the heart of its sales strategy. HubSpot adopted three different sales compensation plans on its way to reaching $100 million in revenues. As an early-stage start-up, its top priority in 2006-07 was to increase its revenue and the sales compensation plan rewarded the sales team for customer acquisition. Roberge soon realized that many customers were cancelling their subscriptions to the company's SaaS[2] products after a few months. He altered the compensation plan in 2009 to focus on revenue retention where the sales team were rewarded for lowest customer churn rate[3]. Sustained profitable growth was the next goal for HubSpot and to achieve this, Roberge revised the sales compensation plan in 2012 with the focus being on cash inflow. The company motivated its sales team to sign annual contracts and get paid 100% commission immediately rather than just focusing on signing monthly deals.

SBI's Nayi Disha – An Initiative to Ensure Work-Life Balance

Jitesh Nair[*] and Balaswamy Pasala[**]

The case describes the State Bank of India's (SBI) initiative to ensure a work-life balance for its more than 200,000 employees. SBI realized that a large number of its employees were working overtime or on holidays to meet their targets and this had led to low motivation and morale among most of them. The result was that many of these employees performed their jobs mechanically. The case describes the Nayi Disha initiative, a phase-wise ongoing employee engagement program to drive home the significance of being agile, inculcating the bank's values through employee engagement, and enhancing customer centricity.

"This was getting to be a serious problem in the bank. Because of work pressure people were coming to office on all days of the week without taking a leave."[1]

– Prashant Kumar, Deputy MD (HR) SBI, in 2018

"Our belief that Nayi Disha will infuse a fresh sense of optimism amongst our valuable employees, has been proven right, and we will endeavour to engage our human capital in best possible manner at all times."[2]

– Rajnish Kumar, Chairman SBI, in 2020

INTRODUCTION

The State Bank of India (SBI), one of the largest banks in India by market capitalization and assets, noticed that a large number of its employees were working overtime or on holidays to meet their official targets. The bank, which had 156,964 employees and 107,077 officers manning its 22,414 branches as of March 31, 2018[3], realized that this had led to low motivation and morale among most employees, with the result that they were performing their jobs mechanically. Fearing that this would have a negative effect on customer service, especially when there was intense competition in the Indian banking sector, SBI issued a circular on October 30, 2017, to its employees related to work life balance. SBI believed that while monetary issues were important, the quality of life of an officer in terms of the time he/she was able to spend with family and on social obligations was equally important.

Later, in February 2019, SBI launched a new employee-engagement program, Nayi Disha, which also involved the employees' spouse. The program aimed to help employees and

Unilever's AI-Powered Internal Talent Marketplace Unlocks Workforce Capacity

Jitesh Nair[*] *and Balaswamy Pasala*[**]

The case describes Unilever's initiative to implement a new AI-powered internal online talent marketplace, 'FLEX Experiences'. The case focuses on how Unilever followed an entrepreneurial approach in developing FLEX by developing a 'minimal viable product' (MVP) and testing it on a small group of employees, followed by a phased roll-out across the organization over two years to cover 100,000 employees. The case then touches upon how the AI platform benefited both the company and its employees in various ways. FLEX offered great support to Unilever when business agility became critical for business continuity during COVID-19.

"We wanted to bring agility to placing the right people, in the right place, at the right time and to allow employees the opportunity to work in collaborative empowered networks. This project was about augmenting AI-enabled technology to disrupt the way we develop our talent and how we staff teams up and down in a flexible way, to unlock capacity and focus on growth."[1]

– Jeroen Wels, EVP Human Resources at Unilever, in December 2020

"In today's competitive workforce, internal mobility is mission critical. 94% of employees say they would stay longer in a company that invests in their career, positioning InnerMobility as the ultimate tool for organisational growth. We have been working closely with Unilever and the Unilever Foundry over the last 12 months to deliver a platform for their employees that will revolutionise how people build a career within the company, unlocking potential and development.[2]

– Ben Reuveni, CEO of Gloat, in June 2019

INTRODUCTION

On June 24, 2019, British-Dutch multinational Unilever introduced a new internal online talent marketplace, 'FLEX Experiences' (FLEX). The AI-powered internal talent marketplace mapped Unilever employees with new career opportunities and projects. The platform was first piloted in 2018 and by mid-2020 was rolled out across Unilever to 100,000+ employees in 12 business areas in 90+ countries. FLEX helped Unilever increase

WestJet Uses #hackinthehangar to Be Future Ready

Jitesh Nair and Bitra Vasudev***

The case describes the various initiatives taken by the management of the Calgary, Canada-based airline WestJet to prepare itself for the future. WestJet recognized the need for embracing digital technologies to streamline its operations and customer experience as it sought to transform itself from a budget carrier into a global network airline. The company's management also realized that despite the regulations, the airline industry was bound to be disrupted by digital technologies. They understood that unless it embraced change and a working culture that supported change, it would not be able to shift from the traditional airline culture.

"WestJet's first hackathon represents a cultural shift toward more innovative thinking at WestJet. We will move fast, learn fast and build fast. We now have an opportunity to do things differently and to innovate in the travel space like has never been done before."[1]

– Ed Sims, WestJet President and CEO, in August, 2018

INTRODUCTION

WestJet was established in 1996 by Clive Beddoe in Calgary, Canada, to provide affordable air travel to domestic passengers. The no-frills[2] airline achieved tremendous success within a short time with 1.6 million air travelers opting to fly with it in 1998.[3] The company spread its wings outside Canada by flying to destinations in the US in 2004 and Europe in 2014. In just two decades, WestJet grew to more than 13,000 employees, covering over 100 destinations in North America, Central America, the Caribbean, and Europe and an additional 175 destinations in over 20 countries through partnerships.

In 2018, WestJet's management decided to transform the company into a global network airline[4] and accordingly acquired Boeing 787-9 Dreamliner aircraft with luxurious business class cabins. As a part of its operational transformation, the company created and implemented digital solutions that adopted the latest digital products and services such as artificial intelligence (AI) driven solutions to offer a seamless flying experience – initially to business class travelers, and then to economy class passengers. The decision to implement digital technologies in the company was also driven by the realization that the traditional airline industry, which was saddled by operational issues, low profit margins, and numerous regulations that prioritized passenger safety, would no longer be immune to digital disruptions as it was just like any other consumer product. WestJet created the position of the

Women Empowerment at HCL Technologies

Jitesh Nair and Balaswamy Pasala***

The caselet describes HCL's gender diversity and inclusivity initiative that helped empower its women employees. It focuses on how the company's women empowerment programs and initiatives helped HCL create an inclusive, open, and transparent culture. Women empowerment programs helped HCL increase the number of women in senior leadership in fiscal 2020 by 30 percent from fiscal 2019. The gender diversity ratio for senior leadership also increased from 5.4 percent in fiscal 2019 to 7.5 percent in fiscal 2020. HCL was also recognized by various associations and industry forums across the globe; its awards included NASSCOM's Award for Excellence in Gender Diversity in 2019.

"Going a step further and putting together focused programs that nurture women leaders is crucial, as some of the leadership challenges and opportunities faced by women are unique; thus the need to go a little deeper to understand those nuances and enable them accordingly."[1]

– Subrat Chakravarty, Senior Vice President, HR at HCL Technologies in 2017

"A commitment to diversity and inclusion has been woven through the fabric of HCL Technologies's culture since its very inception. As a company we are particularly focused on advancing gender diversity in the company's management and executive ranks and to empower women to maximize their potential and aspirations."[2]

– Anant Gupta, CEO, HCL Technologies in 2014

INTRODUCTION

HCL Technologies (HCL), an Indian multinational technology company specializing in information technology services and consulting, was ranked number 30 on Forbes' list of 'The World's Best Employers' released in 2021.[3] HCL, with headquarters in Noida, Uttar Pradesh, India, was the only multinational company based in India to be featured in the top 50. This recognition was given for the company's excellent work environment that included the firm's image, social responsibility, economic footprint, talent development, career opportunities, gender equality, and inclusion.[4] *"We dedicate this prestigious recognition to our employees as all 159,000 ideapreneurs drive our brand with enthusiasm, passion and innovation. This distinction is reflective of our people-centric culture and commitment, deep*

Diversity Metrics at Google

Sharda Singh and Indu Perepu*******

Google LLC, the US-based multinational technology company whose mission is to "organize the world's information and make it universally accessible and useful," considered diversity, equity, and inclusion as business imperatives. According to Google, it was committed to increasing workforce representation and to creating a more inclusive culture. It came out with its first Annual Diversity Report in 2014, and over the years, the reports showed how the company had been building a more representative workforce. This case study is about the Diversity Report published in 2019. The students are asked to check Google's claims about growing diversity and inclusivity in its workforce against this report.

Google LLC, the US-based multinational technology company, was founded in 1998 by two Stanford students, Larry Page and Sergey Brin, as an online search company. Over the years it grew rapidly and added several products and services like mail, browser, the Android operating system for mobile phones, cloud storage, etc. In 2015, it formed a new holding company called Alphabet to oversee its highly lucrative internet business and a growing flock of other ventures. Google then began functioning as a subsidiary of Alphabet. By 2017, Alphabet's annual revenue was $100 billion.

Google's mission was "to organize the world's information and make it universally accessible and useful."

Over the years, Google spread out across the world and as of 2019, it was operating from 69 locations in the US and Canada; 8 in Latin America; 41 in Europe; 28 in the Asia-Pacific Region, and eight locations in Africa and the Middle East. As of 2019, Google employed more than 100,000 people around the world.

In 2014, Google published its first Diversity report, where it revealed the company's diversity figures. While publishing the report, it announced, "Google is committed to creating a diverse and inclusive workforce. Our employees thrive when we get this right. We aim to create a workplace that celebrates the diversity of our employees, customers, and users. We endeavor to build products that work for everyone by including perspectives from backgrounds that vary by race, ethnicity, social background, religion, gender, age, disability, sexual orientation, veteran status, and national origin."

The diversity report of 2015 showed that 69.4% of the workforce was male, and that 79.2% of those in leadership roles were men. When racial diversity figures were considered, 64.5% of the employees were white, 31.5% Asian; 4.5% LatinX; and 2.4% blacks. Women comprised 16.6% of the tech workforce and occupied 20.8% of the leadership positions. (Refer to Table I to Table for the other details of the diversity data at Google)

From then on, Google came out with diversity reports every year. The report for the year 2019 (that gave statistics for the year 2018) showed that Google's workforce comprised

Ruckus @ Wistron India

Raghavendra Sode and Kalaa Chenji***

The case deals with the violent protests that broke out in Wistron's Narasapura unit near Bengaluru. Wistron, one of the leading suppliers of Apple's phones in the world, had to shut down the factory at Narasapura after protests by employees turned violent on December 12, 2020. A thorough investigation by police and appointed auditors found violation of labor codes by the workforce contractor and management negligence in dealing with the grievances of employees, leading to an industrial dispute. Wistron reworked its organizational processes, took corrective actions, and finally restarted its operations on March 17, 2021.

"They quickly expanded. Only in August did this facility go into operation. The plant did not exist prior to the month of August. All of the hiring took place during the last 3 or 4 months. They got permission for 5,000 people to work but increased to 9,000 without approval. Perhaps there was a higher level of interest. This was the time when they switched to 12 hours shift from 8 hours."[1]

– Gaurav Gupta, Karnataka Government Representative

"...We acknowledge that as we grew and made errors. Some of the processes such as labor agency management and payroll process need to be enriched. We are taking prompt measures to address the issues, including disciplinary procedure."[2]

– Wistron Spokesperson

INTRODUCTION

Wistron Corporation, a Taiwan-based iPhone manufacturer with a manufacturing facility in Narasapura in the southern Indian state of Karnataka, made headlines after employees went on the rampage and indulged in vandalism at the plant on December 12, 2020. Trouble began around 6 a.m. that day when the night shift ended. Employees caused property damage by breaking glass panes, doors, and furniture, and even attempted to set fire to vehicles. The employees' unrest was triggered reportedly due to the failure of the company to pay the salaries promised at the time of hiring. Reportedly, engineering graduates were paid Rs.12000 instead

Employee Happiness at TCS

Jitesh Nair[*] and Balaswamy Pasala[**]

The case describes TCS's focus on creating a happy, healthy, inclusive, and vibrant work culture. To create such a work culture, its HR team introduced employee engagement activities from time to time. The case touches upon employee engagement activities that encompassed various facets of the work culture and included regularly appreciating the performance of the employees, ensuring continuous communication and feedback to them, and offering them learning and development opportunities. TCS introduced the 'Star of the Month' program to recognize and appreciate the efforts of its employees on a regular basis. The company rolled out the 'Pulse' survey which provided an opportunity for the employees to grade their satisfaction levels across all aspects of the business.

"At TCS, we employ passionate, empowered and driven employees who are encouraged to make their voices heard in providing first-class service to our customers and creating a happy and healthy work culture for all. This is supported by our many programs that give people opportunities to constantly acquire new skills, take on promising new roles or actively be involved in our various local and nationwide community impact programs."[1]

– Surya Kant, Chairman, North America, TCS, in 2020

"We are happy that we are able to keep engagement going. We were wondering if initial excitement would tail off, but it hasn't – if people see something is relevant then they keep doing it."[2]

– Satya Ramaswamy, Vice President and Global Head of Digital Enterprise, TCS, in 2015

INTRODUCTION

In February 2020, Tata Consultancy Services (TCS), a leading provider of information technology services and consulting, headquartered in Mumbai, India, was recognized as a Global Top Employer for the fifth consecutive year by the Top Employers Institute. TCS attributed this back to back global recognition to its HR policies that focused on employee happiness. Milind Lakkad (Lakkad), Global Head of Human Resources, TCS, said, *"This recognition from the Top Employers Institute is a testament to the culture of life-long learning and collaboration that we have engendered, our investments in people, and our progressive policies, all of which have resulted in a vibrant, empowering workplace."*[3]

TCS wanted its employees to have fun and to be inspired, excited, and valued every day at work. To achieve this positive and enjoyable workplace, TCS focused on creating a happy, healthy, inclusive, and vibrant work culture. This was possible as a result of many employee

IRCTC Announces Termination of Contract Workers – A Step in the Right Direction?

Jitesh Nair and Balaswamy Pasala***

The case focuses on the interests of contract workers who are part of the alternative work arrangements being increasingly adopted by companies. It first describes the objectives of Indian Railways and its arm, the Indian Railway Catering and Tourism Corporation (IRCTC), to hire contract employees as part of their operations plan. The case then talks about the common reasons given by these employers for terminating the contract workers. It touches on the concerns raised by the contract workers with regard to their termination. It ends with a look at a few policy initiatives taken up by Indian Railways to safeguard the interests of contract workers and the future plans of the railway operator to privatize operations.

"In view of partial attendance due to lockdown, and also greater risk involved in the case of those above 60 years due to Covid-19, it is decided that the services of all the re-engaged retired staff of all workshops of Southern Railways as per the details of given below are to be terminated duly given 15-days-notice."[1]

– Notice by Southern Railway, May 2020

INTRODUCTION

On June 25, 2020, Indian Railway Catering and Tourism Corporation (IRCTC)[2], the extended arm of the Indian Railways (IR)[3], issued a letter to all the four zonal headquarters (East in Kolkata, West in Mumbai, South in Chennai, and South Central in Secunderabad), asking them to terminate the contracts of 560 contractual employees. Before that, on May 5, 2020, the South Zone of IR terminated 368 retired employees who had been re-engaged in workshops. The termination giving 15 days' notice was served through SMS, WhatsApp, and email. The common reason for the terminations in both cases was the need to cut down on costs owing to the termination of passenger rail services in India due to the COVID-19 pandemic.

The Indian Railways had announced in late March 2020 that it would release full salaries to all contract employees working in the railways network, including all onboard cleaning staff and house-keeping service and pantry car staff. The Railway Board had also advised all zones to

Labor Unrest at Wistron's iPhone Facility in India

Jitesh Nair and Balaswamy Pasala***

The case describes the various factors that led to the outbreak of violence at the iPhone manufacturing facility of Wistron Infocomm Manufacturing (India) Pvt. Ltd (Wistron) at Narasapura in the southern Indian state of Karnataka. The case focuses on the details of violent unrest on December 12, 2020, when thousands of contract workers and some outsiders vandalized Wistron's Narasapura facility alleging their salaries had been reduced and that payments had been delayed for over six months. The case details the preliminary enquiries initiated by the Karnataka State Labor Department, The Department of Factories, Boilers and Industrial Safety, and Apple which found several violations by Wistron and its contractors. The case ends with the corrective measures taken by Wistron and the possible direct impact of this event on the company's future and its supplier relationship with Apple.

"They went up from 2,000 employees to nearly 10,000. The unprecedented increase in workforce in a rather abnormal pandemic situation impeded their ability to put systems that would have enabled them to discharge their fiduciary responsibilities."[1]

– A Quess Corporation Employee on December 17, 2020

"Though 10,500 workers are employed in the factory the HR department has not been adequately set up with personnel of sound knowledge of labour laws."[2]

– Department of Factories, Boilers, Industrial Safety & Health, Karnataka, December 16, 2020

"This issue has continued for over four months now. Initially, there were three shifts which were converted to two shifts with 12 hours duty and four hours overtime. The company is not paying salaries for the overtime and it has also reduced the promised salaries to the employees."[3]

– Krishna Siddi, All India Trade Union Congress Member, December 15, 2020

INTRODUCTION

On December 12, 2020, the iPhone manufacturing facility of Wistron Infocomm Manufacturing (India) Pvt. Ltd (Wistron)[4], at Narasapura in the southern Indian state of

Yokohama Off-Highway Tires: Empowering Women Employees and First-Time Managers Through Focused L&D Programs

Jitesh Nair and Balaswamy Pasala***

The case describes the initiatives taken by Yokohama Off-Highway Tires (YOHT) on the issues of employee diversity and development. In line with the focus on internal branding by its parent company Yokohama Rubber Co. Ltd. (Yokohama) and the strategic role of YOHT in the global strategy of Yokohama, the management decided to increase its focus on learning and development programs for early and mid-level managers. It also planned to increase employee diversity at its manufacturing facilities by hiring women employees who would comprise a large part of the total workforce.

"*The objective is to ensure that managers across levels are able to understand how to manage themselves, their teams and the stakeholders. Therefore, the goal is to prepare a senior manager to nurture a coaching mindset and then work on making the upcoming manager more effective.*"[1]

– Rajeev Singh, Chief Human Resources Officer, YOHT, in March 2021

"When we started hiring women, we were too skeptical as we had too many apprehensions. But, we were so surprised by their promptness, productivity which is much higher than their male counterparts and 100 per cent safety on the all-women shopfloor."

– Nitin Mantri, Yokohama India Group Head and Director YOHT, in March 2021

INTRODUCTION

In October 2020, the Japanese company Yokohama Rubber Co. Ltd. (Yokohama) consolidated its global off-the-road (OTR) tire business operations under a new single entity Yokohama Off-Highway Tires[2] (YOHT).[3] Yokohama had a leadership development program in place across its businesses. Post the consolidation, the YOHT management decided to increase its focus on learning and development programs in the new entity for early and mid-level managers since they would play a key role in the growth of the newly consolidated

Training Analysis at Mesotime

Rupali Chaudhuri and Sashikala Parimi***

The caselet is about a small pharmaceutical company in India. Shyam, the Unit Head HR, was faced with tough questions on whether training given to the employees was effective. While he had certain notions on why employee training had been required during the past year, he wanted to use HR analytics. He wanted to understand whether there was any correlation between the training programs and improvement in employee performance within the company so that he could take remedial measures.

INTRODUCTION

Shiva Kumar Shyam (Shyam) was happy. As head of the training department of Mesotime for the last 2 years, he was proud of his training team's achievements. The team had achieved the target given to them with regard to total training mandays of 811 days *(Refer to **Exhibit I**)*.

Mesotime was founded in 1974 by Dr. VV Rameshwar, a scientist and entrepreneur. It was one of the few companies in India that had reached Phase III of the clinical trials[1] for its in-house drug, MESOPHARMET, on a few hundred people. Over 40 years, the company had been able to execute 4 drug discoveries in collaboration with medium sized biopharmaceutical companies. The company had earned a good reputation in the Biosimilars[2] market in India because of its quality research and on-track record. Mesotime had 447 employees and worked out of 3 sites, namely, Charlapalli, Hyderabad, and Vishakhapatnam in the southern Indian states of Telangana and Andhra Pradesh. Charlapalli was the research and development center while Hyderabad was the sales center and the head office of Mesotime and Vishakhapatnam was the production unit. Mesotime was trying to enter the Emerging market[3] and was actively looking for opportunities to partner with other local companies.

Thinking back to the days when he had first joined the company, Shyam remembered that many of the business leaders had not been happy at all with the training department. The company had stopped all soft skills training as it believed this training was not a value-add function for the employees. Those were really tough times, Shyam thought to himself. But then, those days were history. One of the first things he had done after joining work was to meet business leaders, department heads, team leaders, HR leaders, shop floor managers,

Employee Experience at Pandora

Rupali Chaudhuri and Debapratim Purkayastha***

The case is about the employee experience initiatives at Pandora Media Inc. (Pandora) that aimed at creating a positive work environment at the company. The HR system at Pandora was designed in such a way that every employee could contribute to it as their unique experience with the company. Employee experience at Pandora revolved around its music business, which the company felt was a great way to make employees relax and to motivate them to work in a more productive way. Pandora initiated a number of innovative programs to boost the morale of its employees through better work place management and manager-employee relationship. Its internship program for self-motivated college students laid the foundation for shaping its recruitment system.

In 2016, Pandora Media Inc. (Pandora) was ranked 47th in the list of 'Best Places to Work'[1] by the Advertising Age[2] and Best Companies Group[3] for its unique employee experience initiatives. Promoted as an internet-based music radio company, Pandora considered music to be an individual's choice and adopted a similar personalized approach to employee experience. The employee experience at Pandora ranged from the employees working out their own agreements with their managers on how they preferred to work and what they expected, to decisions related to the different Pandora employee resource groups and the voluntary hours they worked.

Founded by Tim Westergren (Westergren), Will Glaser, and Jon Kraft in 2000, Pandora was one of the first music streaming and internet-based music radios in the world. Started with a mission "To enrich people's lives by enabling them to enjoy music they know & discover music they'll love, anytime, anywhere,"[4] Pandora aimed to create a separate, individualized radio station for each of its customers. The idea behind the company's launching music radios was that customers would be able to listen to the music they preferred without any advertising breaks. The company employed a team of 25 trained musicologists who analyzed the attributes of each song and delivered hours of personalized music as per the varied tastes and preferences of consumers. Pandora's Music Genome Project[5] consisted of 450 distinct musical attributes that covered the qualities of melody, rhythm, lyrics, and harmony. The company shared with the music artists various data like how many songs had been played? how many listeners heard the song over time. This data helped artists to understand the fans they were connecting with. Pandora provided a platform where fans could purchase tickets to

Industrial Relations Issues at Honda Motorcycle and Scooter India

Indu Perepu[*] and Debapratim Purkayastha[**]

This case is about the labor unrest at Gurugram, India-based Honda Motorcycle and Scooter India (HMSI), a wholly owned subsidiary of Honda Motor Company, Limited, Japan. Trouble started after the management of HMSI asked 200 temporary workers to go on leave on November 5, 2019. The company claimed that the workers had been laid off due to a slowdown in the automobile sector due to sluggish growth in the Indian economy, which had led to reduced production. About 2000 contract workers went on a tool down strike, and were soon joined by permanent workers. The members of the HMSI union claimed that production was going on normally at the company's other plants, and demanded compensation for the retrenched workers. The management of HMSI gave a call to the permanent workers to join duty by the end of November. While many employees rejoined after signing a good conduct agreement, union members claimed that without the contract workers it would not be possible to resume production. While the impasse continued, HMSI continued to produce vehicles at its other plants and the contract workers were left staring at an uncertain future.

It was November 5, 2019, and the day started out like any other day for the workers of Honda Motorcycle and Scooter India (HMSI) plant at Manesar in Gurugram district of the north Indian state of Haryana. But as the workers headed toward the plant to report for duty, some of them were stopped at the gates. The management prevented 200 contract workers from entering the plant, and asked them to go on leave for three months. The workers started protesting and, soon, others joined them. A total of 2,000 contract workers went on a tools-down strike.

The Indian automobile market had been facing tough times and both the car and two-wheeler markets had been adversely impacted by sluggish growth in the economy. The two-wheeler market had witnessed a decline for seven continuous months and, in the first nine months of 2019, it fell by 10 per cent. HMSI, the second largest player in the market, saw sales of its scooters fall by 21 per cent and that of motorcycles by 13 per cent. In October 2019, HMSI's sales dropped to 517,808 units from 521,170 units in October 2018.

The slowdown prompted the company to cut down production at its Manesar plant, which manufactured 3,000 vehicles a day. The management announced, *"Based on demand fluctuations and production adjustment, 200 contractual members whose term had been completed are relieved from their work. Necessary recruitment will be considered on the basis of future market requirements."*

By November 7, the permanent workers also joined the demonstration against the management, and 1,800 workers remained inside the plant, holding demonstrations.

THE WORKERS' GRIEVANCES

According to the workers union, HMSI's Manesar plant had 1,900 permanent workers and 2,500 contract workers. The workers union president said that many of the workers who were

Tata Sky's Innovative Human Resource Management Practices and Work Culture

Jitesh Nair and Balaswamy Pasala***

The case describes Tata Sky's HR initiatives that helped it get the best out of its employees and also contributed to its business objectives. Revamping of the HR initiatives helped Tata Sky to smoothly switch to a productive work-from-home scenario mandated by the lockdown during the COVID-19 pandemic. The company used the pandemic as a springboard to create a world with happier employees and customers.

"You don't have exclusive content, technology or distribution to offer, because your competitors can offer the same. So, we decided service would be our point of difference. Service is very process-based and needs people to make these processes our own. That can't be replicated overnight."[1]

– Harit Nagpal, CEO, Tata Sky, in 2020

"At Tata Sky we always prioritized the well-being of our most important assets - employees. We hence believe in nurturing the concept of 'Be your own CEO' with just the right amount of guidance and a collaborative environment as we now have."[2]

– Sangram Chavan, Chief Human Resources Officer, Tata Sky, in 2018

INTRODUCTION

The Mumbai, India-based Direct to Home (DTH) operator, Tata Sky[3], that provided a comprehensive bouquet of television channels and platform services, had a non-hierarchical and flat structure exemplified by its 'Be Your Own CEO' approach to work and the 'open office' infrastructure at key locations. Such a culture which its use of technology complemented, helped Tata Sky consistently build innovative and pioneering products and services and become the market leader in DTH services in India with a 32 per cent market share (in June 2020). The company reported an operating income of Rs.46.91 billion in fiscal 2020.

To enhance and improve employee collaboration and the communication between employees and customers, the company decided to adopt a non-hierarchical and flat structure. Tata Sky believed that each of its employees needed to be given the opportunity of working like their CEO (Chief Executive Officer) so that they would come up with innovative ideas and execute them with passion and accountability. The new open office design complemented

Adecco India: Leveraging AI and Computer Vision Technologies

Jitesh Nair and Balaswamy Pasala***

The case describes Adecco India's initiative to implement Artificial intelligence (AI) and Computer Vision technologies to withstand competition due to changes in the Indian business sector in the face of the coronavirus pandemic. It focuses on Adecco India's requirement to implement digital technologies to speed up its recruitment activities and improve productivity as part of its digital strategy. AI and Computer Vision technologies helped automate time-consuming tasks like candidate screening and interview scheduling, helping the recruiter to focus only on the final filtering process and provide real value to clients. The digital strategy was in line with the company strategy to create significant differentiated value to clients by focusing only on the parts of the value chain where it had an advantage over other players in the staffing services sector in India.

"We have a huge capability to invest and work with the latest technologies. To transform internally as a part of our digital transformation, we look at tech as the enabler and not as the end goal."[1]

– Ramesh Alluri Reddy, Director-Managed Services & Professional Staffing, Adecco India, in 2021

"We are looking at creating significant differentiated value to clients by focusing only on the parts of the value chain where we believe we have an advantage with the competition, and we can provide real value to clients."[2]

– Marco Valsecchi, Country Manager, Adecco India, in 2019

INTRODUCTION

Adecco India (Adecco), a unit of the Adecco Group, a Swedish human resources provider, took up an internal digital transformation initiative to withstand competition due to changes in the Indian business sector in the face of the corona virus pandemic. Since Adecco operated in the talent acquisition space, it had to act quickly to ensure business continuity. The company decided to leverage technology to advance, complement, and even disrupt its existing business in order to stay attuned and relevant to the workforce needs of companies in India. As part of its digital transformation, Adecco adopted Artificial Intelligence (AI) and 'Computer Vision technologies especially to speed up its recruitment activities and improve employee productivity.

Sanofi Canada Overcomes Resistance to Change Through Change Ambassadors

Jitesh Nair and Bitra Vasudev***

Sanofi Canada (SC) had been witnessing a drop in revenues since 2005 when its exclusive rights to a number of medicines started to expire and patients began to switch over to low-cost generics. Consequently, SC laid off employees, and in 2011 decided to sell off its dermatology business, Dermik. The sale also included the company's existing 45-year-old head office building. These developments had an adverse impact on employee morale, leading to higher attrition rates. Jon Fairest (Jon) took over as CEO in 2012 and was immediately tasked with shifting the head office to a modern facility with an open-plan working environment. Jon along with a steering committee that comprised top management members and personnel from the Communications and Human Resources teams developed a year-long change management campaign. The change leadership strategy focused on empowering employees to actively take part and support the forthcoming change. In line with this strategy, 30 employees were roped in as Change Ambassadors to educate their peers about the transitions.

"At Sanofi Canada, by engaging a total audience of over 425 employees we were able to seize upon a required facility change to precipitate a fundamental shift in organizational culture."[1]

– Jon Fairest, CEO, Sanofi Canada (2012-2015) in July/August 2014

INTRODUCTION

Since 2005, the revenues of Sanofi Canada (SC), an affiliate of Sanofi[2], had been dwindling as its exclusive marketing rights[3] to a number of medicines began to end and inexpensive generic drugs started eating into its sales. To counter falling revenues, SC implemented a number of downsizing initiatives, including employee lay-offs. In 2011, it decided to sell its dermatology business, Dermik, which included the company's existing 45-year-old head office building. These actions adversely impacted employee morale and, as a result, the attrition rate peaked to 15% in 2012. Jon Fairest (Jon) took over as the CEO the same year and was immediately tasked with shifting the company's headquarters from the antiquated 45-year-old building with closed offices, insufficient natural light, and shortage of open meeting spaces at Saint-Elzéar Boulevard West in Laval, Quebec, to a modern building with

Recruitment Indexes: The Key to Measure Recruiter Effectiveness

Chetna Priyadarshini[*] and Rajneesh Ranjan Jha[**]

This caselet is about a senior HR manager of a large textile company, who along with her team conducted a mass recruitment drive. It gives basic facts and figures pertaining to the response time, time to fill the jobs, time to start, cost incurred on recruitment, acceptance rate, and quality of hires. The caselet should help the students in understanding the different recruitment indexes involved in the measurement of recruiter effectiveness. It will also help students in understanding the recruiter effectiveness at face value or actual raw data result, overall average percentage of effectiveness, and weighted evaluation of recruiter effectiveness. Furthermore, with the limited time and budget allocated to the hiring exercise, the students as future managers should be able to calculate the key recruitment indexes and do the cost-benefit analysis.

INTRODUCTION

Anandi Textiles Private Limited, a large textile manufacturing company with headquarters in Mumbai, had recently expanded its operations into the eastern and southern parts of the country. During the calendar year 2019, the company undertook a massive recruitment drive and hired 1390 people for middle level positions. After completion of one year of its operations in the south and east in 2020, the CEO of the company wanted to review the outcomes of the recruitment drive and assess whether it had been effective. Given the time invested and the huge costs incurred by the company on the recruitment drive, Ms Avantika, senior Human Resource (HR) manager of the firm, was assigned the task of making a presentation on its effectiveness at the annual board of directors meeting. Ms Avantika immediately called the team of HR executives and started gathering all the data required to measure the effectiveness of the recruitment drive conducted by her along with her team in 2019. Having been the senior HR manager in the company for the 8 years, Ms Avantika knew that this review would be a part of performance appraisal for her department colleagues and that the increments and promotions of her team members would depend largely on the indexes used for calculating the recruitment effectiveness and the method used to compute them.

After being supplied with all the recruitment related data by her colleagues, Ms Avantika started highlighting the data she thought would be relevant for the presentation. While she went on to review the data, she noted that the date of receipt of the job requisition was April 18, 2019. Further, she noted that it was on May 29, 2019, that the first qualified candidate was referred for an interview. The first offer was accepted on June 17, 2019, and the new hire started working on June 26, 2019.

ActiPass: The Road Ahead†

Ranjan Jaykant Sabhaya, Harsheshkumar Ramanlal Patel**
*and Jayshree Siddhpuria****

This Case Study is about how a young entrepreneur implemented a new idea in real business life. It describes the journey of the ActiPass organization, which is a platform that helps parents discover and book extracurricular activities for their children. The organization was launched in mid-2019 and it started with a subscription-based Unlimited Pass for Rs.1,499 per month for a bunch of activities in the Vapi region of Gujarat. In March 2020, the Indian government announced a countrywide lockdown due to the COVID-19 pandemic. In June 2020, Actipass began working in the online mode. It is active in different countries like the UAE, the UK, South Africa, and India. In India, it operates in various cities like Mumbai, Delhi, Surat, Ahmedabad, Hyderabad, and Vapi. This Case Study narrates the various traits required for entrepreneurship through the narration of the journey of ActiPass.

INTRODUCTION

ActiPass, a pioneering organization in India which offers online extracurricular classes for children, was founded in mid-2019 by Kunal Dedhia and Kunal Shah who are childhood friends and belong to Vapi region. ActiPass, short for Activity Pass, was an aggregator of extracurricular activities that allowed both children and adults to search for, book, and enjoy activities near them. It aimed to enable everyone, especially children, to live a fulfilled and balanced life via sports, fitness, artistic expression, and self-exploration.

The company had a specific vision: "To Partner with Parents & Teachers for All-Round Development of Children". The bootstrapped startup had a team of 6 people – 2 Software Developers, 2 Sales & Marketing Executives, and the 2 Founders. Apart from these six, it had an Advisory Board consisting of experienced mentors who had enjoyed multiple successes in their entrepreneurial journeys.

ActiPass was a one-of-its-kind Activity Discovery and Booking Platform that assisted parents in exploring and booking relevant, age-specific extracurricular activities for children. Kunal Dedhia believed that the learning years were the most important years for a child, that life was much more than the four walls of a classroom, and that real growth happened beyond the classroom. ActiPass thus endeavoured to encourage children to explore different activities and to grow up into well-rounded individuals. Its mission was to enable children to find their passion by exposing them to numerous activities and help them excel in it.

Blue Ventures: Building Transformative Approaches for Catalyzing and Sustaining Locally Led Marine Conservation

D Satish[*]

Alasdair Harris (Harris), a marine ecologist, while on a research expedition to study the coral reef in Madagascar, felt that conservation needed new tools and business-based solutions to address the problems. He started Blue Ventures (BV) in 2003, a social organization that worked with the locals and came up with community-led marine conservation approaches to save and rebuild the fragile ecosystem. It encouraged communities to take up temporary fishing closures, which increased the fishing catch and resulted in a doubling of incomes. This approach generated overwhelming interest that gave a stimulus to the setting up of Madagascar's first locally managed marine area (LMMA). Over the years, BV helped set up more than 65 LMMAs in Madagascar and many more around the world. With experience and by listening to the needs of the communities it served, BV evolved its business model and constantly came up with transformative approaches for catalyzing and sustaining locally led marine initiatives. It recognized that conservation would not be sustainable in the long run if it did not address the pressing issues facing the communities it served. Health, family planning, education, and generating alternate livelihoods were interlinked with conservation. The case exposes the students to the challenges and issues facing a social enterprise in its efforts to build innovative sustainable approaches to make a lasting impact on millions of people living in remote parts of the world.

"We recognise that a conservation organisation could quickly lose its way if it tries to simply replicate its methods quickly across many different settings, without taking the time to build the key assets of trust, experience and relationships."[1]

Alasdair Harris, Founder & Executive Director Blue Ventures

INTRODUCTION

Little did Alasdair Harris (Harris), a marine ecologist, realize that a research trip to survey the coral reef in Mozambique Channel in early 2000, would transform his thinking and mark the start of a whole new journey in his life. Although the expedition was incredible, Harris, while listening (key feature of the organization which he would go on to build) to the local Vezo community, felt their concern for declining fisheries and the effect it had on the community that depended only on fisheries for their livelihood. The threat to the fragile marine ecosystem from commercial and detrimental fishing techniques, compounded by the population growth,

MakeMyTrip – Leading the Indian Online Travel Industry, but Weak on Profits

G V Muralidhara and V Namratha Prasad***

The case traces the growth of MakeMyTrip Private Limited (MMT) that was considered to be the market leader in the Online Travel Agency (OTA) business in India. It starts out by mentioning the entrepreneurial journey of MMT's chief founder, Deep Kalra. It then describes the measures taken by the company to grow the OTA business in India, where Internet penetration was low and hesitancy to do online transactions was high. Later, the case documents MMT's shift in focus from flight ticketing business to the hotels and holiday packages businesses that had comparatively higher margins. The case also mentions the various technologies and innovations that the company adopted to improve its service offering. It concludes with a look into the challenges faced by the company and its prospects for future growth.

"Typical Indian promoters diversify even before they build something truly valuable. Kalra has been unwavering in his focus on travel."[1]

– Neeraj Bhargava, an early investor in MakeMyTrip Private Limited, in 2013

"At MakeMyTrip, the focus has always been on innovation and technological advancements. We believe in bettering ourselves and enhancing offerings for our customers. The customer is always the focal point of our activities and all our efforts are directed at creating a 'delightful experience' for our customer."[2]

– Deep Kalra, CEO of MakeMyTrip Private Limited, in 2010

INTRODUCTION

In October 2016, India's leading OTA (Online Travel Agency)[3], MakeMyTrip Private Limited (MMT), acquired its key rival the Ibibo Group's[4] India travel business in an all-stock deal worth $ 1.8 billion. This was the biggest consolidation in the Indian OTA space and resulted in all travel brands under the Ibibo Group such as Goibibo, redBus, and Ryde coming under MMT *(See Exhibit I for Information on Ibibo Group's Travel Brands).* All the brands of the combined entity were expected to remain operational; the top management of MMT remained the same and Ibibo Group's shareholders got 40% of the stake in the combined entity. Apart from being in a stronger position to negotiate prices and

Laymen Agro Ventures: Creating A Sustainable Farmer-Centric Social Enterprise

G V Muralidhara[*]

This case study presents the story of the early years of the entrepreneurial venture of Selvakumar Varadarajan, an entrepreneur in Tamil Nadu, India. After completing his education and working in corporates and academic institutions, Selvakumar decided to try his hand at entrepreneurship in 2016. Selvakumar's venture, which he called Laymen Agro Ventures, had three priorities: Enriching farmers, empowering rural youth, and exciting urban consumers with farm fresh products. In the initial years of the venture, Laymen Agro's brand, Vilfresh, made successful inroads into both the institutional market and among end consumers. The brand won several awards and recognitions. Laymen Agro Ventures had a healthy growth rate of 30 per cent and the founding team was looking at expanding its footprint. However, the team had to make some critical decisions before they could embark on the next phase of growth of Vilfresh.

INTRODUCTION

It was April 7, 2018. Selvakumar Varadarajan (Selvakumar) was deep in thought recollecting the presentation he had made a few hours earlier to a group of angel investors. ***(See Exhibit 1)***. He was traveling from Bengaluru to Coimbatore after his meeting with the investors for the next series of funding for the venture he had set up with a few likeminded friends in 2016.

Born and brought up in rural Tamil Nadu, a southern state in India, Selvakumar had his grounding in agriculture and had firsthand knowledge of how the rural economy in India operated. After his graduation and Master's education and after working in corporates and academic institutions, rural Tamil Nadu beckoned him again when he decided to try his hand at entrepreneurship in 2016.

Selvakumar knew the problems of farmers who depended on agriculture and cattle rearing for their livelihood. The farmers got a meager income from their produce which made it difficult for them to sustain themselves. Selvakumar's venture, which he called Laymen Agro Ventures, had three priorities as the foundation for its business model: Enriching farmers, empowering rural youth, and exciting urban consumers with farm fresh products.

The first two years of the venture saw Laymen Agro Ventures' brand, Vilfresh, make successful inroads into both the institutional market as well as among end consumers in Coimbatore. Vilfresh received several awards and recognitions for the contribution it was making and the promise it showed.

The venture had a healthy growth rate of 30 per cent and the founding team was looking at expanding its footprint. However, the team had to make some critical decisions before they could embark on the next phase of growth of Vilfresh. Prominent among these were: Burn rate – how to cash break even at the earliest? Funding – to go ahead with angels or go in for

Cyrus Mistry's Exit as Chairman of Tata Group

G V Muralidhara and Hadiya Faheem***

The case discusses Cyrus Mistry's (Mistry) unceremonious exit as the Chairman of Tata Sons, the holding company of the Tata Group, in October 2016. Citing several reasons for his ouster, the Tata Group stated that there was a disconnect between Mistry and Tata Sons with regard to values, ethos, vision, and the direction in which the Tata Group was heading. While Mistry focused on divesting non-performing assets and reducing the group's debt burden, his predecessor Ratan Tata was known for building the group through organic as well as inorganic growth strategies, transforming the group into a $100 billion conglomerate by 2012. Mistry's way of handling business did not go down well with Ratan Tata and other shareholders at Tata Trust. Creating shock in the corporate world, on October 24, 2016, Mistry was ousted from Tata Sons. The boardroom tussle that started with both sides trading allegations morphed into a full-fledged legal battle with both Mistry and Ratan Tata levelling serious accusations against each other.

"I have to say that the board of directors did not cover itself with glory.... To replace your Chairman without so much as a word of explanation and without affording him an opportunity to defend itself... must be unique in the annals of corporate history."[1]

– Cyrus Mistry, on his sudden ouster as the Chairman of Tata Sons, in October 2016

INTRODUCTION

On October 24, 2016, the corporate world in India was shocked to learn that Cyrus Mistry (Mistry) had been ousted from the post of Chairman of Tata Sons, the holding company of the Tata Group. The reason given for the ouster was the disconnect between Mistry and Tata Sons with regard to values, ethos, vision, and the direction in which the Tata Group was heading. Experts stated that this was the first time that the Tata Group had taken such a drastic step against a very senior member of management. Many industry observers felt that Mistry's ouster was a departure from the accepted ethos of the Tata Group. Some critics pointed out that though Mistry's removal was legal it was unethical to remove a senior person from the group that prided itself on doing things the right way. Commenting on his ouster, Mistry said that he was "shocked beyond words". He added, "The sudden action and lack of explanation has led to all manner of speculation and has done my and the group's reputation immeasurable harm."[2]

The One-For-One Model of TOMS Shoes – Can It Bring About Social Change?

G V Muralidhara and V Namratha Prasad***

The case talks about the unique one-for-one business model of TOMS Shoes, LLC (TOMS) that was pioneered by Blake Mycoskie. It starts out by mentioning the rationale behind Mycoskie's adoption of the one-for-one model, wherein he promised to give away one pair of shoes for each pair sold. The case then talks about the marketing strategy adopted by Mycoskie for TOMS and gives an insight into the reasons for the success of the company. Mycoskie's other ventures that followed the same business model are also chronicled. The case also describes in detail the criticism that the particular business *model faced from non-profit organizations and social activists. It ends with details about the future expansion plans of TOMS..*

"Giving one away for each one purchased is something that really resonates with people. It's something they can sort of wrap their head around and know they're making a difference."[1]

– Christopher Marquis, Professor in Sustainable Global Enterprise, Cornell University, in January 2016

"My thinking was that TOMS would show that entrepreneurs no longer had to choose between earning money or making a difference in the world. I wanted to prove that conscious capitalism is a viable business model for innovators worldwide, and entrepreneurs can focus on being ambassadors of humanity."[2]

– Blake Mycoskie, Founder of TOMS Shoes, LLC, in September 2009

INTRODUCTION

In November 2015, the founder of TOMS Shoes, LLC (TOMS), Blake Mycoskie (Mycoskie), announced that he was starting a new fund called the 'TOMS Social Entrepreneurship Fund' which would provide finance to early-stage social startups. He claimed that the company had already begun investing in 11 start-ups[3] which had a core social mission. He added, "We feel it's our responsibility to make sure there are other great companies emerging that will create a positive impact and unlock new ways business can be a force for good. The aim is to continue to reinvest so we can help more and more social entrepreneurs grow and make a positive impact in the world."[4]

The Rise and Fall of Vijay Mallya

*Syeda Maseeha Qumer**

The case discusses the rise and fall of Indian liquor baron Vijay Mallya (Mallya) who successfully expanded the business empire he inherited from his father and transformed it into a global conglomerate with diverse interests. However, Mallya's foray into the aviation sector with his airline service, the Kingfisher Airlines (KFA), was a big misstep. His fortunes came tumbling down in 2012 when the airline was grounded, leaving thousands of workers unemployed and more than Rs.70 billion in unpaid loans. Mallya was declared a wilful defaulter and had the banks, regulators, and the Indian judiciary after him. Thereafter, he fled to London and the Indian government is seeking his extradition. The case concludes by discussing the various possibilities in the Mallya case: Should Mallya be given a fair opportunity to settle the loan-default issues with banks? Will he be able to endure the bad phase and bounce back or is it the end of the road for him?

"The Mallya story is more about our easy embrace of cronyism. Parliament, politics, bureaucracy, media, banks were all complicit not just in the rise and fall of Vijay Mallya but of many others. In the name of socialist protectionism we have built a giant, permanent nexus of the powerful where contacts and networks matter more than balance sheets."[1]

– Shekhar Gupta, Founder and Editor-in-Chief of ThePrint[2], in 2016

"What is the most aspirational part of anybody's life? Lifestyle! Women, fancy cars, aeroplanes. It's all aspirational. All this was brought into play in creating a brand identity and brand personality of Kingfisher. It all got lumped on me. Maybe I should have never have gone down this route at all, in hindsight. I am sometimes a victim of my own image. But I can't do very much about it, can I?"[3]

– Vijay Mallya, Chairman of UB Group in 2016

END OF GOOD TIMES?

In March 2016, Indian liquor baron Vijay Mallya (Mallya) fled to Britain after a consortium of 17 banks pulled the plug on him in a bid to retrieve nearly Rs.70 billion in unpaid loans. Non-bailable arrest warrants were issued against him by separate courts for money laundering and financial mismanagement. As of June 2016, Mallya did not return to India though the Indian government sought his deportation after revoking his passport. The UK government said it would not be able to deport Mallya under its laws and asked the Indian government to seek his extradition instead. However, Mallya clarified that he was willing to return to India and settle the loans, provided he was assured of a fair trial. He accused the

Yogendra Vasupal – The Rise and Fall of Stayzilla

KBS Kumar and Indu Perepu***

This case is about the hotel aggregator Stayzilla that was founded by Yogendra Vasupal and his partners in 2005. The beginning was encouraging. Inasra, which was the name Stayzilla had started with signed contracts with 300 hotels in a year. By 2007, the number had reached 800 across 150 cities. In 2007, as a part of its re-branding exercise, Inasra was re-named as Stayzilla. By 2010, Stayzilla.com had covered 560 cities and towns in India; by 2012, it had witnessed nimble growth in its network of hotels and boasted a network of about 3,751 hotels. Stayzilla swiftly expanded its formats that ranged anywhere between $4 and $1,000. In an attempt to capture market share, Stayzilla entered the alternative stay segment (home stay aggregating) in 2014, inspired by a model popularized by the US hospitality major, Airbnb. With 25000 hotel stays, 40000 properties and 8000 homestays in over 4500 towns a part of social stay model, Stayzilla depicted a rosy picture. However, not all was rosy with its financials. Extensive investments and not much of a focus on profitability dragged Stayzilla into the red. Eventually, Stayzilla failed to generate the revenue needed to cover costs.

"In the last 3 to 4 years, though, I can honestly state that somewhere I lost my path. I started treasuring gross merchandise value (GMV), room-nights, and other 'vanity' metrics instead of the fundamentals of cash flow and working capital."[1]

– Yogendra Vasupal, Founder CEO, Stayzilla, in 2017

INTRODUCTION

On February 23, 2017, in an incident that shook the Indian start-up fraternity, Yogendra Vasupal (Vasupal), founder CEO of Stayzilla, a hotel aggregator[2] and online travel advisory firm (OTA), was arrested on allegations of fraud[3]. Jigsaw, an advertising firm, which was one of its creditors, alleged that Stayzilla had evaded payables to the tune of $0.27 million. Stayzilla, which was founded in the year 2007 and had convincingly expanded pan India with 25,000 rooms and more than 4000 properties, abruptly shut down its operations on March 14, 2017[4].

Its extensive efforts to create a market as well as find new consumers took a toll on Stayzilla, compelling it to burn its cash at double the rate at which it generated revenues. The discount model that was rampant in the Indian hospitality industry made it tough for Stayzilla to recoup what it had put in.

iD Fresh – An Entrepreneurial Success Story

Sanjib Dutta and Smita Ray***

The case talks about the journey of iD Fresh (founded by PC Musthafa) from a start-up to becoming a niche player in the ready-to-cook breakfast market in India. It starts with a brief history of Musthafa. It then describes the creation of the iD brand, launching of new products, and expansion of iD Fresh to different locations across India and the Middle East. The case also touches upon the launch of different marketing campaigns by iD Fresh and its use of innovative packaging. Besides, it highlights the challenges faced by iD Fresh and its future plans.

"iD's philosophy is to enable the homemaker and not to replace her. As a result, all iD products are preservative-free and traditional Indian foods made the natural way, just like 'made-at-home'. iD will use the funds to build category awareness, accelerate geographic expansion, capacity expansion with state-of-the art plants, and augment the team."[1]

– PC Musthafa, Chief Executive Officer (CEO), iD Fresh Food India Pvt. Ltd., 2017

"There exists a billion-dollar opportunity in the space and iD Fresh has clear market leadership due to its first mover advantage."[2]

– Haresh Balani, Vice President, Premji Invest

INTRODUCTION

In June 2019, iD Fresh Food India Pvt. Ltd. (iD Fresh), India-based ready-to-cook food company launched a brand called iD Daileez for its traditionally price sensitive markets. These included Chennai, Kochi, Coimbatore, Kozhikode, Mysuru, Mangaluru, Vishakapatnam, Godavari, Salem, Guntur, and Rajahmundry (*Refer to **Figure I** for Image of iD Fresh's Daileez brand*). Under this brand, the company launched a 1 kg pack of idly (a south Indian steamed cake of rice) and dosa (a pancake made from rice flour and ground pulses) batter at a price of Rs.49 whereas iD Fresh's regular idly and dosa batter was available at Rs.70 and its organic variant at Rs.80. The company offered 20% extra batter in its Daileez products – as a special inaugural offer. Speaking about the objective of launching iD Daileez, PC Musthafa (Musthafa), Chief Executive Officer (CEO) and Co-founder, iD Fresh Food, said, "*iD Fresh's flagship product, the idly and dosa batter, has been a pioneer in the fresh, preservative-free, ready-to-cook category. With iD Daileez, we are looking to compete in the ever-growing batter category, without damaging the existing product's*

Kerala's 'Shailaja Teacher' – Leading Through Crises

Sanjib Dutta and Smita Ray***

On January 30, 2020, Kerala became the first state in India to report a positive case of COVID-19. By the last week of March, the number of cases had increased to 100. After the first case was reported, the Government of Kerala (GoK) under the deft leadership of K K Shailaja (Shailaja), Minister of Health and Social Justice, immediately sprang into action and went in for aggressive testing, tightened surveillance, and social distancing. By April 6, 2020, in Kerala; the number of positive cases had touched 327 but 59 (18%) had recovered and only two (0.61%) died. By April 21, 2020, India had 18,601 confirmed COVID-19 cases, 3252 recoveries, and 590 fatalities. Of the total number of confirmed cases, Kerala accounted for just 408 cases, a share of 2%. Of the 408 confirmed cases, 291 had recovered (71%) and there were just three deaths, the lowest number of deaths in the country. The recovery was also considered the best in the world. Experts opined that under the determined leadership of Shailaja, Kerala had been able to flatten the COVID-19 curve.

"Fighting an epidemic like corona requires scientific temper, humanism and a spirit for inquiry and reform. Superstition, credulity, emotionalism and irrationalism will derail the whole process by dispiriting and discouraging the experts and health activists who try hard to resolve the threat scientifically."[1]

– K. K. Shailaja, Minister of Health and Social Justice, Government of Kerala, in 2020

"I really appreciate the way our health department handled this crisis. Each day, we get calls from the mental health team, and others, checking if we are alright. There is so much effort being made, right down from the minister, that makes us feel that we are cared for."[2]

– Ammu Sreekumar, a techie home-quarantined in Kerala after returning from China, in 2020

"There's a big difference between leading an organization and presiding over it. A crisis is when the leader can demonstrate that difference best."[3]

– Ram Charan and Larry Bossidy, Authors and Advisors, in 2018

OYO – From a Startup to a Global Hotel Chain

Sanjib Dutta[*] and Shubhanjali Chakravarty[**]

The case study describes the journey of an Indian startup from its inception to its becoming a global hotel chain. It weaves the story of the company since it began in 2012 as Oravel Stays and Private Ltd. (Oravel). The rebranding of Oravel into "OYO Hotels and Rooms" in 2013 and OYO's business model before and after the remodeling (2017) are discussed. OYO's marketing strategy, financing, and operational strategies are also elaborated on. The case also takes a look at OYO's domestic and global expansions till date. Its strategy to enhance customer satisfaction with the help of technology is discussed as well. The case concludes with the future plans of the company in terms of global expansion and how it aims to become the largest hotel chain in the world.

. *"We aspire to be the world's largest hotel company built out of Asia with markets in India and China. Currently, Marriott is the largest and we have a lot of respect for the company. We aspire to be bigger than that. We have already built in the growth rate at which they have been growing in the past couple of years to set our target for 2023."*[1]

– Ritesh Agarwal (Agarwal), CEO at OYO Hotels and Rooms in 2019

"Our business model is simple. We take over an asset and manage it fully, and we have a franchise model where we partner with asset owners who run the hotels. We are adding rooms at a rapid pace and if we continue to do that, probably we will able to get to the mark by 2022."[2]

– Ankit Tandon (Tandon), COO at OYO Townhouse in 2018

INTRODUCTION

In April 2019, "On Your Own" Hotels and Rooms (OYO), an aggregator of unbranded hotels and bed and breakfasts (B&B) in India, attracted an investment of around Rs[3]10.55 to Rs.14.05 billion from Airbnb Inc[4]., (Airbnb). As per the OYO-Airbnb deal, OYO's 10,000 villas and homes in India, the UAE, and other markets, would be listed on the Airbnb

The 'We Movement' – Driving Social Change Through Volunteerism

Jitesh Nair and Bitra Vasudev***

Craig Kielburger and Marc Kielburger (Kielburgers) started a charity called WE Charity (formerly "Free the Children") in 1995 to free children from child labor and help their families come out of poverty and exploitative situations. When the brothers realized that solely relying on donations would not help achieve the mission of WE Charity, they established a social enterprise called WE to ME in 2009 with guidance from Jeff Skoll, the first president of eBay and a billionaire. WE to ME faced several allegations in 2017-18, with former employees accusing it of paying low salaries, making them work long working hours without suitable compensation, having an abusive work culture, adopting aggressive tactics while canvassing for donations, focusing excessively on entering into numerous contracts with corporates, entering into partnerships with corporates that sold products made by children, and not honoring the commitment of donating 50% of WE to ME's revenues to WE Charity and others. The Kielburgers, nonetheless, planned to expand the operations of WE Charity to several newer communities. In Canada, they planned to extend the reach of the WE Schools program to 24,000 schools by 2024 and increase the number of participants of the WE Schools to 4.8 million by 2020/2021.

"Everyone keeps asking for money to create social change, but few have come up with mechanisms outside of the direct ask to bring in funds."[1]

– Marc Kielburger, Co-founder of the WE Movement

"ME to WE is a great Canadian example of an innovative business model for positive social change."[2]

– Joyce Sou, Director of B Lab Canada

"Our teenagers need inspiring role models and passionate leaders like Craig and Marc who make a difference in this world! What they teach us is to live a life with purpose, a life that has perspective and finally a life that is bigger than our own 'ME' world."[3]

– Kathy Sarafian, CEO of Drive Medical Canada and former WE Charity Board Member

INTRODUCTION

Globally, there were 152 million child laborers (aged between 5 and 17 years) as of 2016, according to the International Labor Organization. Of these, 73 million were working in hazardous conditions. The menace of child labor was spread across the world, especially in

Ubongo – Revolutionizing Early Childhood Education in Africa

Jitesh Nair and Bitra Vasudev***

The case study highlights the various aspects of social entrepreneurship and innovation required to tackle a social issue and create impact in a large way. It discusses how five young professionals from different fields came together to overcome the challenges confronting the Tanzanian education system and devised highly innovative and cost-effective learning solutions through Ubongo. Tanzania's education system was plagued by numerous issues that included low enrollments in pre-primary schools, a dearth of good quality teachers, archaic policies of the government, and widespread poverty. As a result, a majority of Tanzanian children did not have the requisite literacy, numeracy, cognitive, and social skills to earn a decent living on reaching adulthood. Ubongo tackled these challenges by producing highly engaging edutainment cartoons (both audio and video) and distributing them through numerous low-cost platforms such as TV, radio, and mobile phones that were accessible to a majority of Tanzanians. After starting in Tanzania, Ubongo forayed into sub-Saharan and francophone (French speaking) Africa. Its mission is to reach 30 million children in Africa by 2022 and eventually to reach every child in Africa (440 million).

"Of all of the investments needed to achieve sustainable development, none is more important than a quality education for every child. In a knowledge-based world economy, a good education is vital for finding decent work; achieving good health; building functioning communities; developing the skills to be a dependable parent; and growing up to be an engaged and responsible citizen."

– Jeffrey D. Sachs, Director, the Earth Institute, Columbia University, in March 2015

"Maths is seen by many children as a boring, hard subject. This attitude has a lot to do with how teachers teach maths. We wanted to make it cool and easier to understand."[1]

– Cleophace Ng'atigwa, co-founder, Ubongo Media, in 2015

"The innovation of Ubongo Edutainment is in utilizing locally accessible technologies that tens of millions of families across Africa already use, to deliver fun and localized learning content."[2]

Women Leading the Fight Against COVID-19 Pandemic: Lessons from Finland, Iceland, and Norway

Sanjib Dutta and Smita Ray***

The case talks about how the women leaders of Finland, Iceland, and Norway navigated through the COVID-19 crisis. The case starts out by giving a brief history of Sanna Mirella Marin (Marin) – Prime Minister of Finland; Katrin Jakobsdottir (Jakobsdottir) – Prime Minister of Iceland; and Erna Solberg (Solberg) – Prime Minister of Norway. It then describes the various strategies adopted by these leaders to tackle the COVID-19 crisis. It also touches upon the measures taken by them to protect both the lives and livelihoods of their citizens. The case also covers the impact of the strategies adopted by these women leaders in their respective countries. Lastly, the case provides a brief comparison of how these three countries – all led by women leaders – fared compared to countries led by male leaders such as the UK, France, and Italy in combatting the COVID-19 crisis.

"Women in general lean toward collaboration and people skills (but not always), but then, so do effective men," "Leaders [like these] thought about people first–something I think is critical in a crisis–but they also didn't hesitate to do something to stop the spread."

– Rosabeth Moss Kanter, Professor of Business at Harvard Business School and Author of Men and Women of the Corporation, in June 2020[1]

"We have so far been successful in slowing the spread of the epidemic. Finland will gradually move away from restrictions towards enhanced control of the epidemic."

– Sanna Marin, Prime Minister of Finland, in April 2020[2]

"The contagion curve has flattened out. Together, we have reached the goal that each infected person does not infect more than one other person. It is pleasing, but just a snapshot. We can't lower our guard. We are still far from half-time."

– Erna Solberg, Prime Minister of Norway, in April 2020[3]

INTRODUCTION

The COVID-19 pandemic in early 2020 affected millions of people in 213 countries and territories across the world. With no medicine or vaccine available, it was only the preventive measures taken by the people and, more importantly, the effective strategies developed by the political leadership to contain the spread of the virus and at the same time

Grofers' Growing Ambition in Online Grocery Market in India

Sanjib Dutta[*] *and Shubhanjali Chakravarty*[**]

This case study discusses the journey of online grocery delivery service company, Grofers India Private Ltd (Grofers), and its growing ambition since its inception in 2013. It describes the problems faced by the company, which included losses amounting to Rs.2.25 billion in FY2016, a fragmented supply chain, diseconomies of scale, and dislocation of activities and eventual shutting down of its operations in 9 cities. The case then describes how Grofers improved its supply chain by establishing company warehouses in 2016 and how it changed its delivery slot from 90 minutes to 24 hours the same year. However, it faced difficulties with losses mounting to Rs.2.68 billion at the close of FY2017. From 2017; Grofers re-launched its operations in 5 out of 9 cities; expanded its product categories (2017); launched its own label; "Grofers" (2018); began bringing local kiranas under the Grofers brand (2018); and modified its supply chain by adding 6;500 local service partners to solve the pick-up and distribution problems (2018). Grofers recorded revenues of Rs.10 billion in FY2018; amidst losses of Rs.2.58 billion.

"Our focus is to service what we call the 'Real Bharat' – the two-wheeler families of India who are yet to experience the world of e-commerce and our target is to bring the next 100 million new customers to e-commerce industry through our platform."[1]

– Albinder Dhindsa (Dhindsa), Co-founder and CEO at Grofers India Private Ltd (Grofers), in 2019

"We have already operationally broken even in most of the cities we are present. However, we are on a growth phase right now and will continue to invest on the private brands and hence there is some time before we turn profitable at the company level."[2]

– Saurabh Kumar (Kumar), Co-founder and COO at Grofers India Private Ltd (Grofers) in 2019

INTRODUCTION

On June 13, 2019, Grofers, an online grocery delivery service in India, raised $220 million from Japan's SoftBank Corporation (SoftBank). With this funding, Grofers was expected to

'Biryani by Kilo' - A Biryani Delivery Startup's Success Story

Sanjib Dutta[*] *and Smita Ray*[**]

The case talks about the journey of 'Biryani by Kilo' (BBK), founded by three friends – Kaushik Roy (Roy); Vishal Jindal (Jindal); and Ritesh Sinha (Sinha), from a startup to being a dominant player in the Indian online food market. The case starts with a brief history of BBK and then describes the unique business model it uses. The case touches upon the launch of different promotional activities by BBK and its pricing method. It also highlights the competition faced by BBK and its future plans.

"We don't have a big food and beverage brand. There is no Domino's, McDonald's, or KFC. I wanted to create a company from India which can be around the world tomorrow."[1]

– Vishal Jindal, Co-Founder & Director at Biryani by Kilo (BBK), in October, 2019

"We have put the foundation of best SOPs, technology, and operational efficiencies in Biryani by Kilo so we are able to scale as a world-class F&B Company."[2]

– Kaushik Roy, Co-Founder and CEO at Biryani by Kilo (BBK), in June, 2019

INTRODUCTION

In May 2020, during the lockdown caused by the COVID-19 pandemic, Biryani by Kilo (BBK), a biryani and kebab chain in India popular for its freshly dum-cooked handi biryani[3], donated more than 40,000 fresh lunches from its stores in the National Capital Region[4]. Despite lockdown restrictions, the company's online orders reportedly increased by 10% to 15% during the month of April 2020.[5] BBK was launched in Gurugram, near Delhi in 2015 by three friends – Kaushik Roy (Roy), a veteran in the F&B industry; Vishal Jindal (Jindal), a

'Teach for Change' Campaign: A Social Initiative to Improve Literacy Standards in India

Syeda Maseeha Qumer and Jayasri Bhimalapuram***

This case is about the 'Teach for Change' campaign launched by an NGO, the Passionate Foundation, in 2014. The objective of the campaign was to improve the overall literacy levels in government schools and to deliver quality education with a focus on leadership in these schools. As part of the campaign, volunteers were invited to teach leadership and English at the primary and high school levels in the government schools in Hyderabad. The case describes the objectives of the campaign and how it helped in improving the lives of underprivileged children by improving the education standards in government schools and evoking social responsibility in individuals. The case concludes by highlighting the challenges faced by the campaign and its future prospects.

"The objective of the initiative is to improve the overall literacy standards at the government schools"[1]

– Chaitanya M R S K, founder and CEO of Passionate Foundation in 2014

"We have heard of Corporate Social Responsibility, but Teach for Change has helped us fulfill our Individual Social Responsibility."[2]

– A volunteer of 'Teach for Change' initiative in 2015

INTRODUCTION

In June 2014, Hyderabad[3]-based non-governmental organization (NGO) Passionate Foundation[4], launched a campaign called 'Teach for Change' to improve the overall literacy standards in government schools in India and to deliver quality education with a focus on leadership in these schools. As part of the campaign, volunteers were invited to teach leadership and English at the primary and high school levels in the government schools. Talking about the objective of the campaign, Chaitanya M. R. S. K.,[5] (Chaitanya), founder and CEO of Teach for Change, said, "Started in 2014 the program covered ten schools this year and we are now launching Teach For Change 2015 for 100 schools in Hyderabad in partnership with Government of Telangana and making it one of India's largest educational movements."[6]

Jignesh Shah – The Rise and Fall of an Ambitious Entrepreneur

KBS Kumar and Indu Perepu***

The case presents the enthusiasm and passion with which Jignesh Shah (Shah) started a fintech company and the success it enjoyed. It elaborates how Shah, son of an iron and steel trader in Mumbai, India, became a billionaire by 40. Shah's was a success story until he decided to violate legal and ethical norms and took some decisions that transgressed legal boundaries.

"The Jignesh Shah story is likely to enter management books as a case study in ambition and potential gone horribly wrong."[1]

– Forbes, in September 2014

INTRODUCTION

In July 2016, Jignesh Shah (Shah), founder of India-based financial services company, Financial Technologies India (FTIL), was arrested for leading the Ponzi scheme involving the National Spot Exchange Ltd[2] (NSEL) that resulted in massive losses to many investors. India's law enforcement and economic intelligence agency, the Enforcement Directorate (ED), took Shah into judicial custody under the Prevention of Money Laundering Act (PMLA), for not cooperating with the investigation.

Shah, son of an iron and steel trader in Mumbai, India, wanted to become a billionaire by 40. He accomplished the feat at 41, just a year later. After completing his engineering in the Electrical and Electronics branch, Shah started his career at the Bombay Stock Exchange (BSE), where he worked on a software product that facilitated financial trading. After the short stint with BSE, Shah launched his own company – FTIL in 1988. From 2003, Shah launched a series of stock exchanges, which included the MCX, a multi-commodity bourse under the banner of the National Spot Exchange Ltd (NSEL). In a few years, Shah set up exchanges in various countries that included Singapore, Bahrain, Dubai (UAE), Mauritius, and Botswana.

FTIL became immensely successful. Shah generated enough wealth to figure in Forbes' 2008 list of billionaires. However, the success ride did not last very long. The super ambitious entrepreneur who had surged like a meteor and fell like a feather, failed to realize the significance of ethical conduct as an entrepreneur. In the race to generate wealth, Shah

India's Payments Solution Company 'Razorpay' – From a Fintech Startup to a Unicorn

Sanjib Dutta and Anil Anirudhan***

The case is about Razorpay Software Pvt. Ltd. (Razorpay), an Indian fintech startup that had attained unicorn status within a span of six years. The case dwells upon the growth of the fintech company and the entrepreneurial musings of its founders who overcame the difficulties that plague startups and created innovative solutions in the payments industry. The case also discusses the challenges faced by fintech firms in their quest to provide innovative payment solutions and help banks go digital. Razorpay's innovative products are described in detail along with its business model. The case ends with customer accolades for the company and the future plans of Razorpay. It remains to be seen whether Razorpay will continue with its quest for innovative products in the fintech space and make the payment experience simple for customers.

"India has made significant strides in establishing a digital payments eco-system and Razorpay has established itself as a clear leader, with its strong focus on customer experience and product innovation."[1]

– Choo Yong Cheen, Chief Investment Officer-Private Equity, GIC, in October 2020

"This funding is just a pit stop to refuel while we strengthen our commitment of simplifying the entire money flow so that our partner businesses can focus more on disrupting the Indian economy with their new ideas."[2]

– Shashank Kumar, Co- Founder and CTO, Razorpay Software Private Limited, India in October 2020

INTRODUCTION

In October 2020, Razorpay Software Private Limited (Razorpay), a payments-based startup headquartered in Bengaluru, India *(Refer to **Figure I** for Razorpay's logo)*, announced that the company had joined the unicorn club[3]. The unicorn status was achieved after securing

Paytm: Pioneering Cashless Transactions in India

Indu Perepu[*]

Paytm, launched as a prepaid-mobile-recharge web-based company in January 2010, was founded by Vijay Shekhar Sharma, who was known for his never-give-up attitude. It was a time when millions of Indian customers were entering online payment process; but there were billions more who were averse towards online payments. While Sharma was grappling with increasing his customer base, he struck luck when the government announced the ban of two of the country's largest banknotes on November 8, 2016. Paytm made great business when Indians, fed up of standing in long queues to exchange currency, signed up for Paytm as the best alternative. Moreover, Paytm also received the regulatory approval to launch its Paytm Payments Bank in December 2016.

"I feel like I am in my teens and Paytm is my infatuation."[1]

– Vijay Shekhar Sharma, founder Paytm, November, 2016

"It doesn't matter if it's 3am on a Saturday or if you've just reached out to us on Twitter.... By the time you wake up in the morning, we'll email you or phone you to say 'Job done'."[2]

– Harinder Takhar, CEO Paytm, June 2013

INTRODUCTION

By the end of November 2016, Paytm, an Indian e-commerce and payment system company, had registered more than 7 million transactions per day and was on track to complete 2 billion transactions in 2016.[3] Vijay Shekhar Sharma, (Sharma), Chief Executive and Founder of Paytm, said the company's business had increased manifold after the Indian government banned the use of high value currency notes[4] in the second week of November 2016. This move prompted people to switch over to cashless transactions and Paytm, being one of the widely used digital payment systems in the country, benefitted immensely.

Sharma reported that 8 million new users had signed up for Paytm services in the two weeks after old high-denomination notes were banned.[5] He said, *"This is the golden age of investment in digital payments in India."*[6]

'Tiger Electric' – India's First Electric Field Tractor

Sanjib Dutta and Anil Anirudhan*******

The case is about India's first electric tractor manufactured by Sonalika International Tractors Limited (Sonalika). The electric tractor heralded a new era in agri innovation in the country and was a technological marvel with high performance. The case discusses the growth of the company and its foray into the farm equipments sector. The case also details the history of tractor manufacturing in India. The innovative technological features of Tiger Electric are put forth and discussed. With its electric tractor, Sonalika embarked upon introducing efficient and pollution-free tractors in the agriculture sector in the country. Sonalika's product offensive strategy is described in detail along with its corporate social responsibility initiatives. The case ends with the future plans of the company. It remains to be seen whether the farmers in India adopt the electric tractor for their field operations and whether Sonalika's 'Tiger Electric' becomes a disruptive innovation in the tractor industry in India.

"As the world is moving towards environmental friendly initiatives, electric vehicles across segments are being eagerly looked upon as alternatives to vehicles that run on fossil fuel. Sonalika's Field ready Tiger Electric tractor is our commitment to accelerate India's march towards a greener tomorrow and stay in line with Government of India's ambitious move of introducing EV's by 2030."[1]

– Raman Mittal, Executive Director, Sonalika Group, December 2020

"Electric tractors could become a viable proposition if sold in the domestic as well as export markets as the combined volumes would help in amortising the development costs. Also, the diesel prices have been moving upwards and fuel costs are a concern for the farmers. While there will be some takers for it, what needs to be seen is how the total cost of ownership (TCO) would work in specific segments to achieve cost parity."[2]

– Ashim Sharma, Partner, Nomura Research Institute, December 2020

INTRODUCTION

On December 23, 2020, Sonalika International Tractors Limited (Sonalika) launched India's first electric field tractor, 'Tiger Electric', in the country. The launch coincided with Farmers' Day, which was being observed across the country. The electric tractor heralded a new era in agri innovation. The company was one of the leading tractor companies in India and exported its products to Europe, Africa, South America, and North America.

In December 2020, Sonalika had sold 11,540 tractors in both the domestic and international markets compared to 7,320 tractors sold in December 2019, an increase of 57.65 percent, with a market share of 16.1 percent in tractor sales. In the nine-month period from April 2020 to December 2020, the company sold 104,454 units, a growth of 33 percent compared

WOW! Momo: An Entrepreneurial Success Story

Sanjib Dutta[*] and Smita Ray[**]

The case talks about the journey of Wow! MomoFoods Pvt. Ltd (WOW! Momo), founded by Sagar Daryani (Daryani), from a startup to becoming a niche player in the quick service restaurant (QSR) business in India. It starts out with a brief history of WOW! Momo. It then describes the business model of the company. The case also touches upon the challenges faced by WOW! Momo and its future plans to meet such challenges.

"Operating in different formats gives us the flexibility to enter the right location depending upon the size of the shop. This makes our model scalable and also gives the space to expand. Also it helps to bring down the real estate cost."

– Sagar Daryani, Co-Founder, CEO - WOW! Momo Foods Pvt., in 2017[1]

INTRODUCTION

In October 2020, WOW! Momo Foods Pvt. Ltd (WOW! Momo), a Kolkata, India-based Quick service restaurant (QSR) chain, raised Rs.450 million from Anicut capital[2] with the option of raising another Rs.150 million by April 2021. The company planned to repay an old loan of Rs.350 million taken from Avendus Finance[3]. It also had plans to use this amount for the expansion of its new business vertical WOW! Momo Essentials. Besides, the company was planning to raise Rs.1-1.25 billion in mid-2021 through another round of equity funding.[4]

Launched in Kolkata, India, in 2008 by Sagar Daryani (Daryani) and his friend Binod Kumar Homagai (Homagai), WOW! Momo started out small, with the momos being prepared in a 200 Squarefeet kitchen. Over the years, the company expanded its presence to 13 cities across India by offering 16 varieties of momo to its customers (*Refer to **Figure I** for Image of WOW! Momo Outlet*). Along with the expansion of its product range, WOW! Momo also adopted different strategies such as innovative marketing approaches and focus on research and development to achieve success in the QSR business in India. However, during its journey from 2008-2020, the company faced various challenges like lack of financial support, the consequences of demonetization, and the COVID-19 crisis.

Narayana Peesapaty – The Anti-Plastic Crusader

KBS Kumar and Indu Perepu***

The case elaborates the ground-breaking efforts of Narayana Peesapaty (Peesapaty), a former scientist in groundwater research at the International Water Management Institute (IWMI) who resigned from his comfortable job in his quest for substitutes for plastic cutlery. Driven by his deep concern over plastic being used as cutlery, he understood the long-term consequences of the toxic effects of plastic as cutlery on the people, the environment, and the Earth. Through his rigorous 6 years of research and 4 years of marketing, Peesapaty came up with a product that offered a potential solution to these global concerns. From 2014 onward, he started getting enquiries and orders for product— the edible cutlery— from within as well as outside India. While there was still a long way to go, Peesapaty demonstrated how through diligent research, creative thinking, and effective entrepreneurship, it was possible to deal with economic, social, and environmental challenges together, without compromising on or conflicting with any of the factors.

"Probably, I was born to make it happen. I eat, live, sleep and dream edible cutlery."

– Narayana Peesapaty, Founder Bakey's Foods Pvt Ltd, in 2016

INTRODUCTION

In 2006, Narayana Peesapaty (Peesapaty) - a scientist in groundwater research at the International Water Management Institute (IWMI[1]) - resigned from his comfortable job, driven by his deep concern over plastic being used as cutlery. Being a scientist, he understood the long-term consequences of the toxic effects of plastic as cutlery on the people, the environment, and the Earth. With 120 billion pieces of plastic cutlery consigned to garbage bins every year in India, it posed a great threat to the consumers, directly through contact, as well as indirectly through its ill-effects on the environment.

Peesapaty was equally concerned about the rapidly depleting levels of groundwater in India, which posed an imminent threat, if not addressed in time. He started his entrepreneurial journey with these twin- concerns as his mission and founded Bakeys in 2010, which offered edible cutlery, a potential solution that effectively addressed both the concerns of plastic cutlery and groundwater depletion – one through the end-product and the other through the ingredients that had gone into the product.

It took 6 years of research and 4 years of marketing for Peesapaty's product to gain acceptance as a potential solution to these global concerns. From 2014 onward, he started getting enquiries and orders from within as well as outside India. While there was still a long way to go, Peesapaty demonstrated how through diligent research, creative thinking, and effective entrepreneurship, it was possible to deal with economic, social, and environmental challenges together without compromising on or conflicting with any of the factors.

Women Will: Google's Initiative for Women Entrepreneurship in Rural India

Indu Perepu and Benudhar Sahu***

Women Will was launched in India in 2021. Through the platform, Google promised to transform the lives of female entrepreneurs in the country digitally. The search giant announced that it would offer community support, mentorship, and accelerator programs to rural women entrepreneurs who wanted to convert an existing skill or talent into a business. The economic empowerment program was expected to support 1 million rural women in the country to become entrepreneurs. Under the program, Google collaborated with the social arm of NASSCOM (Chamber of Commerce for Tech Industry in India), NASSCOM Foundation, to empower 100,000 women farmers across six Indian states by imparting digital and financial literacy skills to them. Google's CEO Sundar Pichai announced a grant worth $25 million for non-profits across the world working on advancing women and girls' economic empowerment.

INTRODUCTION

On March 08, 2021, US-based technology company Google LLC (Google) announced the launch of a web platform to support women entrepreneurs in rural India under the name 'Women Will'. Google said the platform would help one million women in rural India pursue their ambitions and improve their livelihoods through entrepreneurship. The platform aimed to provide free online guidance to rural women to help them get the right information on starting and growing a business. For this, Google planned to work with 2,000 internet savvy women trainers called Internet Saathis (Internet Friends), who would help spread awareness among more and more women across the villages in India.

In 2015, under its charitable arm, Google.org, Google launched a Google Impact Challenge for Women and Girls that offered over $25 million in funding to social organizations and non-profits working for the economic empowerment of women and girls. Additionally, in India, Google committed $500,000 in funding to the National Association of Software and Service Companies (NASSCOM) Foundation[1] to train 100,000 women agricultural workers on digital and financial literacy in six states in India.

Founded by Larry Page and Sergey Brin, Google, a California-based multinational technology company specializing in internet-related products and services, was started in 1998 with the mission of organizing information at the global level and making it universally accessible and useful. Google had been working in India to make the internet available to everyone. The tech giant believed that the more access people had to information, services, and training online, the more they would be able to pursue their ambitions and reach their potential.

CallHealth: An Innovative Approach to Healthcare

Syeda Maseeha Qumer and Benudhar Sahu***

The case is about the enterprising initiatives undertaken by young entrepreneur Sandhya Raju through the launch of CallHealth to provide improved medical services to people at their doorstep to help them live a healthy and better life. CallHealth is an innovative and integrated healthcare system to cater to the comprehensive healthcare needs of the people in their homes. As an aggregator of healthcare services, CallHealth provided a complete range of healthcare services under a single platform. It originated from the emerging need to build connectivity and collaboration among the stakeholders of the healthcare system to provide a wholesome healthcare package to people at their doorstep. It aimed to offer the best of kind healthcare services to the people by combining technology and the best minds in the healthcare sector. By integrating technology with the healthcare system, CallHealth made an attempt to gain rich patient experience about its top healthcare products and services.

INTRODUCTION

CallHealth Services Private Limited (CallHealth), one of the first integrated virtual and mobility healthcare platforms in the world, was launched in September 2015. Promoted as an online supermarket of healthcare services, CallHealth offered comprehensive online healthcare products and services to patients, right from wellness to prevention to cure, at their doorstep using a technological platform. Calling CallHealth the Amazon of the healthcare industry, Hari Thalapalli (Thalapalli), CEO of CallHealth, said, "This is a first of its kind in the world because to our understanding there is no player who does an integrated play-virtual and physical-across all services ever."[1]

Based in Hyderabad, India, CallHealth was the brainchild of a young entrepreneur, Sandhya Raju (Sandhya), daughter-in-law of B. Ramalinga Raju (Raju), the founder of Satyam Computer Services Limited[2] (Satyam Computer). Once, Sandhya, a Kuchipudi dancer, fractured her leg and during frequent visits to the hospital, she felt the need for a healthcare provider that could offer healthcare services at the doorstep of a patient in times of need. According to Sandhya, the healthcare infrastructure in India was too fragmented to address the multifarious health requirements of people. Realizing that there was a need for a comprehensive healthcare support system that would offer quality services to patients at their doorstep, she started CallHealth with the noble cause of assisting the people gain access to medical services to live a healthy and better life. "In the last two decades, we have seen technology change the way we work, communicate, bank, buy, and consume media and

Mapro: Sustaining a Family-Run Business

Indu Perepu[*]

The case is about Maharashtra, India-based food processing company, Mapro Foods (Mapro). The company was started in the 1950s by a pharmacist Kishore Vora, who, with the intention of helping the local farmers, started making jam with locally available strawberry. He soon started a food processing unit where jams and squashes were made from different fruits. Later on, Kishore Vora's nephew took up the reins of the company and developed Mapro. As the company entered its third generation, it ventured into other products like chocolates and fruit-based jelly. The success of its fruit jelly brand 'Falero', along with growing competition from both domestic and MNC confectionery companies, made the owners think about establishing a pan-India presence. They chose to bring professionals into the key management roles to run the company, with the family not involving itself in day-to-day activities. The company also moved its headquarters to Mumbai and inducted a new sales team. This left analysts wondering what lay ahead for the company that till then, had been run as a closely managed family venture.

INTRODUCTION

On March 28, 2016, Mapro Foods (Mapro), Maharashtra, India-based manufacturer of jams, fruit beverage concentrates, crushes, squashes, and fruit bars, announced that it was in the process of launching its own brand of premium chocolates and was in talks with the world's largest cocoa producers and grinders, Zurich-based Barry Callebaut. The company, which was headed and run by the family of the founder, Kishore Vora, also announced that it was opening an office in Mumbai, which would be run by professionals. According to Mayur Vora, (Mayur), Managing Director, Mapro, "We are setting in place a new team of seven members. From this we will choose a CEO. If the business has to grow, it has to be run by professionals."[1] This marked a shift for a quaint family-run company from Panchgani, near Mahabaleswar, Maharashtra, which till then had a limited presence across the country.

The history of the company can be traced back to the 1950s, when Kishore Vora, a pharmacist, shifted to the hill-town of Panchgani from Mumbai. He started his retail business with an agency of Kissan Food Products which included products like jam, sauce, etc.

Panchgani was famous for strawberry farming for a long time. The strawberry and raspberry farmers in the area during the 1950s were resorting to distress sales and even selling their produce at low prices due to the lack of storage or processing facilities. Looking at ways to help them, Kishore Vora came up with the idea of making jam with the fruits. In 1958, he started making jam in a small room in his house using two kerosene stoves and a few vessels. He invested Rs.800[2] in the venture. He soon came out with the first batch of 10 kilograms of strawberry and raspberry jams. He started selling them under the label Vora Products. Within no time, the products were sold out. Kishore Vora then decided to venture full time into the business. According to Mayur, "For him (Kishore Vora), making jam and selling it was a hobby, because during fruit season in Panchgani, the markets were

Zorba's Sarvesh Shashi – The Yogic Entrepreneur

K B S Kumar and Indu Perepu***

The case discusses the entrepreneurial venture of Sarvesh Shashi (Sarvesh). Sarvesh underwent a yoga course which transformed his thinking and perception of life. When the course was followed by a stringent phase of penance under the guidance of a shaman, Sarvesh gained immaculate clarity of what goals he should pursue in his life. With this motivation, he founded Zorba—the Renaissance Studio—which gained quick acceptance from the people. Sarvesh's primary motive was to spread happiness to people through the medium of yoga and meditation. He designed several courses that addressed the various issues and challenges people faced, ranging from depression and diabetes to cancer. Sarvesh did face some teething troubles, but his efforts soon yielded results.

INTRODUCTION

In January 2016, Sarvesh Shashi (Sarvesh), a yoga practitioner[1] and the CEO of Zorba - A Renaissance Studio (Zorba), sealed a Memorandum of Understanding (MoU) with India's largest health and fitness chain – Talwalkars Better Value Fitness Ltd (Talwalkars). As a part of the MoU, Talwalkars acquired a 50% stake in Zorba. Sarvesh and Talwalkars looked to expanding their joint presence in India and beyond by 2020 to make the most out of the fast-growing $3.2 trillion global yoga and wellness industry. By May 2016, Talwalkars, in association with Zorba, launched 33 studios across 25 cities in India and had further plans to roll out 100-120 studios in the next 5 years across India and overseas.

Sarvesh, the youngest CEO in the yoga and wellness sector at 24, hailed from an affluent business family based in Chennai[2], South India. During his teens, he had several career options before him. An avid cricket player, he was all set to make a career in cricket as he was just steps away from playing in the IPL[3]. He also had other options like going abroad for higher studies or joining his father in their family business. However, inspired by a shaman[4], Sarvesh turned down all these and chose to follow his heart. Sarvesh was 17 years old when he joined his father for a yoga class from a shaman from the Himalayas, whom he fondly called Guruji[5]. Though his father could not complete the classes, Sarvesh finished the module and developed an innate sense of belonging toward yoga. He told his Guruji that he

Psychological Empowerment as a Predictor of Affective Commitment Among Employees of Indian Banks

Neha Gahlawat and Sandeep Kumar***

The study is an attempt to examine the mechanism of enhancing affective commitment by understanding the effects of psychological empowerment on employees' commitment. The respondents included 208 employees from the Indian banking sector, and the regression results confirm a positive relationship between psychological empowerment and affective commitment. On the theoretical front, the study adds to the limited literature on psychological empowerment in the Indian context. On the practical side, the study helps organizations to understand the importance of psychological empowerment among employees to improve their affective commitment. Bank managers should focus on minimizing the elements present in the work environment that might create a feeling of helplessness in employees. They should create a working environment in the organization where employees are encouraged to take part in the decision-making process.

Introduction

A highly dedicated and committed workforce is essential for achieving organizational goals. Several studies have revealed the numerous benefits of affective commitment of employees to the organization. Commitment binds the employees to their organization and makes them more inclined to stay with the organization (Dewettinck and Ameijde, 2011). Affectively committed workforce feels a sense of pride in being members of the organization (Kehoe and Wright, 2013). Affective commitment develops a sense of organizational citizenship behavior among employees and enhances their level of job performance (Cobbinah *et al.*, 2020). Affective commitment among employees makes them more dedicated to contribute in enhancing the performance of the organization (Hadžiahmetoviæ and Dinç, 2017). Because of these valuable outcomes of affective commitment, organizations feel a strong need to make employees more committed. This

The Impact of Trust and Integrity on Police Performance and Community Happiness: The Mediating Role of Procedural Justice

*Mohammed Abdul Nayeem**

This review explores the impact of trust and integrity on police performance and community happiness and the mediating role of procedural justice in the context of Telangana police. The relationship among the variables is established through a systematic literature review and accordingly, the research gaps are also identified. A conceptual framework is also presented to study the relationships. A mixed-method approach to validate the relationship in question through the collection of data is also suggested, hoping it would provide theoretical and practical implications and recommendations on making community policing more effective in generating community happiness.

Introduction

The Government of Telangana has in place a citizens' charter to cater to the needs of the people by making people-friendly police that determine government policies, strategies, and services that would harness the virtues of positive lifestyle and well-being in the community and a plan to develop happiness index to measure people's satisfaction (Telangana Police Portal, 2019). The government has placed much importance on the happiness of the communities, and community policing is one of the ways expected to achieve it. The State follows a strategic vision of the State police concerning community happiness and has initiated a wide spectrum of initiatives to achieve it. In the State, community policing is employed to promote successful models that bring collaboration between police and communities to address community concerns and ensure that the police respond to the needs of the public in general, thus ensuring that trust and integrity are developed for improved security.

A lot of research has been done on community policing in terms of how close the police are to the community, the best practices, the effect on crime rates, external strategies and security. However, there is still a need to investigate the effect of community

Determinants of Employee Engagement: A Study of Select Information Technology Firms

Vikas Gautam and Harsh Vardhan Kothari***

The study investigates the role of organizational climate and self-efficacy as determinants of employee engagement amongst employees of select Information Technology firms. Primary data was collected from 105 employees working in different sectors in the National Capital Region, India. The Utrecht work engagement scale developed by Schaufeli et al. (2002), General self-efficacy (10 items scale) developed by Schwarzer and Jerusalem (1995) and Organizational climate questionnaire developed by Litwin and Stringer (1968) have been used to measure the constructs. The data was analyzed using Structural equation modeling. The analysis revealed a significant positive impact of organizational climate and self-efficacy on employee engagement. Both determinants explained 46% of the variance in employee engagement construct.

Introduction

Why is it that some employees are very energetic and they find their work meaningful and challenging, whereas others feel exactly the opposite? What is it that makes some employees not feel enthusiastic about their work? And what is it that makes employees not feel proud of what they do? Are these the questions which necessitate an understanding of the determinants of employee engagement? What role does self-efficacy and organizational climate play in helping us find answers to these questions? Indeed, organizations face many challenges at the workplace. However, creating a highly motivated and engaged workforce in order to ensure a high level of performance and productivity is vital for organizational survival and the success of business. The employee engagement as a construct has attracted the attention of management professionals and academicians alike, and yet we do not find answers to a few of the above questions.

The Influence of Job Characteristics on Attrition in the IT Industry

M Showry and Ravi Dasari***

The attrition of employees has emerged as one of the unyielding human resource challenges confronting the IT industry. Brutal cost-efficiency, intense competition, relentless innovation, and persisting rate of attrition of employees would threaten the organization's ability to accomplish strategic goals. Hence, organizations in the IT sector have made substantial efforts to reduce the rate of attrition by implementing diverse HRM practices. Despite the implementation of innovative human resource practices, the attrition among IT professionals remains unabated and threatening the competitive advantage of the organization. Hence, the managers have shifted their attention to examining the influence of the job characteristics on employee attrition. The current study examines whether or not an employee's subjective evaluation of job characteristics influences attrition by using Hackman and Oldham's job characteristics model. The findings of the study conclude that skill variety, task identity, task significance, and autonomy influence attrition.

Introduction

Studies show that employee attrition in the IT industry is significantly higher than in all the other industries. According to the research firm Gartner, the attrition rate has seen a steep rise from sluggish 10% in 2020 to alarming 20% in 2021, and some are even battling with higher rates of up to 30%. According to *Business Standard*, the attrition rate at top tech majors like Infosys, Wipro and HCL Tech touched a new high of 20.1%, 20.5% and 15.7%, respectively. The research studies indicated poorly designed tasks, lack of appreciation in the job and task ambiguities that triggered an intention to leave the organization. Employees are the most indispensable resource of any organization, especially the IT industry, as they are responsible for delivering the projects on time and fulfilling the specifications of the clients which are the key to accomplishing the objectives of an organization. To achieve this, an organization should design a job environment that stirs up efforts to acquire and utilize skills, and importantly allocate specific tasks according to the skills that they deliver on the job. However, many organizations in the

Manager's Role in Employee Turnover Intentions: A Special Study During Covid-19

Yamini Meduri and Poonam Jindal***

The study aims to examine the relationship between manager's role and employee turnover intentions in the Covid-19 pandemic situation. A questionnaire survey was designed by using three constructs – Manager Quality Performance Index (MQPI), Manager's Participation in Talent Planning (MPTP), and Employee Turnover Intention (ETI). 358 IT employees responded to the survey conducted during Covid-19 lockdown. Structured Equation Modeling (SEM) was performed to test the hypothetical association among the variables, which found that if managers are more involved in talent planning and their performance index is high, the turnover intentions in subordinates will be less. The study suggests implications on the practices and theories of Leader Member Exchange (LMX) and Social Exchange Theory (SET). The originality of this study is conceived by focusing on performance index of quantitative and qualitative behavioral information of line managers and their participation in talent planning, and by statistically proving their relationship with employee turnover intentions.

Introduction

The unprecedented Covid-19 pandemic pushed the boundaries of the environment that the employees, employers, businesses and economies are operating in. A sudden drift in the work environment has brought in unexpected challenges to a lot of organizations and thus to the economies around the world. Such uncertainty triggers anxiety and volatile work-life relationships, and the fear of layoffs multiplied the psychological effect of the pandemic, and when these feelings were coupled with negative support systems from the organizations, it led to higher turnover intentions of the employees (Vaziri *et al.*, 2020).

The corporate world is on the one hand working hard to remain in the business in the face of the pandemic and on the other hand, working on tackling the psychological impact of the pandemic on the employees through positive work systems (Carnevale and Hatak, 2020; and Pacheco *et al.*, 2020). Shan and Tang (2020) highlighted the need for developing higher employee morale and its positive impact on the organizations during the pandemic. The GREAT model proposed by Mani and Mishra (2020) underlines the importance of better employee management and the role of frontline managers in

Boundary Dynamics of Work-Life Integration During Covid-19 Induced Work from Home

Kalaa Chenji and Sode Raghavendra***

Many organizations were forced to adopt Work From Home (WFH) practices during the lockdown due to Covid-19. As employees are experiencing WFH for the first time, the study aims to understand the positive and negative experiences of 25 respondents from the manufacturing sector, service sector and academia. Boundary dynamics of work-family conflict and the theory and constructs of work-life integration are reviewed to identify and understand the existing literature. The study examines the trends that contributed to the area, and studies the theoretical perspectives of boundary/border management, integration/segmentation and related constructs.

Introduction

The Covid-19 pandemic has changed the world today. Work From Home (WFH), flaunted as the future of work till recently, has now become the only alternative to survive for employees as well as employers. Remote working has always been a motivational tool for most as it protected many from the confines of a physical office and saved commuting time. A few words like "quarantine", "social distancing", "containment", "community spread", "pandemic", never heard before, are most frequently used today. Unprecedented challenges introduced by Covid-19 have thrown the world into a new universe. Busy office premises are now deserted, dark and lonely, wondering where the army of inhabitants has suddenly disappeared. Millions are no longer confined to the offices but are locked in their own homes.

This paper focuses on the hardships faced by employees due to WFH during the lockdown, provides insights from the border and boundary theories of work-family boundary dynamics of work-life integration during these testing times propounded by Allen *et al.* (2014), and finally suggests opportunities and strategies available to employees to make best use of the present time to overcome the uncertain future. The current study conducted interviews with 25 employees working in different sectors, who are under different age groups, to identify and understand their experiences with the new work regime.

Authentic Leadership, Sustained Performance, Job Satisfaction, and Inclusive Culture: The Role of Psychological Empowerment

Salini S Pillai and Sitamma Mikkilineni***

With disruptions due to technology/transformations and changing market/client landscapes, organizations are constantly adapting to keep up with the external environment. This in turn is driving organizations to be nimble, agile, and flexible in their structures and people practices. The need for the study in the emerging field of Authentic Leadership points to the need for organizations to focus on authentic leadership to create impact, build culture and influence the teams towards achieving the organizational objectives. The paper examines the research on AL and its impact on key variables of sustained performance, job satisfaction and inclusive culture. The paper is unique compared to prior research due to the inclusion of the role of psychological empowerment beyond the structural empowerment discussed in prior research. The paper presents a detailed literature review, key definitions of the variables and multi-level perspectives of the variables. It also provides the prior research measures and tools used to establish the relationship of various variables with Authentic Leadership. The paper concludes with multiple hypotheses to be studied for establishing the impact of psychological empowerment on the AL components, if any.

Introduction

The Covid-19 pandemic, the greatest global crisis of our times, has placed an unprecedented strain on the social, economic, and governance structures worldwide, and leadership has been extremely critical for organizations to face and deal with challenges (Antonakis, 2021) like evolving market landscapes, technology transformations or more importantly the changing workplaces. In the past few years, scholars and practitioners have been trying to comprehend the future of work—from a work, workforce, and workplace perspective and trying to come out with interventions and changes. Fueled by remarkable

Examining the Influence of Self-Efficacy and Conscientiousness on the Freelancers' Self-Leadership: A Study in India

Keerti Shukla, Surajit Saha** and Musarat Shaheen****

Self-leadership strategies make employees agile in today's uncertain and ambiguous work environment. But there exists a debate whether self-leadership is an inborn or developable characteristic. Thus, the present study attempts to investigate whether an individual psychological resource (i.e., self-efficacy), which is malleable in nature, and individual personality trait (i.e., conscientiousness), which is relatively fixed over a period of time, can predict self-leadership. The influence of conscientiousness as a personality trait and self-efficacy as a personal resource on self-leadership were examined based on the data collected from 103 professionals working in different industries of India. Correlations and regression analysis was performed to investigate the impact. The findings indicated a significant effect of self-efficacy and conscientiousness on self-leadership. More interestingly, the data shows that self-efficacy is more critical for self-leadership compared to conscientiousness. The findings of the study suggest several avenues for the engendering of self-leaders at the workplace.

Introduction

Cost-effectiveness is one of the strategic tools for an organization's survival. A good amount of money is required for developing and retaining leaders of an organization. To perform in a Volatile, Uncertain, Complex, and Ambiguous work environment (VUCA), organizations are developing their human resource as an agile workforce who can work independently and take crucial decisions like leadership development (Mack *et al.*, 2015). Creating more self-leaders is a better cost-effective investment. Self-leaders are the ones who are good at self-analysis and can manage and lead themselves across all challenging situations. The conceptualization of self-leadership has its foundation in the self-

The Dark Side of Leadership: A Review of Literature on Abusive Supervision

Ashok Kumar Goute, Avanthika Goute** and N Akbar Jan****

The role of managers and supervisors is becoming more important in the modern VUCA (Volatility, Uncertainty, Complexity and Ambiguity) world and the emerging new normal of post-Covid. The different styles of leadership produce different outcomes for the organization. Similarly, one of the dark sides of leadership, i.e., abusive supervision, brings out outcomes that are of greater concern for organizations across the globe. The present literature review of abusive supervision is intended to highlight the aspects more relevant to organizational behavior domain. The study also elaborates the relationships of abusive supervision with other organizationally important variables, including relevant mediators and moderators. The various opportunities for future research like relationship of abusive supervision with organizational culture, injustice, and organizational citizenship behavior have been identified.

Introduction

Managers and supervisors play an important role in influencing the performance of their reporting teams and the well-being of the team members. The role of managers and supervisors is becoming even more important in the modern VUCA (Volatility, Uncertainty, Complexity and Ambiguity) world and the emerging post-Covid 'new normal'. This has made aspects of the dark side of leadership such as abusive supervision a matter of greater concern for organizations across the globe.

Abusive supervision can be expressed as the subordinate's insight on the supervisor's unfriendly behavior. It refers to both linguistic and non-linguistic behavior. Abusive

Leadership and Communication During a Crisis – The Case of Tony Fernandes (AirAsia) and Ahmad Jauhari Yahya (Malaysia Airlines)

Indu Perepu and Sitamma Mikkilineni***

The purpose of this paper is to examine the communication styles of two leaders in managing the crisis they faced. The study gives an insight into and a perspective on the qualities leaders need in times of crisis. It is significant as it investigates how crisis communication was handled by the leaders of AirAsia and Malaysia Airlines. The study then discusses the main reasons why the communication by Tony Fernandes of AirAsia went on to become a perfect example of how to communicate during a crisis, and why the communication efforts of Malaysia Airlines' Ahmad Jauhari Yahya did not meet the stakeholders' expectations.

Introduction

Herbert Spencer (1884), the philosopher, said that the times produce the person and not the other way around. His philosophy is reflected in the situational leadership theory which assumes that different situations call for different leadership characteristics (Northouse, 2007). This theory states that for a leader to be effective, the person has to adapt his or her style to the demands of the situation. This becomes all the more significant in organizations that are facing a crisis.

The importance of communication in leadership has been stated often enough. Leadership is interpersonal influence exercised in a situation, and directed, through the communication process, toward the attainment of a specified goal or goals (Tannenbaum *et al.*, 1961).

Crisis communication engages both practitioners and scholars in terms of ethics, problem solving, strategy, and effective interpersonal communication. How organizations manage crisis, and how they deal with risk are important concerns for both professionals

Perception of Management Students Towards E-Leadership

Syed Hassan Abdullah and Sitamma Mikkilineni***

Information technology tools have proven to be the desired response for sustaining organizational performance. The paper examines the perceptions of students towards e-leadership. It is based on the observations obtained through a survey from 105 students. An important finding in this paper is that e-leaders will encourage the exchange of information in the organization. The swift decisions, continuous sense of urgency and speed have made e-leadership a vital part of the organization. However, this has certain limitations such as misunderstanding, lack of trust and empathy.

Introduction

The global economy has been witnessing a major shift in recent times. There is a fundamental change in the way organizations build new markets and relate to their stakeholders. The adoption of Advanced Information Technology (AIT) like video conferencing, virtual teams, group decision support systems, artificial intelligence, robotic process automation and cloud computing has had important effects on organizations and the employees. Consequently, leadership processes are continuing to develop through the support of these technologies.

The term e-leadership was first introduced by Avolio *et al.* (2001) to describe leadership in a new emerging context and develop a nomological framework for analyzing it using the adaptive Structuration theoretical framework. The framework assumes that technology influences organizational structures including leadership and these in turn influence the use of technology. Avolio *et al.* (2014) proposed that the effects of AIT interact with and help to develop leadership and leadership itself is transformed when interacting with and adopting AIT. E-leadership is defined by them as "a social influence process embedded in both proximal and distal contexts mediated by AIT that can produce a change in attitudes, feelings, thinking, behavior, and performance".

Graduating Students' Job Search Intensity: The Impact of Social Support Dimensions and Employment Commitment

*Chetna Priyadarshini**

This paper intends to propose a conceptual framework on the personal and contextual antecedents of job search intensity among the final year job-seeking university students in India. It focuses on three dimensions of social support, viz., emotional, financial and informational, received by the graduating students during their job search process. The paper also proposes that the social support dimensions will have a differential impact on the job search behavior exhibited by the entry level job seekers. Further, it discusses the impact of employment commitment on job seekers' search intensity. Besides, the paper proposes a conceptual model that can be used to study the mediating role of job search self-efficacy and job search clarity on the relationship between social support dimensions and job search intensity, and employment commitment and job search intensity.

Introduction

In recent years, concern over elevating youth unemployment rate in India has been raised repeatedly by the national and international bodies (ASSOCHAM, 2016). The unemployment rate of educated youth has been reported to be higher than the overall unemployment rate in both rural and urban India (Ministry of Labor and Employment Labor Bureau, 2014). The inability to find a job often leads to depression, stress, anxiety (Wanberg *et al.*, 1999), and a sense of incompetence among others (Kulik, 2000). In particular, unemployment is reported to be taxing amongst the recent college graduates due to lack of work experience (Swanson and Tokar, 1991). Given the significance of first job in one's life and the negative consequences associated with unemployment, it is relevant to examine the factors that contribute to an effective job search behavior by the new entrants and lead to favorable employment outcomes (Kreemers *et al.*, 2021).

Job search behavior refers to identifying the presence of job opportunities and gathering more detailed information on selected job alternatives (Barber *et al.*, 1994; and van Hooft *et al.*, 2021). Kanfer *et al.* (2001) suggested that job search is a self-regulated behavior directed towards identification of and commitment to an employment goal. Boswell

Perceived Academic Stress and Quality of Campus Life in Business Schools

N Akbar Jan[1], Asha Binu Raj[2], A K Subramani[3] and Ashok Kumar Goute[4]

The main objective of this paper is to explore the impact of students' perceived academic stress on the quality of campus life of business schools in South India. A survey was conducted among the first and final-year MBA students from Chennai, Bengaluru, and Hyderabad business schools. Structured questionnaires designed through Google Forms were used to gather the primary data from a sample of 386 students. A cross-sectional study examined the significant academic stressors and how students perceive and manage these stressors. In addition, this paper also analyzes the impact of academic stress on the quality of campus life by examining the physical health, environmental health, mental health, and social relationships among students. Data was collected thrice in a semester, i.e., during the beginning of the semester, mid-semester, and end of the semester during examinations. The research outcome shows that all the academic stress factors identified in the study (stress perception, stressors, and stress management) significantly relate to the academic stress construct. Similarly, physical, environmental, and mental health and social relationship are positively associated with the quality of campus life. The results of the SEM also portray that the academic stress prevailing in the business schools results in negative perceptions towards the quality of campus life among the student community.

Introduction

Stress is an inevitable part of present-day life; however, the reason, type, and level of stress varies from person to person based on the age group, gender, profession, and lifestyle. In addition, competitive environment around us also leads to stress in our

The Impact of E-Learning Framework on Student's Learning in Technical Education in India

Asha Binu Raj, N Akbar Jan** and A K Subramani****

The focus of this paper is to examine the effect of the e-learning framework on students' learning in technical educational institutions in India. The paper considers Khan's e-learning framework to analyze the students' perception of the system used in their technical education. The student's learning was measured through three main dimensions of learning, which include knowledge, skills, and attitude, by analyzing the individual impact on the overall learning process. This study attempted to test the hypothesis through Structural Equation Modeling (SEM) technique. The data was collected from a sample of 294 respondents. The sample was selected using snowball sampling technique. The results of descriptive analysis and SEM indicate that the e-learning system used in technical educational institutions has a significant positive impact on various dimensions of students' learning. The findings reveal that proper design and delivery of e-learning systems with appropriate pedagogies in technical educational institutions will enhance the quality of technical education and result in improved learning among students, making them employable.

Introduction

Education has a significant contribution to the economic growth of any country. Indian education has two major components, namely, school and higher education. School education is further divided into primary, middle, secondary, and higher secondary (or intermediate) segment. The higher education system comprises of basically technical, medical, law, and arts and science education. Technical education imparts technical knowledge and skills to increase the competencies, thereby improving the productivity

Perception of Female Students Undergoing Professional Courses Towards Gender Stereotypes at the Workplace

Nirupama Chakraborty and Namrata Chatterjee***

Gender stereotyping is a psycho-social process that illustrates structured sets of beliefs about the personal attributes of men and women. An awareness of the contents of gender role stereotypes subconsciously begins in the preschool years and is rather well-developed by the time children enter first grade. Women continue to be plagued by gender stereotyping that we perceive as a thing of the past. The existence of actual differences between male and female managers has been challenged for some time in the research literature. While men are expected to "take charge," women are mostly expected to "take care," playing a more supportive and nurturing role both on their personal and professional fronts. But in order to overcome these disparities, organizations must first acknowledge that gender stereotypes still exist. Studies have reported that organizations that have a significant number of women in the management positions have a higher return on investment, and work teams that consist of an even number of men and women who are more productive than those made up of primarily just one gender. Hence, this study is an attempt to look at some of the key stereotypical perceptions associated with professional women. As more and more young women are entering the various industries today, it is of importance to understand their perceptions regarding the various stereotypes that working women might be subjected to since these might act as perceived barriers for female students undertaking professional courses.

Introduction

Gender stereotyping is categorical beliefs about traits and behaviors that are attributed to people based on their gender. They serve as expectations about the characteristics and behavior of individual group members (Cleveland *et al.*, 2000) and are considered one of the direct antecedents of discrimination at workplaces (Dovidio and Hebl, 2005).

The Success of Learning Management System in Higher Educational Institutions in India

Saumya Kapoor Sharma, N Akbar Jan** and A K Subramani****

The study's key objective is to examine the success of the Learning Management System (LMS) used in various Higher Educational Institutions (HEIs) in Chennai city. This study used a descriptive research design, which describes the users' perspective towards the success of LMS used in various HEIs in Chennai city. Data was collected through a stratified sampling technique to measure the satisfaction level attained by institutions adopting LMS. The SEM model shows that all the LMS factors have a significant positive effect on the usage of LMS. The findings of the study will help policymakers of HEI focus more on content quality while developing LMS platforms.

Introduction

The economic growth of a country depends on the knowledge possessed by its citizens. Therefore, education is considered fundamental for building a sustainable society. Knowledge platforms across the globe are changing with varied methods incorporated for enrichment. Even our government has drafted National Education Policy, 2021, which plans for everyone's equitable and lifelong learning opportunities by 2030. The future of our country depends on the knowledge landscape provided primarily to the younger generation. Therefore, learning is an inevitable part of human life. The emergence of an unforeseen contingency like Covid-19 has taught us to innovate and inculcate new methodologies for teaching and learning. The basic premise of learning has shifted its attention from "what to" to "how to" learn in the current scenario. Learning may be of two types, namely, formal learning and informal learning. Formal learning refers to learning in a training-based organization, workplace, mobile devices, classrooms, online and

Perceived Stress and Coping Mechanism of Generation Z Management Students: Empirical Evidence

Sombala Ningthoujam[1], Teena Singh[2], Vikas Gautam[3] and Maria Zafar[4]

The present study investigates the relationship between perceived stress and coping mechanism of postgraduate management students. The qualitative research led to identification of six themes related to sources of stress among students, namely, academic/career, financial factors, environmental factors, interpersonal factors, moving to a new place for college, and miscellaneous sources. Further, the qualitative methodology identified stress coping measures such as problem-focused strategies, and emotion-focused strategies. The results of Correlation Analysis confirmed positive relationship between perceived stress and self-distractions (r = 0.118); denial (r = 0.170); substance abuse (r = 0.178); use of instrumental support (r = 0.129); behavioral disengagement (r = 0.158); venting (r = 0.233); self-blame (r = 0.290) and humor (r = 0.133). Moreover, the study found negative relationship between perceived stress and active coping mechanism (r = –0.211); perceived stress and positive reframing (r = –0.159); perceived stress and acceptance (r = –0.211). Also, the study found moderate stress level with 76.5% (n = 309) of the respondents, low stress level with 14.10% (n = 57) and perceived high stress level with 9.40% (n = 38). A MANOVA was conducted with gender as the independent variable on the group of outcome variables (perceived stress and coping mechanism).

Introduction

The definition of stress was formally given by Selye (1979) as stress is a perception and perceived demands that are imposed upon us because there are too many alternatives, and as a result, the body develops General Adaptation Syndrome (GAS) to fight or flight stage to meet the demand. Lazarus (1993) defined stress as a condition when a person

Work-Life Conflict and Psychological Health Among Healthcare Sector Employees: A Comparative Study of Employees of Public and Private Hospitals

Sombala Ningthoujam[1], Teena Singh[2], Vikas Gautam[3], Anupama D Raina[4] and Maria Zafar[5]

In the current situation of Covid-19, it is clear as to how health professional warriors are fighting against disease, distress, social discrimination and many atrocities while upholding their profession and compassion. Moreover, they are exposing themselves to the risk of infection and death to save the lives of patients from a life-threatening disease. The study examines the relationship between work-life conflict and psychological health of healthcare sector employees and the flexible workplace arrangement. Further, it examines if there is any difference between those employed in public hospitals and those in private hospitals. Comparison of means using t-test, means, frequency and correlation analysis is done in order to achieve the study objectives. The results confirm low levels of overall conflict as well as family-work and work-family conflicts. With regard to comparison between government and private hospitals, a significant difference is found between the two at burnout levels only and not in terms of conflict and health.

Introduction

Greenhaus and Beutell (1985) conceptualized Work-Family Conflict (WFC) as a form of inter-role conflict that arises when one's work and family roles interact and result in three sources of conflict: time-based, strain-based, and behavior-based, while investigating the

Occupational Stress as a Function of Organizational Commitment and Personality Type: A Study on Legal Professionals

Preshita Neha Tudu* and Piyushita Meha Tudu**

Occupational stress is experienced in all professions, law included. There are studies to suggest that organizational commitment has a positive impact on occupational stress. Similarly, studies have been conducted to prove the link between personality type and occupational stress. However, there are very few studies linking all three variables. The present work aims to bridge this gap. The aim of the paper is to measure occupational stress experienced by lawyers. Studies on this subject in India are few and far between. Data from 102 respondents, representing 68% response rate, were analyzed. The study was carried out using standardized questionnaires, which include Philip L Rice occupational stress questionnaire, Myers-Briggs personality type questionnaire and Alan Meyer organizational commitment questionnaire. Correlation and stepwise regression statistical analysis was performed to arrive at the results. The results show that there is significant correlation between occupational stress and personality types of introversion, sensing, feeling and thinking. A significant inverse correlation has also been deduced between occupational stress and organizational commitment. Emotional commitment has been identified as the best predictor of occupational stress and feeling as the least predicting variable. The findings of the study can be used to devise strategies to combat occupational stress experienced by lawyers working in litigation as well as for corporates.

Introduction

The word 'stress' is derived from the Latin word, *stringere*, meaning to draw tight. In 1936, Hans Selye, the father of modern stress, borrowed the term from physics and used it in medical literature. He suggested that stress is a non-specific response of the body to any demand. In this modern hyper competitive world, stress can come from anywhere and everywhere.

What Factors Influence a Woman's Decision to Return to Work? A Review of Literature on Career Models

Rupali Nandamuri, Smita Kulkarni** and Prerna Chhetri****

The literature on women workforce that rejoin work after a career break, is limited to either determinants or consequences. However, there is a need to identify and understand career development models that focus on career breaks and women re-joining the workplace. This will give an understanding and insight into the factors that determine and influence women to return to work. Therefore, the paper reviews existing career development models in the available literature and proposes a comprehensive framework of factors that influence a woman's decision to re-join work post career break. The factors have been classified as internal and external factors. An understanding of the factors can help organizations as well as individuals contribute towards supporting women to rejoin work post career break.

Introduction

Career motivation and development have long been topics of great interest for both practitioners and academic research. This has led to a plethora of research on career and career development which resulted in several career models. However, many of these models are not specific to women and their issues. This is especially critical for women who leave work to look after their families, responsibilities of caring for younger children, elders, etc. Several papers have focused on the reasons why women leave the workplace (Hanson *et al.*, 2008; and Metz, 2011), but rarely have researchers investigated the reasons for women returning to work after a break. This paper aims to understand the reasons why women who have left the workplace want to return to work by reviewing the literature on the career models. It aims to understand the influence of internal factors

Application of Theory of Planned Behavior for Assessing Entrepreneurial Behavior of Workers in the Unorganized Sector

P Venkateswarlu and R R Reddy***

Ajzen's Theory of Planned Behavior (TPB) was applied to study the entrepreneurial behavior of workers in the unorganized sector. Workers from the construction sector were considered for the study. The results indicate that all the three TPB variables, viz., attitude, subjective norm and perceived behavior control, have significant effect and are the strongest predictors of becoming entrepreneurs. It is evident that females have shown lesser attitude and perceived behavior control than males to become entrepreneurs. There is a need for the governments to recognize the unorganized construction sector and provide some basic education to strengthen their entrepreneurial skills and enhance their confidence to become better entrepreneurs.

Introduction

Entrepreneurship is always a priority when it comes to the socioeconomic agenda of the country. Entrepreneurship generates employment opportunities and bridges the gap between the poor and the rich. The word entrepreneurship depicts the challenges and the struggles of individuals who invest their time, money and efforts to bring a change in the lives of the people. Entrepreneurs create job opportunities and spend on innovation of new products and technology development, thus contributing to the economy of the country. People who are highly motivated towards business, their perseverance and willingness to take risk for making profits in their business become successful entrepreneurs.

The construction industry in India is the second-largest sector after agriculture. Building activity is highly labor-intensive and creates a lot of employment opportunities. It is also one of the engines for the economic development of the country. There are several big players in the market who undertake the activities and in turn subcontract to the petty contractors for completing the activity.

The Influence of Stream on the Entrepreneurial Intentions of Engineering Students

*P Venkateswarlu**

This paper was conceptualized with an objective to identify the entrepreneurial intentions among the students pursuing engineering degree and to assess the influence of the stream, such as Electronics and Communication Engineering, Computer Science Engineering, Mechanical Engineering and Civil Engineering. Ajzen's Theory of Planned Behavior was applied to assess the behavioral intentions of the students pursuing engineering degree. The results indicated that no influence of stream was found on the entrepreneurial intentions of the students. However, students pursuing mechanical engineering and civil engineering had shown higher degree of attitude towards entrepreneurship as their career.

Introduction

Entrepreneurship essentially comprises two important aspects: acumen to create a business venture and risk-taking propensity. An entrepreneur is an individual who is driven by the desire to innovate and create business idea, products and services and anticipate the risk and rewards involved in the business. They are expected to encounter challenges and hardships related to market contingencies, regulatory issues or raising financial resources. Entrepreneurship calls for immense passion and perseverance as it involves several factors, such as predicting the market uncertainties, bureaucratic glitches, financial quandaries and risks. Entrepreneurs need to be possessing resilience, self-efficacy and propensity to take high risks. Characteristics such as enterprise, ambition, providence, competitiveness, appetite for success coupled with aptitude to face the competition are indispensable to the entrepreneur. Entrepreneurs create wealth, generate employment opportunities and enhance quality of life for larger public. They also stimulate the socioeconomic development of the country. The roles played by the entrepreneurs in the country's economic growth are multifold such as improving the quality of life through innovation of new products and services; creating employment at various levels; and to cater to the needs of the global markets.

E-Commerce Industry – HR Strategies: A Perspective Analysis

Brigadier Bhuvanagiri Chandrasekhar* and B S S Karthik**

The purpose of the study is to explore the challenges faced by the stakeholders of e-commerce industry in India, and to understand the business as well as HR strategies adopted by them to cope with these challenges and stay at the top. To study the phenomenon and understand the challenges of e-commerce industry, the qualitative methodology was used. The approach followed by the authors was: on-site observation of e-commerce processing centers; conducting semi-structured interviews with subject matter experts and with the team leaders in charge of 'planning' and 'operations' of e-commerce business players; with the team leaders in charge of operations at the parcel and COD processing centers, Transportation Management Center at Hyderabad, and HR at the Delivery Points (involved in last mile delivery of the shipments) in a south Indian State. The interaction was at length with the functionaries in charge of the logistics partner of these e-commerce players based in Hyderabad. The findings explored the approaches adopted by the two e-commerce business players and by their service partners at the processing centers and at the last mile delivery points. The study also brought forth some interesting business strategies and strategic HR practices being adopted by the different stakeholders. Themes emerged out of these interviews and the on-site observations were captured and a set of propositions were made as findings in this study. Based on these findings, a set of propositions were made, which can become a base for all the stakeholders to work upon for planning and reaching higher efficiency levels. Further, such studies can be carried out in other states of the country and also in other countries of Asia in the future.

Introduction

With technological advancement, e-commerce is growing from strength to strength, with easy access of the consumers to the huge selection and product range, enabling the linking of different stakeholders. Even as the electronically-driven business and commerce is soaring at a stupendous rate, there is a need for players in the e-commerce business to match up to the requirements of the boom.

Strategic Human Resource Management and Employee Relationship Management: An Approach for Realizing Sustainable Competitive Advantage

*Swati Hans**

The paper presents a conceptual framework establishing the link between strategic human resource management and employee outcomes (such as motivation, satisfaction, and happiness), and sustainable competitive advantage at the firm level. The paper also explains that HR practices, if integrated with other functions at work and strategically aligned with the overall business strategy, would lead to superior benefits for an organization. This framework could be used as a reference framework by future researchers for similar kind of research on SHRM.

Introduction

The business environment around the globe has changed dramatically over the last few decades, and today it is characterized by phenomena such as acceleration in information technology, intense competition, changing customer needs, and diverse workforce (Khajeheian *et al.*, 2018; and Soloducho-Pelc and Sulich, 2020). To stay competitive in this dynamic environment, organizations are required to constantly evolve and adapt by innovating products, acquiring new technologies, improving process and service quality, and formulating powerful strategies (Augier and Marshall, 2017; and Miceli *et al.*, 2021). An organization's physical capital no longer benefits in realizing the Sustainable Competitive Advantage (SCA) for an organization, rather what helps is, non-physical human resources and their intellectual capital (Delery and Roumpi, 2017; and Emeagwal and Ogbonmwan, 2018).

Since HR practices are instrumental in managing, developing, and influencing employees, it becomes paramount to appropriately integrate those practices with the overall strategy of the organization as a means of gaining competitive advantage (Gilmore and Williams, 2009; and Collins, 2021). The Strategic Human Resource Management (SHRM) views HR from the strategic perspective and considers employees as strategic assets. SHRM makes it evident that linking HR practices and policies with the strategic

Case Study

Open Leadership at Red Hat

A Kranthi Kumar and Jitesh Nair***

The case study describes the open leadership approach followed by Red Hat, Inc., an American multinational software company providing open source software products. Red Hat's culture was rooted in the open source movement since it had hired employees mostly from open source communities in the initial years post its inception in 1993. Constructive criticism through open and heated debates was common and acting openly was the norm and what was expected. The top management realized that open leadership gave Red Hat a competitive advantage and efforts had to be made to retain this culture even as the company grew in size. The company management observed that in an open organization, employees evolved into leaders when they exhibited certain behaviors as a result of their beliefs. Red Hat identified the general principles (mindsets) and the resulting open leadership practices (behaviors) and took steps to interlock these mindsets with the leadership behaviors. In the initial phase of building an open leadership system, Red Hat did not find any suitable end-to-end leadership development systems that would help train its people to lead in a flat organizational structure and a culture that preferred meritocracy over hierarchy and seniority. The company decided that it would build some of those systems itself, and in other cases modify and adapt best practices used in standard organizations.

> *I believe that the future success for businesses to attract and retain top talent relies on a more open management and leadership approach. The workforce is evolving and the new employee is part of a major change affecting not only how we hire and who we hire, but how our companies operate on a basic level. It's especially prevalent in the new generation entering the workforce.*[1]
>
> **– DeLisa Alexander, Chief People Officer, Red Hat, in 2012**

> *People are emotional beings. Traditional management does its best to wring every bit of emotion out of people, which can often lead to disengagement. We recognize that if you can actually leverage emotion and the passion it creates, you can really double down the effort you get from your people.*[2]

IBM's Desperate Bid to Create Younger Organization – Big Blue's Woes with Age Discrimination

K B S Kumar and Indu Perepu***

In 2018, US-based multinational information technology company International Business Machines Corporation (IBM) faced a series of lawsuits filed by former employees. These lawsuits accused IBM of discriminating against the employees who were over 40 years old, in order to make way for new talent and tech-savvy millennials in the workforce. The case explains the different ways that IBM used to target older employees and discriminated against them. With many employees approaching the courts and senior personnel testifying to the deep-rooted age discrimination prevailing in the company, IBM's future course of action remained uncertain. The verdict in these cases would have wider repercussions for the aging employees and age-related discrimination not only in the US but across the world.

Age discrimination is an open secret like sexual harassment was until recently. Everybody knows it's happening, but often these cases are difficult to prove because courts have weakened the law. The fact remains it's an unfair and illegal way to treat people that can be economically devastating.[1]

– Victoria Lipnic, the acting Chair of the Equal Employment Opportunity Commission[2] in 2018

Introduction

"When people look at IBM, we're blue and we are 100 years old. So it is a question of in the eyes of people coming to join the organization, how do we show IBM as a different place to the one they have in their mind? One way to show millennials that IBM was

Can Thierry Delaporte Revive Wipro?

Smita Kulkarni*, Syeda Maseeha Qumer** and Syeda Ikrama*

The case focuses on corporate restructuring at Wipro, one of the largest IT companies in India. Wipro's CEO, Thierry Delaporte, announced a huge restructuring exercise, the first since he took charge of the company in July 2020. The restructuring of the company was aimed at simplifying the existing organizational structure and driving growth in all markets beyond the US. Wipro, which was one of the leaders in the Indian IT space, had been witnessing a slump in revenues since 2012 compared to other IT peers. Its inability to adapt to new technologies, its conservative approach, unimpressive acquisitions, slow economic growth, growing competition, and unwarranted price concessions to clients were some of the reasons for its underperformance. As Delaporte embarked on a major restructuring at Wipro, the challenges before him would be to boost revenues, build a strong talent pool, strengthen market share, help the company regain its market position, and drive growth amidst the Covid-19 pandemic.

> *The new management has tried to take the bull by the horns—which is what Wipro needed. After many failed experiments, this was perhaps the last throw of the dice by the Wipro board—a CEO who will not shy away from taking hard decisions, to take Wipro to its rightful place, on a par with peers.*[i]
>
> ***– Analysts at Philip Capital (India) Pvt. Ltd., a financial advisory firm, in November 2020***

Introduction

In November 2020, India-based global information technology, consulting, and business process services company Wipro Ltd.'s (Wipro) newly appointed CEO and MD, Thierry Delaporte (Delaporte), announced a major organizational restructuring to turnaround the

Crisis at Papa John's Pizza: Fall of John Schnatter

Memendu Showry* and Indu Perepu**

This case describes the struggle of the US-based pizza chain Papa John's International Inc. (Papa John) to recover from the PR crisis. In 2018, the troubles for the company began when Forbes *reported about the racial slur made by the founder of the company John H Schnatter (Schnatter).* Forbes' *article also detailed about the company's 'toxic' culture and a number of deep-rooted issues involving Schnatter. Following the controversy, Schnatter had to step down as chairman of the company, but did not stop putting his foot in his mouth. In 2017, he lost his position as CEO after he set off an uproar by blaming the National Football League (NFL) players for the pizza chain's lagging sales. His statement led to a drop in sales. Further, marketing partners and consultants were breaking ties with the pizza chain. The numerous allegations against the founder posed a threat to the company's image. Struggling to put an end to the fiasco, the board of Papa John's finally decided to ward off Schnatter from the business by adopting 'poison pill'.*

Our future will not be defined by the words or actions of one person.[i]

– Steve Ritchie, CEO, Papa John's, in 2018

The outlook for Papa John's is growing dimmer with recent media reports citing a fraternal corporate culture that is reinforcing consumer perception that Papa John's is not a trusted brand.[ii]

– Chris O'Cull, Analyst, Stifel Financial Corp[1], in 2018

Ethical Dilemmas of Decision Making in a Crisis: Tragedy at Memorial Medical Center, New Orleans

Akbar N Jan, G V Muralidhara** and Shwetha Kumari****

The case study describes the moral dilemmas faced by the leaders, doctors, and nurses of Memorial Medical Center (Memorial), New Orleans, during Hurricane Katrina in 2005. The hospital had no electricity, running water, or air conditioning. The temperature shot up to more than 110° Fahrenheit and the putrid smell of dead bodies burnt the back of the throat. Both chaos and heroism defined the scenes at Memorial; Memorial staff worked around the clock with few provisions to sustain them. Further, the case discusses the decision of the hospital leaders that patients with Do-Not-Resuscitate (DNR) orders should get the lowest priority as they had the least to lose. It then describes the triage conducted by Dr. Anna Marie Pou (Dr. Pou), a well-regarded head and neck surgeon. Later, Dr. Pou along with two nurses Cheri Landry, and Lori Budo, euthanized the DNR patients, although there was still hope of evacuation. The case ends with a discussion on the arrest of Dr. Pou, Cheri Landry, and Lori Budo for second-degree murder..

The physicians and staff responsible for the care of patients, many of whom were gravely ill, faced loss of generator power, the absence of routine medical equipment to sustain life, lack of water and sanitation facilities, extreme heat in excess of one hundred degrees, all occurring in an environment of deteriorating security, apparent social unrest and the absence of governmental authority. Dr. Pou and other medical personnel at Memorial Hospital worked tirelessly for five days to save and evacuate patients, none of whom were abandoned. We feel confident that the facts will reveal heroic efforts by the physicians and the staff in a desperate situation.[i]

Hindustan Unilever Limited: Providing the Right Work-Life Balance

Ashok Kumar Goute, Koti Vinod Babu** and Namratha V Prasad****

The case study discusses the initiatives taken by India's largest Fast-Moving Consumer Goods (FMCG) company, Hindustan Unilever Limited (HUL), to enable its employees to strike the right work-life balance. The case delves into details of HUL's various Human Resource (HR) policies and explains how each of the policies made the company's employees execute both work and personal responsibilities better. HUL's initiatives to cater to the varied needs of its women employees are explained in detail. The measures being taken by the company to keep itself abreast of the changing needs of new-age employees are also mentioned. So, will HUL continue to remain an 'Employer of Choice' and a 'CEO Factory' in India?

> *At HUL, we have policies and workplace facilities that enable a nurturing environment for everyone. We support and encourage our employees not only to be great business leaders but to also lead happy and fulfilling families.*[1]
>
> **– B P Biddappa, Ex-Executive Director of Human Resources, Hindustan Unilever Limited, in 2018**

In December 2020, India's largest Fast-Moving Consumer Goods (FMCG)[2] company, Hindustan Unilever Limited (HUL),[3] announced a policy to protect its staff from domestic abuse.[4] This was the first time that such a policy was being introduced by an Indian company.

1 "Extending Full Support to Working Parents," www.hul.co.in, July 1, 2018.

2 Fast-moving consumer goods are products that sell quickly at relatively low cost. These goods are also called consumer packaged goods. FMCGs have a short shelf life because of high consumer demand (e.g., soft drinks and confections) or because they are perishable (e.g., meat, dairy products, and baked goods).

3 Hindustan Unilever Limited is an India-based global consumer goods company. It was founded in 1933. It is a subsidiary of British multinational consumer goods company, Unilever plc. Its products include foods, beverages, personal care products, water purifiers, and other fast-moving consumer goods. In fiscal year 2020, Hindustan Unilever Limited reported an investment value of about ₹15 bn (As of March 15, 2021, $1 = ₹72 approximately).

4 Domestic violence (also called domestic abuse or family violence) is violence or other abuse in a domestic setting, such as in marriage or cohabitation.

IKEA's Talent Management and Corporate Culture

Mohammad Abdul Nayeem* and Hadiya Faheem**

The case discusses IKEA's talent management initiatives and its corporate culture. The retailer recruited employees based on values and beliefs rather than just on skills, experience, and other credentials. It fostered an 'egalitarian culture' that offered full benefits even to part-time workers who worked for 20 hours or more per week. In 2017, global research and consulting firm Great Place to Work and Fortune named IKEA US among its 2017 Fortune 100 Best Companies to Work For. Analysts opined that its talent management initiatives and its strong corporate culture provided IKEA with a competitive advantage. Though IKEA was touted to be an ideal employer in the retail market, it was hit with a lawsuit in the US court over alleged age discrimination in February 2019. Some IKEA employees stated that the retailer had fostered a culture of age discrimination wherein young workers were recruited and promoted over workers who were 40 years and older, thereby violating the Age Discrimination in Employment Act.

When recruiting for IKEA, it is attractive to recognize that the applicant has read up about the company and managed to describe the connection, i.e., what are the values they have as a person which makes them the perfect fit for working with the organization.[i]

– Anna-Carin Månsson, Country HR Manager for India, in 2018

Maintaining a strong IKEA culture is one of the most crucial factors behind the continued success of the IKEA Concept.[ii]

– Ingvar Kamprad, founder of IKEA, in 2004

Introduction

In February 2019, Swedish furniture retailer IKEA Group (IKEA) launched an interesting recruitment campaign for the job interview process. The campaign showed potential candidates entering a room for giving the interview only to be confronted with a board

Launchpad: The Internship Program at Flipkart

Jitesh Nair and Balaswamy Pasala***

The case looks at the selection process and design of the internship programs offered by Flipkart for graduate and undergraduate students in India. It first describes the summer internship program offered to students pursuing their Bachelor's or Master's in computer science or business management who interned for two months in the software development, operations management, and product management roles. The case then talks about Launchpad, an internship program offered by ekart, the supply chain arm of Flipkart, since 2019 for undergraduate students. The 45-day internship program was designed to introduce students to work in Flipkart's supply chain. It ends with a look at Flipkart's focus on becoming a value player in the Tier-II cities of India as part of its long-term business strategy.

> *We have been focussing on Tier 2 business but it has become more intense now. We want to be a value player focussed on Tier 2 locations.*[1]
>

Microsoft: Building a Collaborative Work Culture to Foster Innovation

Radha Mohan Chebolu and Jitesh Nair***

The case describes how Microsoft, a market leader in desktop computing in 1995 with a 95% market share, faced its share of problems from 2000 to 2010 with existing products losing market share and new products not taking off. Microsoft executives blamed the system of stack ranking for the lack of innovation in the company compared to competitors like Google and Apple. Upon realizing this, Microsoft ditched its traditional performance management system in 2013 and took several initiatives to help create a new Performance and Development (P&D) system. The new P&D system focused on employees' skills and competencies and facilitated open conversations. Through 'Connects', employees received real-time feedback that helped them learn, grow, and focus on their strengths and key learning areas. Satya Nadella's push for a cultural shift and a growth mindset created an enthusiasm for a new era of innovation at Microsoft. These efforts to improve innovation, collaboration, and communication also led to a business shift. In November 2019, Microsoft achieved a one-trillion-dollar valuation, a 200% increase since Satya Nadella became CEO in 2014.

> *The company was sick. Employees were tired. They were frustrated. They were fed up with losing and falling behind despite their grand plans and great ideas. They came to Microsoft with big dreams, but it felt like all they really did was deal with upper management, execute taxing processes, and bicker in meetings.*[1]

Safety Culture at General Motors Post the Ignition Switch Recall Crisis

Sireesha Mamidenna* and Balaswamy Pasala**

The case study describes how faulty ignition switches in some car models of General Motors (GM) led to one of the biggest recalls in the history of the US automobile industry. The recall happened almost 10 years after customers first complained about safety issues related to the ignition switch that automatically turned the car's engine off while the vehicle was in motion and caused non-deployment of airbags during crashes. The defect was linked to 124 deaths and 275 injuries and GM paid about $2.6 bn in penalties and settlements, including the fine. The case looks into the various reasons identified for this fiasco when Mary Barra, soon after becoming the CEO of GM in 2014, appointed a law firm Jenner & Block LLP and former US Attorney Anton Valukas to conduct a thorough investigation into the circumstances that led to the recall. One of the primary observations of the Valukas Report was the absence of a culture of safety at GM. The report also cited issues related to working in silos that impacted cross-functional communication and technical operations. GM undertook a number of measures to bring about a change in its safety culture.

> *We are not going to be satisfied with just solving our current problems. We are going to be industry leaders.*[1]
>
> ***– Mary Barra, CEO, GM, in July 2014***

> *Openness and accountability are two things that are very different at GM now. Everyone is encouraged to speak up on safety issues. They'll be followed up on and we'll take action.*[2]
>

College Students' Smartphone App Brand Engagement: An Empirical Study in the Indian Context

Souvik Roy and Sanchali Roy Biswas***

The purpose of this paper is to comprehend the causes and outcomes of smartphone applications brand retention among young consumers, specially college students belonging to Gen Y in India. The smartphone applications market is witnessing one of the most competitive market conditions today because of expanded rivalry and change. Thus, it is very important for the marketer/app developer to identify variables that influence the consumer decision-making process in downloading and utilizing smartphone applications (app) brands. On this premise, and based on the insights from marketing and information technology literature, this paper attempts to investigate shoppers' decision rules in downloading/utilizing smartphone application by examining the factors that prompt customer brand engagement and the results with regard to smartphone application brands. PLS was used to analyze 232 completed survey responses out of the 650 collected responses, for testing the validity of the proposed relationship. The findings indicated that all the relationships are statistically significant, increasing the robustness of the research framework proposed in the study.

Introduction

Today smartphone applications (apps) are progressively getting popular because of their abilities to supplement clients/users' regular lifestyle activities (Baek and Yoo, 2018) as well as any other specific works regardless of whichever age group that client/user belongs to (Reyes *et al.*, 2018; and Wang *et al.*, 2018). Although it is used by all age groups, it is overwhelmingly used by young clients, college students specifically (Gurbuz and Ozkan, 2020). Today around 85% of the advanced mobile apps are possessed by the young buyers in the age group of 18-34 years, the greater part of whom are 20 to 30 year olds in the Gen Y category (Nielson, 2014). 20 to 30 year olds (born between 1981 and 2000) are known for their capacity to perform multiple tasks and use numerous mechanical gadgets at the same time (Gibson and Sodeman, 2014). As indicated by a report by CISCO, about 70% of the millennials use their smartphone app for various

Atmospheric Marketing: New Way to Create Consumer Perception Towards a Coffee Outlet

Seeboli Ghosh, Radhika Ramesh** and Madhurima Ganguly****

With the paradigm shift in retail from brick-and-mortar stores to e-tailing, retail marketers are forced to incorporate different experiential techniques as their survival strategies. Effective marketing communication points are created through atmospheric marketing in retail. Retail organizations have started paying attention to create a positive buying atmosphere that ultimately leads to desired emotional effects in the purchasing behavior of consumers. Though this is a burning topic in the Western markets, not many studies have been conducted on this aspect in India. This current study seeks to explore the relationship between different factors of store ambience that influence consumers' perceptions towards the coffee outlets. Also, this paper provides significant statistical insights on the topic.

Introduction

Marketing managers have always sought an in-depth understanding of factors that influence the buying behavior of customers. The retail outlets are continually made up in order to match the tastes of the customers. The store atmospherics is made up of a combination of different elements like color, lighting, design, layout, sound and scents, which have an influence on the buying behavior of customers.

Over the years, atmospheric marketing has been a well-researched topic. A significant number of studies have been conducted on fundamental atmospheric elements like light, layout, music, staff, etc. (e.g., Turley and Milliman, 2000; and Dunne and Lusch, 2004). However, most of the studies talked about the importance of further research in this domain. Very few studies have been conducted on some of the topics like the effects of the integrated atmosphere on consumer's purchasing decision, how the atmosphere can create a different impact on different consumer segments, how different categories of retail are impacted by atmospheric marketing, etc. Most of the studies in this domain tried to analyze empirically how single variables create an impact on the mind of the

Conceptual Model Development for Celebrity Endorsement in Social Advertising: The Case of Source Credibility and Celebrity-Fan Relationship

*Bharathi S Gopal**

The influence of the famous is a widely researched topic. It is equally a sure-shot success formula for marketers selling clothes, cement, life insurance, cars, electronic gadgets, seeking political endorsement, and a plethora of consumption choices. Marketers have been successful with celebrity endorsements to launch a new product, change negative attitudes towards brands, influence trial and even convince a purchase. Celebrities, though not at a comparable scale of consumer product advertising, have also shared their liking and views, and endorsed social issues ranging from immunization, safe driving to creating awareness for rare disorders. While academic studies have explored and validated the influence of a celebrity on consumption-related outcomes, is it any different when celebrities endorse behavioral change for social good? This paper presents the conceptual framework to understand the influence of the source (celebrity) and celebrity-fan relationship on the cognitive and affective components of attitude towards a social cause. The conceptual framework examines the source credibility factors (Ohanian, 1990) of source attractiveness, expertise and trustworthiness and proposes the influence of celebrity-fan relationship as measured through Celebrity Attitude Scale (CAS) (McCutcheon et al., 2004) on the attitude outcomes mediated by Need for Cognition (Cacioppo and Petty, 1982). The conceptual research model is developed using the Eight-Step Theory Building Framework of Dubin (1978).

Introduction

In October 2021, 46-year-old Kannada film actor Puneeth Rajkumar breathed his last. While his fans, moviegoers and stalwarts from across different walks of life were shocked, his family donated his eyes to fulfil his last wishes. Following this incident, eye banks in Bengaluru witnessed a spike in eye donation pledges (Puneeth, 2021). A decade and a half ago, in 2006, when Puneeth's father, Rajkumar breathed his last and his eyes were donated, three of Bengaluru's hospitals reported that there have been more than 205 applicants for eye donation. Several other hospitals also reported receiving more than 1,000 applicants. A year later, in 2007, to commemorate the thespian's first death anniversary, 501 fans were believed to have signed certificates to indicate willingness to donate eyes (501 Fans Donate Eyes, 2007).

Examining the Association Between Perceived Relationship Investment, Perceived Relationship Quality, and Customer Loyalty with Structural Equation Modeling

Santosh Kumar Alreddy and Dwarakanath Siriguppi***

This study proposed and verified the model of retailer-buyer relationship and presents the association among perceived association investment, perceived association quality, interactive loyalty and emotional/attitudinal loyalty. This framework was created based on De Wulf et al.'s ideal of retailer-buyer relationship exchange, and hypotheses were further established. The outcomes show that the perceived relationship investment has a direct impact on perceived relationship quality that has a direct effect on interactive loyalty intent; and in turn, interactive or behavioral loyalty intent contributes to emotional or attitudinal loyalty.

Introduction

The growth of the retail business is unparalleled in today's economy. It includes a sector like apparel retailing. Different techniques were adopted by marketers to sustain the business and the sellers/stores believed in the importance of customer loyalty. During the visits to stores in the Kalyana-Karnataka area, the authors found that there is no similar study of this kind that surveyed apparel retailers. Hence, there is enough scope for measuring loyalty and to examine the association among different dimensions.

Literature Review

In order to prosper, evolve and estimate the association between stores and loyal buyers the role played by affiliation marketing is apparent (Sheth and Parvatiyar, 1992 and 1995; Clark and Payne, 1995; Lindgreen *et al.*, 2006; and Kim *et al.*, 2009). There are studies indicating that association marketing outcomes are prejudiced by the relational concepts of trust, promise and relationship gratification; and association quality affects buying conduct (Odekerken-Schroder *et al.*, 2003) and increases loyalty (De Wulf and Odekerken-Schroder, 2001 and 2003; and Robert's *et al.*, 2003). Prior studies identified

Examining the Influence of Transcendent Customer Experience on Website Patronage Intentions in E-Retailing

Nandan Kumar Dey and Vikas Gautam***

This study aims at empirically examining the influence of Transcendent Customer Experience (TCE) on website patronage intentions both directly and indirectly (through two mediators, namely, attitude towards a website and attitude towards the product). In this regard, the study analyzed 120 responses collected from a large Indian university. Hypotheses testing using structural equation modeling with IBM SPSS Amos 21.0 revealed that no direct relationship exists between TCE and website patronage intentions, whereas a significant relationship exists between the two forms of attitudes (mediators). Similarly, indirect effect testing using PROCESS macro for IBM SPSS 22.0 revealed that TCE does not influence website patronage intentions when mediated only through the attitude towards the product. Full mediation as well as serial mediation effects were identified by the multiple-mediation analysis procedure. These findings led to a decent number of theoretical and practical implications.

Introduction

An increasing tendency is being witnessed towards creating "unique experiences" by e-retailers (online retailers). According to researchers, the most pronounced unique experiences are flow and peak experiences (Klaus and Maklan, 2011) by which e-retailers can successfully engage their online customers for the long term and gain competitive advantage (Lemke *et al.*, 2011; and Izogo and Jayawardhena, 2018). Having the aspects of flow and peak experience, Transcendent Customer Experience (TCE) has the power to shape a customer's attitude and behavior (e.g., Agarwal and Karahanna, 2000; Schouten *et al.*, 2007; and Sukhu *et al.*, 2018). By creating TCE, e-retailers can make their customers return to their websites, browse for more, purchase/repurchase, and thus patronize their websites (Hoffman and Novak, 1996; Wang *et al.*, 2007; and Hausman and Sikpe, 2009). Moreover, words associated with TCE such as interconnectedness, interdependence, technological integration, etc. elucidate the phenomenon of retail website globalization (Kale, 2004). Thus, investigating the influence of TCE on customers' attitudes and website patronage intentions is important for any e-retailer.

Starting with the research on some outdoor activities like commercial river rafting (Arnould and Price, 1993), TCE research has recently focused on relationship marketing

Factors Driving the Adoption of Mobile Phones in the Agriculture Sector: A Literature Review

Police Keerthi and Vikas Gautam***

Agriculture is considered the main driving force in the Indian economy employing around 42% of the country's labor force and generating 18% of national GDP. Indian agriculture sector is facing numerous challenges, including non-adoption of agricultural technology at the farm level due to farmers' lack of access to the latest information. Farmers need to take timely effective farming decisions for improving productivity and their revenue. These decisions may be contingent on the information available to them. The government-funded extension services failed to meet the changing needs of farmers and they need to look for alternative sources of information. Mobile phones act as a good source of information dissemination. This facilitates the farming community in practicing sustainable practices. Given the important role mobile phones play in the agriculture sector, this study attempts to review the literature on factors influencing the adoption of mobile phones by farmers. The factors identified in the review are broadly categorized using content analysis. The findings revealed that there was a huge focus on studying the influence of demographic and socioeconomic factors on adoption in extant literature. Despite testing the impact of these variables in many studies, the influence of these variables on mobile phone adoption is inconclusive.

Introduction

Agriculture is considered as the main driving force in the Indian economy employing 41.49% (Statista, 2020) of the country's labor force and generating 17.76% of national GDP (Statistics Times, 2021). "Everything can wait, but not agriculture," said the first Prime Minister of India, Jawaharlal Nehru. This statement holds true even today (*The Indian Express*, 2014). Farmers need to take timely effective farming decisions for improving agriculture productivity and their revenue. These decisions may be contingent on the information available to them. In developing nations, the dissemination of information to farmers is generally done by government-funded extension services, which could not meet the changing needs of farmers (Ali, 2012). At the national level in India, for instance, the ratio of agriculture extension officers to farmers is as low as 1:1162 (*The HansIndia*, 2018; and Nendumaran and Ravi, 2019) against the recommended ratio of 1:750. With such a low ratio of extension officers to farmers, timely information

The Impact of Students' Overall Experience Quality on Loyalty

*P Venkateswarlu**

Students are the principal customers for universities and institutions offering higher education. To succeed in the increasingly competitive market, it has become imperative for universities to provide overall experience in terms of quality and satisfy the needs and expectations of the stakeholders, primarily the students and the parents. This study was conceived as an attempt to determine the correlation between the dimensions of student experience quality, including service outcome quality, interaction quality and peer-to-peer interaction quality, corresponding to the overall student experience quality and loyalty. The results indicated that a significantly positive correlation exists between all these dimensions. Universities offering higher education must recognize that these dimensions are very important to retain students and enhance their loyalty towards the university.

Introduction

Education is vital for the development of a society, country and civilization at large. Presently, education is a trillion-dollar industry worldwide. With globalization, universities are spreading their reach beyond geographical and political borders. 'Education Services' is one of the twelve sectors defined by the World Trade Organization as service. Today, a nation's growth or progress depends on the quality of higher education, more than ever in the human history. People with the right repertoire of skills, possessing higher capacity to learn have unlimited opportunities for unprecedented economic fulfillment. Universities are now actively pursuing students using a wide variety of strategies to market their courses.

Service Quality

The premise of "service quality" as one of the tools for attaining advantage over the competitors and lead the institutions in a market-driven system has been pertinently recognized in the educational sector. Service quality has become increasingly important to be the market leader and also to maintain an institution's position in the highly competitive environment. Researchers around the globe have affirmatively established that offering quality services to the customers renders sustainable competitive advantage.

Marketing of Life Insurance to the Indian BOP Segment: A Literature Review Using the 4A Framework

Rohit Joshi, Vikas Chauhan** and Vipin Choudhary****

The design and implementation of strategies to enter into the base of the economic pyramid requires a thorough understanding of market potential, opportunities and challenges. Life insurance market is a less explored territory in low-income emerging countries. This paper investigates life insurance services using the 4As framework for the bottom of pyramid (BOP) market. The study conducted a systematic literature review in the BOP context, life insurance, and other related services. Literature that fulfilled certain inclusion criteria was subjected to a quality evaluation before being considered for review. The study presents a very good discussion on various key attributes, opportunities, and challenges for life insurance in the BOP market in terms of acceptability, affordability, accessibility, and awareness. Furthermore, it provides suggestions and implications for marketing life insurance in the BOP market.

Introduction

Life happens, be prepared! A phrase that makes us ponder over beauty and uncertainty of life at the same time. As per Kocchar (2015), today, 70% people globally live on less than $10 per day, having insufficient financial provisions to tackle unfortunate events such as demise of the income earner and managing unplanned health expenses. As per Ple and Angot (2015), most of the poor population is still not an active part of the financial inclusion activities. A strong and sustainable financial sector needs to be designed for coping with this graphic reality. Insuring the poor can be a fairly good approach to reduce their vulnerability. BOP concept, as per Simanis and Hart (2011), focuses on developing value for both corporations and low-income customers.

According to a recent World Bank (2021) report, climate change and Covid-19 pandemic stress has caused extreme poverty to rise after two decades in the year 2020.

Millennials' Brand Switching Behavior in the Indian Online Retail Using Markov Chain†

Surjit Kumar Kar, Debasmita Panigrahi** and Neha Sharma****

The aim of this study is to examine the shifting loyalty and brand switching behavior of Indian millennials in three specific categories of online businesses, pertaining to food ordering and delivery, travel booking, and purchase of fashion apparel one-commerce channels. The primary data was collected through an online survey using Google Form, with a structured questionnaire. The technique of Markov Chain analysis helped forecast the value of a variable whose future value is influenced only by its current position or state, not any prior activity. Calculation and analysis were done manually, using cross-tabulation. It was observed that in all the three selected business categories, two-thirds of loyalty is retained by the top two players in their respective industry, whereas about one-fifth to one-fourth of the market is captured by new entrants who exploit the shifting loyalty in the targeted market. In the cross-sectional study, the respondents were asked about their latest usage of the brands studied, and hence the findings may subsequently vary over time. This paper highlights application of Markov chain analysis in an Indian context.

Introduction

The global Internet audience continues to grow steadily, with the worldwide base of users exceeding 4.8 billion as of July 2021 (https://datareportal.com/global-digital-overview). This growth in the number of Internet users has encouraged businesses to innovate business models in order to offer a variety of online services. Sectors that are growing very fast include food tech, travel tech, edu tech, fin tech and overall e-commerce industries. The online industry consists of companies that provide a variety of products

Social Commerce Preferences in Emerging Economy: An Analysis Using Multidimensional Scaling

Debajani Sahoo and Prattyush Roy***

Selling and trading goods over the Internet is referred to as e-commerce. It has become convenient and this platform has redefined the conventional mode of purchasing goods and services. Besides, the active participation on social media makes it evident that there is indeed great scope for leveraging on this behavior in social commerce such as Facebook Marketplace, WhatsAppShop, LinkedIn Groups, InstagramforBusiness, etc. The purpose of the present study is to identify the social commerce preference among the youth in an emerging economy like India through word-of-mouth promotions, satisfaction that is also aligned to the Net Promoter Score (NPS) of the social commerce platforms, observing the placement of the four social commerce platforms using MDS technique, and identification of pain points they faced while having their social commerce experiences. As social commerce is expected to have the potential to overthrow e-retail in the future, the study holds major significance in the present market scenario.

Introduction

The evolution of purchase of products through the World Wide Web is known as electronic commerce (e-commerce for short). Due to the popularity and ease of meeting consumer needs, this platform is in a constant flux and is rapidly evolving. In India, Facebook Marketplace as well as WhatsAppShop are very famous social commerce-based platforms. Employing social media to carry out the commerce of goods and services is known as social commerce, bridging the gap between the two of the biggest digital movements, e-commerce and social media. Social media allows the generation and exchange of content as generated by the user, building on Web 2.0 foundation. According to previous research, building trust—which is said to be linked to the electronic seller's perceived competence as well as how ethically it runs its business—and their purchase intention, which is linked to their trust in the online retailer, are two major factors that

Understanding the Dynamics Between Trust, Student Loyalty and Word-of-Mouth: A Case of Higher Education Institutions

*Insha Amin**

Previous researchers have made an attempt to study trust as an antecedent to student loyalty in higher education institutions but took a very narrow view, thereby treating it as a unidimensional construct. This study conducted an empirical investigation considering all aspects of brand trust that would be useful to fill this gap in the literature. A non-proportionate stratified random sampling technique was adopted and data was collected from 580 respondents. Confirmatory Factor Analysis (CFA), followed by Structural Equation Modeling (SEM), was used. The results show that different dimensions of trust have different impact on student loyalty. The main contribution of this study lies in validating a diverse measurement model of brand trust in the education context, which includes components like reliability, benevolence, credibility and integrity studied as separate dimensions, that was so far examined narrowly by previous researchers. By using these components as individual antecedents, the study was able to evaluate the relative effects of those on student loyalty and positive word-of-mouth. This in itself is a novel contribution, as no prior study has examined them this way.

Introduction

The education sector, public as well as private, is booming. The demand for Higher Education Institutions (HEIs hereafter) has increased in the last few years (Girad and Pinar, 2020). Competition among the HEIs has increased significantly and they are struggling to attract and retain students (James-MacEachern and Yun, 2017; and Azzone and Soncin, 2019). Many HEIs are closing down every year because of lack of operating expenses and profits (ASSOCHAM, 2017). As a result, the education sector has become more commercialized and the concept of acquiring competitive advantage has gained momentum (Rampl and Kenning, 2014; and Tan *et al.*, 2016). Previous researchers have made an attempt to study the antecedents to student loyalty and word-of-mouth formation in HEIs and used constructs such as student satisfaction, program image, institute image, etc. A few used brand trust as an antecedent for student loyalty in the higher education sector (e.g., Alves and Raposo, 2007; Helgesen and Nesset, 2007; and Yousaf *et al.*, 2020). Despite the popularity that brand trust has gained in the literature,

Can Zomato Continue Its Deep Discounting Strategy? (Abridged)

Syeda Maseeha Qumer and Debapratim Purkayastha***

Zomato, one of India's leading Food Service Aggregators (FSAs), was engaged in a conflict with restaurant partners over its practice of offering high discounts to customers. On August 15, 2019, hundreds of restaurants under the National Restaurant Association of India (NRAI) launched a logout campaign and delisted themselves from platforms of FSAs such as Zomato, EazyDiner, Nearbuy, Magicpin, and Dineout, alleging that the aggregators had distorted the food service sector through aggressive discounting and predatory pricing, which hurt the core value proposition and bottom line of restaurants. Zomato, in particular, came under severe criticism as its premium subscription-based dining out service Zomato Gold (ZG) had 6,500 restaurants partners and a total of 1.1 million subscribers in India as of August 2019. As part of the campaign, around 2,500 restaurants logged out from the ZG service.

Since August 2019, Zomato, one of India's leading Food Service Aggregators (FSAs), was engaged in a conflict with restaurant partners over its practice of offering high discounts to the customers. While the FSAs were credited with creating a digital platform to bring restaurants closer to customers, National Restaurant Association of India (NRAI) alleged that in their one-upmanship to acquire customers they resorted to deep discounting spoiling customers and eroding loyalty. NRAI alleged that restaurants bore the brunt of these heavy discounts, which came at the expense of their brand value, core value proposition and bottom line. On August 15, 2019, hundreds of restaurants under NRAI launched a logout campaign and delisted themselves from platforms of FSAs such as Zomato, EazyDiner, Nearbuy, Magicpin and Dineout. Zomato, in particular, came under severe scrutiny as its premium subscription-based dining out service Zomato Gold (ZG) had 6,500 restaurants partners and a total of 1.1 million subscribers in India as of August 2019. As part of the campaign, around 2,500 restaurants logged out from the ZG service.

Dabur Chyawanprash: Repositioning and Continuous Reinforcement

Mukesh Kumar Mishra and Manish Agarwal***

This case describes how Dabur India (Dabur) repositioned one of its popular brands, Dabur Chyawanprash, over the years. It is not only one of Dabur's renowned brands but is also a leader in the branded Chyawanprash market. Over a period of time, the brand started facing competition not only from other branded chyawanprash but also from related categories such as health drinks. Children did not find Chyawanprash as appealing as health food drinks like Horlicks, Bournvita, Complan, etc. Chyawanprash looked dated due to the changes in the modern lifestyle. Consumers had the perception that chyawanprash should be consumed when someone is not feeling healthy. Even though Dabur Chyawanprash was a market leader, its growth rate started declining. To overcome this, the company went in for a major repositioning exercise of its popular brand.

The basic positioning remains the same, but the brand message has been changed to help current consumers better identify with the brand and also to establish the age-old Chyawanprash's relevance even in today's world.[1]

– K K Chutani, Executive Director – Marketing, Dabur India Ltd., January 2008.

If we have to be relevant for the next 130 years, we will have to be nimble, engage and inspire and have youth at the center of focus, as consumers and employees. We are getting future ready, not just with its products, but also with its communications, the way it reaches out to consumers and future employees.[2]

Dineout – Constantly Re-Imagining Restaurant Technology

Purna P Nandamuri and V Namratha Prasad***

The case talks about the efforts of India-based restaurant technology company Dineout Services Pvt. Ltd. (Dineout) to provide innovative technology solutions in the restaurant industry. Dineout's initiative to enhance its product profile by acquiring other companies with technical know-how is described. The case also explains how the rising prospects of the Indian restaurant industry were expected to create a strong future for Dineout. However, the Covid-19 pandemic drastically altered the restaurant industry, plunging it into losses. Responding to the changed environment, Dineout came out with a slew of new technology offerings. It remains to be seen if Dineout's re-imagining of restaurant technology would work out in its favor.

The Post-Covid (Covid-19)[1] decade would be a test for restaurants to earn the respect and trust of their customers. As responsible entrepreneurs we realize the amount of faith customers put in us, when they dine at our outlets, and this product suite by Dineout will help fellow restaurant owners across the country revive their business and adjust to the new demands of the ever-evolving hospitality industry.[2]

Evolution of India's Policy on FDI in Single Brand Retailing: IKEA's Response and Its Impact on India

*R Harish**

IKEA's strong and determined entry into the Indian market is a marker of India's success with its Foreign Direct Investment (FDI) policy on single brand retailing. The slow, steady and cautious approach in relaxing the FDI norms eventually led to a take-off point, whereby not only IKEA, but many other multinational retail companies would find it attractive to enter the Indian market. This would in turn bring in multiple benefits to the local economy by way of better back-end infrastructure and modern technology in manufacturing and retailing. This would also boost domestic manufacturing (thus furthering the Make-in-India cause) and create employment as well, apart from triggering several secondary and tertiary benefits.

Introduction

IKEA is the world's largest furniture company. It designs and sells ready-to-assemble furniture, modular kitchens and kitchenware, bathroom accessories, lighting and other home appliances, bedding, bedspreads, furnishings, etc. It is known for its innovative, modernistic and minimalist designs. IKEA is also known for its stringent operational processes, cost control and affordable prices (Goel and Garg, 2018).

IKEA was founded by the then 17-year old Ingvar Kamprad in 1943. It is a Swedish founded multinational, but officially headquartered in Delft, the Netherlands. IKEA is an acronym which is meant to convey—"Ingvar Kamprad from Elmtaryd, Agunnaryd". Elmtaryd and Agunnaryd are the names of Ingvar Kamprad's farm and his village respectively (Freden, 2020).

As of 2019, there were 433 IKEA stores operating in 52 countries. During the year September 2018 to August 2019, IKEA had a total turnover of €41.3 bn (about.ikea.com, 2019). IKEA may be termed as a big box retailer, as its outlets are often very huge, having within them typically over 10,000 varieties of items, with extensive in-situ displays.

A distinctive feature of an IKEA store is its service-scape, whereby shoppers are encouraged to interact with the items and also experience some of the larger items of furniture and accessories, as they would be in an actual room or kitchen. The stores are

Kirkland Signature Private Label Powering Costco

Shailendra Singh Bisht and Jitesh Nair***

The case describes how 'Kirkland Signature,' the private label brand of Costco Wholesale Corporation (Costco), a US-based membership warehouse club, became the leading private label accounting for nearly 30% of all the private-label grocery business in the US, and how it enabled Costco, in the process, to emerge as the leading retailer in the US. Kirkland Signature, introduced in 1995, contributed to over a quarter of Costco's net sales of US$152.7 bn in 2019 and nearly 26.2% of the company's overall net sales in 2018. The case ends with a note on the future plans of Costco for the 'Kirkland Signature' product range as well as the need for it to further innovate and differentiate itself owing to the rising competition in the private label space from other retailers like Walmart and Target.

The working rule followed by Costco employees is that all Kirkland Signature products must be equal to or better than the national brands, and must offer a savings to our members.[1]

– Dick DiCerchio, Senior Executive Vice President – Chief Operating Officer, Costco, in October 2009.

I don't think at the beginning of this process in the early 1990s we thought nearly a third of our business would be under this brand [Kirkland Signature].[2]

– Richard Galanti, Vice President and Former Chief Financial Officer, Costco, in January 2019.

Kirkland is a brand in its own right. It is one of the reasons people go to Costco.[3]

– Karen Short, Retail Analyst at Barclays, in January 2019.

Kweichow Moutai – Building and Sustaining a Top Luxury Brand

Madhavi Garikaparthi and Vinod Babu***

This case describes the journey of Kweichow Moutai Co., Ltd. (KM) to becoming China's biggest public company by market capitalization and to its key product Moutai becoming the world's top liquor brand. Though Moutai had always been renowned, the dramatic rise in its popularity in recent years was due to the marketing and branding strategies undertaken by KM from the 2000s. The case then touches upon the challenges that KM faced – supply shortages, counterfeits, and corruption scandals in its management ranks – that had the potential to adversely impact its carefully crafted brand image. In the present scenario, KM's Chairman Gao Weidong was confronted with the dilemma of growing the company keeping in mind KM's Moutai production limitations. He also had to think about ways to protect the brand image of Moutai and prevent it from being associated with bribery and corruption.

I challenge you to find another company that is so predictable. Great margins, very beloved brand... people still buying it like there's no tomorrow.[1]

– Hao Hong, Head of Research at BOCOM International Securities Limited[2], in June 2020.

Two thousand years ago, the Chinese calling card was lions, 1,000 years ago it was Chinese porcelain, 500 years ago it was tea leaves and now it's local brands with their own intellectual property. I believe Moutai is one of these.[3]

OnePlus: A Chinese Success Story in India

K S Venu Gopal Rao and Syeda Maseeha Qumer***

The case discusses the success story of Chinese smartphone maker OnePlus in India, the world's second-largest smartphone market. OnePlus came to India in late December 2014 and in just four years emerged as the number one smartphone brand in the Indian premium smartphone segment. With the launch of its first flagship smart TV – the OnePlus TV – exclusively in India in September 2019, the company planned to develop a strong ecosystem of products in order to strengthen its premium-only brand proposition in the country. Despite its phenomenal success in India, OnePlus had several challenges ahead. These included fierce competition, issues relating to scaling offline, price-sensitive Indian consumers, low smartphone penetration, and an economic slowdown. Moreover, as OnePlus phones were getting expensive, the company faced the risk of losing price-conscious customers. As India continued to be a critical market for OnePlus, the challenges before OnePlus India were to increase adoption of OnePlus devices in the country, expand offline, crush competition, and continue to rule the premium Indian smartphone segment.

While over 70% of our business comes from global regions, India has been our biggest success... [T]oday, OnePlus has a 43% share in the premium segment. This is more than the combined share of the next two brands—Apple and Samsung—in India. And this has been just from online presence.[1]

– Vikas Agarwal, General Manager, OnePlus India, in 2019.

Introduction

In Q2 2019, China's OnePlus overtook Samsung Electronics Co., Ltd[1]. (Samsung),the world's largest mobile phone maker, to become the number one smartphone brand in the Indian premium smartphone segment (₹[2]30,000 and above). Driven by strong demand

TATA AIA Life Leverages Digital Technologies to Create a Superior Customer Experience

Dwarakanath Siriguppi and Jitesh Nair***

The case study discusses the different digital initiatives undertaken by Tata AIA Life Insurance Company Limited (Tata AIA Life) and their impact on its business operations. The initiatives included equipping sales agents with smartphones and tablets, providing user-friendly mobile applications to customers that enabled them to access and download information and upload documents from their smartphones, implementing the Video Post Sales Calling (PSC) procedure to prevent mis-selling by agents, and deploying predictive tools to identify high-risk policies. Tata AIA Life adopted different digital technologies to simplify various post-sales services and processes such as customer service operations, redressal of customer grievances through the adoption and improvement of the Net Promoter Score (NPS) metric, timely payment of insurance premiums, as well as cross-selling and up-selling. The company plans to digitize more internal business operations such as data management platforms as well as external business operations such as electronic standing instructions.

Video technologies along with face recognition can help minimize and even eliminate mis-selling instances. Cognitive capabilities are helping insurers streamline the issuance processes. Application programming interface are bringing ecosystem players closer, thereby allowing convenience for customers.[1]

– Sachin Goel, Chief Technology Officer, Tata AIA Life Insurance, in June 2019.

Today's knowledgeable and connected customer expects service providers to be in step with their evolving needs. Our endeavour has always been to anticipate those needs and offer best-in-class service solutions. We will continue to explore innovative ways of servicing customers.[2]

– Yusuf Pachmariwala, Executive Vice President & Head – Operations, Tata AIA Life Insurance, in October 2017.

Unlocking in the Lockdown: Amul's Surge During Testing Times

JSK Chakravarthi and Benudhar Sahu***

The case study is about the success of the Indian dairy cooperative society Amul during the Covid-19 pandemic in 2020. While several businesses including small vendors, ice-cream manufacturers, hotels, and restaurants stopped procuring milk from farmers during the lockdown, Amul collected an additional 3.5 million liters of milk daily from the farmers and paid them well. The company ensured an uninterrupted supply of milk and milk products across the country during the lockdown. It decided to double its marketing spend on advertising and branding. Amul revisited its marketing strategy, focusing on both the traditional and digital advertising space. It said the lockdown had not affected it and it went ahead with reinventing its distribution network and launching a range of immunity boosting products such as turmeric, tulsi (basil), and ginger milk. The dairy giant said its brand reputation, resilience, prompt action during the crisis, and ability to adapt to the situation would enable it to overcome any future challenges too.

On March 24, 2020, late in the evening, Narendra Damodardas Modi, Prime Minister of India, announced a stringent 21-day nationwide lockdown to contain the spread of the Covid-19[1] pandemic in the country. The lockdown limited movement of the entire 1.3 billion population of India. With the imposition of a self-proclaimed curfew[2] (though essential services were exempted from the lockdown), people rushed to nearby grocery stores to stockpile essential commodities. Like many, Rupinder Singh Sodhi (Sodhi), MD of the milk cooperative body Gujarat Co-operative Milk Marketing Federation Limited (GCMMF, popularly known as Amul), also rushed to the nearby milk booth to stock up on milk products for household consumption. But,

Curriculum Design Aspects for the 21st Century Hybrid Classrooms: An Exploratory Study

*Swathi Mulinti**

A curriculum is a crucial part of any educational system. It defines the values, knowledge, content to be taught, guides teachers in developing teaching strategies and highlights the various ways of assessing students at various levels of education. In the current century, the value systems, the knowledge requirements, the contents are no longer the same as they were a few years ago. We are surrounded by various plagues, environmental issues, globalization, changed value systems, advancing technologies, etc. The volatile conditions of post-Covid gave rise to new methods of teaching and assessing as well. A consequential rethinking should be carried out in the curriculum design aspects for 21st-century classrooms. It should include a full range of skills and competencies that fit the current society which is constantly turbulent and evolving at a fast pace. This paper highlights some of the important 21st-century values, skills and competencies that ought to be considered for curriculum design and development and a few suggestions for their implementation in the current hybrid educational environment.

Introduction

Understanding what curriculum is essential to comprehend the designing, development and assessment of the same. The definition or understanding of a curriculum has been emerging for ages. These changing ideas of a curriculum are a result of developing notions, values, dynamic theories of learning and teaching and evolving technologies. As and when new components were included as part of a curriculum the definitions have changed accordingly. Wiles and Bondi (1989) stated that curriculum is an objective or a set of objectives embedded with values, which are achieved through an evolutionary process through classroom activities and experiences. Chidananda (2019) mentioned that

"curriculum is the total of the academic and non-academic experiences of a school. It is based on educational intended outcomes to fulfill the personal and social growth of the learners." Dodd (2020) defined curriculum as "... a core pillar of how we educate, train, and engage in formal learning experiences." All these definitions give a clear understanding of a curriculum. It can be understood as a document that converts a set of theories and values into practical and workable activities which lead to gaining knowledge and understanding the world around us.

Curriculum Design

Elements of Curriculum Design

The ideals of a good curriculum need to be designed and drafted appropriately. Every curriculum has set outcomes that are achieved through the courses which are taught at graded levels of an education system. These courses should conform to certain educational policies. Apart from these, the technological aspects and content design and creation are also clearly outlined in a curriculum. Once the outcomes, courses, policies, technological aspects and content are determined they are used to develop learning materials, delivery methods, interactional designs, teaching-learning activities and evaluating methods.

Stakeholders of Curriculum Design

To design a curriculum that encompasses all the elements mentioned above various stakeholders of an education system would be involved. The stakeholders involve policy experts, content experts, technology experts, content developers, instructors and researchers. A learner is one of the major stakeholders in the curriculum design process, as Wiggins and McTighe (1998) mention that students are 'clients' and they have to be the primary focus while designing a curriculum. Though there is no direct participation of the learner in the designing process, he/she will determine if the set objectives were achieved at the end of designing, implementing and assessing the set curriculum. Dodd (2020) examined that "Curriculum design, when done well, is a process that is collaborative, results-oriented and transforms diverse ideas into a focused vision for learning."

Author please provide the reference

Standardized Curriculum

Any curriculum designer is not free to choose content, instructional procedures and assessment procedures at their free will. Certain standards have to be followed. Usually, these standards are often laid out by national, state, district or institutes. These standards are what learners should be able to learn and can perform. The end products of achievements drive the designing of the curriculum and its assessment. The student goals become a priority, but Wiggins and McTighe (1998) noted that curriculum design does not solely depend on student goals but also 'student interests, developmental levels, and previous achievements influence the design'.

A Review on Lexical Access in Speech Production: The Bilingual Case

*Loreina Pagag**

The present paper reviews the models discussed by Costa *et al.* of lexical access used in speech production of bilingual speakers. Costa *et al.* consider two substantial features of lexical access as to how lexical selection is attained, and whether lexical access implies cascaded or discrete stages of processing. Costa *et al.* initiated the experiment by considering the vital assumptions of how lexical access works in monolingual speakers and then took forward the discussion in the context of bilingual speakers.

Author please check, does Costa *et al.* refer to all the references pertaining to Costa *et al.* as a whole which are given in the references at the end. Or does it pertain to a single reference of Costa?

Introduction

In the field of psycholinguistics, "Lexical access" can be described as the process through which a person produces a particular word or phrase from his/her "Mental Lexicon." "Mental Lexicon" is the mental library of a person where the words and phrases learned in his/her lifetime get stored and are accessed as per the need for communication, both spoken and written. In this paper, the focus is specifically on speech production with respect to bilingual speakers.

Costa *et al.* evaluated the representations of "Lexical access" observed in the speech production of bilingual speakers. Two significant outlooks regarding lexical access were discussed in the paper to review the models of "Lexical access" in human speech production. These primary aspects are:

a. How does an individual achieve the lexical selection?

b. Whether the process of lexical access involves any discreteness?

Author please provide the reference

Caramazza *et al.* (2000) considered the major hypotheses of how lexical access functions in monolingual speakers before carrying on an experiment on how the same speculations will result in the context of bilingual speakers (Costa and Caramazza 2000).

Author please provide the reference

The speech production process involves the manifestation of mental notions and suggestions through words, which are further divided into patterns of sounds produced by our articulatory organs. In the process of translating, the speaker has to retrieve the exact

* Department of English, Faculty of Science and Technology, ICFAI Foundation for Higher Education (A Deemed to be University u/s 3 of the UGC Act, 1956), Hyderabad, Telangana, India. Email: loreina.pagag@ifheindia.org

Author please check the author info and confirm

© 2021 IUP. All Rights Reserved.

word to convey the meaning he wants to and for that, he has to look into the grammatical properties of the spoken language and should retrieve the information about how to articulate that particular information involving sounds. Though the speakers go through all these processes yet the speech production mechanism is considered complex and poorly understood (Costa and Caramazza 2000).

In this paper, they have their focus on the issue of lexical access in bilinguals during their speech production. Costa *et al.* looked into the primary attributes of the functional architecture and the filtering qualities of the articulatory process of the monolinguals and investigated to identify if in any way these characteristics associated with the lexical access mechanism can be implicitly used in bilingual speech production (Costa and Caramazza 2000). The paper moves forward with an assumption that the architecture of the bilingual speech system is nearly similar to the one proposed for monolingual speakers. As per the discussion of the paper, for a deeper understanding of the bilingual speech production system postulation of additional assumptions will be required (Costa and Caramazza 2000).

An Overview of Lexical Access: Functional Architecture and Dynamics

The picture-naming assignment is comparatively the manageable one to explore the processes lexical access involves. During the picture-naming task, the primary stage is to identify the picture and select its parallel semantic depiction (Costa and Caramazza 2000). Throughout this picture-naming task, not only the semantic demonstration conforming to the image but also the associated semantic representations are stimulated, and this triggered semantic representation sends an equal amount of activation to their agreeing lexical nodes in the mental lexicon, and the speaker has to go for the corresponding semantic illustration from amongst all the other correlated semantic depictions (Bock and Levelt, 1994; Levelt *et al.* 1998). The selected lexical node leads to its recovery of phonological segments. After phonology, the grammatical encoding happens at which point the grammatical characteristics of the word are retrieved. But there is a difference in the application of these phonological and grammatical encodings (Dell 1986; Starreveld and La Heij 1995; Caramazza 1997; Roelofs *et al.* 1998; Levelt *et al.* 1999).

Author please check the year, is it 1999?

Implication of the Spreading Activation Principle: Lexical Selection

In the process of naming a picture in the picture-naming task, several semantic representations get activated. According to the model of the non-descompositional semantic concept, the nodes corresponding to the picture are attached to the nodes of semantically-related nodes because the corresponding nodes spread some activation to them (Levelt 1989; and Roelofs 1992), whereas according to other models (Dell 1986; Caramazza 1997), concepts are represented as a bundle of semantic features; the activation of a given concept would activate the part of the semantic representation of other related concepts, because some of the semantic features are shared. In the course of naming a

Internationalization of Higher Education in India and National Education Policy 2020

*Veena**

The New Education Policy 2020 is notified with an objective to place India as 'knowledge superpower' on the map of the global education providers. The new policy is overhauling the entire Indian education system which includes the primary, middle, high school and higher education. The embedded target of the policy is to make the Indian education competitive with the international education and attract foreign students and impart high quality education on par with the international institutions. Though India has taken some strategic initiatives and education policies pronounced earlier have paved way for qualitative education and liberal approach to the education sector, they have not accomplished the desired results. The General Agreement on Trade in Services (GATS) has facilitated and opened the education markets for the global players, and the institutions with quality products and services will only survive in the stiff competition. The new education policy has opened discussions and a road map for internationalization of education in India as part of compliance of GATS provisions. This paper provides discussion on the advantages and disadvantages of the internationalization of higher education and facilitating the educational institutions towards achieving the goals of the education policy.

Introduction

India is known for its higher education and stood as a destination for many foreign students during good olden days. India has inherited excellent cultural heritage and knowledge base for years. The history has the record of students coming from different countries to India to pursue higher education. But the scene is reversed today. There is flocking of students for immigration to the countries like the US, Australia, the UK and the other

European countries and New Zealand to capture placement opportunities after their higher education. As a result, the internationalization of the students of our country is on the reverse direction and higher education institutes of the globe are capturing the Indian students by establishing their marketing offices and posting their representatives in India to facilitate the enrollment of students into their institutions and universities. They conduct road shows, seminars, workshops and other activities to attract the students to their native countries. Some of the universities have started to establish their campuses in India jointly with the local institutions. The stiff competition at the global level in the field of higher education is throwing challenges to Indian higher education, particularly in the light of the provisions of the GATS as it permits trade in educational services.

Education System in India

The education system in India has three different formats—formal, informal and adult education. The formal education system has different facets—the school education consisting of 10 years, and higher education consisting of 2 +3 + 2 years (pre-graduation, undergraduation and postgraduation). This model is not in convergent with that of the western education system. Another important problem in Indian education system is the dropouts of the students after their high school education. Remarkable dropouts of student enrollments are attributed to the lack of financial resources in the families of the students and poverty to access the quality education imparted by the existing institutions of excellence. In the recent times, some of the constraints like the financial resources and poverty are addressed by way of education loans at reasonably cheaper rates without any cumbersome process and procedures. It is a gift of liberalization of the economy to the eligible students. Non-availability of quality educational institutions is another important factor which needs to be addressed by reducing the gap between the demand and supply. The reason for limited number of quality education is the higher and rigid regulation of the education system and lack of facilitation approach. **Author please check**

The higher education in India is delivered by the state universities and institutions from the private sector which are very minimal, whereas in the US and the UK, it is by the two-tier system—state universities and private universities. The state universities in those countries are wholly funded and governed by the government whereas the private universities are self-financing institutions with the participation of private players. The scenario is changing in India in the recent past. Today, India has approximately 1,000 universities of which 54 are central universities, 416 are state universities, 125 are deemed-to-be universities and 159 institutes of national importance which include NITs, IIMs, IITs, IIITs, etc. (the number of universities in the year 1950-51 was 27). Whereas there are more than 6,000 universities in the US, both in the public and private sector, and many of these universities and educational institutions appear in the world rankings, but not a single Indian university is appearing in the first 500 ranks of the world rankings. World ranking is one of the significant factors to attract the students to join the universities. In order to internationalize higher education, there is a need for revamping the educational system in India to compete with the best universities of the world and redesign the education

Risk Measurement of Indian Banks: A CSRISK Analysis

Satish Chandra Tiwari, Sandeep Kumar Keasarwani** and Sikandar Azam****

This paper proposes another proportion of foundational chance, namely, Capital Shortfall Risk (CSRISK), which recognizes a budgetary organization's capital shortage under the most noticeably terrible situation restrictive on a significant market decay. The CSRISK list requires just open monetary information, including bookkeeping and market exchanging data, which is time and practice. The sample includes 251 Indian banks for the period of 20 years, starting from January 1, 1998 to December 31, 2018. The period is divided into three phases: pre-crisis (1998-2007), crisis (2008) and post-crisis (2009-2018)—data on returns collected from Yahoo Finance. The market value of equity and book value of debt are extracted from the Prowess database. Variable k is 9% (Basel norms II), which is the regulatory requirement by the Indian banks to maintain assets as a part of total assets. This fundamental hazard measure can be generally applied in the field of executives and macroprudential strategy making. The paper focuses on CSRISK using regression analysis approach. The study found that the larger the CSRISK, the greater the bank size; this could help risk managers to control the course of action. Banking regulators may evaluate the market capital shortfall proficiently and efficiently with the help of CSRISK in case of a troubled economic scenario.

Introduction

One of the lessons learned from the 2007-2009 financial crisis is that undercapitalization of large financial institutions can impose significant negative externalities on the real economy (Brownlee and Engle, 2017). A number of contributions have introduced theoretical models that formalize this new risk. Acharya *et al.* (2010) developed a model to study the effect of capital shortfall experienced by a financial firm in generating negative externalities to the entire economy when the financial system is undercapitalized.

The concept of systemic risk is not accessible due to divergences in what a system represents. Some researchers only consider the collection of institutions that make up the

© 2021 IUP. All Rights Reserved.

risk assessments around several Japanese financial crises. Throughout crisis times, they recorded systematic changes in the degree of systemic risk, indicating that systemic risk indicators can accurately describe financial crises in Japan. Campbell *et al.* (2014) focused on the linkages of systemic risk among banks and insurance companies. Acharya *et al.* (2014) compared the capital shortfall estimates given by the SRISK systemic risk institutions with the regulatory stress tests (taking supervisory data as a basis). Brunnermeier and Cheridito (2019) proposed ΔCoVaR as a systemic risk measure, described as a change in the financial system's value-at-risk on the assumption that "an entity is in distress relative to its median state". Moreover, ΔCoVaR is a reduced-form measure of systemic risk "that captures the (cross-sectional) tail dependence between the whole financial system and a particular institution". Bernal *et al.* (2014) used CoVaR to determine systematic risk separately by the contribution made by banking, insurance, and other financial services institutions in the US and the euro area.

Brownlees and Engle (2012) implemented the SRISK index, a company's anticipated capital shortage condition on a significant downturn in the economy, as an alternative measure of systemic risk, while Engle *et al.* (2015) established an econometric method to quantify European financial institutions' systemic risk. Billio *et al.* (2012) suggested various econometric measures to analyze the connectivity among financial institutions dependent on the analysis of critical components and networks of Granger causality. Nonetheless, systemic risk measures based on stock prices and contingent claims analysis are pervasive in literature and among practitioners, particularly when evaluating crisis times (Bisias *et al.*, 2012; and Blancher *et al.*, 2013).

The crisis made it clear that the regulatory measures implemented so far could not prevent a breakdown of the financial system because of its macroprudential features, which sought to protect each financial institution separately from the risks to which it would be exposed (Blanchard *et al.*, 2010; Kiefer et al., 2011; and Hanson *et al.*, 2011). Also, there is heterogeneity in the literature about the factors that cause systemic-risk, whether endogenous (Kindleberger and Aliber, 2005) or exogenous (Diamond and Rajan, 2001; and Allen and Wood, 2006) to each country's financial system. Drakos and Kouretas (2015) used ΔCoVaR as a measure of systemic risk to examine whether the involvement of foreign banks leads to a rise in systemic risk in the US. The authors further argued that "stock market movements can be seen as the leading indicator of anticipated economic change as a whole". The results showed that US banks have a more significant contribution to systemic risk in the US than foreign banks. Aldasoro and Faia (2016) pointed out that sales of assets quickly turn a liquidity crisis into a solvency crisis. Liquidity risk thus emerges as a critical risk factor (Santomero and Babbel, 1997; and Brunnermeier and Pedersen, 2009). According to Ramos-Tallada (2015), in the event of a currency tightening, the higher the vulnerability of assets to a rise in short-term interest rates, the higher the possible losses to banks.

Bisias *et al.* (2012) and Brunnermeier and Oehmke (2013) categorized and contrasted the quantitative systemic risk indicators in economics and finance literature. Using the Systemic Expected Shortfall (SES), Acharya *et al.* (2010) identified the downside risk when the entire market is in crisis. Brownlees and Engle (2012) extended the SES method and suggested an alternative strategy for dynamically reduced estimation. Brownlees and Engle (2012) calculated expected capital shortfall when the financial market is in distress.

A Comparative Analysis of the Non-Performing Assets of Public and Private Sector Banks in India

*D Sreenivasa Chary**

Banks are obliged to repay the deposits to the public on due date with an embedded option for foreclosure. They can also take preventive, remedial and legal measures for recovery of loans. However, despite their best efforts, some loans become Non-Performing Assets (NPAs) as they do not generate income. On the other hand, banks are required to make provision out of the current year's profits as a cushion against such NPAs. If such NPAs become irrecoverable, the resultant losses are required to be absorbed by banks. In this context, banks are required to maintain as much capital as required to meet the probable loan losses. The Reserve Bank of India (RBI) issued detailed guidelines to banks on classification of loan accounts and provisioning norms, called Income Recognition and Asset Classification (IRAC) norms. The two important groups of banks in India are public sector and private sector banks. The present study is an attempt to analyze the performance of these two banking groups in terms of classification and provisioning of their loan assets under standard, substandard, doubtful and loss assets as per RBI guidelines. The study observes that private sectors banks are comparatively better in maintaining standard assets and making adequate provision for the NPAs.

Introduction

Banking is defined as the business activity of accepting deposits from customers for the purpose of lending and investment. Prima facie, it appears that banking business is luxurious, because banks lend money to public from the deposits raised. The deposits collected by banks from public are of two types: demand deposits and time deposits. Current and savings deposits are called demand deposits. They are repayable on demand. Fixed deposits, recurring deposits, daily deposits are called term deposits. They are normally repayable on expiry of the period for which they are accepted. In reality, these term deposits also have the option of foreclosure. It means the term deposits can also be closed by the depositors, as and when they want, irrespective of the period of deposit. To put it in a nutshell, we can say that all

* Associate Professor, Department of Finance and Accounting, IBS Hyderabad (Under IFHE – A Deemed to be University u/s 3 of the UGC Act 1956), Hyderabad, Telangana, India. E-mail: dschary@ibsindia.org

© 2021 IUP. All Rights Reserved.

performing assets as income for the bank. Performing assets are called standard assets. NPAs are further classified as sub-standard, doubtful and loss assets depending on the record of recovery in the loan accounts, for the purpose of making provision. The provision rates are presented in Appendix.

Thus, NPAs, on the one hand, do not earn any interest on the loan accounts, and on the other hand, profit earned on some other loans/services is required to be used to meet the contingent loan losses. The longer the period of overdue of the loan account, the higher would be the amount of provision to be made.

Literature Review

Das and Uppal (2021) examined the NPAs and profitability of 39 public and private sector banks for a period of 15 years (2005 to 2019) and opined that the NPAs have got negative impact on the profitability of banks. They suggested that banks shall reduce the NPAs and operating cost to increase their profitability.

Gaur *et al.* (2021) probed the causes for NPAs in the banks and developed a model with bank-specific, industry-specific and macroeconomic variables to address the NPA problem. Their research indicates that in India the NPA problem is time persistent and it can be overcome by positive bank performance.

Sharma *et al.* (2020) conducted research on the impact of gross NPA on the profitability of various public and private sector banks in India for the years 2006 to 2019, and observed a negative impact between them. They reiterated the need for reduction of NPAs in banks as they not only impact the banks but also the growth of the economy.

Misra *et al.* (2020) observed procyclicality and income smoothing by Indian Banks in the Loan Loss Provisioning (LLP). They further observed that such procyclicality in provisioning is more in public sector banks, when compared with the private sector banks.

Ozili and Outa (2017) conducted extensive research on LLP practices by banks across the world. According to them, the LLP objectives are good, but its utility depends on the assumptions of the model and the accuracy of the inputs. They opined that the LLP is done by some banks as income smoothening activity for accomplishment of the regulatory requirement.

Rajeev and Mahesh (2010) in their working paper examined the trends of NPAs in India from various dimensions and opined that the awareness of impact of NPAs on the banks and economy has resulted in significant reduction in their volume.

Kalluru (2009) explored the significant differences in the performance and risk-taking capacity of state-owned banks, domestic private banks and foreign banks in India for the period 1995-2007 using fixed effects and random effects models. The study did not find any significant differences between the state-owned and domestic private banks. They further observed that managerial discretion in provisioning does not necessarily generate LLP estimates that reflect the true and underlying economic reality of banks' credit risk exposure,

Evaluation of Marketing Implications/ Customer Perception of Service Quality of Banks in the Face of Commercial Bank Mergers in India: A Literature Review

*D S Prasad**

The paper reviews research on the linkages between select demographic and behavioral variables and customer perception of the banking service quality in the face of commercial bank mergers in India and seeks to identify gaps in the current body of knowledge which justify future research directions. The impact of bank mergers on customer service quality has attracted a great deal of attention during the last two to three decades in view of the ongoing consolidation of the Indian banking sector with a view to improving its efficiency and profitability. Using Systematic Literature Review (SLR) method, the study reviews papers from 37 refereed journals and other books published on the subject. Detailed content analysis reveals that most of the research is empirical and identifies brand equity, Customer Relationship Management (CRM) and innovative ability, among others, as the major factors influencing the customer perception (marketing implications of commercial bank mergers) of service quality of commercial banks in India in the face of mergers. In conclusion, the study found that demographic and behavioral variables and customer perception of the quality of service of the merging commercial banks in India are related and the bank managements must give due importance to the segmental differences while formulating their marketing strategies if they have to be successful in the emerging competitive commercial banking scenario of India. Future research may be carried out taking larger and more diversified samples of bank customers to generalize the research findings.

Introduction

Many consumers are concerned that the level of service quality has been declining over the last two decades. From the customer service perspective, a decline in service quality can be attributed to the rise in two-income households and the busier lifestyles of the consumers of such services. Having higher incomes, better education, and less time have made consumers more demanding with regard to convenience and service quality.

* Professor, Department of Finance and Accounting, IBS Hyderabad (Under IFHE – A Deemed to be University u/s 3 of the UGC Act 1956), Hyderabad, Telangana, India. E-mail: dsprasad2008@gmail.com; dsprasad@ibsindia.org

© 2021 IUP. All Rights Reserved.

Objectives

- To understand the marketing implications of commercial bank mergers in general and in the Indian context;
- To identify the key factors influencing the service quality perception of customers in the face of commercial bank mergers in India;
- To explore whether different demographic/behavioral groups have unique service needs and deserve distinct promotional appeals in the marketing strategy formulation of commercial banks in the face of mergers; and
- To suggest measures aimed at improving the service quality of the commercial banks in India in the face of mergers.

Literature Review

A detailed review of literature pertaining to the marketing implications of commercial bank mergers is furnished:

Consumer Perceptions of Bank Mergers (Global Evidence)

Much of the literature on bank marketing in the face of mergers has appeared in trade publications and the papers have generally been published by bank executives and consultants. The papers published by academicians on banking services tend to focus on general issues of bank/financial services marketing and not on mergers (Urban and Pratt, 2000).

Trade Publications

Comscore, Inc. (NASDAQ: SCOR), a leader in measuring the digital world, in a study of the US online banking industry, released on January 22, 2009 found that the weak economy's impact on consumer finances, combined with the banking crisis, has posed added challenges for banks to attract new customers and exploit opportunities to cross-sell to the existing clients.

The report on "Bank Mergers and the Public Interest" (February 1, 2006) published by Public interest advocacy center, a Canadian law firm, outlines briefly the rules and policies that govern large bank mergers in the Canadian Banking environment. It looks at the reasons for turning down two large mergers in 1998 and whether the reasons adduced for the same had changed by 2002. It also investigates briefly the bank merger experiences in other jurisdictions, surveys financial services environment from a customer perspective and then evaluates how mergers might affect public interest issues of choice, access, and price. The report does not find any persuasive evidence that consumer choice and access to banking services will be enhanced by large bank mergers. It also finds no evidence that the cost of banking services will be reduced following a bank merger. The dominance of Canada's major banks makes successful new entry of foreign banks or other domestic entities very difficult. The proposal that physical branches can be replaced by e-banking does not meet

CEO Gender and Employee Compensation: Evidence from India

Pavana Jyothi, P Bhanu Sireesha** and Hussain Yaganti****

In this study, we examine the impact of CEO gender on the compensation of Indian corporate employees. Based on the theoretical and empirical research in business ethics and leadership styles, which argue that females are 'care' and 'relationship' oriented, we hypothesize a positive impact on compensation. Our results show that the average compensation increased by about 14% when females took over the leadership and they pay a significantly higher compensation as compared to the industry averages. This increase is observed irrespective of the size, performance and growth of firms. However, the positive impact is weaker for highly levered firms.

Author Copy

Introduction

There are several studies in economic literature, which argue that management styles, a behavioral aspect, influence firm level policies, including wage/compensation policy (Bertrand and Schoar, 2003). These behavioral researchers argue that employee wages are affected by the race, gender and cultural aspects (Tate and Yang, 2015). Taking a cue from Becker's (2010) theoretical foundation on the taste for discrimination, various researchers have studied the impact of these behavioral aspects, especially the gender of the leader, on the wage policy of corporate firms (Cardoso and Winter-Ebmer, 2010; and Abendroth *et al.*, 2017). Generally, this stream of research addresses two important questions. First, what is the impact of female leadership on the wage gap between male and female employees. And second, the impact of female leadership on the distribution of wage gap across different levels of jobs (Grund, 2015). The general conclusion of this stream of literature is that female leadership has a negative impact on the wage gap and the impact varies across different levels of job. The maximum reduction is seen at the top level of the organization, while the minimum reduction is seen at the bottom level of the organization (Cardoso and Winter-Ebmer, 2010; Tate and Yang, 2015; and Abendroth *et al.*, 2017). However, there is no

© 2021 IUP. All Rights Reserved.

clarity on the impact of CEO gender on the average wages of employees. Or to put it differently, do firms headed by female leaders pay higher/lesser compensation to their employees as compared to those headed by male leaders? This is what we try to address in this study.

Theoretical and empirical research on business ethics show that females, in general, are more ethical, benevolent and sympathetic towards other individuals (Gilligan, 1982; Langdale, 1983; Appelbaum *et al.*, 2003; and Roxas and Stonebac, 2004). This "care" and "relationship" based moral orientation of females would, in the organizational setting, result in employee-oriented considerate leadership (Kabacoff, 1988; Eagly and Johnson, 1990; Stanford *et al.*, 1995; Hare *et al.*, 1997; Appelbaum *et al.*, 2003; and Melero, 2011). Because of these differences in ethical orientation and leadership styles, as Schubert *et al.* (1999) and Bart and McQueen (2013) conclude, females make firm-related decisions significantly different from what males would have made under similar circumstances. This applies equally well to compensation policy as Bertrand and Schoar (2003) point out. The empirical evidence could be found in the study of Adams and Ferreira (2009) who examine the implications of this stream research on employee retention. They argue that females make more employee-friendly decisions and show that the presence of females at the board level affects employee retention decisions among US firms. Overall, this literature implies that considerate leadership style of female leaders would possibly result in better working conditions for employees. If this is the case, then employee compensation should also be influenced by the gender of the leaders. However, prior literature has not empirically examined this aspect. Understanding this aspect becomes important because employees' work productivity and the agency costs associated with employees depend directly on their compensation[1], which could possibly explain the empirically observed positive association between firm performance (firm value) and female participation (Powell and Ansic, 1997; Huang and Kisgen, 2013; Azmat and Petrongolo, 2014; Levi *et al.*, 2014; and Reguera *et al.*, 2015). Therefore, in this study, we empirically examine the impact of female leadership on employee compensation.

In summary, our result shows that female leaders pay higher compensation to their employees as compared to male leaders. The difference (14%) is economically significant too. Further, the compensation paid by the female-led firms is significantly higher than that of their industry peers. The increase in compensation is observed irrespective of firm size, performance and growth opportunities that a firm faces. However, the increase is lower for highly levered firms.

The rest of the paper is organized as follows. The data and methodology adopted to test our hypotheses are discussed in the second section. In the third section, we present and discuss the results. Finally, the paper ends with conclusion.

[1] There is a vast amount of literature which examines the relationship between executive compensation and agency costs (Core *et al.*, 1999). This literature, in general, has found a negative association between executive compensation and the agency costs (Elston and Goldberg, 2003). We argue that the agency costs are associated with every employee in an organization as they are the agents of the owners, who are arranged in a hierarchical way. Therefore, the total agency costs of a firm arise at a much broader level, which not only include top executives but also every employee of the firm. Thus, the observed negative association between executive compensation and the agency costs could easily be extended to employee level.

Audit Practices Linked to Corporate Governance: A Literature Review

*S Sandhya**

In this paper, a review of recent research on the connection of auditing with corporate governance practices is conducted. The role of auditing is to validate the financial statements, the system process and procedure. The assurance of goodness in these would lead to better corporate governance. A good corporate governance framework involves better managed internal processes and best use of investors' money. The study identifies the linkage of auditing with corporate governance and also the contribution of its various components, namely, internal auditing function, external auditors and the audit committees for establishing good corporate governance practices. The studies reviewed found that auditing mechanism can effectively monitor and evaluate internal operations and ensure compliance; there can be fair view of financial statements and efficient risk management, thereby protecting investor's interest. It can be inferred that high quality auditing practices can reduce misappropriations of resources, frauds and scams, reduce risk to all stakeholders, leading to better corporate governance in firms. In the absence of very recent research on this issue, this paper contributes to the existing literature wherein it reiterates the role of different components of auditing in corporate governance.

Author Copy

Introduction

The primary objective of auditing is to authenticate the accounts and records and report to the owners of the business whether the books of accounts are properly drawn up according to the requirements of law, and whether they exhibit a true and fair view of the profit and the financial position of the company. Corporate governance involves an oversight of a corporation's policies, procedures and practices. It is defined by the conventional accounting and finance literature as "the range of control mechanisms that protect and enhance the interests of shareholders of business enterprises" (Fama and Jensen, 1983). It helps to ensure that the corporate is operated in the best interests of the business and its investors. The onus of corporate governance usually lies with the board of directors. Auditors are employed to monitor and test the internal controls, but the ultimate responsibility of corporate governance lies with board.

* Assistant Professor, Department of Finance and Accounting, IBS Hyderabad (Under IFHE – A Deemed to be University u/s 3 of the UGC Act, 1956), Hyderabad, Telangana, India. E-mail: sandhya.s@ibsindia.org

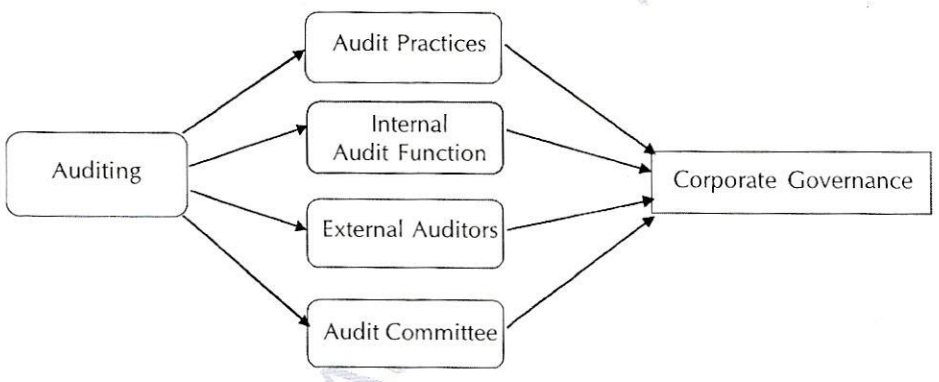
A significant facet to understand the effectiveness of governance is related to the interface between auditing and corporate governance (Hay *et al.*, 2017). The regulations on company law have a framework to understand the role of auditing practices in corporate governance. The financial statements and reports are needed by law to be published regularly in the required formats and standards to pass on the necessary information to shareholders. The shareholders do not have any means by which they can verify the authenticity of such statements provided by the management. Here comes the role of designated auditors who articulate an opinion about the fairness of the statements and operations of the company. This can be defined as the role of auditing in corporate governance (Figure 1). An internal auditor's job is to ensure that company processes and allied controls are functioning as proposed. In addition, they can also suggest ways to improve corporate processes, save the corporation money, and become more efficient. Ensuring the efficient utilization of resources of the corporation is an important task of internal auditors.

Figure 1: The Components of Auditing That Influence Corporate Governance



Literature Review

The insights of corporate governance generally do not state the role of auditing in corporate governance. There has been rather little research dealing with this relationship, and the research that has been done tends to focus more on how corporate governance affects auditing, rather than how auditing affects corporate governance. There is an implied assumption that the aim of both auditing and corporate governance is to contribute to the shareholders' interest (Baker and Owsen, 2002). The literature on these grounds can be examined as follows.

Auditor-the Major Player in Corporate Governance

The role of auditing must be increased for an enhanced control over the activities of corporations which benefits the stakeholders and the society as well. And one of the major reasons that lead to the need for such control is the agency theory concept. Baker and Owsen (2002) stated that the incentives and penalties on auditors for failures differ across countries depending on the

Accounting Conservatism and Corporate Governance: A Literature Review

*Rajneesh Ranjan Jha**

The paper reviews the literature on accounting conservatism and its different dimensions. In literature, accounting conservatism is classified into two classes, namely, conditional accounting conservatism and unconditional accounting conservatism. Accounting conservatism plays an important role in shaping the corporate governance of any firm. It also interacts with other dimensions like board structure and ownership structure to decide the firm level of corporate governance. Board structure and accounting conservatism act as a substitute to each other. Accounting conservatism literature mainly focuses on advanced or developed nations, while research on emerging nations needs more attention. As there are institutional differences between advanced and emerging nations, the results generated from advanced nations cannot be generalized for the emerging nations. There are many unattended research gaps in the context of emerging nations like India, where ownership structure is concentrated and business group affiliation is a rule rather than exception.

Author Copy

Introduction

In a setting where the misconduct of a company's management is found to have been widespread, accounting conservatism could contribute to higher managerial liability. It may be due to the limitations of accountants to detect fraud and other misbehavior in multi-corporation firms, leading directors and audit committees to believe that there is a lack of evidence, when all along there may actually be a host of concealed corporate crimes. In other words, the truth may be hidden in plain sight—and accounting conservatism could help conceal it. The effects of accounting conservatism on managerial liability are theoretically ambiguous. For example, if the costs to the firm of recognizing revenue prematurely are greater than the benefits of hiding it, accounting conservatism will lead to lower management liability because it makes revenue recognition more difficult. Theoretical ambiguity regarding accounting conservatism and managerial liability is partly due to conflicting views about how conservative accounting affects managerial incentives. Accounting conservatism is related to corporate governance, with corporate governance being closely associated with reduced

* Assistant Professor, IBS Hyderabad (Under IFHE – A Deemed to be University u/s 3 of the UGC Act 1956), Hyderabad, Telangana, India. E-mail: rajneeshranjan.jha@ibsindia.org

© 2021 IUP. All Rights Reserved.

managerial liability. Thus, the potentially deleterious effects of accounting conservatism on corporate governance are likely to outweigh its relatively weak individual effects on management liability. Financial scandals in public companies, such as Enron and WorldCom, have raised questions about how much they are influenced by accounting conservatism in the management of earnings. The view that changes in accounting standards can encourage or discourage misreporting motivated influential work in economics on managerial incentives. According to Watt (2003), "Conservatism is defined as the differential verifiability required for recognition of profits versus losses". It indicates that bad news will be reflected more quickly than good news, leading to asymmetric timeliness in earnings (Basu, 1997; Ball *et al.*, 2000; and Givoly and Hayn, 2000). Overestimation of an allowance for doubtful accounts can be an example of accounting conservatism.

Literature Review

Ahmed and Duellman (2007) examined the relationship between the characteristics of board of directors and accounting conservatism. Their sample includes 306 US firms from S&P500 for the period of 1999-2001. Prior to this study, a number of studies examined the relationship between various board characteristics and the quality of financial reporting. For example, Peasnell *et al.* (2000) and Bowen *et al.* (2008) reported a negative relationship between the earnings management and the percentage of outside directors. Anderson *et al.* (2004) examined the relationship between debt ratings and board structure. Beasley (1996) and Farber (2005) examined the relationship between the outside director percentage and the likelihood of fraud, and they found a negative relationship between outside director percentage and the likelihood of fraud. Wright (1996) examined the relationship between the percentage of outside directors and analyst ratings of financial reporting quality, and they found that the relationship is positive. Beekes *et al.* (2004) also investigated the relationship between board independence and accounting conservatism. They reported a positive relationship between board independence and accounting conservatism for a sample of UK firms where they use Basu measure of accounting conservatism. Ahmed and Duellman (2007) differentiated their study from Beekes *et al.* (2004) in three important ways. First, there are many and important differences in UK and US GAAP along with other important institutional frameworks. Second, Beekes *et al.* (2004) used only board independence as their key independent variable, whereas Ahmed and Duellman (2007) investigated a broader range of board characteristics. They used insiders on board percentage, board size, outside director ownership, separation of chairman and CEO positions and the number of additional directorships held by board members. Third, Beekes *et al.* (2004) examined the relationship between accounting conservatism and board structure using only one measure of conservatism, i.e., Basu's (1997) conservatism measure, whereas Ahmed and Duellman (2007) used three measures, i.e., Basu measure, an accrual-based measure and a market-based measure. Using multiple measures of accounting conservatism, they found that there is a negative relationship between inside directors' percentage and accounting conservatism. They also found a positive relationship between outsider directors' ownership and accounting conservatism. They also reported an important limitation of their study, i.e., they do not

Stakeholders' Perception of CSR Practices: Evidence from Indian Companies

T Sita Ramaiah, Kishan Jee** and Satish Chandra Tiwari****

In recent years, companies have become more conscious of customer satisfaction while implementing social responsibilities compliance. The Corporate Social Responsibility (CSR) literature is tremendously rich. Numerous scholars and researchers have contributed to enriching the literature on CSR. Following a thorough review of literary texts on CSR, it was found that most crucial aspects of CSR have been explored and studied so far. The study helps to create a deeper understanding of essential and functional elements of CSR. CSR scope and models have been discussed by analyzing the amount of research reporting performed in this field in India and abroad over the last few years. The goal of the researcher is also to project the research gap that exists in this field and to concentrate on the topics that have received priority and attention in this regard. Surveys about CSR within the framework of a selling approach have shown that there is a positive relationship between consumer preference of products and social responsibility of the corporate. Thus, a trend is revealed towards consumers' increasingly preferring products of a socially responsible company (Edelman, 2010). The results suggest that CSR activities induce positive CSR perception that improves performance. Furthermore, the results indicate that companies should consider employees' perception of CSR and their feeling of attachment and long-term performance.

quality of product or service as a contract. The contract, in turn, conveys broader obligations to fulfill, and as such, is closely related to building and restoring trust". Hence, successful building of a corporate brand requires a clear articulation of its identity (Brockner and Rubin, 2012), which is the organization's distinctive and differentiated attribute, behavior, and performance for the delivery of the corporate brand covenant (Balmer, 2012). Monsen *et al.* (1968) suggested a hierarchy of four rates of business operation. He stated that as long as the company complies with the law, managers who form the foundation believe that society is well-served. In India, the CSR tradition has its origins in individual philanthropy. In ancient and medieval India, social responsibility manifested itself in the form of charity, trickling down from those in power (especially the king), with the absence of concepts such as stakeholder relations and collective decision making. The literature traces the overarching role that tradition, spirituality, and ethics play in CSR evolution in India (Kumar *et al.*, 2004; Balasubramanian *et al.*, 2005; and Agarwal, 2008). A national survey conducted by Titler *et al.* (1994), a subsidiary of the 12th largest research organization in the United States, over six months in 1994 showed that the social success of a company greatly influenced prospective customers, workers, and investors in making the required decisions about the product. The study found that if the goods and services provided by rival firms were comparable, 47% of customers would be much more likely to purchase from a socially conscious business and an excellent corporate citizen. The combined figure jumped to 88% when the word 'somewhat more likely' was applied to the same metric. The Walker research also found that a secure link existed between the reputation of an organization for social responsibility and employee satisfaction, indicating that this was an important factor in hiring and retaining employees. How the workers were handled and the business practices practiced were the two crucial factors in determining whether a company would be an excellent place to work. Additionally, a company's reputation for social responsibility was a significant driver of investment decisions. 26% of potential investors said that in deciding where to invest, best practices and ethics were essential. 39% said they test business practices and values often or frequently before investing in a product. Van Marrewijk (2003) narrowed down the concept of CSR so that it covers three dimensions of corporate action: economic, social, and environmental management.

Indian Studies

The article, "CSR: A Cover for Crooks", published in *The Economic Times* on October 21, 2012, revealed that several firms, including Satyam Computer Services, had pursued CSR initiatives, even though they had to battle fraud and financial problems. Maira (2013) raised doubts about the validity of 2% of corporate profit spending on CSR. She expressed apprehension that politicians could force the company to redirect those funds to their corpus and desired causes. In August 2012, India's Securities and Exchange Board (SEBI) made it mandatory for the top 100 listed Indian companies to include a report on business responsibilities as part of their annual report (SEBI, 2012). Furthermore, the Companies Act, 2013 made it compulsory for large Indian companies to spend at least 2% of their average

Currency Exposure of Equity Returns: Evidence from India

M V S Kameshwar Rao and Ranajee***

The paper studies the meager evidence on currency exposure of Indian companies. It addresses three research questions. What is the long-term currency exposure (FX Equity Beta) of listed firms in India? Does it show cross-sectional variation in firms and variation across industries? Is it time varying? With NSE 100 firms, currency exposure of equity returns to US Dollar (USD) is estimated at portfolio and firm levels for the period 2001-2016, and also for two sub-periods 2001-2008 and 2008-2016. Robustness of the estimates is verified using Composite Exchange Rate (CER). Long-term FX Equity Beta of Indian firms is negative and time varying, and varies across industries and firms. This evidence is contrary to the thinking that currency depreciation is good for emerging economies. The forex beta of the equity portfolio of NSE 100 firms to USD (CER) is −1.352 (−1.352), for 2001-2016; −1.718 (−1.704) for 2001-2008, and −1.283 (−1.256) for 2008-2016. Mean firm level FX Equity Beta on USD (CER) is −1.601 (−1.551) for 2001-2016; −2.078 (−1.875) for 2001-2008, and −1.667 (−1.803) for 2008-2016. Mean FX Equity Beta on USD (CER) of financial services firms is −2.221 (−2.215) and that of IT firms is −0.47 (−0.56).

Introduction

Indian companies are exposed to currency volatility due to their international business transactions involving exchange of currency. Indian Rupee (INR), since 1947, displayed a depreciating trend till 2003, later it appreciated till 2007. Beginning 2008, INR has shown more volatility, coupled with a depreciating trend (see Figure 1). Theory in international finance establishes that both domestic firms and firms with foreign currency transactions are susceptible to currency risk. Empirical literature estimates currency exposure[1] of firms using equity returns as a proxy, and highlights a "currency exposure puzzle".[2]

* Associate Professor, IBS, Hyderabad (Under IFHE – A Deemed to be University u/s 3 of the UGC Act 1956), Hyderabad, Telangana, India; and is the corresponding author. E-mail: kamesh@ibsindia.org

** Associate Professor, IBS, Hyderabad (Under IFHE – A Deemed to be University u/s 3 of the UGC Act 1956), Hyderabad, Telangana, India. E-mail: ranajee@ibsindia.org

[1] "Currency Exposure" as a word has two connotations. One, it represents the quantum of a variable that is denominated in foreign currency. Two, the degree to which, the domestic currency value of that variable is sensitive to changes in exchange rates (measured as an elasticity coefficient). While the text books of International Finance have promoted the former connotation, empirical research promotes the later (Adler and Dumas, 1984; and Jorion, 1990). One of the advantages of measuring currency exposure as an elasticity coefficient is that it is tractable for statistical estimation, and facilitates comparison of currency exposure of various firms, irrespective of their size and industry affiliation. It also helps in designing a hedging program, and assists generic policy formulation at macro level, understanding the sensitivities of firms to currency fluctuations.

[2] Refers to feeble empirical evidence on currency exposure even in MNCs.

© 2021 IUP. All Rights Reserved.

Jorion (1990) showed evidence that currency exposure displays significant cross-sectional and industry sectoral variation. Bodnar and Gentry (1993) described such disparity to industry structure and its competitive environment. Portfolio level and industry level estimates of currency exposures mask significant firm level variation as per Choi and Prasad (1995). There seems to be only one study Sikarwar (2014), in the Indian context, that examined currency exposure at industry level with data up to 2011. Whether for industry-based policy formulation on foreign trade or designing the asset allocation strategies of portfolio investments, understanding portfolio and firm level exchange rate exposures is important, which leads to the second research question of this paper: Does currency exposure of equity returns, of listed firms in India, depict cross-sectional and industry-based variation?

Changes in foreign trade baskets of firms, central bank's intervention policy, firms' expertise in risk management, and constraints on access to derivative products for hedging can lead to time varying currency exposures. Unexpected and wide fluctuations in forex rates also impact firms without leaving room to hedge. The monthly mean (volatility) of INR during 3/2001-3/2008 was 45.25 (2.63) and during 4/2008-3/2016 was 54.89 (8.33). Saradhi (2003) showed evidence that Indian importers are price takers, and Gopinath (2015) showed that Indian firms face difficulty in invoicing in home currency. Considering the above evidence and the jump in INR by ₹9 during 2008-2016, importing firms could have been negatively affected, because in the short run they cannot alter their sources of procurement or the cost structures. Time varying currency exposure is detected as early as 1990 by Jorion (1990) and further verified by Choi and Prasad (1995), Allayannis (1997) and Doukas *et al.* (2003), yet there seems to be no evidence on this aspect in the Indian context, hence the third research question of this paper: Is the currency exposure of listed firms in India, time varying?

With equity returns of sample firms—contained in NSE[5] 100 index—as dependent variable, USD/INR[6] as the independent variable, BSE 500 index as control variable, this paper estimates currency exposure of the sample firms. NSE 100 firms possess significant negative FX Equity Betas during the entire period of 2001-2016. There is considerable variation in the currency exposure estimates of firms across industries. Currency exposure at portfolio level is higher during the period 2001-08, and it declines during the period 2008-16. At firm level, the evidence on such time varying behavior is to the contrary. 47% of the sample firms possess significant currency exposure during 2001-2008 and around 88% possess significant currency risk in 2008-2016?. The rest of the paper is organized as follows. First, the paper presents relevant literature, followed by methodology, model, variables and data sources. Then, it discusses the results. Finally, the paper ends with conclusion and with some suggestions for further research.

Literature Review

Empirical estimation of currency exposure is found in literature since Adler and Dumas (1984) seminal paper. Equation (1) is the popular augmented model of Jorion (1990) in the literature to estimate currency exposure:

[5] National Stock Exchange (NSE) publishes an index of 100 most traded listed firms.

[6] Number of Indian Rupees per 1US$ (Nominal Exchange Rate).

A Comparative Study of the Performance of Government Promoted Firms and Non-Government Promoted Firms: Evidence from India

*D Satish**

Promoters play a very important role in the performance of companies. In India, the average holding of promoters is very large at around 54%. These promoters are either government or private individuals and business houses. India started the privatization process in a big way in the early 1990s and also started disinvesting stakes in major public sector companies, while retaining a minimum of 51% stake in a majority of companies, in effect keeping the control. The paper with an objective to study whether there exists a significant difference in the performance of government promoted firms and private firms and found a significant difference in the performance between them using both independent sample t-test and pooled panel data regression. The paper is based on the data of public listed companies in India over a period of 11 years (2008-2019).

Author Copy

Introduction

Investors around the world are often curious to know whether there exists a relationship between promoter holding and firm performance and whether a government promoter or a private promoter holding would result in better performance of the firm. This research question has attracted researchers from various streams, including finance, accounting, economic and strategic management.

Need and Importance of the Study

The study on the relationship between the type of promoter ownership and the performance of the firm is very important to understand many issues, especially in the Indian context. In a country like India, where a majority of the firms are owned by promoters belonging to family-owned businesses or by the government, the retail investors have just started to participate in stock markets and financial institutions like banks cannot invest in stock markets directly. In this setting, the promoters end up holding a large proportion of the shares and

* Professor, (Finance and Accounting), IBS Hyderabad (Under IFHE – A Deemed to be University u/s 3 of the UGC Act 1956), Hyderabad, Telangana, India. E-mail: satishd@ibsindia.org; dsatish2000@gmail.com

© 2021 IUP. All Rights Reserved.

Marcia *et al.* (2010) studied the impact of state ownership on the difference in performance of state-owned banks and private banks in international settings. The period of the study was from 1989 to 2004. They came out with a changing pattern of performance between private and state-owned banks during the Asian Financial Crises. They found that the state-owned banks had greater credit risk with less core capital and less profitability and the difference in performance was higher in countries which had a greater involvement by the government and higher level of corruption. They also observed that the state-owned banks increased their performance after the financial crises. The study used the *t*-test for analyzing the difference in means as well as the regression.

Nandini (2005) categorized privatization in India as partial privatization as only non-controlling share of the firm is offloaded on to the stock market and the controlling stake is not passed on to the private partner and so the impact of such a privatization is minimal. He showed that it had a positive impact on profitability, productivity and investment as the stock markets play an important role in not only monitoring but also rewarding managerial performance even if the controlling stake is held with the government.

Milind (2005), based on the data from 1998 to 2002, measured the financial performance of banks using ROA. Efficiency was measured using deposit per employee and the impact of privatization on firm performance was measured using synchronic approach, in which the performance of the state-owned firms is compared with privatized firms and other private firms. They found that partially privatized banks and private banks significantly outperformed public sector banks, but on the quality of advances, no significant difference was observed between public banks and private banks.

Research Gap

Most of the studies were conducted during the time of privatization or narrowly covered only a specific sector like banking. The present study is set in a time when privatization has long been started and both the entities, government promoted and non-government promoted firms, are competing with each other for better performance. Also, the study is on a much broader scale studying all the listed companies on National Stock Exchange (NSE) rather than keeping it to a single sector.

Objective and Hypotheses

To examine whether there is a significant difference between the performance of government promoted firms and non-government promoted firms.

Therefore, the following are the null and alternate hypotheses:

H_0: *There exists no significant difference between the performance of government promoted firms and non-government promoted firms.*

H_1: *There exists a significant difference between the performance of government promoted firms and non-government promoted firms.*

Does Ownership Structure Impact Competitiveness of Firms in Their Product Markets? Evidence from India

P Bhanu Sireesha[1], Pavana Jyothi[2], Hussain Yaganti[3] and Richa Gupta[4]

Existing literature shows that monitoring the effect of concentrated ownership has a positive impact on firm value. However, the economic channel of such a positive impact has not been examined. This study offers a possible economic channel and tests it empirically using a panel of Indian firms. The hypothesis of the paper is that concentrated ownership increases the competitiveness of the firms, through efficient monitoring of their activities, in their product markets, thus increasing the growth rate of firms. The results show that both institutional and promoter ownership have a positive impact on firm competitiveness. However, foreign concentration has an insignificant impact. Moreover, for business group-affiliated firms, only institutional concentration has a positive impact. The results remain robust for different specifications and endogeneity issue.

Author Copy

Introduction

Finance theory argues that effective monitoring by owners aligns the interests of managers and shareholders in the presence of the agency problem (Jensen and Meckling, 1976). Shleifer and Vishny (1997) argue that owners' incentive to monitor firm activities increases with an increase in their percentage shareholding, and Boubakri *et al.* (2005) and Burns *et al.* (2010) provide empirical evidence for such increased monitoring of concentrated owners. It is expected that shareholders, being rational and utility maximizers, influence managers' decisions towards value maximization when they hold higher stock ownership. Several studies have tested this theoretical argument empirically and found a positive impact of good governance of ownership concentration on firm value in the market (De Miguel *et al.*, 2004; and Pindado and De la Torre, 2006). However, firm performance and its value being

peers. Therefore, the positive impact of corporate governance on value could be seen only in less competitive industries as there is less competitive pressure from the industry peers. This argument predicts a positive relationship between concentrated ownership and firm growth only in less competitive industries. However, these arguments ignore the fact that managers' incentive to expropriate a part of firm wealth does not depend on the level of competition within that industry. Even in the competitive industries, the absence of effective monitoring would lead to value reducing decisions by the managers. Therefore, it is our argument that corporate governance differences among firms should govern the performance of firms even in the competitive markets. In such competitive industries, firms which are poorly governed would eventually exit the industry as they lose their ground to other firms which are better governed.

The next pertinent question in this context is: Does the impact of corporate governance on growth depend on the size of the firm? Owners' incentive to monitor firm activities should depend on the size of the firm. In small firms, the proportion of wealth invested is small as compared to that of large firms. Therefore, the incentives to monitor such firms should be less. From this, we may predict that the positive impact should be pronounced for larger firms.

The existing literature on ownership structure, especially for an emerging market like India, documents that not all investors have the same kind of monitoring incentives on firm activities. For example, in the presence of a principal-principal type of agency problem, an increasing promoter ownership may actually increase the agency conflict between promoter (who is a majority shareholder) and other minority shareholders (Singla *et al.*, 2014). For such firms, i.e., business group affiliated, the impact of promoter concentration should actually increase the agency costs. Hence, the impact promoter ownership on competitiveness should be different.[2]

We test these hypotheses using a panel of National Stock Exchange (NSE) listed Indian firms. We use Indian data for two reasons. First, there is a clear information about the concentration of shareholdings of different owners such as promoters, institutional and foreign. Second and the most important one is that the phenomenon of group affiliation helps us to understand the impact of different types of owners on the agency costs and thus on market competitiveness. It is to be noted here that not every type of owner has the same impact on the agency costs of firms. In the presence of principal-principal type of agency costs, increasing concentration of promoter ownership in group affiliated firms may actually increase the agency costs of suboptimal decision making and thus may have a negative impact on firm competitiveness. This might explain the findings of Carney (2005), who found insignificant impact of family ownership on the competitive advantage of firms in their product market. Therefore, using Indian data, we can clearly establish the impact of different types of owners on the competitiveness of the firms in their product market.

[2] Using the same insight, Carney (2005) examines the impact of family ownership on the competitive advantage of firms and finds that family ownership does not impact the competitive advantage of a firm in the product market.

Do Financial Constraints Matter in Accessing Agricultural Loan? Organic vs. Conventional Farmers

Md Sikandar Azam, Satish Chandra Tiwari** and Harsh Raj Pathak****

Economic empowerment and sustainable livelihood of small and marginal farmers have become a major challenge in India. The NSS survey report indicated that around 40% of farmers are willing to quit farming and seek other means of economic survival. The ease of agricultural credit for the financially weak farmers can significantly help them to sustain. This study aims to understand the relationship between the financial position of organic and conventional farmers and their accessibility to agricultural loans. The primary data from 400 farmers has been collected from organic and convention farmers. To address the objectives, a Binomial logistic regression model has been used to examine the impact of financial position in accessing agricultural credit. The study revealed that educated, large-scale, and financially sound farmers benefited more from financial institutions, whereas economically deprived small and marginal farmers were unable to access agricultural credit due to illiteracy, lack of awareness, and lengthy documentation. The study suggests that generalization of loan waived should be avoided. Further, the required documents for availing agricultural credit for the economically weak and uneducated small and marginal farmers need to be simplified that could minimize the non-institutional sources of loan.

Introduction

Agriculture in India has always been largely dependent on monsoons; therefore, it has been an inherent risk activity (Mohan, 2006). The failure of monsoon leads to high rural indebtedness, and it is seen as the continuation characteristics. The sustainable livelihood of small and marginal farmers has been a major challenge in India. The gradual shrinking in cultivated landholding size has reached 44% for small and marginal farmers out of the total

cultivated land area. Despite the existence of river systems, agriculture in India has always been heavily dependent on the monsoons and has hence been an inherently risky activity (Auffhammer *et al.*, 2012). The economic instability of the farmers induces them to sell their agricultural land or willingness to quit farming. It creates distress among India's millions of small and marginal farmers (Pathak and Chattopadhyay, 2021). The farmers have also been facing post-harvesting challenges in the marketing of their crops, such as lack of warehousing facilities, costly transportation, price fluctuation, and crops demand at the time of harvesting (Azam *et al.*, 2019). The various challenges other than economic such as psychological, social, environmental, and political, have increased suicide among the farmers in the past few decades (Das, 2011). The financial crisis is mainly due to the indebtedness from informal sources as one of the reasons among India's small and marginal farmers (Reddy *et al.*, 2021). The previous study revealed that the economic crisis due to monsoon failure, high debt burdens, and crops failure became one of the important economic reasons for committing suicide for the farmers. According to a National Crime Records Bureau (NCRB) report, 10,677 Indian farmers committed suicide in the year 2020.

As per the census report, there has been a decline in absolute numbers of cultivators, which is unprecedented, from 127 to 118 million farmers. A decline of 9 million farmers indicates a greater shift of small and marginal farmers from agriculture to non-agriculture sectors in one decade. However, agriculture is the demographically widest economic sector and plays a significant role in the overall socio-economic development in rural India. As per the government report (Ministry of Statistics and Programme Implementation), agriculture and allied sectors reached 16.38% of the gross domestic product at a constant price in 2020-21, while the sector still accounts for more than 50% of the total employment.

The constant increase of various chemical fertilizers and pesticides in agriculture production (Pimentel and Burgess, 2014), particularly after the Green Revolution, has led to numerous challenges such as deterioration of human health, effects on reproduction and central nervous system (Von Duszeln, 1991; and Singh, 2000). Hence, the concept of organic farming has been strengthened and emerged as alternative farming in the form of sustainable agriculture. According to USDA, "organic farming is a system which avoids or largely excludes the use of synthetic inputs and to the maximum extent feasible rely upon crop rotations, crop residues, animal manures, off-farm organic waste, mineral grade rock additives and biological system of nutrient mobilization and plant protection".

Government Initiative for Agricultural Credit

Regarding the survival of farmers, the government ensures credit flow from time to time with different schemes. For smooth cultivation, the state and central governments have provided various subsidies and loans to the farmers in agricultural fertilizer and technologies.

- Doubling of Agricultural Credit: The government announced a package in June 2004 to double agricultural credit over three years.
- Kisan Credit Cards: KCC Scheme was introduced in August 1998 to meet the credit needs of the farmer.

Financial and Social Impact of Skill Development Programs for Empowerment of the Tribal Community in Telangana State, India: An Empirical Study

*P Vijaya Kumar**

Telangana is a new state of the Indian Union that was formed in 2014 after a prolonged and relentless struggle. Close to 10% of the total population belongs to the tribal community. The tribes are socially and economically backward in the state when compared to other communities. The Telangana government has initiated a number of skill development programs for the tribal people to get employment and entrepreneurship opportunities and to improve their socioeconomic status. The study is an empirical evaluation of the skill development programs for the socioeconomic development of the tribes which are being implemented in the state. The tools used for the analysis are percentage, chi-square, t-test and ANOVA. The study found that the skill development programs are helping the tribes to get employment and entrepreneurship opportunities and to improve their socioeconomic conditions. The skill development schemes have a positive impact on the socioeconomic status of the tribal beneficiaries, and they have expressed satisfaction as there is significant social advancement in their lives.

Author Copy

Introduction

Telangana is a new state of the Indian union. It was achieved after a prolonged and relentless struggle during which many sacrificed their lives, and it has successfully completed a little over six years. There are 32 scheduled tribes in the state of Telangana as per the AP Reorganization Act, 2014. The tribal population accounts for 9% of the total population in the state. ST population in ITDA districts is 52.96% of the total ST population in the state and remaining 47.04%. Tribals inhabit the plain areas (census India). The tribes are socially and economically backward in the state when compared to other communities. The Telangana government has initiated a lot of skill development programs for the tribal people to get employment and entrepreneurship opportunities and also to improve their socioeconomic status. The study is

* Visiting Faculty, IBS Hyderabad (Under IFHE – A Deemed to be University u/s 3 of the UGC Act 1956), Hyderabad, Telangana, India. E-mail: vijayakumarpenumala@ibsindia.org

an empirical evaluation of the skill development programs for the socioeconomic development of tribes, which are being implemented in the state. The focus of the Telangana government is on the welfare of the downtrodden through well-designed welfare schemes that cater to their needs. The government is fully committed to supporting the scheduled tribes, who lack adequate opportunities to move forward and to achieve their goals and fulfill their aims. The Tribal Welfare Department (TWD) evolved detailed plans, focusing on raising the competencies of tribal youth to enable them to secure a better future.[1]

Skill Development Programs

The TWD is implementing the skill development activities with a three-pronged approach in tribal areas. The first one is placement linked training for private employment in existing youth training centers through skill training agencies, viz., IL & FS, Synchro Serve, Gram Tarang, AISECT, B- ABLE, National Academy of Construction and EGMM, etc. The second one is self-employment-oriented training for entrepreneurship development in youth training centers through RSETI, BIRED, TSRTC and RTP, etc. The third one is pre-examination coaching for formal employment like Police Constable, Sub-Inspector, Forest Beat Officers, Banking and Railways, etc., through Pre-Examination Training Centers (PETCs).

Literature Review

The literature review highlights the studies conducted on the skill development programs across the world. George Sugai *et al.* (1997) recommended improvement of the pre-service and in-service training of educators that specifically expands models of educator supervision to include the pre- transition and post-graduation periods and expand university-based learning to focus on the work, classroom, and school environment, rather than the university laboratory or lecture. Nicholas (2000) investigated the effect of automated driving systems on skill development in a simplified driving simulator task. Brown (2001) examined the myths and misconceptions about who pays and who reaps the return on investment in training. Investments in skill development training are assumed to have positive returns. Punia (2002) determined the training needs for individuals, staff, supervisors, executives, groups and organizations. Alison Bullock and Vickie Firmstone (2011) contributed the skill-mix debate by focusing on UK primary care dentistry, revealing unintended and intended consequences of a modularized, technocratic view of dentistry. Saleem and Shahid (2011) highlighted how the training and development of an employee plays an important role and how higher authorities of these different sectors give feedback that all employees should be given opportunities for training and development that lead to organizational efficiency, effectiveness, quality and growth.

Yoko Asuyama (2012) examined the different comparative advantages of China and India in relation to their different skill distribution patterns. Okada (2012) discussed the initiatives to facilitate young people's transition to the world of work. He discussed the education and employment of Indian youth. He also discussed the challenges to skill development training:

Domestic Institutional Ownership and Firm Value: A Study of NSE 500 Companies

Pranati Mohapatra*

The paper studies the impact of Domestic Institutional Ownership (DIO) upon firm performance in India using panel data for NSE 500 companies from 2010 to 2016. The study finds DIO to have a positive impact on Tobin's Q in panel regressions-fixed effects after using controls such as firm age, size, leverage, marketing intensity, foreign institutional ownership and promoter ownership. The study also tests the impact of Mutual Fund Ownership (MFO) and the impact of Banks, Development Financial Institutions (DFI), Insurance companies' (BFII) ownership separately and found MF has a positive impact on Tobin's Q. The study observed that all variables DIO, MF and BFII had no impact on Return on Assets (ROA) but BFII is found to have a negative impact on Return on Equity (ROE). The study found a positive impact of Mutual Funds (MFs) and a negative impact of 'Banks, FIs and Insurance companies' on firm performance in India. The paper contributes to the empirical literature on institutional ownership and firm performance in emerging economies. It has important implications for firms, investors, corporate policy makers and researchers particularly, in India.

Author Copy

Introduction

The connection between ownership structure and performance has been the subject of an important and ongoing debate in corporate finance literature (Demsetz and Villalonga, 2001). Ownership structure is considered as an important internal mechanism to control the agency costs (Jensen and Meckling, 1976; and Shleifer and Vishny, 1986). Large investors and financial institutions can afford to invest in information and effectively monitor managers and reduce conflict of interests between owners and managers (Shleifer and Vishny, 1986). Institutional investors can also influence corporate behavior by actively participating in the corporate control and decision-making processes such as proxy contests (Pound, 1988; and Smith, 1996) and CEO turnover. Thus institutional ownership is considered to have important implications for firm performance and value. They can make a positive contribution by cost-effectively monitoring management behavior.

* Assistant Professor, Department of Finance, IBS Hyderabad (Under IFHE – A Deemed to be University u/s 3 of the UGC Act, 1956), Hyderabad, Telangana, India. E-mail: pranatim@ibsindia.org

This inconsistency in findings is said to arise because of the heterogeneity of institutional investors (Brickley *et al.*, 1988; and Pound, 1988). Different classes of institutional investors are likely to have different objectives (David, Kochhar, and Levitas; and Kochhar and David, as cited in Dalton *et al.*, 2003) and hence different influence.

Pound (1988) explored the influence of institutional ownerships on firm performance and proposed three hypotheses to explain the relation between institutional ownership and corporate value: (i) the efficient-monitoring hypothesis, (ii) the conflict-of-interest hypothesis, and (iii) the strategic-alignment hypothesis. Efficient-monitoring hypothesis predicts a positive relation between institutional ownership and firm value. This hypothesis considered institutional investors as efficient monitors of the management because of their expertise. It assumed only an investment relationship between institutional owners and the firm. The conflict-of-interest proposition assumes other profitable business relationships of institutional owners with the firm. For example, a bank may be an investor and also a primary lender. Voting against management in such situations may significantly affect the bank's business relationship with the firm, so this hypothesis assumed a negative relationship between institutional holding and firm value. The strategic-alignment hypothesis is similar to conflict of interest and it stated that institutional owners and managers may find it mutually advantageous to cooperate. This cooperation reduces the benefits from institutional monitoring. Thus, the conflict-of-interest and the strategic-alignment hypotheses both predict a negative relation between institutional ownership and the value of the firm.

Brickley *et al.* (1988) gave similar arguments. According to them, the propensity to engage in monitoring differs for pressure-resistant and pressure-sensitive institutional investors. Pressure-resistant institutional investors only have an investment relationships with firms in which they invest such as pension funds, Mutual Funds (MFs), endowments and foundations. They are most likely to be active monitors of the management. On the other hand, pressure-sensitive institutional investors usually have both an investment and business relationship that include insurance companies, banks and non-bank trusts. The business relationships may create a dependency, because of which these investors are unlikely to be active monitors of the firms in which they invest. Davis and Thompson (1994) (as cited in Dalton, Certo and Roengpitya: p. 15) noted that these funds "have a virtually unblemished history of passivity".

In India, Kumar (2003) examined the link between firm performance and ownership structure for a panel of 2478 BSE manufacturing firms over the years 1994 to 2000. The study found that the institutional investors have a significant positive impact on firm performance once their ownership crosses a threshold level and the impact is nonlinear in nature. The threshold point for institutional investors is found to be at 18%, Return on Assets (ROA) decreases when institutional holding increases up to 18% and then starts increasing. Patibandla (2006) examined the role of large outside investors on corporate performance using firm level panel data from 1989 to 1999 for 11 Indian industries. The

Dividends and Promoters: The Role of Controlling Shareholders in India

Geeta Singh and S Vijayalakshmi***

The paper investigates the lesser researched area of possible association between promoter equity ownership and dividend policy. Firms in India have concentrated ownership of promoters and thus, promoters may influence the firm's various decisions, including its dividend policy. The paper tests the relation between the promoter ownership and dividend payment, after controlling several firm characteristics such as size, return on assets, cash ratio and leverage. Based on panel data of Nifty 100 firms from March 2011 to March 2019, evidence for a positive relation between the promoter's equity ownership and dividend payment is provided. The results are in line with the reputation building hypothesis. This hypothesis suggests that the positive relation between promoter ownership and dividend payout is a result of reputation building mechanism such that firms intend to send a positive signal to the market and investors that they are not expropriating the rights of minority shareholders.

Introduction

Corporate governance is defined as the way through which suppliers of finance to corporations assure themselves of getting a return on their investment. For knowing the wider scope of corporate governance, Andrei and Robert (1997) sought to find out: How do the suppliers of finance get managers to return some of the profits to them? How do they make sure that managers do not steal the capital they supply or invest it in bad projects? How do suppliers of finance control managers? Many mechanisms can answer these questions and one such mechanism is the dividend payment which acts as a signaling tool, sending a signal to the market and investors that the firm is not expropriating the rights of minority shareholders. Dividend payment has been considered a disciplinary mechanism of corporate governance which also works as a substitute for poor monitoring by a firm's shareholders.

In this paper, we provide evidence that the dividend payment is related to the percent of equity ownership of promoters. In the presence of control variables which also influence the

dividend policy of the firms, we test if the promoter ownership impacts the dividend payments in Indian firms, selected on the basis of market capitalization. Similar work has been done in developed and other emerging countries (Yoshikawa *et al.*, 2010; Huang *et al.*, 2012; Benjamin *et al.*, 2016; Mulyani *et al.*, 2016; and Kuo, 2017). Chris *et al.* (2015) examined the relation between dividend policy, managerial ownership and debt-financing for firms listed on NYSE, AMEX and NASDAQ. They found that in firms where managerial ownership is low, there is a negative relationship between ownership and dividend; however, the relation gets reversed when managerial ownership is high. Further, they concluded that the relationship between managerial ownership and dividends becomes more complex across firms with different levels of financial constraints. Luciana and Aydin (2010) empirically investigated the relation between dividend policy and ownership structure of the Italian firms, characterized by high ownership concentration. Results revealed that with increase in the voting rights of the largest shareholder, firms make lower dividend payouts. Ronny *et al.* (2012) used a sample of non-financial, independent and group-affiliated Indian firms and found that the dividend payout ratios of group-affiliated firms are higher than those of independent firms; however, the reason for this difference is not due to the level of diversification or group size. Helen *et al.* (2002) examined the link between dividend policy and institutional ownership for UK firms. They established a positive association between dividend payout ratio and institutional ownership; however, they also provided evidence for a negative relation between dividend payout policy and managerial ownership.

We explore the very neglected and lesser explored area of promoters' equity ownership and dividend policy of the Indian firms of the Nifty 100 index. To the best of our knowledge, there is no study which examines this relationship for the Nifty 100 companies of India for the time period of nine years (2011-2019). Eliminating the government and financial companies, we study the relation between the promoter ownership and dividend payments in the Nifty 100 companies of India. The relationship between the promoter ownership and the dividend policy has been an area of interest for researchers and industry analysts. Dividend policy is considered as a means of corporate governance mechanism. La Porta *et al.* (2000) stated that the poorly governed companies pay out less to minority shareholders, thus more funds are under the discretion of the controlling shareholders. Studying the relationship between the promoter ownership and dividend policy can be helpful to examine if dividend payments play a role in mitigating agency conflicts between promoters and minority shareholders in promoter-controlled firms. India, being a country characterized by predominance of promoter controlled firms, provides a research avenue to examine if there is any relationship between the promoter ownership and dividend policy. We control other factors influencing the dividend policy of the firm and find that there is positive relation between the promoter ownership and dividend payment in Indian large cap firms from 2011 to 2019.

The paper is organized as follows: first, it provides a brief literature review; then it describes the data and the methodology, followed by the results and discussion; finally, the paper ends with conclusion.

Internal Capital and Firm Financing: Evidence from Indian Group-Affiliated Firms

Akanksha Saxena and Shilpi Banerjee***

In this study, we examine the phenomenon of the existence of internal capital market among business group firms. Researchers in this field use the existence of the internal capital as a base to explain the difference between group and stand-alone firms with respect to various financing decisions. Using a panel of Indian listed firms, we analyze the equity and debt components of the internal capital market. We find that for group firms, the debt component of internal capital exists mainly in the form of intercorporate loans. And among equity components, it exists in the form of promoter and intercorporate shareholdings. However, for stand-alone firms, debt from promoters' loans, fixed deposits from promoters and deferred credit are higher and so are equity from persons acting as promoters and institutions and Hindu Undivided Families (HUFs).

Author Copy

Introduction

Business group affiliation is a common phenomenon around the world. However, in emerging market economies, business groups have a strong presence and predominance over most of the business activities. This is because of certain market imperfections that emerging economies face, such as underdeveloped capital, labor and product markets and at the same time weak corporate governance and control. Business groups replicate the functions of such institutions and fill the voids of market imperfections (Khanna and Palepu, 2000; and Gopalan *et al.*, 2007).

Business group firms take different structural forms in different countries, but they usually have an independent legal structure with some formal and informal ties connecting them. These formal and informal ties are what differentiate them from non-group-affiliated firms. Research on business group affiliation has focused on various aspects of corporate finance literature to analyze the impact of group affiliation and to see if the impact on various aspects is good or bad. Earlier research has focused on the difference in capital structure of both business group-affiliated firms and non-group-affiliated firms (Manos *et al.*, 2007; and

* Assistant Professor, IBS Hyderabad (Under IFHE – A Deemed to be University u/s 3 of the UGC Act 1956), Hyderabad, Telangana, India. E-mail: akanksha.saxena@ibsindia.org

Chakraborty, 2013), difference in profitability across the firm categories (Khanna and Palepu, 2000), difference in dividend payout policy of the firms (Gopalan *et al.*, 2014), difference in cash management (Locorotondo *et al.*, 2014), etc. and most of the studies have also found strong evidences of such differences in group-affiliated firms and stand-alone firms. Also researchers have analyzed the group phenomenon for both developing and developed economies (Buchuk *et al.*, 2014 studied business group firms of Chile; Byun *et al.*, 2013 for Korean firms; and Bamiatzi *et al.*, 2014 for firms in UK).

The most widely accepted and similar claims of researchers about business group firms are the presence of internal capital market among group firms, and because of presence of such internal capital market, group-affiliated firms perform differently from non-group-affiliated or stand-alone firms. However, the impact of the presence of internal capital market among group-affiliated firms has conflicting views. One view is in support of internal capital market and posit that the presence of such internal market enables firms to distribute resources among the other group firms that are in need of resources and in this way enhances firm performance and also the overall performance of the group. Gopalan *et al.* (2007) found support for this view. They found evidence of decrease in bankruptcy probability of business group firms; and they reasoned presence of internal capital market among business group firms for decrease in probability of bankruptcy.

The other view talks about tunneling behavior in group firms according to which, group-affiliated firms are also believed to tunnel the cash out from lower insider ownership firms to higher insider ownership firms; this way expropriating wealth from minority shareholders to majority shareholders of the group. Expropriation of wealth is a sign of agency problem and governance issues. So, if the tunneling behavior of business firms exists, then business group firms should perform significantly worse than stand-alone firms. Singh *et al.* (2007) found Indian diversified firms to perform significantly worse than focused firms; and thus their results support the presence of agency problem due to poor asset quality, asset management and cost inefficiencies among business group firms.

Existence of internal capital market has not been evidenced by researchers empirically but they have taken it as a basic assumption to reason for the differences between group-affiliated and non group-affiliated firms. This is the significant shortcoming of existing literature; as these studies do not test empirically if there actually is some existence of internal capital market, and if yes what form does it take and what is the strength or magnitude of such internal capital market. These are a few questions that are yet not answered in group firms' literature and our study is an attempt to address some of these questions. It is important to empirically test the existence of internal capital market across firm categories because if we do not find any difference between internal capital market of group and non-group-affiliated firms then the claims of the existing studies could be wrong and the observed results could be because of some other reasons.

Hence, in this paper, we revisit the claims of previous studies and explore if the internal capital market of group-affiliated firms exists and if this market for group-affiliated firm is significantly different from stand-alone firms or not.

Pledging of Promoter Holdings and Earnings Management

Sager Reddy Adavelli and CMA Srikanth Potharla***

Pledging of shares by the promoters induces them to follow earnings management when financial performance is poor, as the fall in reported earnings will have imminent negative impact on stock price. By analyzing the unbalanced panel data of 158 companies for the period of 2012-2018, the study corroborates the debt covenant hypothesis, as the pledge ratio has a significant positive impact on earnings management. The study also evidenced significant negative impact of operating cash flows on the earnings management, which may be attributed to the reason that when operating performance is poor, firms are more induced towards earnings management in order to report better profits.

Author Copy

Introduction

Issue of debt by corporate entities is usually backed by a covenant, which is a legally binding term of agreement between issuer of debt securities and debt security holder. The underlying motive behind imposing covenants is to safeguard the interest of the debt security holders that can mitigate default by the issuer and its repercussions. The recent past has evidenced increased number of pledging of shares by the promoters to raise loan. Share pledging makes the promoters virtual borrowers, exposing them personally to the risk eliminating from the leverage. Fall in share price due to reporting of subdued performance subsequent to pledging of shares will entail costlier penalties on the part of the promoters. They may have to pledge an additional number of shares or else the lenders may liquidate the pledged shares. In order to avert such adverse situations, the promoters may indulge in upward earnings management. Against this backdrop, the study hypothesizes that management is incentivized to increase or maintain the present level of market price of the shares by managing earnings upwardly, as a fall in share price due to subdued earnings will be costlier for the borrowers.

Literature Review

The positive accounting theory, proposed by Watts and Zimmerman (1986), is a cornerstone of research on how the management chooses accounting and auditing policies. One of the

* Assistant Professor, IBS Hyderabad (Under IFHE – A Deemed to be University u/s 3 of the UGC Act 1956), Hyderabad, Telangana, India; and is the corresponding author. E-mail: sager@ibsindia.org

** Assistant Professor, IBS Hyderabad (Under IFHE – A Deemed to be University u/s 3 of the UGC Act 1956), Hyderabad, Telangana, India. E-mail: psk@ibsindia.org

© 2021 IUP. All Rights Reserved.

main hypotheses of positive accounting theory is debt covenant hypothesis. The debt covenant hypothesis conjectures that when a firm is closer to default debt covenants, it is more likely to shift earnings from future periods to present period in order to present virtually fair performance. Dichev and Skinner (2002) provided clear evidence on debt covenant hypothesis. Jaggi and Lee (2002) evidenced strong support in favor of relationship between earnings management and financial distress and proved that covenants could constrain earnings management only if the accounting system recognizes economic losses in a timely manner. Nikolaev (2010) found that when private debt is present, the relationship between covenants in public debt and timely recognition of economic losses is very poor. Franz *et al.* (2014) proved the presence of stronger incentive to engage in earnings management when firms are closer to the violation of debt covenant hypotheses.

Jha (2013) found upward earnings management in the quarters preceding the debt-covenant violation. It also found downward earnings management in the quarters in which debt-covenant hypothesis is violated. Butt *et al.* (2016) proved that abnormal operating cash flows decrease in the quarter of the violation of debt covenants and they increase in the quarter following the debt covenant violation. Lazzem and Jilani (2018) substantiated positive effect of leverage on earnings management, indicating how leverage incentivizes the management to manage the earnings. Degiannakis *et al.* (2017) found that the cross-sectional distribution of scaled earnings and changes in earnings show high frequencies of small positive earnings and small increases in earnings, while the frequencies of small losses and small decreases in earnings are less frequent. Asija *et al.* (2014) found that first-time pledging is associated with positive discretionary accruals, while second and continuing pledging is associated with significant negative discretionary accruals.

Methodology

The study considers 5079 listed companies on both National Stock Exchange (NSE) and Bombay Stock Exchange (BSE). Of which, promoters of 744 companies pledged shares during the period of 2012-2018. However, the variables required for empirical testing of the proposed model are available completely for only 158 companies throughout the study period i.e., from March 2012 to March 2018, and the total number of firm years used in the model is only 929. Based on theoretical foundation and existing literature, the study hypothesizes relationship between earnings management and pledging of shares by the promoters. The baseline regression equation is:

$$|EM|_{it} = \alpha_0 + \beta_1 Pledge_{it} + \gamma_1 OCF/TA_{it(-1)} + \gamma_2 ICF/TA_{it(-1)} + \gamma_3 LNMCap_{it} + \gamma_4 PBV_{it(-1)} + \gamma_5 LnAge_{it} + \gamma_6 Debt/TA_{it(-1)} + \varepsilon_{it} \quad ...(1)$$

To measure the earnings management, Jones (1991) model has been used. $Pledge_{it}$ is the ratio of pledged shares to total shareholdings of the promoters; $OCF / TA_{it(-1)}$ is scaled operating cash flows; $ICF / TA_{it(-1)}$ is the scaled cash flows from investment activities, a proxy for capital expenditure; $LNMCap_{it}$ is log value of market capitalization of the firm; and $PBV_{it(-1)}$ is the ratio of market price to book value. $LnAge_{it}$ is computed as the length of

Does Operating Cash Flow Volatility Impact Capital Structure Decision: An Empirical Study?

Nitya Nand Tripathi and Naseem Ahamed***

The paper examines the relationship between Operating Cash Flow (OCF) volatility and debt usage in the capital structure of firms. Using the model used by Bates et al. *(2009) and Frank and Goyal (2009) on a sample of 22,798 firm-years data points, we found that there is an inverse relationship between the debt component of capital structure and OCF. We also found a positive relationship between total debt (adjusted for total market value of the firm) and volatility of the OCF both in the full sample and the two highest quartiles. An increase of one standard deviation in OCF volatility causes a 5% increase in total debt in the capital structure. Hence, increase in OCF volatility of a firm leads to increased borrowing. The paper is probably the first to examine the relationship between OCF volatility and debt proportion of the capital structure in the Indian context.*

Author Copy

Introduction

Despite the existence of literature on the theoretical relationship between cash flow volatility and financial leverage of firms, there is little empirical evidence towards the same. The studies on Asian corporations are even less and most of those studies support various explanations on financing decisions previously established in the developed markets (Getzmann *et al.*, 2014). In this paper, we discuss two contemporary trends in designing capital structure of the Indian firms. First, we found approximately 20.87% firm-years with negative cash flow in Indian firms (Refer Figure 1 for quarterly ratio of Operating Cash Flow (OCF) to Total Assets) as against the findings of Ritter and Welch (2002), Fama and French (2004) and Denis and McKeon (2018) that document that there are a large number of firms with negative cash flow globally. Second, we found that OCF volatility ranged between

* Assistant Professor, Finance and Accounting, IBS Hyderabad (Under IFHE – A Deemed to be University u/s 3 of the UGC Act 1956), Hyderabad, Telangana, India; and is the corresponding author. E-mail: nityanand18@gmail.com

** Assistant Professor, Finance and Accounting, IBS Hyderabad (Under IFHE – A Deemed to be University u/s 3 of the UGC Act 1956), Hyderabad, Telangana, India. E-mail: naseemahamed@ibsindia.org

OCF volatility. In conciliation with the pervious findings, we also found a positive and statistically significant relation between debt and OCF volatility (see Minton and Schrand, 1999; Memon *et al.*, 2018 and Harris and Roark, 2019) in the Indian market. It reinforces the relationship between OCF volatility and debt level in the capital structure found in developed economies.

This paper reinforces the relationship between the OCF volatility and use of debt in a rapidly developing major economy. The strength of relationship is higher than that of developed economies, which in part can be a result of institutional voids, limited stock market size making debt finance the major source of viable funding.

Literature Review

There are different theories developed by researchers to explain the capital structures of firms. Myers (1984) differentiated the major schools of thought on capital structure, i.e., static and dynamic versions of the trade-off theory, the pecking order theory and the market timing theory. Evidence from the USA and Europe supports the trade-off theory, whereas the pecking order theory in finance decisions is supported in Asia. Getzmann *et al.* (2014) asserted that the trade-off theory provides a positive relationship between debt component of capital structure and OCF volatility because bankruptcies of large corporations are less likely due to less volatile and more diversified cash flows. The dynamic trade-off theory is tested by the 'target adjustment hypothesis' (Frank and Goyal, 2008). Frank and Goyal (2009) used six major determinants of capital structures such as median industry debt, market-to-book ratio, asset tangibility, firm profitability, firm size and expected inflation and documented that the capital structure changes over time as a function of exogenous and endogenous factors. Other scholars too have used these six determinants in their capital structure studies (Leary and Roberts, 2014; Faccio and Xu, 2015; Faulkender and Smith, 2016; Reinartz and Schmid, 2016; and DeAngelo *et al.*, 2018). OCF volatility is indicated as one of the major reasons to hold excess cash as asserted by Bates *et al.* (2009). Some researchers showed a negative association between volatility with debt ratio (Friend and Lang, 1988; Keefe and Yaghoubi, 2016; and Memon *et al.*, 2018), whereas Kim and Sorensen (1986) documented a positive relationship between debt and cash flow volatility. There is no conclusive evidence in the empirical studies of the relationship between OCF volatility and debt.

Hypotheses Formulation

It is clear from the literature that the OCF volatility is more in firms with more shortfalls in OCF, that are compensated for by the usage of debt instruments. Empirically, we found overall a positive relationship between OCF and debt. Firms in the lowest quartile of OCF levels increase their usage of debt by approximately 19 times.[1] On the other hand, firms with higher levels of OCF and those in the highest and second highest quartiles also

[1] Refer Table 2 for descriptive statistic. $18.79 \text{ times} = \frac{(12435-(-699))}{699}$.

Determinants of Underpricing of IPOs in the Infrastructure Sector

*Abhishek Sinha**

The infrastructure sector determines GDP growth. With debt drying up in India due to increasing Non-Performing Assets (NPAs), equity has become an important source of funding. The promoter who is raising the money and is selling his equity through offer for sale, is not able to maximize his returns, as the stock markets evidence 25%-30% underpricing. Hence, there is a need to identify the drivers of underpricing in the infrastructure sector, as there is limited study in this area. The study has identified 23 variables from literature and then vetted the variables from 10 industry experts. The data comprises stocks listed on the National Stock Exchange (NSE) and Bombay Stock Exchange (BSE) in the period 2003 to 2015 collected from Prime Database, BSE and NSE website. To avoid overfitting, Principal Component Analysis (PCA) followed by stepwise regression are used to identify factors driving underpricing. Ten factors related to the market, fundamental and macroeconomic factors are identified as drivers of underpricing in infrastructure sector. Hence, factors such as economic growth, balance sheet size and hot and cold period are the drivers of underpricing in infrastructure sector. The management should take cognizance of these drivers while listing the stock in the market to reduce underpricing.

Author Copy

Introduction

The growth of a developing nation hinges on infrastructural growth (Sanchez-Robles, 1998; Esfahani and María, 2003; and Perkins *et al.*, 2005). The same is contingent on private funding. The Public-Private Partnership is a means through which government can bridge the gap in investment by raising funds (Grimsey and Mervyn, 2002; Kwak *et al.*, 2009; and Francis and Elliott, 2019). The private sector has better managerial skills, which enables organizations to reduce cost and increase profitability. Thus, it makes investment in the infrastructural sector highly attractive for them (Winch and Onishi, 2012). Furthermore, it helps to maximize the value for money of infrastructure provisions (Savas, 1987). However, the returns on a project is contingent upon the method of financing used. There are two forms of funding available – debt and equity. Traditionally, promoters have relied more on debt in India. In May 2018, the total funding to the infrastructure sector by the government

* Assistant Professor (Finance and Accounting), IBS Hyderabad (Under IFHE – A Deemed to be University u/s 3 of the UGC Act, 1956), Hyderabad, Telangana, India. E-mail: abhisheksinha@ibsindia.org

raising funds. In the 1990s, stock markets emerged as an important source for mobilizing foreign capital globally (El-Erian, 1992).

An important question that has been addressed by research on IPO is, why companies raise money through equities? The major reason that can be attributed to raising money through equity is that companies want to be listed publicly and promoters and investors need a channel through which they can cash upon their holdings in the company (Christian and Axel, 2011).

Underpricing can be arrived at by finding the difference between listing price and offer price and then dividing it by the offer price (Ritter, 2011). Academicians have studied generally two aspects of IPO underpricing – returns in the short term and returns in the long run. Furthermore, the companies generate positive returns in the beginning, however, they start generating negative returns in the long run (Kumar, 2007).

Indian markets are one of the most active markets in terms of number of IPOs listed. In the 17-year period starting from 1988 to 2015, India had seen a listing of 2,700 IPOs, while Australia had approximately 1,100 stocks listed in their stock markets in the same period (Beatty and Ritter, 1986).

Theories Related to Reasons for Underpricing

Study on underpricing started way back in the 1970s, and since then there are a lot of theories that have been promulgated to identify the reasons for existing underpricing. In 1977, Ibbotson stated that his paper on underpricing provides insight, however, it does not solve the underpricing puzzle. Numerous papers have been written after that, however, none of them have been able to propound a theory which could solve the mystery of underpricing (Rock, 1986). The underlying theory which is generally attributed as an explanation for underpricing of IPO is agency theory. The structure of corporate law in the United States in the 1930s enforced the separation of ownership and control because the promoter owned the company and the directors managed the business. The same structure exists even today (Berle *et al.*, 1967).

Emphasis on separation of security ownership and control as the cause of underpricing was laid down for the first time by Fama and Jensen (1983). Furthermore, there is a conflict of interest between the promoter and the investment banker. The promoter does not want to leave money on the table, while the investment banker wants to presell the issue. Hence, the investment banker causes underpricing (Benveniste and Spindt, 1989).

The other theory that is commonly used for explaining underpricing is the contracts theory. Contracts theory defines a company as aggregate inputs which synergize together to produce the final product. Hence, there is a conflict of interest between the investor and the manager (Amihud and Lev, 1981). The manager is contractually obliged to look after the interest of the company, however, the same does not always happen. At times, the manager may find short-term profits more lucrative. This leads to an agency problem. In the case of IPO, there are essentially three parties involved—the promoter and initial investors, the

Relevance of Gold Monetization Scheme as an Investment Option for Retail Customers in Hyderabad

*Shree Jyothi Koutha**

Traditionally, Indians have been known as accumulators of gold, who take pride in investing huge amounts in collecting gold jewelry. However, this investment is confined to lockers either at home or in banks for most of the time without earning any returns for the investors, except for gratifying their family pride and prestige. The Indian government has come out with a scheme of monetizing this, literally speaking, gold mine, wherein the gold gets deposited and attractive returns are assured on maturity with active involvement of banking sector, both private and public. The paper attempts to study the popularity and success of this Gold Monetization Scheme (GMS) among bank customers and the reasons thereof.

Author Copy

Introduction

Being a part of the ethos of every Indian household irrespective of the socioeconomic conditions, gold remains an integral and most important part of the investment portfolio of every member of this country. As a lot of sentimental value is attached to the gold possessed, it is never treated as an investment in the modern sense of investment but hoarded physically. As per the union budget for 2015-16, it is estimated that there were about 20,000 tons of gold in India that was not traded or monetized, offering huge potential for income generation, and hence the Gold Monetization Scheme (GMS) was launched.

In this paper, an attempt has been made to study the popularity of the scheme along with the preference of investors between public and private banks. An analysis has been done to evaluate the success of this scheme and study the difference in the performance of public and private sector banks.

Gold Monetization Scheme

Monetization refers to the process of converting a commodity into domestic currency. Gold monetization refers to unlocking the value of gold in terms of rupees. Gold Monetization

* Assistant Professor, Department of Finance and Accounting, IBS Hyderabad (Under IFHE – A Deemed to be University u/s 3 of the UGC Act, 1956), Hyderabad, Telangana, India. E-mail: shreejyoti.koutha@ibsindia.org; jyothi.koutha@gmail.com

Literature Review

Priya (2017) emphasized family functions and festivals to be a trigger for gold purchase, indicating ingrained habit and planned accumulation and analyzed that propensity to consume gold is positively correlated with proportion of females in the household and with the number of daughters in the household.

Paramjeet (2017) revealed that gold monetization within the nation is essential for macroeconomic stability, requiring a sound scheme for valuing, storing and tracking the metal. Hence, GMS is considered to be the need of the hour for the country like India. Given that India has surpassed China in gold imports per year, it would only be prudent for people to benefit from this scheme and monetize their gold lying idle in their lockers.

Charan *et al.* (2017) stated that it is essential to address issues relating to consumer behavior and preferences, and called for all stakeholders to come together to create a robust ecosystem for the scheme that minimizes inefficiencies and takes care of the interests of all parties involved for the successful implementation GMS.

Chaitanya (2015) explained that the response to the scheme has been disappointing because of the low interest rate. Gold imports still account for more than one-fourth of India's trade deficit and the country remains the largest importer of gold in the world despite having ceded the title of the "largest consumer" to China in the last few years.

Deepak (2016) revealed that with the introduction of gold schemes, there is a perception that ETFs would lose their attractiveness. Thus, the lessons learnt from the past have been revisited in the present schemes by increasing the deposit rates to encourage investors.

Deepak (2015) studied that as gold demand in India increases abruptly the demand is satisfied through imports. The emergence of GMS in India can bring down the dependency on gold imports. The financial institutions play a key role in this scheme to make the yellow metal uplift the Indian economy. Gold, considered as an unproductive asset in the hands of households, can be pulled off, to be either traded or monetized through this economically stable scheme.

Errol D'Souza (2015) discussed that with the introduction of GMS, there will be reduction in gold imports which consumes 4.6% of GDP, helping make the Indian rupee stronger, reducing the cost of living, and expects the RBI to be more flexible in reducing interest rates.

Aghila (2015) revealed that gold as an asset plays a very important role in an investor's portfolio as it not only provides stability for returns but also gives an opportunity to maximize the wealth of an investor.

Nishad (2013) studied the factors needed to be aware of, the know-how of investing in gold, and the pros and cons of various forms of investments to create awareness among investors about the various gold investment options and concluded that respondents further looked for options which assure them greater returns and free them from unnecessary hustle and bustle.

Region-Wise Market Integration: Pre- and Post-Covid-19 Period in Asia-Pacific, GCC, Europe and US Markets

Munawar Sayyad[1], *Manu Sreenivasan*[2], *Kaushik Bhattacharjee*[3] *and Vijayalakshmi S*[4]

Covid-19 crisis has impacted almost all the economies with different severity. Due to the shocks by this pandemic, the usual interrelationship between the stock markets also got affected. This paper aims to quantify the changes in the interconnectedness and comovements in the pre- and during Covid-19 period for 18 international stock exchanges spread across the world. The study included returns of 18 stock indices and analyzed the short-term dynamics change using the changes in the pair-wise correlations. For changes in the long-term equilibrium relationship, we have used the Johansen's cointegration tests and compared the changes in the speed of adjustments. Also, we have made common trend analysis using Stock Watson methodology to corroborate the findings of cointegration tests. Tests were used to know the impact on stock markets for the pre-Covid-19 and during Covid-19 across the globe. Finally, we analyzed the volume of the transactions during Covid-19 and pre-Covid-19 for the different stock markets to find out the severity of the shocks at an individual level.

Introduction

The rapid growth in international portfolio investments in the last several decades reflects the globalization of financial markets. The major force behind this globalization of the financial markets though initially came from the governments of developed economies that started to deregulate their capital markets in the beginning of 1980s. Subsequently, the governments of developing countries such as India, Korea, Brazil and Mexico undertook measures to allow foreign investments in their capital markets by offering country funds or

Wagner (2020) studied the European and the US markets and found that earlier Chinese trade firms were exposed to decline, but later it was European and US markets which got affected. Zhang *et al.* (2020a) suggested that policies related to level the stock market prices are the need of the hour and showed that the volatility in the markets has increased. Ashraf (2020) found that strict lockdown had negative impact on stock returns, whereas stimulus income package had positive impact on stock returns. Phan and Narayan (2020) showed that the stock market returns based on the travel ban by each country and the number of deaths occurring in each country showed that market overreacts to the information at the beginning and later corrects itself. Baker *et al.* (2020) suggested that government restrictions led the US stock markets to react more than to the other earlier pandemics which occurred during 1918-19, 1957-1958 and 1968. Given that stock markets worldwide are directly or indirectly linked to economic fundamentals and cross-border investments are a reality due to the high level of financial integration, the implications regarding the pandemic's effect on the stock markets' connectedness and comovement warrant careful investigation.

G´omez *et al.* (2020) studied job losses in the Brazilian market using cointegration approach and found that during Covid-19 period, there were many job losses due to situational changes. Some studies were also done showing that due to Covid-19, there was reduction in air pollution (Rahman *et al.*, 2020). Chien *et al.* (2021), using wavelet coherence method, used stock exchange indices, oil indices, GDP growth, exchange rates, gold markets, electricity demand as variables for the period of December 2019 to May 2020 for daily prices for the Europe, USA and China and found low comovement of oil index with exchange rates, stock exchange and gold markets and thus recommending investment in oil due to its low comovement with other assets during the time of embargo and sanctions. On the contrary, Prabheesh *et al.* (2020) used stock market indices and oil prices for China, India, Japan and Korea and suggested that during the times of crisis there is comovement between oils prices and stock market returns which suggests that the positive comovement between stock market and oil prices leaves less scope for portfolio diversification. They used the DCC-Garch model for the daily prices between January 2, 2020 and April 28, 2020. Mike *et al.* (2021) analyzed two market indices, viz., Hang Seng China Enterprises Index (HSCEI) and Hang Seng Index (HSI), from January 3, 2006 to October 30, 2020 and made use of network analysis by checking the correlations and partial correlations. The study showed that the clustering and network density was higher in the partial correlations during the Covid-19 situation as compared to the previous crises periods. Yousfi *et al.* (2021) studied US and Chinese markets for the first and second waves of the Covid-19 and found that the US markets were more affected by Covid-19.

In these contexts, our study compares and contrasts the nature of interrelationship, pre-Covid-19 and during Covid-19, by considering both short and long-term dynamics of stock markets. For short-term comovements, we compared the pair-wise correlations between these markets, whereas for long-term dynamics, we compared and contrasted the pair-wise common trends and the cointegration between these markets. Thus, we examined the market integration before and during the Covid-19 period using short-term and long-term measures. Finally, we analyzed the traded volumes of pre- and during Covid-19 period across these stock market indices.

Measurement Comparison and Predictability of Range-Based Volatility Models

Rama Krishna Yelamanchili and Sager Reddy Adavelli***

Extensive research is going on in applied finance and econometrics on modeling the volatility of financial assets. Contemporary research uses most sophisticated methods to model the volatility. However, there exists two different schools of thought on the input variable, i.e., measure of volatility series. One school of thought advocates volatility measured using close-close price and the other school posits use of extreme values, that is, Open, High, Low and Close (OHLC). Little empirical work has been carried out on this topic in the Indian context. Using 1,421 daily observations of each of the three highly volatile sector-specific stock indices in India, we measure, compare and assess predictive ability of close-to-close estimator, Parkinson's and Garman and Klass's extreme value estimators over the period January 1, 2016 to September 30, 2021. The results of relative efficiency measures indicate superior performance of Extreme Value Methods (EVMs) over classical method. Furthermore, the results of 483 cross-sectional regression tests indicate the predictive ability of EVMs and report statistically significant t-statistics for a majority of the periods. It is also observed that EVMs have low standard errors when outliers are weeded out. Similarly, EVMs have t-statistic values and are statistically significant at 1% level during highly volatile market conditions. Our results support the argument that use of volatility measured with EVMs is efficient and suggest its use in modeling volatility of financial assets.

Introduction

Volatility estimation is pivotal in empirical finance. Researchers and practitioners use volatility in prediction of stock returns, calculation of option price, estimation of speed of adjustment in stock returns, estimation of abnormal returns due to events and in many more instances. Efficiency is key in volatility estimation, because volatility may change over long periods of time; an extremely efficient method will allow to estimate volatility with a small number of observations. Methods based on range-based stochastic volatility estimation have arisen in

response to this need of efficiency. In the previous four decades, several methods have been proposed to estimate the stochastic volatility parameter in dynamic security price models context. Parkinson (1980) was the pioneer and proposed the Extreme Value Method (EVM) for estimating the volatility parameter on the rate of return of stock price. Since then, many methods have been proposed, tested and presented to estimate the stochastic volatility parameter. Parkinson (1980) proved that EVM is five times better than close-to-close volatility estimator. Furthermore, EVM needs about 80% less data to get accuracy in volatility estimation compared to classical estimator. During the same period, in another context, Garman and Klass (1980) extended Parkinson's model and proved that EVM is at least eight times better than classical volatility estimator. Extensive research is carried out on these two models, many researchers supported the argument, few researchers added new dimensions and strongly advocated their application in applied finance. These models still form part of many contemporary studies on estimation of stochastic volatility models.

Traditionally, the volatility of the rate of return on the stock is estimated using close price. The close price is measured at a discrete time point of the day and is a more of "snap shot." An estimation of volatility using only close price ignores other readily available information, i.e., open, high and low prices, which may contribute to estimator efficiency. Proponents of EVM propose that by fusing the snapshots (open and close prices) with continuously monitored (high and low prices), one would be able to make an efficient estimate of volatility. Empirical evidence is produced to prove that the EVM or range-based method provides a much better estimate of volatility than the classical method does. Another dimension is that during initial days of stock trading, exchanges used to record only open and close prices. Now daily Open, High, Low and Close (OHLC) prices are available. In this context, it makes more sense to use all the four prices to estimate volatility of rate of return of the stock or index. Extant research proves that EVM is very easy to apply in practice, since, daily OHLC are published for every market index and stock. Moreover, the significant advantage of using EVMs is that they are superior in computing volatility than simply squaring daily returns. Garman and Klass (1980) and Parkinson (1980) argued that range-based volatility is superior to the usual classical volatility measure as it is 2.5 times to 8 times efficient, less noisy and more robust.

In this paper we calculate, compare, measure relative efficiency and predictability of EVMs with traditional method. We measure the volatility parameter using classical method, Parkinson method and Garman and Klass method. Sample contains daily OHLC values of three leading service sector indices in India since the day of availability of these four values. The rest of the paper is organized as follows: First, the paper presents literature review, followed by methodology. Then results and implications are discussed in the next section. Finally, the paper ends with conclusion.

Literature Review

From the time it is introduced in finance literature, the EVM or range-based method attracted great interest of researchers and practitioners. Initial research was on building the models and

Does Low Volatile Index Perform Better Than High Beta Index During a Crisis Period Like Covid-19?

*VDMV Lakshmi**

The paper examines if low volatile index acted as a safe haven by exhibiting better performance than high beta index during the recent Covid-19 pandemic. The study period is divided into three sub-periods (pre-Covid, Covid and post-Covid). A portfolio consisting of long position in high beta index and short position in low volatile index (HML) has been formulated during pre-Covid and post-Covid periods. The portfolio has been rebalanced with long position in low volatile index and short position in high beta index (LMH) during Covid-19 period. The study applies Jensen differential return model and Treynor-Mazuy market timing model to assess the performance of the portfolios. The study finds no evidence that low volatile index performs better than high beta index during the crisis period. There is also no evidence that high beta index performs better during stable periods. However, there is clear evidence of benchmark Nifty 50 having significant impact on the two indices and the portfolios.

Author Copy

Introduction

The recent Covid-19 pandemic not only affected the social lives of people but also resulted in stagnation of economic activity. Historically, crises increased the correlations between the financial assets and financial markets (Forbes and Rigobon, 2002) causing financial contagion. Similarly, the pandemic-driven crisis increased portfolio risk due to strengthening of the co-movements between the assets. This warranted the need for looking for safe investment haven. Traditionally, gold is considered as safe haven. However, the study examines the popular market timing strategy which suggests the inclusion of low beta stocks in the portfolio during market downs and high beta stocks during market ups. The study contributes to the literature by testing the portfolio performance in line with Banz (1981) model, which states that small capitalization stocks provide higher risk adjusted returns than large capitalization stocks. The study constructs a portfolio consisting of long position in high beta stocks and short position in low volatile stocks during relatively stable periods (Pre-Covid and Post-Covid periods) and long position in low volatile stocks

* Associate Professor, Department of Finance and Accounting, IBS Hyderabad, (Under IFHE – A Deemed to be University u/s 3 of the UGC Act, 1956), Hyderabad, Telangana, India. E-mail: vdmvlakshmi@ibsindia.org

© 2021 IUP. All Rights Reserved.

selection abilities but negligible market timing abilities. Market timing abilities are more prominently visible in daily data rather than monthly data (Sehgal and Jhanwar, 2008). Ferson and Warther (1996) found improved fund performance with the inclusion of dynamic indicators such as dividend yields and risk-free yields. There is no evidence of market timing ability, but fund managers are able to exhibit stock selection skills, which is against efficient market hypothesis (Chen and Stockum, 1986). Bramante and Gabbi (2006) used different betas for bull and bear markets to assess the fund performance and found that active management strategies perform better.

Data and Methodology

To examine whether low volatile index performs better than market during pandemic period and high beta index during stable period, the study considers daily data of low volatile index, high beta index and Nifty 50 for the period January 1, 2017 to October 31, 2021. Rai *et al.* (2021) observed higher β value for the Covid-19 crash compared to sub-prime crisis of 2008, indicating faster recovery of stock price during the pandemic. Though the lockdown was not completely lifted, stock market recovered faster than economic activity and stabilized by the end of June 2020. Hence, the study period is divided into three sub-periods: pre-Covid period (January 1, 2017 to December 31, 2019); Covid-19 period (January 1, 2020-June 30, 2020) and post-Covid period (July 1, 2020-October 31, 2021). The study considers Nifty 50 as the benchmark market index and 91-day Treasury bill yield as a proxy for risk-free return. The data for all the indices has been sourced from national stock exchange website (www.nseindia.com). Data on Treasury bill yield has been extracted from the website of Reserve Bank of India (www.rbi.org.in).

Author Copy

Daily prices are converted into daily log returns on the assumption of continuous compounding as follows:

$$R_t = ln\left(\frac{P_t}{P_{t-1}}\right) \quad ...(1)$$

Annualized Treasury bill yield sourced from RBI is converted into daily as follows:

$$R_{fd} = \left(\frac{\ln(1+R_f)}{256}\right) \quad ...(2)$$

The study applies Jensen differential return model and Treynor Mazuy Model to examine if low volatile index during pandemic period and high beta index during stable period perform better than the market in terms of stock selection and market timing. Apart from the selected indices, the study designs two different portfolios which are rebalanced as per changing market conditions. A portfolio consisting of high beta index and low volatile index is formulated, which is called designed portfolio (DP) in the study. During pre-Covid period and post-Covid period, portfolio consists of 90% investment in high beta index and 10% in low volatile index. During Covid period, weights are rebalanced in such a way that

Does Re-Categorization Affect Mutual Fund Investment? A Comparative Study of Pre- and Post-Categorization of Mutual Fund Schemes in India

Harsh Raj Pathak[1], *Kaushik Bhattacharjee*[2], *Sonali Narbariya*[3] *and Md Sikandar Azam*[4]

In light of the growing importance of mutual fund investment in academic and industrial research, the paper aims at answering a question of paramount importance, i.e. Does re-categorization affect mutual fund investment? An unmatched sample t-test was conducted to compare the pre- and post-categorization among the large, mid, and small-cap firms based on three variables: liquidity, volatility, and returns. The results of the t-test postulate that the liquidity of large-cap firms and returns of the small-cap firms were significantly different for both periods of study. In contrast, all other variables remain indifferent across both periods. Overall, the study contributes to the literature and practice by providing meaningful pre- and post-categorization insights. The study provides important insights for mutual fund managers to understand the correct effect of re-categorization on market efficiency. The study provides transparency for future research in the field of mutual fund investment.

Author Copy

Introduction

In October 2017, the Securities and Exchange Board of India (SEBI) came up with guidelines for categorizing and rationalizing mutual funds in India. A few schemes were merged under this re-categorization, while a few saw changes in fundamental attributes and nomenclature. After the SEBI mutual fund re-categorization mandate came into force, all balanced funds came to be officially known as hybrid funds. Hybrid schemes are those that invest in both

equity and debt assets in varying proportions. In October 2017, SEBI decided that all mutual funds must be 'true-to-label' and share uniform characteristics with other schemes in the same category.[1] The new rules state that mutual fund houses can have only one mutual fund offering under each category.[2] As a result, in early 2018, all mutual fund schemes were renamed, categorized, or merged/ terminated.[3] In terms of full market capitalization, these categories are large-cap: 1st-100th companies, mid-cap: 101st -250th companies, and small-cap: 251st company onwards. These categories were created to ensure uniformity with respect to the investment for equity schemes.[4] For an investor, it meant that some of the mutual funds in their portfolio could be re-categorized and/or merged with another scheme of that Mutual Fund House. Therefore, the names of their schemes could change due to such mergers. Previously, the scheme was mixed with market capitalization. Schemes could be a combination of large and mid-cap or large and small-cap or mid and small-cap. These schemes were vague in the sense that it created difficulties to understand the scheme in order to invest in mutual funds. After the re-categorization of the mutual funds, the schemes could only be in one market capitalization, i.e., assets allocation could be only in a large-cap.

Literature Review

Frino *et al.* (2017) examined the impact of corporate earnings announcements on trading activity and speed of price adjustment, analyzing algorithmic and non-algorithmic trades during the immediate period pre- and post-corporate earnings announcements. This was done using a unique dataset obtained from the Australian Securities Exchange (ASX) from October 27, 2008 to October 23, 2009. Their study confirmed that algorithms react faster and more correctly to announcements than non-algorithmic traders. During the pre-announcement period, non-algorithmic volume imbalance led to algorithmic volume imbalance; however, in the post-announcement period, the direction of the lead-lag association was precisely reversed. Overall, their results suggested that compared to non-algorithmic traders, algorithms are faster at interpreting the information correctly. Therefore, algorithmic trading enhances market efficiency.

Bergstresser and Poterba (2002) explored the relationship between taxable investors' after-tax returns from stock mutual funds and subsequent cash inflows into these funds. They evidenced that after-tax returns have more explanatory power than pre-tax returns in explaining entries, based on a large sample of retail equity mutual funds from 1993 to 1999. Additionally, funds with large amounts of unrealized capital gains experience smaller inflows than funds without such unrealized gains, all things being equal. A large capital gains overhang inhibits both gross fund inflows and gross outflows, but the entry effect dominates the outflow effect. These studies found that net fund inflows are positively correlated with

Mutual Funds: The Most Suitable Investment Avenue for Common People

*Divya Mittal**

The study emphasizes that mutual fund is the most suitable investment avenue for common persons. The study investigates the popularity of mutual fund investments in the present scenario. The paper consisted of 281 usable samples of mutual fund investors. The variables were measured on a five-point Likert scale, which starts from 1 = strongly disagree to 5 = strongly agree. The selected method of data analysis included descriptive analysis, reliability and validity analysis, percentage, and regression analysis to test the validity, reliability and research hypotheses with the help of Statistical Package for the Social Science (SPSS version 16.0). The study found that popularity of mutual funds has increased in today's market. This paper suggests that mutual funds are the most suitable investment avenue for common persons due to high returns with low risks, portfolio diversification investment scheme, tax benefits, rating of funds by renowned agencies, and so on. This study would help the mutual fund companies and their managers in designing innovative products and services according to the needs of the investors. It would also help in developing and expanding knowledge in the field of mutual fund investment and planning.

Introduction

Creation of wealth is the primary objective of investors. There are a number of investment opportunities for the investor to achieve his objective, such as bank deposits, company deposits, equities bonds, life insurance policies, small savings schemes and mutual fund products, which create wealth and which in a way compete among themselves for the choice of the investor. Different investment instruments have different qualities—return, risk, safety, convenience, etc. The investor is faced with the problem of asset allocation, that is, how to build his portfolio of financial assets. Investment game, though fascinating, is a highly complex and complicated one. The investor has to match the product qualities with his financial needs and personal circumstances. He has to invest not in one or two but in a basket of financial products. The product qualities and personal circumstances of the investor change quite often, and uncertainty adds a new dimension to the investment puzzle.

Financial market investment has become a trend with the households in India. But the growing volatility in the stock market has made the investors ponder deeply while investing in the stock market. No doubt stock market investment is a profitable option, but choosing a right stock for investment is a very difficult task. Not all the investors in the market have the required skill sets for picking up right stocks at the right time. Because of this, an investor can face losses from the investment, but if they put their money in mutual fund, then the losses can be mitigated. Mutual fund can be described as an investment vehicle that pools the savings and invests them into selected stocks. It helps the investors in minimizing the risk and maximizing the return on their investment. The study has formulated the following objectives:

- To analyze the popularity of mutual fund investments in the present scenario; and
- To show that mutual fund is the most suitable investment avenue for common persons.

Literature Review and Hypothesis Development

As the mutual fund industry has developed rapidly over the past 20 years, a large number of studies have been conducted, covering different aspects of mutual funds. Singh (2012) conducted an empirical study of Indian investors and observed that most of the respondents do not have much awareness about the various functions of mutual funds and they are a bit confused regarding investment in mutual funds. The study found that some demographic factors like gender, income and level of education have their significant impact on the attitude towards mutual funds. On the contrary, age and occupation have not been found influencing the investor's attitude. The study noticed that return potential and liquidity have been perceived to be the most lucrative benefits of investment in mutual funds, and the same are followed by flexibility, transparency and affordability. Saini *et al.* (2011) analyzed investors' behavior, opinion and perception relating to various issues like type of mutual fund scheme, its objective, role of financial advisors/brokers, sources of information, deficiencies in the provision of services, investors' opinion relating to factors that attract them to invest in mutual funds and challenges before the Indian mutual fund industry, etc. The study found that investors look for liquidity, simplicity in offer documents, online trading, regular updates through SMS and stringent follow-up of provisions laid by the Association of Mutual Funds in India (AMFI). Samal (2009) stressed the various factors that influenced the fund/scheme selection behavior of retail investors who invest in mutual funds. The investors look for safety first in mutual fund products, followed by good returns, tax benefits, liquidity and capital appreciation. The survey further revealed that the scheme selection decision is made by respondents on their own, and the other sources influencing their selection decision are newspapers and magazines, brokers and agents, television, friends' suggestions and direct mail. It also provided a comparative analysis of different types of mutual funds in India and of mutual funds and other investment products. Rajeswari and Rama Moorthy (2005) revealed that mutual fund is a retail product designed to target small investors, salaried people and others who are intimidated by the mysteries of stock market, but nevertheless like to reap the benefits of stock market investing.

Rise and Fall of LeEco: Will It Survive?

*D Satish**

LeEco, a leading Chinese conglomerate company, had ambitious plans to build a global ecosystem of products and take on bigwigs like Apple, Google, and Samsung. But the plans of Jia Yueting (Jia), Founder of LeEco, to create a great ecosystem came crashing down as the company's revenues slowed down even as expenses mounted, leading to liquidity issues and financial woes. The company ended up staring at a huge debt. LeEco, which had 15 subsidiaries and 68 affiliated partners, also had questionable related party transactions. With a plummeting share price, trading in its shares on the stock exchange was halted by the company. Amongst the gloom came a ray of hope with Jia being replaced by Sun Hongbin (Hongbin) as Chairman of LeEco. Sun is a successful Chinese real estate baron who had invested considerably in LeEco and infused $2.4 bn to bail it out. LeEco's failure also resulted in the Chinese regulators' scrutinizing shared ecosystem companies and asking them to make more disclosures and reduce related party transactions—steps which could have a major impact on Chinese tech companies. The case brings out the scope of questionable accounting policies and earnings management in related party transactions in a shared ecosystem environment and the challenge that it poses to the regulators. The case also allows for a discussion on whether LeEco's failure would have an impact on Chinese start-ups as well as on its tech companies. Finally, the case allows for a constructive debate on what should Sun do to bring LeEco out of the muddle.

They have a reputation for splashing cash around. There has been a sense of lack of strategy to what they're doing. Fast cars and entertainment—it's a tough mix.[i]

– Duncan Clark, Chairman of BDA China[1], November 2016

To build an ecosystem was right, but the pattern of development was wrong.[ii]

Accounting Scandal at Tesco

Pranati Mohapatra and Nagendra Kumar M V***

The voluntary disclosure of misrepresentation of financial statements by the management of the UK-based retailer Tesco plc (Tesco) in September 2014 impacted the market price of its share, affecting the investment value of its shareholders. The shareholders expressed resentment over the negligence of Tesco's management and filed legal suits against it, demanding compensation for the losses they had suffered as a result of the misrepresentation. The case focuses on the events that led to the misrepresentation of financial statements – the market position, process of determining the revenue streams, relationship with suppliers, and related issues. The case focuses on the steps initiated by the management of Tesco to overcome the crisis situation, and the role of regulatory authorities in handling the situation. Further, it provides scope for a discussion on the importance of accounting principles and their role in determining the investment objectives of various stakeholders. It also provides scope for a discussion on the importance of ethics in the auditing profession and the challenges faced by the auditors.

Introduction

In June 2017, the Financial Reporting Council (FRC), UK's financial watchdog, dropped investigations into internationally reputed auditing firm PricewaterhouseCoopers LLC (PwC)[1] in connection with the accounting scandal at the UK-based retailer Tesco Plc (Tesco), PwC's long-time client. FRC said in a statement that there was no formal evidence against PwC to accuse the firm of ignoring basic auditing practices while auditing Tesco's financial statements. It said, "The executive counsel to the FRC has concluded that there is not a realistic prospect that a tribunal would make an adverse finding against PwC and certain members in respect of the matters within the scope of the investigation."[2]

Modeling Sovereign Credit Score of US and UK

*D Satish**

Credit Rating Agencies (CRAs) play a crucial role in reducing the asymmetry in the information available to the issuer and investor. This role gains even more significance when rating is for sovereign entities and their securities. The CRAs like S&P, Moody's, and Fitch, which rate sovereign entities, consider a number of variables, both qualitative and quantitative, to assess the creditworthiness and rating of these entities and their securities. The case study gives a view of the sovereign credit rating industry, its major players, the industry issues and controversies. It also discusses the variables and parameters used by these big three agencies to rate sovereign entities. Most importantly, the case study helps the students to develop a basic model taking generally accepted variables to arrive at a credit score for two of the largest economies in the world – the US and the UK. This will help the student appreciate the various variables that go into sovereign credit rating apart from helping them to develop a basic model and analyze the creditworthiness of the two sovereign entities. The case also comes with Excel supplements.

There are two superpowers in the world today in my opinion. There's the United States and there's Moody's Bond Rating Service. The United States can destroy you by dropping bombs, and Moody's can destroy you by downgrading your bonds. And believe me, it's not clear sometimes who is more powerful.

Managing Non-Performing Assets in Indian Banking Industry

Koya Raghunath and Manish Agarwal***

The case discusses the issue of high Non-Performing Assets (NPAs) in the Indian banking system in the first two decades of the 21st century. It covers in detail the various steps taken by the central bank of India and the Government of India (GoI) to bring down the NPAs, and how Gross Non-Performing Assets (GNPAs) went down by ₹1 tn in the financial year 2019 when compared with the previous financial year. Although the GNPAs had gone down by close to ₹1 tn in FY19, bad loans were still very high. Some experts opined that the high number of bad loans would continue as long as the Public Sector Banks (PSBs) remained under the shadow of the government. They commented that the RBI and the GoI should take more stringent steps to clean up the balance sheet of banks.

The important thing that concerns RBI when it comes to financial sector intermediation in general and banks in particular, is risk management. If banks get this right, most of the problems are not likely to be there.[1]

– N S Vishwanathan, Deputy Governor of the Reserve Bank of India, November 2019

Introduction

In July 2019, Nirmala Sitharaman (Sitharaman), Union Finance Minister of India, stated that the bad loans in the Indian banking industry had gone down in FY19 compared to FY18. The Gross Non-Performing Assets (GNPAs) had decreased from ₹10.5 tn in FY18 to ₹9.24 tn in FY19. Similarly, Non-Performing Assets (NPAs) had also come down from ₹5.27 tn in FY18 to ₹3.52 tn in FY19. Experts stated that various factors such as bad loan write-offs by banks, change in the credit culture, prohibiting willful defaulters from raising funds from the market,

SEBI and Its Role in Prohibiting Insider Trading

Richa Gupta and Smita Ray***

The case describes the role played by the Securities and Exchange Board of India (SEBI) in regulating the securities market to prohibit insider trading activities. It starts out with a brief history of insider trading and then explains the need for a regulatory body in the Indian Capital market. It then describes the various SEBI Acts, starting with the SEBI Prohibition of Insider Trading Act 1992, and the subsequent amendments in 2002, 2015, and 2018. The case also covers the process of investigation under the SEBI Prohibition of Insider Trading, 1992. Besides, it highlights the challenges faced by SEBI in prohibiting insider trading. It also shows that the cases of insider trading have been increasing and concludes by stating that more support from the Government of India (GoI) will help SEBI in controlling insider trading more effectively.

When the whole system depends on the trust, when capital markets are booming and people are investing in the markets if select people have access to results before it is in the public domain, it is just not on. We're looking into it from all aspects: whatever technological improvement is required, whatever system improvement is needed, whatever legal and enforcement actions are required, we will do.[1]

– Ajay Tyagi, Chairman,
Securities and Exchange Board of India (SEBI) in 2017

Introduction

In October 2019, Indian capital market regulator, the Securities and Exchange Board of India (SEBI) declared that the code of conduct under the insider trading[2] norms was applicable not only to persons designated by the board of a company but also to the promoters. It said,

Financial Statement Analysis and Valuation Dilemma of WeWork (The We Company)

*D Satish**

WeWork, the New York-based start-up that revolutionized commercial real estate by offering flexible shared workspaces, attracted massive investments from the likes of SoftBank, Goldman Sachs, JP Morgan Chase & Company, and many other top private equity players. WeWork's valuation soared to more than $47 bn in January 2019. But its mandatory filing of S-1 papers on August 14, 2019 with the Securities and Exchange Commission (SEC) to go public left investors unconvinced, as they felt that the company did not deserve such a high valuation. WeWork's complex corporate structure, questionable corporate governance and business practices, and less than anticipated financial projections drove away potential investors. Adam Neumann (Neumann), WeWork's CEO, found himself in the middle of the controversy with some analysts questioning the transactions between him and WeWork. The controversy led to a failed Initial Public Offering (IPO) and to Neumann exiting WeWork. The case study captures the growth story of WeWork and its valuation journey through a series of findings. It delves deeper into the issues of complex corporate structures, a non-transparent corporate culture, questionable related party transactions, and iconic entrepreneurs and valuations which might not match the fundamentals. The case also gives an opportunity to students to analyze the Space-as-a-Service (SPaaS) industry, work out the relative valuation of WeWork with a close industry peer, and analyze the financial statements of WeWork.

We are a community company committed to maximum global impact. Our mission is to elevate the world's consciousness. We have built a worldwide platform that supports growth, shared experiences and true success. We provide our members with flexible access to beautiful spaces, a culture of inclusivity and the energy of an inspired community, all connected by our extensive technology infrastructure. We believe our company has the power to elevate how people work, live and grow.[1]

Saudi Aramco

Alok Kavthankar and Indu Perepu***

In early 2016, the largest state-owned oil company in the world, Saudi Arabia-based Saudi Aramco (Aramco), declared a proposal to float an IPO. The crown prince of Saudi Arabia, Prince Salman, had stunned the world when he declared in early 2016 that Aramco's worth would be around $2 tn. Aramco was not only an oil company but a budget to run the nation as 85% of Saudi Arabia's budget came from the tax which Aramco had to pay. The intent to monetize the state jewel came at a time when the economy of the Kingdom was under pressure. A widening fiscal deficit and depleting foreign reserves indicated that it was no longer viable to depend on oil exports to run the nation. There was a need to diversify and the impetus to do so would come from the proceeds of the IPO. But the IPO which would decide the fate of 33 million Saudis would come with its own set of challenges. The success of Aramco's IPO would be a function of numerous factors—some in the Kingdom's control and some beyond. In 2017, concerns about climate change were on the rise. Climate policies threatened to put a 40% discount on Prince Salman's $2 tn aspirations. The commitment of global leaders to keep a check on global warming would escalate proliferation of renewables across the world and further build a pessimistic outlook for the future of oil prices. It remained to be seen how an IPO would shape the nation and how an oil giant would shape the future of world climate.

Aramco is not a company; it is the Saudi Arabian budget to run the country.[1]

– Aswath Damodaran, Professor of Finance at the Stern School of Business, in 2017

Introduction

In early 2016, it was reported that Saudi Arabian national petroleum and natural gas company Saudi Aramco (Aramco), the world's largest oil exporter with access to the world's second largest proven oil reserves, was seeking proposals to float an IPO.[2] Though Aramco was a

Toshiba's Accounting Scandal: A Spotlight on Japan Inc's Corporate Governance Systems

*D Satish**

On July 21, 2015, the top management executives of Japanese major, Toshiba Corporation, resigned over allegations of encouraging irregular accounting practices across various divisions of the company. Despite putting in place high corporate governance standards, it was found that various divisions resorted to window dressing due to various compulsions. The case study goes beyond the accounting scandal at Toshiba, highlighting different ways in which the accounts were manipulated. Also it looks into whistleblower policy and corporate governance systems at Toshiba in particular and Japanese corporations in general.

Toshiba was lauded as a front-runner in governance efforts, but that was a misunderstanding. Its governance structure looked good but the execution was not.

– Kota Ezawa, Analyst, Citi Group[1]

Japan is changing and I think the Toshiba scandal will accelerate that, because it shows a public desire for better governance. What is important is that Japan needs to develop a system that is best for it, and that requires a good, rigorous public discussion. And these scandals help.

Samsung BioLogics – Accounting a Subsidiary as an Affiliate

*K B S Kumar**

Samsung BioLogics, South Korea-based biopharmaceutical company, was established in 2011, as a future growth engine of conglomerate Samsung Group. The company, one of the largest contract manufacturers in the country, operated through three domestic plants. The case is about the accounting of Bioepis, a joint venture between BioLogics and US-based biotechnology company Biogen that was started in 2012 as an 85:15 joint venture.

Introduction

In November 2018, Kim Yong-beom (Kim), chairman of South Korea's finance regulator, Securities and Futures Commission (SFC), announced, "We concluded that the company violated accounting standards intentionally in 2015 to have legitimacy in changing its controlling power [in its affiliate]."[1] The company Kim was referring to was Samsung BioLogics Co Ltd. (BioLogics), South-Korea-based manufacturer of biopharmaceuticals.

The violation that SFC[2] cited referred to the way BioLogics accounted Samsung Bioepis (Bioepis), its research joint venture with US-based Biogen. Bioepis was accounted at a book value of KRW 330 mn (1 US$ = KRW or Korean Won 1105 in January 2015) till 2014. In 2015, it was valued at a market value of KRW 4.5 tn, which inflated the earnings of Samsung

Transformation of NGO to NBFC: Case of NMSPL

C Anitha, S Galab** and D Raghunatha Reddy****

The income inequalities that have widened the gap between the rich and the poor lead to financial exclusion, consequently depriving access to credit and financial services such as savings, loans, insurance, payments, remittance facilities and financial counseling or advisory services by the formal financial system to underprivileged groups such as weaker sections and low earning groups. The Government of India (GoI) realized the importance of financial inclusion and had taken measures to address the issues of exclusion. The quintessence of financial inclusion is to make sure that a range of suitable financial services are accessible to every individual, enabling them to realize and access the formal financial system.

Microfinance (MF) plays a crucial role in delivering credit to the poor segments of the society, who lack access to formal sources of credit and financial services. Anitha and Reddy (2017) studied the major initiatives taken by the Indian government for the growth of MF in India. MF created a channel to facilitate the formally excluded population who were not eligible to receive through formal sources of funds and financial services due to lack of proper credentials. In MF sector, Microfinance Institutions (MFI) provide credit, thrift and other financial services to these segments.

Structural Constraints for NGO-MFIs

Initially, Indian microfinance industry witnessed growth of many MFIs, especially NGOs, inspired by Grameen model in Bangladesh to serve the poor. A majority of these NGOs were either registered as trusts or societies.

In January 2000, RBI created a new legal class/entity – Non-Banking Finance Company-Micro Finance Institution (NBFC-MFI) to address the scalability and funding issues of NGOs-MFIs. Around 2005, Indian MF sector witnessed the emergence of a new organizational format the NBFCs. NBFCs are distinguished from other conventional microfinance

is based on principle of organizational sustainability; both these entities have a different legal structure, work on different strategies, and organizational functions, and also have diverse value propositions.

From the above literature, evident reasons for transformation of NGOs and outcomes/ benefits associated with NGO transformations are documented. In this backdrop, a study is conducted through a case-based approach. An attempt is made to document the key aspects of transformational evidence of Navachetana Foundation (NCF), an NGO that transformed into an NBFC-MFI, namely, Navachetana Microfin Services Private Limited (NMSPL). For this purpose, data is collected from primary and secondary data sources. As a part of primary data, the researchers interviewed Nagendra Mali, CMD to appreciate the journey of transformation process of NCF. Secondary data is collected from the company's website, Mixmarket.org and other authentic sources.

Transformation of NCF

NCF was founded by Mr Nagendra Mali and a small group of young, socially-minded entrepreneurs in 1999 as an NGO, non-profit organization; was registered under the Karnataka State Societies Registration Act. It is headquartered at Haveri, a north western town in Karnataka, with a motive to bring economic development and livelihood enhancement of needy women of the Haveri village and its surroundings.

During the initial years, NCF had focused on social projects—to enhance natural resource management in rural areas, large-scale watershed development and tank rehabilitation. In 2005, the organization sensed the requirement to provide financial services to marginalized large-scale watershed development and tank rehabilitation.

NCF, with a broadened vision, sensed the requirement to offer microloans and financial services to marginalized women (who were unable to obtain credit from mainstream commercial banks) and to provide income-generating opportunities to all families. As the foundation was initially supported by donors funds, it could not access commercial funds due to its legal organizational structure as an NGO. In the due course of personal interview with researchers Nagendra Mali, founder, mentioned that they made several attempts to access funds from various sources and was futile due to its legal format of NGO. In the NGO format, NCF was finding it difficult to source funds to achieve the funding requirements of the target group.

In May 2009, NCF created a new institutional entity to handle all its MF operations, viz., NMSPL by acquiring an NBFC called Sree Santeshwara Credit and Investment Company Limited, and NCF transferred its loan portfolio to NMSPL after it. NMSPL is constituted as non-deposit accepting, NBFC-MFI which to handle all its MF operations. NMSPL was registered with Reserve Bank of India is currently operating in two states (i.e., Karnataka and Maharashtra) providing financial services to marginalized women who are excluded from mainstream banking service.

Goodwill Accounting – The Road Ahead

Goodwill is an intriguing and often large asset on the balance sheet of many Fortune 500 companies. The definition of goodwill and its accounting treatment have always been the subject of intense debate. This debate has gathered further momentum as in 2020, publicly listed US companies wrote down the largest amount of goodwill in more than a decade (Maurer, 2021). The subject is also gaining attention because the US accounting standards authorities are contemplating changes in the way goodwill is accounted for, i.e., moving back from impairment accounting to amortization. This research note, written primarily from a US accounting standards perspective, looks at how goodwill accounting has evolved over time and what lies ahead.

The Importance of Goodwill

In recent years, goodwill has become important both in terms of the value reported and the quantum of write-offs. As the Economist (2018) reported, total goodwill for all listed firms worldwide was $8 tn, compared to $14 tn of physical assets. According to the authors, the majority of the top 500 European and the top 500 American firms by market value, had one-third or more of their book equity tied up in goodwill. At the same time, for these firms, cumulative goodwill write-offs over the past ten years had amounted to $690 bn.

Major goodwill write-offs can lead to sharp fall in share prices. On January 19, 2009, Royal Bank of Scotland's shares collapsed as the British government raised its stake (*Economist*, 2009). The troubled bank said it would report Britain's largest-ever corporate loss after an impairment charge on its takeover of ABN AMRO. Regions Financial, an American bank, lost a quarter of its value on January 20 after taking a $6 bn goodwill charge on its $10.5 bn purchase of AmSouth Bancorp.

Carillon, the UK construction company collapsed after a major goodwill write-off in January 2018.[1] Since 2011, disclosed goodwill had accounted for at least 84% of Carillion's market enterprise value, and in the years 2012, 2016, and 2017, the book value of goodwill even exceeded the total market worth of the company (Brown, 2018). Despite a weakened financial outlook, no impairment charges were booked by Carillon's management. On the other hand, Carillion was able to pay out a record amount of £78 mn in dividends in 2016.[2]

Understanding Goodwill

Goodwill arises in the context of an acquisition, which is the difference between

Author Copy

separate them to measure their performance. So even if the management has good intentions to recognize goodwill impairment, there is usually a gap of several years before companies own up to their mistakes. Often, it takes a leadership change for these write-offs to happen, like, on the day that GE introduced Larry Culp as CEO, the company announced a $23 bn goodwill impairment.[4]

Goodwill Impairment and Write-Off

Goodwill impairment is influenced by macroeconomic, sectoral, and firm specific factors. Economic slowdowns can affect all companies. But some sectors may suffer more. Within the affected sectors, companies which have grown by acquisitions are affected the most as they are more likely to carry some amount of goodwill on their balance sheet. Among the large companies, Apple is a rarity as it has generally avoided big deals. So, it does not have a goodwill problem to deal with. In contrast, AT&T ($135 bn as on Dec. 31, 2020), Anheuser-Busch InBev ($121bn as on Dec. 31, 2020), General Electric ($25 bn as on Dec. 31, 2020) and Berkshire Hathaway ($47 bn as on Dec. 31, 2020) carry a lot of goodwill on their balance sheets.

Economic recessions historically lead to an increase in goodwill impairments. The pandemic is a good example. During 2020, many industries slowed down and the US GDP declined by 2.3% (Maurer, 2021). Some sectors slowed down more. Thus, energy companies wrote down more goodwill than businesses in many other industries due to the sharp drop in oil prices caused by the pandemic. The largest impairment in 2020 was by the oil-field-services company, Baker Hughes, to the extent of $14.8 bn written off in April (Maurer 2021). The goodwill was the result of an oil-field services and equipment business Baker Hughes acquired in its merger with GE's oil and gas division in 2017. AT&T disclosed a $10.47 bn impairment, the second largest charge of any US company in 2020. The write-downs were related to its pay-television and Vrio Corp. businesses (Maurer, 2021).

Goodwill Accounting: A Short History

According to Garcia (2006), four accounting treatments are possible, based on whether goodwill should be treated as an asset or not. They are:

1. Goodwill is recognized as an asset at cost and amortized over its useful life.
2. Goodwill is recognized as an asset at cost but retained permanently on the balance sheet and written off only when impaired.
3. Goodwill is written off immediately against reserves.
4. Goodwill is immediately or rapidly written off in the P&L account.

Initially, between 1880 and 1929, when regulations were not fully in place, goodwill was not considered an asset and was deducted from revenues. Later, companies started considering goodwill as an asset but there was a debate over its useful life. Some argued for an immediate write-off against capital, while others advocated a gradual reduction of the asset value against earnings.

The Great Depression and the financial collapse revealed a disconnect between the

Open Banking in India – A Technology Revolution in the Banking Sector

Traditional banking is gradually losing its sheen and technology-enabled banking is making rapid strides. Later, providing better customer experience, new ways of generating revenue to banks by partnering with Fintech companies and efforts of Fintech companies pitching in for new customers become easy. Finally customers, Fintechs and banks are benefitting from leveraging technology. Banks today are compelled to innovate and search for new revenue models to sustain competition. Earlier banks were working in a closed environment and now they have to embark upon collaborative environment. With the pandemic affecting the nations and the emphasis moving towards digitization, it will give the necessary fillip to open banking.

Genesis of Open Banking

UK Open Banking Working Group (OBWG) and PSD2 (Second Payment Services Directive) in Europe are the pioneers who have jointly paved the way for open banking (https://www.openbanking.org.uk). PSD2 in Europe is also known as open banking. The joint UK and EU directive came into force on January 13, 2018, and it forces the nine big banks, namely, HSBC, Barclays, RBS, Santander, Bank of Ireland, Allied Irish Bank, Danske, Lloyds and Nationwide, to publish financial information of customers held with them to third parties (usually Fintech Companies) via APIs (Application Programming Interface) (https://www.thehindubusinessline.com/money-and-banking/open-banking-ushering-in-a-new-world-of-opportunity/article22694808.ece). The third parties should be authorized entities as AISP (Account Information Service Providers) under FCA (Financial Conduct Authority) to utilize the APIs of banks. FCA is the regulatory body of financial services firm and financial markets in the UK (https://www.fca.org.uk/).

Concept of Open Banking

Open banking is a new way of banking which entails customers (individual and small businesses) of a bank sharing his/her financial information to third parties via bank's API (https://www.wired.co.uk/article/open-banking-cma-psd2-explained). API is software which facilitates the transfer of customer's financial information from bank to third parties. The transfer should happen with the explicit consent given by customers themselves to the bank where the account is in operation. There are mutual benefits for customers and banks sharing the data. It has to be remembered that consent obtained from customer could be only for a specific purpose and particular period of time. For example, a corporate customer who wants to avail

Open Banking Approaches Across the World and in India

Countries across the world are adopting their own approaches to open banking according to their markets and policy objectives, and in some cases developing cross-industry approaches beyond financial services.

There are too many open banking approaches, however, they all fall broadly into one of the two categories: market-driven or regulatory-driven (https://www2.deloitte.com/global/en/pages/financial-services/articles/open-banking-around-the-world.html).

Market-Driven

A number of countries, including India, Japan, Singapore and South Korea, do not currently have formal or mandatory open banking regimes, but their policy makers are introducing a host of measures to endorse and fast-track the take-up of data sharing frameworks in banking. In Singapore, MAS (Monetary Authority of Singapore) and the Association of Banks have published an API Playbook to support data exchange and communication between banks and Fintechs. In Japan, the FSA (Financial Services Agency) has established an authorization process for Third Party Providers (TPPs), introduced a requirement for banks to circulate their Open APIs policies, and encouraged banks to contract with at least one TPP by 2020. The US has also opted for a market-led approach, but without any material government initiatives to support the development of open banking products and services.

Regulatory-Driven

The two major countries that have opted for a regulatory-driven approach are Hong Kong and Australia.

The Hong Kong Monetary Authority issued an Open API Framework in July 2018. This sets out a four-phase approach for banks to implement Open APIs, starting with information sharing on products and services, and ending with sharing of transactional information and payments initiation services. Australia stands out from the rest due to its innovative approach and scale of ambition. The important piece of legislation brought out here is the Consumer Data Right Act (CDR). This Act will allow consumers to share their data with whichever authorized third parties they choose. The notable feature of CDR is that it is a data policy initiative and not a financial services one. While it will apply to banks first, the CDR will subsequently apply to the energy and telecommunication sectors as well, and eventually it could be applied to any sector.

Open Banking Approach in India – Regulatory Initiatives

National Payments Corporation of India (NPCI) has paved the way for open banking in India with the introduction of Unified Payments Interface (UPI) and Aadhaar-Enabled Payment Services (AePS). UPI is an instant interbank payment system. India has started gaining momentum in its approach to open banking by enabling an intermediary which will be responsible for the customers' consent management. These intermediaries are licensed as Non-Banking Financial Companies (NBFCs). In September 2016, RBI announced the creation of a new licensed entity called Account Aggregator (AA) and
