Abstract

Background/Objectives: Constrained Layer Damping (CLD) is an effective passive damping technique to suppress the vibrations using to analyze the vibration behaviour of viscoelastic sandwich beams. A Sandwich beam contains two face layers at top and bottom, one core layer of viscoelastic material. **Methods/Statistical Analysis:** In this paper free vibration analysis has been carried out on various viscoelastic sandwich beams likes Al-NR-Al, Al-NeR-Al, MS-NR-MS and MS-NeR-MS under four edge conditions viz., clamped-free, clamped - clamped, clamped-simply supported and simply supported-simply supported. Analytical solutions are to be carried out using Euler-Bernoulli's theory and Newton-Raphson method has to be adopted to investigate the natural frequencies of various sandwich beams. **Findings:** The beam's natural frequencies for different mode numbers with face material as aluminium and core as polyurethane rigid for analysis of fixed free sandwich beam and observed that as mode number increases natural frequencies increases due to non dimensional number increases. And found that the higher natural frequencies obtained for clamped-clamped condition of Al-NR-Al sandwich model for various edge conditions such as conditions like clamped-free, clamped - clamped, clamped -SS and SS-SS. As mode numbers increase the modal behaviour shows diverging nature because of the effect of eigenvalue. The maximum percentage variation in natural frequency from fixed-fixed and fixed-free condition is 26.35. **Improvements:** The higher natural frequencies are obtained when mild steel is used as face material. The natural frequencies were reduced when neoprene rubber was used as core material.

Keywords: CLD, Free Vibration, Natural Frequency, Passive Damping, Sandwich Beam, Viscoelastic

1. Introduction

A beam is an important slender structural member in engineering structures such as supporting members in buildings, railways, bridges, satellites, robot arms, airplane wings, etc. A viscoelastic sandwich beam is a layered fabricated structure prepared from two strong thin and solid face sheet materials joined to a less weight viscoelastic core material to create light weight and strong structural element. The development of sandwich structures will continue to be demand for the need of light weight, excellent strength under compression, providing outstanding stiffness to mass and strength to mass features. Different damping mechanism developed to suppress vibration. In[1] investigated the natural frequencies, vibration characteristics and corresponding complex loss factor of a sandwich beam. He derived an equation to find the core layer effective thickness. Required natural frequencies and corresponding loss-factors were found by him by applying boundary conditions to the loading uniform freely vibrating beam. In[2] studied the viscoelastic core sandwich beams free vibration. They identified high values calculated for beams of different material are capable for vibration damping applications. They presented that damping effort increased with core part of the beam as damping material. The applicability of the structural theory to find the natural frequencies is verified by them with experimental backup programme. In [3]used an energy technique in the primary mode of a viscoelastic core simply supported sandwich beams to study the effect of damping. They developed a theory to find damped natural frequency and

ABSTRACT

In general plate girders are designed using two different theories : design using beam theory and tension field theory. Until the latest revision of IS 800-2007 tension field theory was not popular in Indian Engineering Industry. But the present code allows the user to adopt the tension field theory for girders in engineering construction. This paper is focusing on analytical investigation on the ultimate load behavior of beam member designed using tension field theory. The frame is subjected to different load conditions. A parametric study was carried out with slenderness ratio of the web as parameter. The present study concluded that the member with slenderness ratio 150 to 175 can be used in seismic prone areas, as it have more reserve strength due to post buckling and tension field action.

1. Introduction

Plate girders are normally designed to support heavy loads over long spans in situations where it is necessary to reduce an efficient design by providing girders of high strength to weight ratio. The search for an efficient design procedure conflicting the requirements, particularly in the case of the web plate. To produce the lowest axial flange force for a given bending moment, the web depth must be made as large as possible. To reduce the self weight, the web thickness must be reduced to minimum. As a consequence, in many instances the web plate is of slender proportions and is therefore prone to buckling at relatively low values of applied shear.

IS 800-2007 clause 8.4.2.2 offers two shear buckling design methods for the design of plate girders having slender web panels. The two methods are,

a) Simple post-critical method, which may be applied to both stiffened and unstiffened girders and is therefore of general application.

b) Tension field method, which may only be applied to girders with intermediate transverse stiffeners. Even for such girders its range of application is limited to a range of stiffener spacing defined by: $1.0 \leq c/d$ 3.0. The simple post-critical method is seen as a general-purpose method which can be applied to the design of all girders. The tension field method can be applied to a certain range of girders only, but will lead to considerably more efficient designs for these girders, because it takes full account of the post-buckling reserve of resistance. The value of the tension field stress at which yield will occur, termed the "yield strength of tension field" in IS 800-2007, may be determined by applying Mises-Hencky yield criterion.

Alinia et al. (2009) modelled and analysed a num scale plate girders in ABAGUS .They studied failure mechanism characteristics.The objecti study was to clarify how, when and why plasi that emerge in the experimental tests actually addition of end-posts provides more fixity to flar and increases the ultimate resistance of plat Baskar and Shanmugan (2003) have done exp investigation on steel- concrete composite pla subjected to the combined action of shear and Two bare steel plate girders and six composite pl were tested to failure in order to study ulti behavior. FIRE DISASTER -WINDSOR TOWER A REVIEW

Priya S. Natesh
Assistant Professor,Faculty of Sience and Technology,, ICFAI Foundation for Higher Education (Declared as Deemed to be University u/s 3 of the UGC Act 1956), Hyderabad- 501 203, India

ABSTRACT

The Windsor Tower or Torre Windsor (officially known as Edificio Windsor) was a 32-storey concrete building with a reinforced concrete central core. Originally, the perimeter columns and internal steel beams were left unprotected in accordance with the Spanish building code at the time of construction. The building featured two heavily reinforced concrete transfer structures (technical floors) between the 2nd and 3rd Floors, and between the 16th and 17th Floors respectively. The building was subjected to a three year refurbishment programme. However, the vertical compartmentation might not be fully achieved due to the lack of fire stop system in floor openings and between the original cladding and the floor slabs. The fire was believed to have been caused by a short-circuit on the 21st floor. The main factors leading to the rapid fire growth and the fire spread to almost all floors included: the lack of effective fire fighting measures, such as automotive sprinklers, the "open plan" floors with a floor area of 1000m² and the failure of vertical compartmentation measures, in the façade system and the floor openings. If the steel mullions have been properly fire protected, the multiple load paths they provided would almost certainly have helped redistribute the loads and the steel part of building may not have collapsed.

1. Introduction

The Windsor Building was a 32-story office building in Madrid, Spain, which was constructed with a steel-reinforced concrete core and a steel exterior frame. Its façade was completely covered by reflective glass-like panels that mirrored the sky of Madrid, diminishing its visual impact. Originally, the perimeter columns and internal steel beams were left unprotected in accordance with the Spanish building code at the time of construction. On 12-13 February 2005, the Tower was involved in a major fire, of duration 18-20 hours. The building was subjected to a three year refurbishment programme of works when the fire was broke out. The origin was in an office on the 21st floor of the building, causing extensive structural damage to the upper floors of the building. The exterior steel frame from the 21st to 32nd stories collapsed, while the main building survived. Damage to the lower floors, below the second transfer floor, was considerably less [4]. The insurance value of the total damage caused was estimated at EUR 122 million [5].

1.1. Design/layout

The Windsor Tower or Torre Windsor (officially known as Edificio Windsor) was built in 1978 and was at one time the tallest building in Madrid [4]. The Tower was a 32-storey concrete building (with 29 above ground and 3 below) with a reinforced concrete central core. A typical floor was two-way spanning 280mm deep waffle slab (with permanent clay formwork) supported by the concrete core, internal RC columns with additional 360mm deep steel I-beams and steel perimeter columns. The Windsor Tower's original structural design complied with the Spanish building codes in 1970s. At the time of the construction, the Spanish codes did not require fire protection to steelwork and sprinkler fire protection for the building. The building featured two heavily reinforced concrete transfer structures (technical floors) between the 2nd and 3rd Floors, and between the 16th and 17th Floors respectively. The perimeter columns were supported by the transfer structures at the 17th and 3rd Floor levels [6]. The tower was built using normal strength concrete,[5]

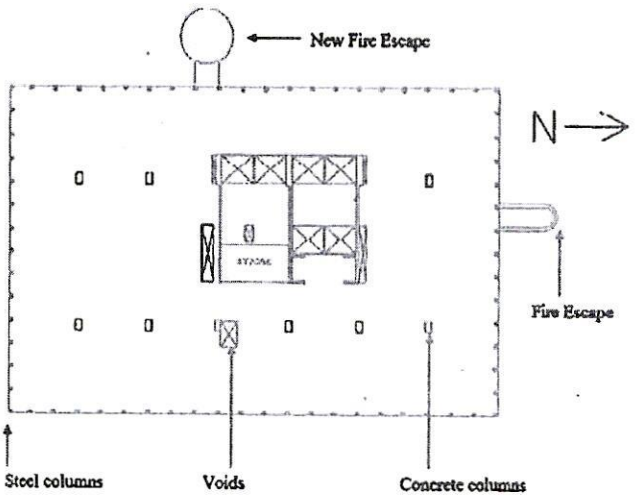

Figure No.1: Windsor Tower Floor plan above second transfer floor [4]

1.2. Occupancy

It was an office building. Below the third floor there was an entertainment and shopping complex, with a different structural layout, and underground parking on several levels; however this part of building was largely unaffected by the fire and did not sustain any structural damage [4]. Its occupants included Deloitte accountants and the Spanish firm Garrigues but the building was undergoing renovation, which meant it was empty when fire broke out around 23:00 on Saint Valentine's Day 2005.

1.3. Fire Protection system

The Windsor Tower's original structural design complied with the Spanish building codes in 1970s. At the time of the construction, the Spanish codes did not require fire protection to steelwork and sprinkler fire protection for the building. Fire alarms systems and dry riser systems where

Abstract

Hybrid watermarking techniques are gaining importance in the field of image watermarking as they meet criterions like Imperceptibility and Robustness. A novel approach for the hybrid color image watermarking using Cycle Spinning based Sharp Frequency Localized Contourlet Transform (CS-SFLCT) and Principal Component Analysis is proposed. Contourlet Transform (CT) is applied to decompose the images into various sub bands for all the color spaces of both the host and water mark images. For inclusion operation principal components of middle band(X bands) are considered and CS-SFLCT is chosen for watermarking. CS-SFLCT provides better frequency localization resulting in a very good PSNR and Principal Component's helps in fruitful extraction of watermark from the host image. This hybrid technique has shown better correlation between input watermark and extracted one and shown very high very high robustness under various intentional and non intentional attacks.

ABSTRACT

In this research as a first step we have concentrated on collecting non-intra cortical EEG data of Brainstem Speech Evoked Potentials from human subjects in an Audiology Lab in University of Ottawa. The problems we have considered are the most advanced and most essential problems of interest in Auditory Neural Signal Processing area in the world: The first problem is the Voice Activity Detection (VAD) in Speech Auditory Brainstem Responses (ABR); The second problem is to identify the best De-noising technique for Auditory Artifact removal in Speech ABR of Brainstem Speech Evoked Potentials. In VAD problem we have implemented Zero-Crossing Detection VAD, statistical algorithms (two algorithms) which are already a standard in Speech Processing VAD problems, and then a third VAD we have presented is based on spectral subtraction method in which we have developed our own mathematical formula for the peak valley difference detection of the frequency spectra to detect the voice activity (we named it as SNRPVD VAD). These algorithms we applied on our data sets of EEG collected Brainstem Speech Evoked Potentials and compared their performances. VAD is verified and we found that SNRPVD VAD algorithm is working better than the Statistical VAD techniques and found to be it is detecting Voice even in more noisy data where statistical method could not detect. The second problem we considered is to de-noise the data from auditory artifacts and improve its SNR. We developed various De-noising techniques specifically: Yule-Walker Multiband filter; Cascaded "Yule-Walker and Comb" filter; Conventional Wavelets: Daubechies, Symlet, Coiflet Wavelet filtering; FAST Independent Component Analysis (FASTICA) filtering; Translation-Invariant (TI) Estimation filtering; Cycle Spin Translation Invariant Wavelets Independent Component Analysis (CSTIICA) Filtering approaches. We found the Wavelets are working better and TI wavelets are working far better than all; and then CSTIICA is working even better than TI wavelets. The performance measures considered are Signal to Noise Ratio (SNR) and Mean Square Error (MSE). Ultimately we observed that Wavelets are working surely as one of the best tools for de-noising neurological signals specifically Speech ABR signals. With these Novel observations in VAD and De-noising for Speech ABR, as both are relatively new and advanced areas in Audiology and as they gained wide interest in the last about a decade in scientific community of audiology scientists and engineers, Novel techniques are essentially emergency and hence with our research we are contributing some advanced working ideas to the community of Auditory Neural Signal Processing.

KEYWORDS: EEG, Translation Invariance, ICA, FASTICA, CS, Yule-Walker Multiband Filter, Comb filter, Wavelets, VAD

RESEARCH OBJECTIVE

The brainstem speech evoked potentials real time data was collected using EEG from different human subjects for synthesized vowel sounds. The data of this Auditory Brainstem Responses (ABR) was collected using EEG from up-to 20 human subjects non-intracortically in an audiology lab in University of Ottawa, Canada. The goals of the research are to

Abstract.ZnO thin films were deposited by using RF sputtering technique at 150W and 4×10^{-3} mbar pressure. Post-deposition rapid thermal annealing of ZnO thin films were carried out at 1000°C for 600sec. ZnO nanostructures (nanowires/nanorods) were hydrothermally grown by using equimolar solution of Zinc nitrate and hexamethyltetramine. Morphology of ZnO thin films and nanostructures were investigated using scanning electron microscope. A comparative study on the ultraviolet photodetection behaviour of ZnO thin films and nanostructures were carried out by adopting current-voltage measurement technique at room temperature. ZnO annealed films have shown relatively lower transient photocurrent decay as compared to as-deposited film, which may be due to the faster evacuation of the charge carries. However, in case of ZnO nanorods transient photocurrent decay is relatively slow than that of nanowires, which is attributed to delayed readsorption of oxygen molecules onto the nanorods surface due to its larger width.

Keywords: Thin films; Nanostructures; Photodetection; Ultraviolet; Zinc Oxide

1. Introduction

In recent years, ultraviolet (UV) light is used in many commercial fields such as telecommunications, ozone and pollution monitoring, high temperature flame detection, and missile warning systems [1–3]. The well-established CMOS compatible semiconductor such as silicon (Si) has a limitation for UV detection due to its low bandgap. Since the bandgap energy of Si is 1.1eV, costly high pass optical filters and phosphors are needed to stop low energy photons [4-9]. Therefore, the Si based UV detector performance are significantly reduced due to its efficiency and increase of dark currents [10-11]. However, the bandgap of ZnO (3.37eV) corresponds to the intermediate region between UV and visible light. In addition, outstanding physical and chemical properties of ZnO nanostructures such as large surface area, radiation hardness [12], superior spatial resolution [13] and high electron mobility provide a platform for versatile applications such as in food processing, sterilization of medical equipment, research laboratories, semiconductor processing industry etc., where an installation of UV

Abstract.$CaCu_3Ti_4O_{12}$ (CCTO) ceramic pellet of 10mm diameter has been synthesized by adopting solid state route. The structural and morphological characterization of the ceramics sample was carried out by X–ray diffraction (XRD) and scanning electron microscope (SEM), respectively. XRD pattern revealed the CCTO phase formation, where as SEM micrograph shows the sample consisting of well defined grain and grain boundaries. The room temperature dielectric constant of the sample was found to be ~ 5000 at 1kHz. After successful preparation of CCTO pellet, a 2 inch diameter CCTO sputtering target is also fabricated in order to deposit CCTO thin films for microelectronic applications.

Keywords: Ceramic, X-ray diffraction, Dielectrics, Electron Microscopy

1. Introduction

In recent years, development of high-k dielectric thin films for microelectronics has drawn tremendous attention in order to replace SiO_2. The colossal dielectric constant (CDC) phenomenon in $CaCu_3Ti_4O_{12}$ (CCTO) has drawn a great deal of interest. It possesses a distorted cubic perovskite (ABO_3) structure with lattice parameter of 7.391Å. It also shows a negligible temperature dependence on dielectric constant [1, 2]. The origin of the giant dielectric constant in CCTO is not well understood yet. The origin of high dielectric constant in CCTO may be due to stoichiometric variation [3], oxygen vacancies [4] and/or presence of secondary phases which forms layered structures which can be explained by Internal Barrier Layer Capacitance (IBLC) [5]. For fabrication of microelectronic devices, the synthesis of high quality CCTO thin films is highly required. CCTO thin films can be deposited by different techniques notably PLD [6], Sol-gel route [8], CVD, RF sputtering [9] etc. Out of them RF sputtering have some advantages over other deposition techniques such as low cost, low processing temperature, good compositional homogeneity, and large area deposition [10]. For sputtering, a high pure CCTO target is required. In this report, an attempt has been done to fabricate 2 inch diameter target for deposition of high-k thin film.

Abstract. Hafnium oxide films were deposited on silicon substrates by RF sputtering at room temperature. Post-deposition rapid thermal annealing of the sputtered HfO_2 films was carried out in the temperature range of 400°C to 800°C in oxygen ambient. The structural properties ware studied by X-ray diffraction (XRD), where the enhancement in the crystallinity of HfO_2 ($\bar{1}11$) orientation was observed. The Capacitance –Voltage (C–V) and Current density –Voltage (J–V) characteristics of the annealed dielectric film were investigated employing Al/HfO_2/Si Metal Oxide Semiconductor (MOS) capacitor structure. The flatband voltage (V_{fb}) and oxide charge density (Q_{ox}) were extracted from the high frequency (1 MHz) C–V curve. Leakage current was found to be minimum for the annealing temperature of 600°C.

1. Introduction

In the past few decades, continuously scaling down of silicon dioxide (SiO_2) gate dielectrics has facilitated increased-numbers of transistors per chip with enhanced circuit functionality and performance at low costs in complementary metal-oxide semiconductor (CMOS) technologies as predicted by Moore's law [1]. However, conventional SiO_2 gate dielectric (low-k) has reached the maximum operational limit during the downscaling of the CMOS devices. In order to overcome these problem, high-k dielectric materials such as Ta_2O_5, TiO_2, ZrO_2 and HfO_2 are currently under active consideration. Among them hafnium oxide thin film has long been recognized as most suitable high dielectric material owing to its relatively high dielectric constant, wide bandgap (5.68 eV), compatibility with polysilicon gate electrodes, low density of interface states and good electrical reliability [2–4]. HfO_2 is also a potential candidate for several other applications such as gas sensing devices, tunnel junctions, laser damage-resistance optical coatings and thin film capacitors [5]. The growth process of gate oxide film is a very important issue and received considerable interest in order to get high quality reliable high-k gate dielectric thin films for MOS structures. Various methods such as pulsed laser deposition, chemical vapor deposition, e-beam evaporation and radio frequency (RF) magnetron sputtering have been used to achieve good quality high-k thin films. Among them, RF sputtering, a physical vapor deposition (PVD) based technique combined with plasma, has several advantages such as low thermal budget, ease of handling, less consumption of source materials, good reproducibility, possibility of multi-target processing.

Direct Torque and Flux Control of an Induction Motor Using MRAS Technique.

- **Source:** IUP Journal of Electrical & Electronics Engineering . Apr2016, Vol. 9 Issue 2, p19-29. 11p.

- **Author(s):** Sudheer, H.; Kodad, S. F.; Sarvesh, B.

- **Abstract:** Direct Torque Control (DTC) has emerged as a powerful control technique for induction motors. It has replaced the vector control methods owing to the simplicity involved. Like many other control methods, it allows the control of induction motor in all four quadrants very efficiently. It has many advantages over the traditional control methods such as minimum torque response time and no requirement of the voltage modulator blocks. However, when the parameters of the system vary along with disturbances in the load torque, the system's performance is reduced. To reduce the effect of the variations in parameters on the system's performance, one technique can be adapting the controller in real-time depending on the plant parameter variation and the load torque disturbance. Many adaptive control techniques are available, and one of them is Model Reference Adaptive System (MRAS). In this, the adaptive algorithm forces the plant's response to track the response of a reference model. The reference model may be fixed or adaptive. In this paper, the response of an induction motor to the DTC in the presence and absence of MRAS has been studied. The results at various operating conditions were obtained and analyzed using MATLAB/Simulink.

Abstract

Material joining is one of the key manufacturing processes used to assemble metallic and non-metallic parts for several applications. But the industries are facing many difficulties in joining of thin sheets of dissimilar metals by the conventional welding process because of their differences in chemical composition, physical and mechanical properties. Thus, ultrasonic welding is a solid state joining process used for joining of small elements in microelectronics industries. In this process, acoustic horn and booster are the important assets. The accuracy and strength of the welding depend mainly on their geometry. This proposed work deals with the design and modelling of an acoustic stepped sonotrode with booster using finite element analysis (FEA). From this analysis, the actual length of the horn is obtained by gradually decreasing its theoretical length. The quality of the wel

Local mesh quantized extrema patterns for image retrieval

L. Koteswara Rao, D. Venkata Rao & L. Pratap Reddy

SpringerPlus **5**, Article number: 976 (2016)

849 Accesses | **6** Citations | Metrics

Abstract

In this paper, we propose a new feature descriptor, named local mesh quantized extrema patterns (LMeQEP) for image indexing and retrieval. The standard local quantized patterns collect the spatial relationship in the form of larger or deeper texture pattern based on the relative variations in the gray values of center pixel and its neighbors. Directional local extrema patterns explore the directional information in 0°, 90°, 45° and 135° for a pixel positioned at the center. A mesh structure is created from a quantized extrema to derive significant textural information. Initially, the directional quantized data from the mesh structure is extracted to form LMeQEP of given image. Then, RGB color histogram is built and integrated with the LMeQEP to enhance the performance of the system. In order to test the impact of proposed method, experimentation is done with bench mark image repositories such as MIT VisTex and Corel-1k. Avg. retrieval rate and avg. retrieval precision are considered as the evaluation metrics to record the performance level. The results from experiments show a considerable improvement when compared to other recent techniques in the image retrieval.

Abstract

The case study shows how R can be used to analyze transaction database related to an investor's equity trading and investment portfolio. It starts importing the data from the spread sheet files into a data frame. The built-in functions were used to analyze and plot the trends extracting the raw data. It also processes the raw data by melting and casting the same to generate pivot tables. The case demonstrates how the built-in features in the base system can be used to analyze various investment and trading patterns concealed in the transaction database. The visualization techniques using R can help in understanding the behavior of the individual investor was also demonstrated.

Description

Ram having worked in a government office for more than 30 years, felt that he needed to invest his savings in equity market to test his luck and make fortune over a period of time. Ram never realized that stock exchange operations are peculiar in nature and as an individual managing one's own portfolio by taking decisions to identify the companies which are likely to provide growth prospects for the investment will be a difficult task. His expectations to get a good return from the mutual funds had also disappointed him in the past. Having burned his investment during the mid-nineties when mutual funds declined sharply, he started investing into equities directly and gradually. As his portfolio covered a wide range of stocks across various sectors, he felt the need to look back and analyze his investment and trading strategy adopted over a period of time. He was keen to look out for the tools to analyze large volumes of transaction data obtained from the online brokerage firms with which he was investing and trading in the market.

Ram's investment decisions were influenced by the media reports and recommendations made by the analysts in various TV business channels. Very often he tends to buy, rather than sell, those stocks which were in the news. This attention-based buying led Ram to trade too speculatively. Often he started realizing that he had sold the winning stocks while holding on to the losing stocks, a behavior referred to as the 'disposition effect' (Barber and Ordean, 2011). Added together he failed to realize that the transaction costs were going to emerge as unambiguous drags on the profits he was likely to make.

Abstract. We derive explicit formulas for Dirichlet series which do not appear in the Catalog [3]. We calculate the mean of the Dirichlet coefficients by Tauberian and Abelian theorems.

Keywords: Dirichlet series; Mean of Dirichlet Coefficients; Wiener-Ikehara Theorem.

1. Introduction

We extend the Catalog of Interesting Dirichlet Series [3] of Gould-Shonigawa by adding several examples involving the Riemann Zeta function and L-series of quadratic fields. We also compute the means of the Dirichlet coefficients. For this we use mostly variants of the Wiener-Ikehara theorem (Theorems 1.2 below)and the converse Abelian theorem (for the examples which are ratios of L-series)

Recall that a Dirichlet series is of the form $\sum_{n=1}^{\infty} \frac{a_n}{n^s}$; the domain is (a superset of) $\{Re\ s > 1\}$ in all our examples. The Riemann Zeta function is

$$\zeta(s) = \sum_{n=1}^{\infty} \frac{1}{n^s}$$

Primary Methods to Address the Data Security Problems in Cloud Computing

*Sirisha Potluri**

Cloud computing is a service to deliver the hosted services over the network. This technology makes companies utilize the resources as a service rather than building on their own. It has many advantages like: on demand self service, elasticity, and pay per use by giving public cloud, private cloud, hybrid cloud and community clouds as deployment models and SaaS, PaaS and IaaS as service models. On the other hand, data security, data privacy, limited control over the service, data location, vendor lock-in and downtime are the basic challenges in cloud computing. The primary methods to address the data security problem are encryption and Consistency as a Service (CaaS). Encryption ensures securing the data present in cloud server. Even though many encryption techniques are available attribute-based encryption gives better results. It provides an access control by using private key, master key and cipher text. Key-policy attribute-based encryption and attribute-based encryption using hash functions are giving secure results. In CaaS, a group of users, namely, audit cloud and cloud service providers, together frequently check the cloud consistency.

Keywords: Cloud computing, Attribute based encryption, Consistency as a Service

Introduction

Cloud computing is a budding technology. The number of cloud service providers and cloud users are increasing day-by-day. To deploy the number of services, this technology provides different types of models. In public cloud, the cloud service provider or third-party provides the services over the Internet based on the user's demand. The customer will pay for the used services. In private cloud, the services and resources are made available in the organization premises by their own IT team. Unlike public cloud, the services in private cloud are limited to the organization that owns it. This model gains the benefits of cloud architecture without giving the control to third parties. Hybrid cloud is combined service because it distributes the applications across the public and private clouds. Community cloud provides the computing infrastructure as a service by sharing it across a number of organizations belonging to one community.

Cloud computing allows sharing of computer resources by using different service models. SaaS means Software as a Service and provides the complete application as a service. Software is made available over the Internet and the number of client organizations and users will access the service based on the demand. PaaS means

Hydrocarbon Refrigerant mixtures as an alternative to R134a in Domestic Refrigeration system: The state-of-the-art review

D.V.Raghunatha Reddy, P.Bhramara, K.Govindarajulu

Abstract- The objective of this paper is to present review on the alternative refrigerants used in the domestic refrigerators to have better performance with minimum losses. This paper give the summary and range of various refrigerants used in the domestic refrigerators. of global warming which affect the environment by the use of refrigerant, and our aim is to reduce the effect of global warming as well as optimize the performance of domestic refrigerators by using the latest refrigerants. This review paper represents the recent developments done in domestic refrigerator. Performance of refrigerator is increased by using different refrigerants. R134a is used in domestic refrigeration and other vapor compression system. R134a is having zero ozone depletion potential (ODP) and almost good thermodynamic properties, but it has a high Global Warming Potential (GWP) of 1300.The higher GWP due to R134a emissions from domestic refrigerators leads to identifying a long term alternative to meet the requirements of system performance, Therefore it is going to be banned very soon for environmental safety. Some new refrigerants is been found by researchers which are environmental friendly refrigerants having low GWP and low ODP. Hydrocarbon refrigerants particularly propane, butane and isobutene are proposed as an environment friendly refrigerants. After reviewing the various literatures on the hydrocarbons (R290 and R600a) refrigerants and their mixture gives good performance in small capacity domestic refrigerator to replace R134a.

Keywords: Hydro fluorocarbon refrigerant, GWP, ODP, Alternative refrigerants, Hydrocarbon refrigerants, Propane (R290), Isobutene (R600a).

1 INTRODUCTION

Refrigerator is one of the home appliance utilizing mechanical vapor compression cycle in it process. The Vapor Compression Refrigeration Cycle is a process that cools an enclosed space to a temperature lower than the surroundings. To accomplish this, heat must be removed from the enclosed space and dissipated into the surroundings. However, heat tends to flow from an area of high temperature to that of a lower temperature. Figure (a) shows an ideal single-stage vapor compression refrigeration cycle in which compression occurs in the superheated region. Many investigators have reported that GWP of HFC refrigerants is more significant even though it has less than that of chlorofluorocarbons (CFC) refrigerants. HCFCs (hydro chlorofluorocarbons) and CFCs (chlorofluocarbons) have been applied extensively as refrigerants in air conditioning and refrigeration systems from 1930s as a result of their outstanding safety properties. However, due to harmful impact on ozone layer, by the year 1987 at Montreal Protocol it was decided to establish requirements that initiated the worldwide phase out of CFCs. By the year 1992, the Montreal Protocol was improved to found a schedule in order to phase out the HCFCs. Moreover in 1997 at Kyoto Protocol it was expressed that concentration of greenhouse gases in the atmosphere should be established in a level which is not intensifying global warming ozone layer. Subsequently it was decided to decrease global warming by reduction of greenhouse gases emissions.

2 ANALYSIS OF VAPOR COMPRESSION REFRIGERATION CYCLE

Figure 2 shows the refrigeration cycle on p-h diagram. The refrigerant evaporates entirely in the evaporator and produces the refrigerating effect. It is then extracted by the compressor at state point 1, compressor suction, and is compressed isentropic ally from state point 1 to 2. It is next condensed to liquid in the condenser, and the latent heat of condensation is rejected to the heat sink. The liquid refrigerant, at state point 3, flows through an expansion valve, which reduces it to the evaporating pressure. In the ideal vapor compression cycle, the throttling process at the expansion valve is the only irreversible process, usually indicated by a dotted line. Some of the liquid flashes into vapor and enters the evaporator at state point 4. The remaining liquid portion evaporates at the evaporating temperature, thus completing the cycle. Fig: 1

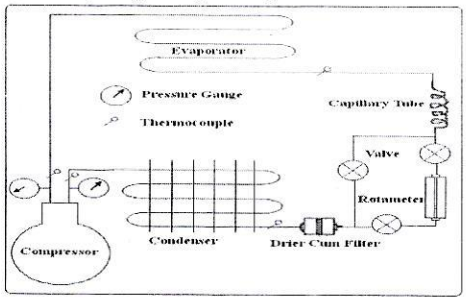

Fig1: Vapor compression refrigeration cycle

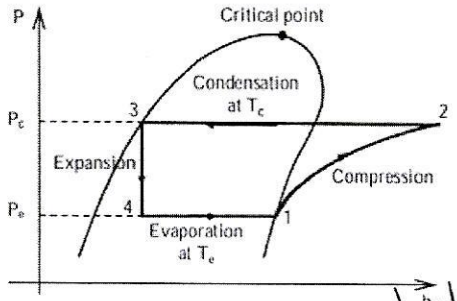

Fig2: p-h diagram Vapor compression refrigeration cycle

The refrigeration process that employed in the domestic refrigerator is based on a vapor compression cycle as shown in Figure

Abstract

Social Networks are increasingly getting popular among the Internet users and such networks have large volumes of content and linkage data which can be leveraged for many corporate and other policy decisions. While the content data typically contain text, images and other multimedia contents, the linkage data essentially provide dynamic graph structures for the interactions that take place through the social networks. The information hidden behind these structures gives unprecedented opportunities for data analysis. However, these graph network data often carry additional temporal information and hence the data are better viewed as a sequence of snapshots of an evolving dynamic network. The availability of massive data generated dynamically by the social media networks on the Internet will enable the analysts to test their hypotheses and conjectures identified by various conventional social network analysts over a period of time. The current work reported in this paper proposes to develop an algorithm to predict hard-to-detect interaction patterns hidden behind these networks. The developed algorithm is aimed at identifying the frequent patterns and periodic sub-graphs superimposed in a dynamic network. The proposed algorithm may also be used to explore other patterns based on the attributes associated with nodes and edges of the network.

ABSTRACT

Recommender system (RS) has become a very important factor in many eCommerce sites. In our daily life, we rely on the recommendation from other persons either by word of mouth, recommendation letters, movie, item and book reviews printed in newspapers, etc. The typical Recommender Systems are software tools and techniques that provide support to people by identifying interesting products and services in online store. It also provides a recommendation for certain users who search for the recommendations. The most important open challenge in Collaborative filtering recommender system is the cold start problem. If the adequate or sufficient information is not available for a new item or users, the recommender system runs into the cold start problem. To increase the usefulness of collaborative recommender systems, it could be desirable to eliminate the challenge such as cold start problem. Revealing the community structures is crucial to understand and more important with the increasing popularity of online social networks. The community detection is a key issue in social network analysis in which nodes of the communities are tightly connected each other and loosely connected between other communities. Many algorithms like Givan-Newman algorithm, modularity maximization, leading eigenvector, walk trap, etc., are used to detect the communities in the networks. To test the community division is meaningful we define a quality function called modularity. Modularity is that the links within a community are higher than the expected links in those communities. In this paper, we try to give a solution to the cold-start problem based on community detection algorithm that extracts the community from the social networks and identifies the similar users on that network. Hence, within the

Abstract

In an image retrieval system, more information can be extracted by combining two or more features. Feature vectors based on local patterns are very popular in deriving the local information present in an image. A majority of these methods are mainly based on encoding the difference in intensity values of the center pixel and its neighbors. The center pixel is assigned a value that gets reflected in the form of a histogram. Local Binary Pattern (LBP) operator is the first of its kind in which a center pixel is compared with surrounding pixels to encode the texture information in the process of retrieval. However, the information directions are not obtained in this method. The directional extrema patterns are used to encode the edge information mainly in four directions. The performance of directional local extrema patterns can be improved by taking the magnitude into consideration. In this paper, a new feature vector is proposed for an image retrieval system with the combination of Gabor and MDLEP. The results show considerable improvement in terms of precision and recall.

Description

In recent years, due to the exponential growth in the areas of digital electronics and the Internet, more and more images are being created and stored every moment across the globe. These images cannot be utilized effectively for various purposes unless there is a system to manage the database. Hence there is a need for a system which can search and index the images for various applications. Initially, manual annotation was followed in the indexing and searching process. However, conventional text-based method becomes ineffective when database is large. Content-Based Image Retrieval (CBIR), has become an eye-catching area for many researchers across the world. In this method, the visual features such as color, texture, shape, etc. are extracted to make a signature or a vector. The resemblance between the query image and the database image is measured to explore more similar images out of the database. In fact, the efficiency of any CBIR system mainly relies upon the method of extraction of features such as color, texture, shape and layout (Rui et al., 1999; Smeulders et al., 2000; and Datta et al., 2008).

This paper is organized as follows. Related works are discussed in Section 2, then different types of local patterns are reviewed in Section 3. The proposed work for image retrieval system is mentioned in Section 4, followed by results and discussion in Section 5. Finally, the paper ends with conclusion.

Sensorless Direct Torque Control of Induction Motor Using AI Based Duty Ratio Controllers

Sudheer Hanumanthakari[1], S. F. Kodad[2], Sarvesh Botlaguduru[3]*

[1] Faculty of Science and Technology, ICFAI Foundation for Higher Education, India

Abstract

This paper presents some improvements in direct torque control of an induction motor using fuzzy logic switching controller along with fuzzy logic and neural network based duty ratio controller. The conventional direct torque control of induction motor suffers from major drawbacks like high torque and flux ripples, current and torque distortion when sector changes and poor transient response. High torque and flux ripples are reduced to some extent by replacing hysteresis controller and switching table with fuzzy logic switching controller (FDTC). However, in FDTC the selected switching vector is applied for the complete switching time period which results in ripples under steady state. The FDTC steady state performance is improved by using duty ratio controller. Using duty ratio controller, the selected switching vector is applied to voltage source inverter only for the time determined by the duty ratio (δ) and for the remaining time, a zero switching vector is applied. As the switching vector is applied for only a time period till torque reaches its reference value, it results in the reduction of torque and flux ripples of induction motor. The selection of duty ratio is a nonlinear function of flux error, flux error and stator flux angle which is effectively implemented in this paper using the following artificial intelligence techniques: fuzzy logic and neural networks. The effectiveness of the proposed methods are evaluated by the simulation with

THE ONSET OF CONVECTION IN A ROTATING POROUS LAYER USING A THERMAL NON-EQUILLIBRIUM MODEL WITH A CATTANEO EFFECT IN THE SOLID PHASE

PREMILA KOLLUR*[1], G. SUDHAAMSH MOHAN REDDY[2]

[1]Department of Mathematics,
Governtment Women's First Grade College, Kalaburgi, India.

[2]Faculty of Science and Technology,
ICFAI Foundation for Higher Education, Hyderabad, India.

(Received On: 28-11-16; Revised & Accepted On: 26-12-16)

ABSTRACT

This paper aims to investigate the onset of convection in a layer of fluid saturated Brinkman with rotating porous medium taking into account fluid inertia and local thermal non-equillibrium(LTNE) between the solid and fluid phases with Cattaneo effect in the solid. A two field is used for the energy equations each representing the solid and fluid phases separately. The usual Fourier heat-transfer law is retained in the fluid phase while the solid phase is allowed to transfer heat via Cattaneo heat flux theory.

Keywords: *Cattaneo effect, porous medium, local thermal non-equillibrium, linear stability, thermal convection, rotation.*

INTRODUCTION

In modeling a fluid-saturated porous medium all the above investigations on double diffusive convection have assumed a state of local thermal equilibrium (LTE) between the fluid and the solid phase at any point in the medium. This is a common practice for most of the studies where the temperature gradient at any location between the two phases is assumed to be negligible. For many practical applications, involving high-speed flows or large temperature differences between the fluid and solid phases, the assumption of local thermal equilibrium is inadequate and it is important to take account of the thermal non-equilibrium effects. Due to applications of porous media theory in drying, freezing of foods and other mundane materials and applications in everyday technology such as microwave heating, rapid heat transfer from computer chips via use of porous metal foams and their use in heat pipes, it is believed that local thermal non-equilibrium (LTNE) theory will play a major role in future developments.

Recently, attention has been given to the LTNE model in the study of convection heat transfer in porous media. Much of this work has been reviewed in recent books by Ingham and Pop (1998, 2005). Kuznetsov (1996) studied a perturbation solution for a thermal non-equilibrium fluid flow through a three-dimensional sensible storage packed bed. The review of Kuznetsov (1998) gives detailed information about the most but very latest works on thermal non-equilibrium effects on internal forced convection flows. An excellent review of research on local thermal non-equilibrium phenomena in porous medium convection, primarily free and forced convection boundary layers and free convection within cavities, is given by Rees and Pop (2005). Free convection in a square porous cavity using a thermal non-equilibrium model is studied by Baytas and Pop (2002). A review of thermal non- The problem of two-dimensional steady mixed convection in a vertical porous layer using thermal non-equilibrium model is investigated numerically by Saeid (2004). The effect of thermal non-equilibrium on the onset of convection in a porous layer using the Lapwood-Brinkman model and also including anisotropy in permeability and thermal diffusivity in a densely packed porous layer have been investigated by Malashetty et al. (2005). Straughan (2006) has considered a problem of thermal convection in a fluid-saturated porous layer using a global nonlinear stability analysis with a thermal non-equilibrium model. He has established the equivalence of the linear instability and nonlinear stability boundaries for the thermal convection in a rotating porous layer with the Darcy law using the non-equilibrium model. More recently, Malashetty and co-workers (2009) have studied the LTNE problem including rotation, boundary effect and second diffusive component on thermal convection in a porous layer.

Abstract

Identifying a person through face biometric and analysis of Facial image has been drawing interest of researchers in the field of Machine learning and Pattern recognition. Face Recognition Across Ages (FRA) is a challenging task due to aging effects like changes in facial shape and texture. In this paper, an attempt is made to describe a schematic using two different discriminative approaches for feature extraction and a see5.0 classifier for classification purposes. One of the feature finding approaches is based on Gradient Orientation Pyramids (GOP) that includes finding of gradient orientations in Gaussian pyramids, the later one is based on Local Binary Patterns (LBP) calculated at each stage of Gaussian pyramid decomposition. These we have used FG-NET database and accuracies of both the approaches are compared.

ABSTRACT

In this research we did quantification of contrast level for various general and biomedical images. Here we considered two novel techniques under evaluation first one is Histogram Flatness Measure (HFM) and second one is Histogram Spread (HS). In case of HFM the values of the measure are found to be inconsistent in the sense that even for low contrast images also the value of HFM are higher than original images being inconsistent to identify whether it is high contrast or low contrast image with respect to original image. When it comes to HS the values of the measure are coming as for high contrast images high values of HS and low contrast images low values of HS with respected to the value of Original Image. Here we observed the values in terms of taking the images of high contrast at certain level to fully high contrast (histogram equalized images). For all the high contrast images HS found to be high values and low contrast images HS found to be low values and being highly consistent and specifically useful than HFM. The standardization of HS can be useful in database management, visualization, image classification. As par the images we put into application for the evaluation of Novel metric 'HS', then we may standardize the notion "High contrast high value and low contrast low value". Then we did want to analyze the images of high contrast which follow the notion along with images of histogram equalized high contrast images for every image under consideration, in terms of image contrast enhancement Image Quality Assessment (IQA) measures, and we would like to find out the image whether if it is higher level of high contrast or lower level of high contrast with respected to the fully high contrast (histogram equalized) image, so that we can have an idea of the given partially high contrast (towards histogram equalization) image that how much near it is to Fully high contrast image. One advantage of this observation is that, if the image is high contrast and if it is far from fully high contrast image, then we can become cautious especially In the case of Biomedical Images, Cosmological images that the images have to be carefully preserved. Here we have found the Computational time in milliseconds for each IQA measure for all the images so that we can have an idea of which measure we can choose for any hardware design of the performance measure by using tradeoffs basing on the required application of interest of any high speed Digital Image Processor Hardware Implementation for any Real time Medical Device. The image quality measures we considered are Peak Signal–to-Noise-Ratio (PSNR), Mean Absolute Error (MAE), Absolute Mean Brightness Error (AMBE), Signal to Noise Ratio (SNR), Contrast to Noise Ratio (CNR), Universal Quality Index (UQI), Noise Quality Measure (NQM), Structural SIMilarity (SSIM), Mean SSIM(MSSIM), Information Fidelity Criterion(IFC), Visual Information Fidelity (VIF), Visual Information Fidelity in Pixel Domain (VIFP), Visual Signal-to-Noise Ratio (VSNR), Wavelets Based SNR (WSNR), Feature similarity Metric (FSIM), Riesz Transform FSIM (RFSIM). One more observation we made is that partially high contrast images are having low computational time of performance metrics when compared to fully high contrast (histogram equalized) images. So in some applications, where no need of fully high contrast images, we can utilize these reasonably high contrast images instead of fully high contrast images for reducing the computational time and also it is highly useful in the case of Digital Image Processing hardware design for saving time and to get a high speed processor, which is highly useful observation. All the research is done in MATLAB
8.3 R2014a programming.

KEYWORDS: Image contrast enhancement, histogram equalization, HS, HFM, Image Quality Assessment (IQA), MAE, PSNR, AMBR, RFSIM, WSNR, MATLAB.

INTRODUCTION

Image contrast enhancement techniques play an important role to improve the visual appearance of a digital image so that extracting image details becomes easy. These techniques have varied applications in medical image processing like detection of cancers, tumors etc., seismic exploration, video processing, camera and surveillance. Image enhancement process consist of a collection of techniques that seek to improve the visual appearance of an image or to convert the image to a form better suited for analysis by a human or machine. Image enhancement means as the improvement of an image appearance by increasing dominance of some features or by decreasing ambiguity between different regions of the image. The objective of enhancement is to process an image so that the result is more suitable than the original image for a specific application. Image enhancement is one of the most interesting and visually appealing areas of image processing. Image enhancement is broadly divided into two categories: spatial domain methods and frequency domain methods. Image enhancement, which is one of the significant techniques in digital image processing, plays important roles in many fields, such as medical image analysis, remote sensing, high definition television (HDTV), hyper spectral image processing, industrial X-ray image processing, microscopic imaging etc [1,14]. Image enhancement is a processing on image in order to make it more appropriate for certain applications. It is mainly utilized to improve the visual effects and the clarity of the image, or to make the original image more conducive for computer to process. Generally, an image may have poor dynamic range or distortion due to the poor quality of the imaging devices or the adverse external conditions at the time of acquisition. The contrast enhancement is one of the commonly

used image enhancement methods. Many methods for image contrast enhancement have been proposed which can be broadly categorized into two methods: direct methods and indirect methods [1,14]. Among the indirect methods, the histogram modification techniques have been widely utilized because of its simplicity and explicitness [13]. Contrast enhancement changing the pixels intensity of the input image to utilize maximum possible bins [7]. Contrast enhancement is based on five techniques such as local, global, partial, bright and dark contrast. Main problem is to identity whether the contrast enhancement is needed for the images or not. Contrast enhancement of a good image many lead to an overexposed or saturated image [8, 9]. So we need a metric which can effectively quantify the contrast and thereby discriminate the good and poor contrast images [12]. So we have considered two proposed methods under evaluation; to identify which one is best for developing a sure approach and to develop a notion of "low contrast low value and high contrast high value". The approaches we have considered are histogram flatness measure (HFM) and histogram spread (HS). We did extensive application of general and biomedical images and HS found to be best and sure approach as a performance metric which follows the notion "low contrast low value; high contrast high value". Then we consider most important Image Quality Assessment (IQA) Measures for observing the quality of each image, and we also observed the computational time for each method. We did some analysis on these measures and we made some highly useful conclusions on hardware implementations of Digital Image Processors.

This research is organized in this way: Section II explains about mathematical analysis of HFM, HS metrics. Section III analyzes the mathematics behind the Image Quality Assessment Measures. Section IV provides the MATLAB simulation results for HFM, HS & for all IQA measures, Computational time; and critical analysis on the observed results is made. We made advanced conclusions and provided in section V.

HISTOGRAM FLATNESS MEASURE (HFM) and HISTOGRAM SPREAD (HS)

Image quality assessment in digital domain is critical [2,3] in all applications of image processing. Image enhancement provides to enhance the apparent visual quality of an image or emphasize certain features based on the knowledge of source of degradation [4,5]. Image contrast is an important feature of image enhancement. Here in this research we have taken into consideration of two novel methods under evaluation and applied on some images. Those two novel techniques under evaluation are [9,10]

1. Histogram Flatness Measure (HFM)
2. Histogram Spread (HS)

These two we have utilized for image contrast enhancement performance analysis to have a quantifying measure for the notion **"low contrast low value; high contrast high value".** These two techniques HFM and HS are based on the statistical parameters of image histogram like geometric mean, quartile distance and range.

readings of regular parts per million (ppm) of the gas are to be noted. Each sensor produces an output voltage equivalent to the concentration of gas and output readings are plotted, calibration equation is obtained to record voltage signals into its equivalent concentrations in ppm. Sensors produce an output voltage which is unstable in nature and having a very low magnitude. Signal conditioning circuits were used to stabilize and increase the strength of output signal obtain from the sensors in the calibration process.

REVIEW OF SMALL-SIGNAL STABILITY ANALYSIS OF POWER SYSTEM

Digvijay V Nair[1]
[1]*FDepartment of EEE, FST-IFHE,Hyderabad*

ABSTRACT:

Various methods have been proposed for small signal stability analysis of power systems based on computations of eigen values and their sensitivities. Significant information on performance and stability of the system can be obtained using these methods. A review of small signal stability analysis using eigen values based on the published literature is presented in this paper.

Keywords—Eigen values, eigen values sensitivities, small signal stability, oscillations and damping.

INTRODUCTION:

Power system stability refers to the ability of the Power system to remain integrated so that all machines remain in synchronism when faced with small and large disturbances. Stability of a power system when subjected to small disturbances like load changes is referred to 'small signal stability'. Stability pertaining to large disturbances like loss of a machine or major faults is called 'transient stability'. Small signal stability analysis is studied using a linearized model of the power system valid around an operating point.

The problems in power system operation for small disturbances are low frequency oscillations in important variables like rotor angles, speeds, powers etc., The action of various controllers and the tuning values of their constants determines the small signal stability margins. The power system should have adequate stability margins which can be ensured with proper understanding and analysis.

This paper is organized as follows, Section 2 describes the small signal stability concepts and the phenomenon of oscillations. In Section 3, power system model in state variable form as required for eigen values based approach is given. Various methods for determining the eigen values of a large power system state variable model are discussed in Section 4. Computational approach for determining inters area oscillations are given in Section 5.

2.0 SMALL SIGNAL STABILITY

Power system oscillations involving generating machines in same area or different areas have always been of interest to researchers and power engineers. The swinging of machines leading to electro-mechanical oscillations has constantly generated interest for last several decades and numerous papers have been published in this area. Several papers [1-7]have dealt with the under-lying reasons and causes for these oscillations along-with ways of their control. These oscillations are inherent part of the system response to the changes going through the system (at all times). In the context of the present day system and near to the upper load limit that system operates oscillations become significant and should not be allowed to cause instability in the system.

Eigen values are important in analysis system stability. Small signal stability analysis is determined by eigen value calculations either direct or indirect way. The various eigen modes that causes oscillations are ones near to the jw axis are critical ones. Identifying the critical eigen values have different approaches and methods [8-10].

Modal analysis leads to generating machines and control equipments contributing significantly in the power oscillations. Eigen vectors with right eigen vector giving mode shapes and left eigen vector giving share of eigen values.

INTRODUCTION

In modern medicinal chemistry, the approach of pharmacophore hybrid for the exploration of novel and highly active compounds is an effective and commonly used direction. Pyrazolines have been found to possess broad-spectrum of biological activities[1, 2].The chemistry of pyrazolone derivatives has received much attention, because of their interesting structural properties and applications to diverse areas[3].Pyrazolin-5-ones are very important class of heterocycles, due to their potential pharmacological and biological applications[3-6]. It is well known fact that they have been used as therapeutic agents, such as anti-inflammatory[7], antibacterial[8], antifungal[9], analgesic[9], antipyretic[11,12], anti-oxidant[13], insecticidal [14], molluscicidal[7], antidepressant[15], antitubercular[16], anti HIV[17], antimalarial[18], anti cancer[19,20]and cerebral infarction (Free radical Scavenger)[21-24].The diversified applications of pyrazolin-5-ones in different fields have inspired the authors to synthesize the new pyrazolin-5-ones

EXPERIMENITAL

Instruments and Chemicals employed: pH measurements were made using the ELICO Private Limited, Hyderabad, India. IR Spectral details were obtained from a Perkin-Elmer 283 spectrometer.
All reagents used were of analytical grade procured from Merck, India. The working solutions were prepared using double distilled water. The Britton-Robinson buffer was prepared from appropriate amounts of 0.04M o-phosphoric acid, 0.04M Boric acid and 0.04M acetic acid. The solutions of desired pH values were prepared by the addition of an appropriate volume of 0.2M sodium hydroxide solution.

Synthesis of N-(Benzene sulfonyl)-3-methyl-4-(2'-substituted aryl hydrazono)-pyrazolin-5-ones: The synthesis involves the following steps:

1. **Synthesis of Benzene sulfonyl hydrazide**
   A solution of benzene sulfonyl chloride in acetone and an appropriate amount of hydrazine hydrate were treated with 5% NaOH solution. The mixture is shaken vigorously for 10 minutes, cooled and poured into 1:1 HCl. The precipitate is filtered off, washed with water and recrystallized from methanol. Melting point of the compound is 104-106^{0}C.

Abstract:
Due to the nature of various types of end-to-end mobile devices in heterogeneous network, congestion was one of the main problems in heterogeneous networks. This paper proposes a congestion aware routing approach based on the evaluation of weight value as a link cost index. The link cost evaluation considers the evaluation of buffer delay, data rate, MAC overhead and link quality. This approach uses a multipath routing approach which discovers multiple disjoint routes from a source to destination having heterogeneity between each other. Among the discovered routes, the route with minimum cost index is selected, which is based on the node weight of all the in-network nodes from the source node to the destination node. By simulation results, the proposed approach has proved that it attains high packet delivery, low routing overhead and also low end-to-end delay.

Abstract—**The wide variety of damping techniques are used to reduce the vibrations, out of them constrained layer damping (CLD) treatment is used for studying the free vibration behaviour of sandwich beams. The sandwich model is formed by placing the viscoelastic material bonded between the face and base layer. Viscoelastic sandwich beam consists of three layers with viscoelastic material as a core layer, the face layers are isotropic and linear elastic material. In this paper free vibrations of fixed free sandwich beam with different configurations are investigated analytically. Analytical solution is carried out using Euler-Bernoulli beam theory to find the natural frequencies with different configurations of the beam using MATLAB. The analytical results of the sandwich beams are to be compared with available literature values.**

Keywords — Free vibration; sandwich beam; natural frequency; CLD.

I. INTRODUCTION

A beam is a slender horizontal structural member that resists lateral loads by bending. This is an important element in engineering structures such as supporting members in high-rise buildings, railways, long-span bridges, flexible satellites, gun barrels, robot arms, airplane wings, etc. A sandwich beam is a layered assembly made from two thin, strong and stiff face sheets bonded to a lightweight core material to create light weight and strong structural element. The development of sandwich structures will continue to be demand for the need of light weight, to carry both in-plane and out-of-plane loads, good stability under compression, providing excellent stiffness to weight and strength to weight characteristics. Many types of damping mechanism have been developed to suppress the vibration level. Passive damping using viscoelastic materials is widely used in both commercial and aerospace applications. Viscoelastic materials are elastomeric whose long- chain molecules cause them to convert mechanical energy into heat when they are deformed. Banerjee [1] carried the free vibration analysis of three layered symmetric sandwich beams using the dynamic stiffness method. He used the Hamilton's principle to derive the governing partial differential equations of motion in free natural vibration that are coupled both in axial and bending deformation. Compute the natural frequencies and mode shapes of a sandwich beam using Wittrick-Williams algorithm by him. Mohammad Sedighi and Hiwa Hosseini [2] investigated free vibration of stepped Timoshenko shaft with insignificant damping using FEM with uniform and non-uniform status. In case of non-uniform Timoshenko shaft the first and third part will be uniform while the middle part is in conical form. They calculated natural frequencies and corresponding mode shape for two cases of boundary conditions namely clamped free and simply supported. They compared the obtained values with those of classical Euler Bernoulli theory results. Mohammadi and Hassanirad [3] introduced two vibration measuring instruments that is Accelerometer and RFID. They recognized RFID is more easier and simple to analyze in order to measure free vibration of a cantilever beam. Dawid Cekus [4] used Lagrange multiplier method to find the solution of the free vibration problem of the cantilever tapered beam. He carried out sample numerical calculations for cantilever tapered beam and compared with experimental values. Mohammad Zannonc [5] studied vibration of thin film cantilever beams and derived equations of equilibrium. He derived equations of frequency and mode shapes to solve for different cantilever beams for various materials. A Mat-Lab programme is developed by him to find natural frequencies and corresponding mode shapes for one layer and two layer beams with different dimensions and properties. Rajesh and Suresh Kumar [6] studied the vibration analysis of fixed free structure with different core material. They found the dynamic effect of core material in different position of sandwich structure with same volume of viscoelastic and structure materials. They found that positioning of the core material at the center has a great influence in controlling vibration of structures. Abdel Salam and Bondok [7] developed sandwich beams to calculate the flexural rigidity and dynamic characteristics. They investigated different cases of sandwich beams with multi layer cores, multi cells, different shape and orientation of holes in its cores. Results of natural frequencies and mode shapes and the static deflection of the sandwich beams were obtained by them using ANSYS and compared with analytical values. Iiodees et al. [8] presented the methods to predict the natural frequencies and mode shapes of composite beams. They solved the equations of motion in two ways i.e., finite element method and exact integration method. Natural frequencies and mode shapes for a variety of ply layups are obtained by them. I. M. Daniel et al. [9] developed simple models in order to explain the behaviour of composite sandwich as a function of material, geometric and loading parameters. They used direct observation and nondestructive evaluation to study the mechanical characterization of the sandwich constituent materials. Linear variation in strain through thickness was determined by them in both core and skin thickness. Jinhee Lee [10] employed the pseudospectral method to non-ideal boundary Timoshenko beam model for free vibration analysis where as analytical method was carried out for Euler

This is an important element in engineering structures such as supporting members in high-rise buildings, railways, long-span bridges, flexible satellites, gun barrels, robot arms, airplane wings, etc. A sandwich beam is a layered assembly made from two thin, strong and stiff face sheets bonded to a lightweight core material to create light weight and strong structural element. The development of sandwich structures will continue to be demand for the need of light weight, to carry both in-plane and out-of-plane loads, good stability under compression, providing excellent stiffness to weight and strength to weight characteristics. Many types of damping mechanism have been developed to suppress the vibration level. Passive damping using viscoelastic materials is widely used in both commercial and aerospace applications. Viscoelastic materials are elastomeric whose long- chain molecules cause them to convert mechanical energy into heat when they are deformed. Banerjee [1] carried the free vibration analysis of three layered symmetric sandwich beams using the dynamic stiffness method. He used the Hamilton's principle to derive the governing partial differential equations of motion in free natural vibration that are coupled both in axial and bending deformation. Compute the natural frequencies and mode shapes of a sandwich beam using Wittrick-Williams algorithm by him. Mohammad Sedighi and Hiwa Hosseini [2] investigated free vibration of stepped Timoshenko shaft with insignificant damping using FEM with uniform and non-uniform status. In case of non-uniform Timoshenko shaft the first and third part will be uniform while the middle part is in conical form. They calculated natural frequencies and corresponding mode shape for two cases of boundary conditions namely clamped free and simply supported. They compared the obtained values with those of classical Euler Bernoulli theory results. Mohammadi and Hassanirad [3] introduced two vibration measuring instruments that is Accelerometer and RFID. They recognized RFID is more easier and simple to analyze in order to measure free vibration of a cantilever beam. Dawid Cekus [4] used Lagrange multiplier method to find the solution of the free vibration problem of the cantilever tapered beam. He carried out sample numerical calculations for cantilever tapered beam and compared with experimental values. Mohammad Zannonc [5] studied vibration of thin film cantilever beams and derived equations of equilibrium. He derived equations of frequency and mode shapes to solve for different cantilever beams for various materials. A Mat-Lab programme is developed by him to find natural frequencies and corresponding mode shapes for one layer and two layer beams with different dimensions and properties. Rajesh and Suresh Kumar [6] studied the vibration analysis of fixed free structure with different core material. They found the dynamic effect of core material in different position of sandwich structure with same volume of viscoelastic and structure materials. They found that positioning of the core material at the center has a great influence in controlling vibration of structures. Abdel Salam and Bondok [7] developed sandwich beams to calculate the flexural rigidity and dynamic characteristics. They investigated different cases of sandwich beams with multi layer cores, multi cells, different shape and orientation of holes in its cores. Results of natural frequencies and mode shapes and the static deflection of the sandwich beams were obtained by them using ANSYS and compared with analytical values. Iiodees et al. [8] presented the methods to predict the natural frequencies and mode shapes of composite beams. They solved the equations of motion in two ways i.e., finite element method and exact integration method. Natural frequencies and mode shapes for a variety of ply layups are obtained by them. I. M. Daniel et al. [9] developed simple models in order to explain the behaviour of composite sandwich as a function of material, geometric and loading parameters. They used direct observation and nondestructive evaluation to study the mechanical characterization of the sandwich constituent materials. Linear variation in strain through thickness was determined by them in both core and skin thickness. Jinhee Lee [10] employed the pseudospectral method to non-ideal boundary Timoshenko beam model for free vibration analysis where as analytical method was carried out for Euler

performance of routing protocols AODV, CBRP and DSR using Network Simulator-2 Recent developments in WSNs had directed to the advances in real-time (RT) applications. The researchers have proposed some real time delivery schemes for Wireless Sensor Networks. Various challenges and issues in providing real-time communication in WSNs [7] [8]. The earliest real-time routing protocol for the addressing the Wireless Sensor Networks is the Routing Awareness Protocol (RAP) [9]. Admittedly, the SPEED protocol [10] is the most significant real-time routing protocols which is an inspiration to several other RT routing protocols.

III. TYPES OF ROUTING PROTOCOLS

Routing protocols in WSNs[11] are classified based on the method used to acquire the information, maintain the information and also on the basis of identification of the path from the source node to a destination node [12].

Proactive Protocols [13]

These protocols are table driven protocols which maintain accurate routing tables of all nodes present in the network and all routes are computed before their usage.

Reactive Protocols [13]

Reactive routing protocols do not preserve the data of all the clients of a network . Based upon demand the route is made between the source and destination by using the route query before route establishment.

Dynamic Source Routing [14]

DSR is a straightforward and well-organized protocol intended for multi-hop wireless networks with movable nodes.The system is entirely self-configuring and organizing with no requirement of physical infrastructure or supervision. The DSR routing protocol is comprised of two important procedures (i) detection and (ii) preservation of source routes in the system.

Ad-hoc On-Demand Distance Vector [15]

AODV is a reactive routing protocol where the paths from the source nodes to the destination are identified when there is a necessity of requirement. The five messages used for the communication through AODV routing protocol are (i) Hello message, (ii) Route Request (RREQ) message (iii) Route Reply (RREP) and (iv) Route Error (RERR) message.

IV. SPEED ROUTING PROTOCOL

SPEED [10] is a stateless protocol for the real-time communications. It is an adaptive, location-based which can be used effectively if all sensor nodes have the location information[16] and location updates are delivered regularly to the source sensors. By the novel combination of feedback control and non-deterministic QoS aware geographic forwarding [17], it imposes a consistent speed at each node in the network. SPEED first finds out the neighbour's information by exchanging communication delay of single hop with neighbours to choose a path based on local geography and communication speed data. By reverse pressure routing method, it avoids big delay links and routing traps. In SPEED, a node dynamically controls the data rate for the congestion free by maintaining a relatively stable relay speed to each neighbour.

SPEED [10] is a routing protocol for real-time communication in WSNs. It allows soft communication based on stateless algorithms and feedback control which minimizes the end-to-end delays, the deadline-miss ratio in a WSNs. SPEED moreover allows three types of real-time communication services: unicast, multicast and anycast. It employs the localized routing decisions to identify the routing paths and the direction finding unit in SPEED is termed as Stateless Non- Deterministic Geographic forwarding (SNGF). It coordinates with four units at the network layer [10], as depicted in Fig 1.

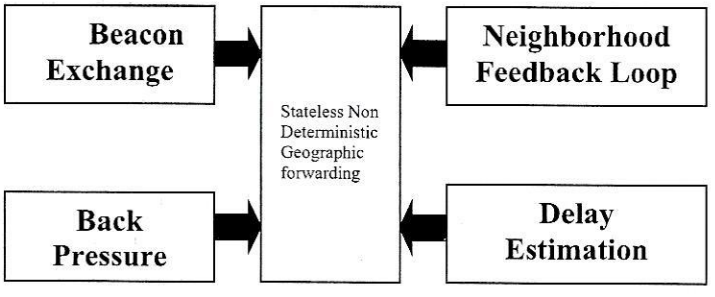

Fig.1 Routing Mechanism in SPEED Protocol

Mechanism of Beacon exchange is to collect data of nodes along with their locations in the network. A data packet is transmitted from the node to the neighbouring nodes to receive the ACK response to estimate the delay at every node. Stateless Non- Deterministic Geographic forwarding method identifies the nodes to match the speed constraint by calculating the delay values.

Neighborhood Feedback Loop (NFL) calculates the relay, ratio of each node and is given as input to the SNGF unit. Relay ratio is estimated by the miss ratios of all the neighbouring nodes for a given node which is not able to offer the required and preferred speed. If relay ratio is less than a defined value between 0 and 1, the data packet is dropped. The role of the back pressure-rerouting unit is to avoid voids and to remove congestion by transferring back the information to the originated node such that they will identify the new paths.

The SPEED protocol rapidly drains the energy[19] of various nodes present in the network. SPEED protocol is not feasible

PAIRED FASTER FFT: GRIGORYAN FFT IMPLEMENTATION AND PERFORMANCE ON XILINX FPGAS AND TMS DSPS

Ranganadh Narayanam*, Artyom M. Grigoryan, Parimal A. Patel, Bindu Tushara D

DOI: 10.5281/zenodo.55536

ABSTRACT

Discrete Fourier Transform is a principal mathematical method for the frequency analysis and has wide applications in Engineering and Sciences. Because the DFT is so ubiquitous, fast methods for computing DFT have been studied extensively, and continuous to be an active research. The way of splitting the DFT gives out various fast algorithms. In this paper, we present the implementation of two fast algorithms for the DFT for evaluating their performance. One of them is the popular radix-2 Cooley-Tukey fast Fourier transform algorithm (FFT) [1] and the other one is the Grigoryan FFT based on the splitting by the paired transform [2]. We evaluate the performance of these algorithms by implementing them on the Xilinx Virtex-II Pro [6], Virtex-4[9] and Virtex-5[7] FPGAs, by developing our own FFT processor architectures. We have evaluated the performances also by implementing on Texas Instruments fixed point DSP processors: TMS320C5416[17], TMS320C6748[17], TMS320C5515[17]. Finally we show that the Grigoryan FFT is working faster than the Cooley-Tukey FFT, consequently it is useful for higher sampling rates. Operating at higher sampling rates is a challenge in DSP applications. We proved that on Xilinx FPGAs and TMS DSPs, the Grigoryan FFT is performing at most 1.358 and 1.7 times faster than the Cooley-Tukey FFT respectively. We also confirm that for the same architectures Virtex-5 platform is better platform for implementing the Grigoryan FFT.

KEYWORDS: frequency analysis, fast algorithms, DFT, FFT, paired transforms, SIMULINK, CC Studio.

INTRODUCTION

In the recent decades DFT has been playing several important roles in advanced applications such as image compression and reconstruction in biomedical images, audiology research for analyzing biomedical brain-stem speech signals, sound filtering, data compression, partial differential equations, and multiplication of large integers. The fast algorithms for DFT always look for DFT process to be fast, accurate and simple. Fast is the most important [10]. FFT is universal in signal processing, but it can also be used to compress image and audio files, solve differential equations and price stock options, among other things.

Since the introduction of the fast Fourier transform (FFT), Fourier analysis has become one of the most frequently used tool in signal/image processing and communication systems; The main problem when calculating the transform relates to construction of the decomposition, namely, the transition to the short DFT's with minimal computational complexity. The computation of unitary transforms is complicated and time consuming process. Since the decomposition of the DFT is not unique, it is natural to ask how to manage splitting and how to obtain the fastest algorithm of the DFT. The difference between the lower bound of arithmetical operations and the complexity of fast transform algorithms shows that it is possible to obtain FFT algorithms of various speed [2]. One approach is to design efficient manageable split algorithms. Indeed, many algorithms make different assumptions about the transform length [2]. The signal/image processing related to engineering research becomes increasingly dependent on the development and implementation of the algorithms of orthogonal or non-orthogonal transforms and convolution operations in modern computer systems. The increasing importance of processing large vectors and parallel computing in many scientific and engineering applications require new ideas for designing super-efficient algorithms of the transforms and their implementations [2].

Abstract

Hybrid watermarking techniques are gaining importance in the field of image watermarking as they meet criterions like Imperceptibility and Robustness. A novel approach for the hybrid color image watermarking using Cycle Spinning based Sharp Frequency Localized Contourlet Transform (CS-SFLCT) and Principal Component Analysis is proposed. Contourlet Transform (CT) is applied to decompose the images into various sub bands for all the color spaces of both the host and water mark images. For inclusion operation principal components of middle band(X bands) are considered and CS-SFLCT is chosen for watermarking. CS-SFLCT provides better frequency localization resulting in a very good PSNR and Principal Component's helps in fruitful extraction of watermark from the host image. This hybrid technique has shown better correlation between input watermark and extracted one and shown very high very high robustness under various intentional and non intentional attacks.

Abstract

Gasification of high ash coals and controlling resulting emissions is a challenging task. Effective utilization of these coals depends on proper selection of operating conditions. This paper is aimed at comprehensive analysis of effect of operating conditions on the gasification of a high ash Indian (Jharia) coal with two-fold objectives of maximizing syngas heating value and reducing CO_2 emissions. An ASPEN Plus model is developed to simulate the gasification process and simulation results are validated with experimental data available in literature. The simulated results are in good agreement with experimental results with less than 10% error.

In the first stage the sensitivity analysis of four operating conditions viz., Equivalence Ratio (ER), Steam-to-Coal Ratio (SCR), Gasifier Temperature, and Gasifier Pressures is performed. A design specification Limiting Air Flow Rate (LAFR) is used for effective carbon conversion and reduced emissions. Gasification temperature is the most influencing parameter among all parameters, followed by ER and SCR. Gasification pressure has no significant effect on syngas composition. The results clearly indicate that a lower ER and SCR are favorable for formation of maximum amount of combustible gases (H_2, CO) and minimum amount of CO_2. Different combination of ER and SCR in the specified ranges were examined. In all cases, the maximum efficiency is attained in a temperature range of 600 °C to 900 °C. In the second stage these parameter are optimized with an objective of maximizing the heating value of syngas and minimizing CO_2 emissions. Both normal and constraint based optimization is performed. In constraint based optimization, a constraint of CO_2 mole fraction less than 1% is imposed. Optimum parametric domains for maximum efficiency are presented.

Keywords: Coal gasification, high ash coals, sensitivity analysis, optimization, equivalence ratio, steam to coal ratio, limiting air flow rate, minimum steam flow rate

Nomenclature

ER	Equivalence Ratio
SCR	Steam to Coal Ratio
HHV	Higher Heating Value (MJ/Nm^3)
CGE	Cold Gas Efficiency
M	Moisture (wt.%)
VM	Volatile Matter (wt.%)
FC	Fixed Carbon (wt.%)
ΔH_o	Enthalpy of formation (kJ/mol)
GCV	Gross Calorific Value of coal (MJ/k
LAFR	Limiting Air Flow Rate

INTRODUCTION

Gasification is process of converting carbonace high calorific value gases like H_2, CO and CI efficient and eco-friendly process of utilizing fo biomass fuels [1]. The product gas of gasificati called syngas consisting of mainly H_2, CO and ot CH_4, CO_2, SO_x and NO_x in smaller quantities. T used for power generation and for producing products. Indian coals contain high amount of a them difficult to use for direct combustion. Ga good alternative to exploit these resources generation. One of the metrics of gasification gasification efficiency which primarily depend fuel gases H_2 and CO present in syngas. Gasifica complex chemical reactions and depends on seve gasifier design, fuel properties, gasifying age conditions like flow rate of gasifying agent, temperature, pressure, equivalence ratio, etc.

In the past decade many researchers worked on the effect of various parameters and operating

ABSTRACT
The onset of non linear double diffusive convection in a couple stress fluid with rotation modulation is studied using a truncated representation of Fourier series. The resulting non-autonomous Lorenz model is solved numerically using of Fourier series. The Fehlberg45 method to qualify the heat and mass transport.
Keywords: Double diffusive convection,Lorenz Model,Rotational Modulation.Couple Stress Fluid.

Date of Submission: 18 -07-2017 Date of acceptance: 31-07-2017

I. INTRODUCTION.

The problem of double diffusive convection in porous media has attracted considerable interest during the last few decades because of its wide range of applications, from the solidification of binary mixtures to the migration of solutes in water-saturated soils.Other examples include geophysical systems, electro-chemistry, and the migration of moisture through air contained in fibrous insulation.A comprehensive review of the literature concerning natural convection in fluid-saturated porous media may be found in the books by Ingham and Pop [1, 2], Nield and Bejan [3].

Although the problem of Rayleigh-Benard convection has been extensively investigated for Newtonian fluids, relatively little attention has been devoted to the thermal convection of non-Newtonian fluids. The corresponding problem in the case of a porous medium has also not received much attention until recently. With growing importance of non-Newtonian fluids with suspended particles in modern technology and industries, the investigations of such fluids are desirable. The study of such fluids have applications in a number of processes that occur in industry, such as the extrusion of polymer fluids, solidification of liquid crystals, cooling of metallic plate in a bath, exotic lubrication and colloidal and suspension solutions. In the category of non-Newtonian fluids couple stress fluids have distinct features, such as polar effects. The theory of polar fluids and related theories are models for fluids whose microstructure is mechanically significant. The constitutive equations for couple stress fluids were given by Stokes [4]. The theory proposed by Stokes is the simplest one for micro-fluids, which allows polar effects such as the presence of couple stress, body couple and non-symmetric tensors.

The Rayleigh-Benard situation is often used in rheomatric applications and hence the consideration of the effects of rotational modulation in the control of convection is important from the point of view of applications. In many practical situations, by modulating one of the controlling parameters it is possible to delay or advance the onset of convection. The studies due to Venzian[5],Bhadauria and Khan [6], and pranesh and Sangeetha [7],Malashetty and Padmavati [8] are few examples of problems involving the modulation effect. None of the works, however, quantify the heat and mass transfer. The main objective of this paper is to perform the non-linear stability analysis of double diffusive convection in presence of the modulation of rotational speed in a couple stress fluid using the minimal representation of Fourier series.

II. MATHEMATICAL FORMULATION

We consider a viscous, incompressible two component fluid layer of thickness d and infinite extent in the horizontal direction subject to an adverse temperature gradient and a stabilizing concentration gradient. A Cartesian coordinate system is chosen with the origin in the lower boundary and z-axis vertically upward. In this paper Oberbeck-Boussinesq approximation is assumed to be valid. The sinusoidal applied modulation on the rotation speed is $\omega(t) = \Omega_0 (1 + \varepsilon \cos \omega t)\hat{k}$

Where $\Omega(t)$ represents the Z-component of the rotation speed, ε is he amplitude of modulation

Abstract: Text mining is a branch of artificial intelligence. Text mining allows searching the data to extract valuable information. There are many techniques available to mine the text. Efficient text mining techniques are surveyed and compared in this paper. The methods involved in text mining are classification and clustering. Classification or categorization methods use keywords to classify the documents. Clustering uses similarity based search to find the similar documents. These two methods are providing powerful tools to mine text data. Text mining is an emerging area in computer science and is used to access large quantity of unstructured text efficiently. By using techniques like categorization, entity extraction, sentiment analysis etc, efficient text mining can be implemented. These methods are useful to extract useful information and knowledge from hidden text content.

Keywords: Text mining, entity extraction, sentiment analysis, categorization

1. Introduction

Text mining is an emerging area in computer science and is used to access large quantity of unstructured text efficiently. By using techniques like categorization, entity extraction, sentiment analysis etc, efficient text mining can be implemented. These methods are useful to extract useful information and knowledge from hidden text content. Text mining allows searching the data to extract valuable information. There are many techniques available to mine the text. Efficient text mining techniques are surveyed and compared in this paper. The methods involved in text mining are classification and clustering. Classification or categorization methods use keywords to classify the documents. Clustering uses similarity based search to find the similar documents. Abstract

Random graphs are extensive, in addition, it is used in several functional areas of research, particularly in the field of complex networks. The study of complex networks is a useful and active research areas in science, such as electrical power grids and telecommunication networks, collaboration and citation networks of scientists,protein interaction networks, World-Wide Web and Internet Social networks, etc. A social network is a graph in which n vertices and m edges are selected at random, the vertices represent people and the edges represent relationships between them. In network analysis, the number of properties is defined and studied in the literature to identify the important vertex in a network. Recent studies have focused on statistical and structural properties such as diameter, small world effect, clustering coefficient, centrality measure, modularity, community structure in social networks like Facebook, YouTube, Twitter, etc. In this paper, we first provide a brief introduction to the complex network properties. We then discuss the complex network properties with values expected for random graphs.

Abstract

Ceria–titania doped highly ordered hexagonal and cubic mesoporous silica composite samples with varying amounts of Ce and Ti have been synthesized using hexadecyltrimethylammonium bromide (CTAB) surfactant as a template under basic conditions in the presence of ammonia. The removal of the template resulted in the formation of mesoporous composites doped with Ce and Ti, which were thoroughly characterized *via* small-angle X-ray scattering (SAXS), wide-angle X-ray diffraction (WAXRD), N_2 adsorption, scanning and transmission electron microscopy analysis with energy-dispersive spectrometry mapping (SEM-TEM-EDS), inductively coupled plasma atomic emission spectrophotometry (ICP-AES), and ultraviolet-visible diffuse reflectance spectrometry (UV-visible). The electronic states of Ti and Ce species present on the surface of silica were also investigated by X-ray photoelectron spectroscopy (XPS). The catalytic activity of these Ti-modified ceria–silica samples for the photodecomposition of rhodamine B under visible-light irradiation was investigated. The results revealed that a sample with a higher Ti content, as well as equal amounts of Ce and Ti, displayed higher catalytic activity for the photodegradation of the organic dye rhodamine B.

Abstract

With the widespread application of carbon fibre-reinforced polymer (CFRP) composites, mostly in defence, automotive, and aerospace industries, the machining of those materials has become a major concern today. As the machinability of those composites differs from the conventional metals, a proper understanding of process behaviour and identification of the favourable machining environment (optimal setting of process parameters) are indeed necessary to improve product quality. The present work highlights the application potential of a multi-response optimization route by integrati

Manufacturing and Testing of Braking Material-Amc 3

By Shaik Himam Saheb & M. Naveen Kumar
ICFAI University

Abstract- Braking system is an integral part of automobile mechanism. for certain unique automobiles like go-kart systems, the braking system must be designed with accurate and material importance. this is done to keep in accordance with various parameters such as economy and weight of the automobiles etc. the braking systems have to provide enough force in order to decelerate by completely locking the wheels. the report concentrates on explaining the engineering aspects of designing a braking system and its material for go-kart. this report explains objectiveness, assumptions and calculations made in designing a go-kart braking system.

A comparative study for the braking system made of grey cast iron (i.e; conventional material), Ti-alloy, 7.5 wt% WC and 7.5wt% TiC reinforced Ti-composite and 20% SiC reinforced Al-Cu alloy (AMC1) and 30% SiC reinforced Al-Cu alloy (AMC2) was done. The purpose of this project was to analyze the test results and implement a better perspective for the installation of braking system in a Go-Kart automobile mechanism. The test parameters considered are compressive strength, coefficient of friction, wear rate, specific heat, specific gravity etc. which are believed to be the most important parameters for the operation of a braking system.

Design and Analysis of Light Weight Agriculture Robot

Shaik Himam Saheb, G. Satish Babu

Abstract

Agriculture is the main source of food for human beings living on earth. The farmer who works in field facing lots o problems due to lack of machinery equipment and human labour. Agriculture robot which is light in weight, having high payload capacity with high speed and stability all these can be controlled in field using programming techniques fully. The body frame of Agriculture robot is made of glass fiber, which is lighter in weight and strength t weight ratio is high compared to the conventional materials like steel or aluminum. A dynamic model for a multipurpose Agriculture robot which is made of flexible parts will be developed. Drone acts as the main body controlling all works in fields providing the tasks which are controllable. Agriculture robot main task is to perform seed sowing of any agricultural crop mainly we have done work on maize crop. Agriculture robot may be furthe developed accordingly for the applications of other crops like cotton, mango, onions, and groundnut and also developed for Can performing tasks like plants spraying, cutting, pitting holes, harvesting, security causes, and inspecting crop. In air Agriculture robot works with all necessary operations of Pitch, Yaw and Roll and covers the future applications in different Missions.

Fuzzy logic switching controller (FLSC)
Induction motor (IM)

ABSTRACT

This paper presents improvements in Direct Torque control of an induction motor using Fuzzy logic with Fuzzy logic and neural network based duty ratio controller. The conventional DTC (CDTC) of induction motor suffers from major drawbacks like high torque and flux ripples and poor transient response. Torque and flux ripples are reduced by replacing hysteresis controller and switching table with Fuzzy logic switching controller (FDTC). In FDTC the selected switching vector is applied for the complete switching time period. The FDTC steady state performance can be improved by using duty ratio controller, the selected switching vector is applied only for the time determined by the duty ratio (δ) and for the remaining time period zero switching vector is applied. The selection of duty ratio using Fuzzy logic and neural networks is projected in this paper. The effectiveness proposed methods are evaluated using simulation by Matlab/Simulink.

1. INTRODUCTION

Direct Torque and Flux Control of induction motor popularly known as DTC (Direct Torque control) was introduced by Takahashi and Naguchi for quick response and high efficiency of induction motor [1-2]. Over the years DTC emerged as an alternative to FOC (Field Oriented Control) due to advantages like absence of co-ordinate transformations, current loops and separate voltage modulation block [3-4]. However, conventional DTC (CDTC) suffers from major drawbacks like high torque and flux ripples predominantly at a) low speed and start-up [5-7] b) Variable switching frequency varies according to motor speed, hysteresis bans in torque and flux loops [5-6] c) current and torque distortion when sector changes [7]. In order to overcome the disadvantages several techniques are developed by researches during like direct self-control, DTC with SVM and DTC-SVM with Neuro-Fuzzy logic controllers as given in [8]. Improved CDTC with multi-level inverters, matrix inverters and sensorless drive are proposed in [9-11]. The application of AI techniques like Fuzzy logic, Neural Networks, Neuro-Fuzzy in Direct Torque control gained great attention in late years. The execution of the CDTC switching table with Fuzzy is given in [8], [12-15] which results in reduction of torque and flux ripples. The implementation of DTC with Neuro Fuzzy controller is given by [7], [16] and using ANN is given in [17-19]. Torque ripple reduction in DTC using simple duty ratio controller is first proposed in [20]. The duty ratio algorithm proposed by [21] demonstrates that active voltage vector is given only for a part of sampling period while zero voltage vector is applied for remaining time period results in torque ripple reduction. Implementation of Fuzzy logic duty ratio controller help to

Abstract:

Biometrie systems have become a vital part of our present day automated systems. Every individual has its unique biometrie features in terms of Face, Iris and periocular regions. Identification/Recognition of a person by using these biometrie features is significantly studied over the last decade to build robust systems. The periocular region has become the powerful alternative for unconstrained biometrics with better robustness and high discrimination ability. In the proposed paper local descriptor Local Binary Patterns (LBP), is used for the feature extraction of discriminative features from the regions of full face, periocular and city block distance is used as a classifier. FRGC and FERET databases are utilized for the experimentation to compare the performance of both periocular and face biometric modalities and it showed that the periocular region has a similar level of performance of the face region using only 25% data of the complete face.

Abstract:

In this paper, we presented the design of low-cost, compact and wireless 12 lead Electrocardiogram analog front-end (AFE) system using TI ADS 1198. ECG analog front-end (AFE) systems are designed with ASICs or custom designed ICs which are too expensive to be used. The main components of a conventional ECG system include instrumentation amplifiers, operational amplifiers that implement active filters and analog-to-digital converters (ADCs). There has been high demand for the development of low-cost ECG systems as the market requires systems more and more affordable. We presented used the latest high-performance delta-sigma (ΔΣ) ADCs from Texas Instruments (ADS1198) as components of an ECG AFE system to optimize the cost from a system design perspective. The main parts of the present work are

Abstract- In the process of image retrieval, more information can be extracted by combining two or more features. Feature vectors based on local patterns are very popular in deriving the local information present in an image. Majority of these methods are mainly based on encoding the variation in gray scale values of centre pixel and its neighboring elements. The centre pixel is assigned a value that gets reflected in a Histogram. LBP operator became the first of its kind where the intensity value of centre pixel is treated as threshold to capture the information by comparing with other neighbors. However, the information directions are not explored in the method The DLEPs are proposed to code the edge information mainly in four directions. The performance of Directional local extrema patterns can be improved by taking the magnitude into consideration. In this paper, we propose a new method to improve the performance of the retrieval system with the help of Hadoop framework. The main objective is distribution of image data over a large number of nodes over Hadoop using Map Reduce Technique. Hadoop defines a framework which allows processing on distributed large sets across clusters of computer.

Keywords- Color, LBP, DLEP, MDLEP,image retrieval, Hadoop, Mapreduce, precision, recall

1. Introduction

In recent times, due to substantial growth in few areas of digital electronics and the Internet more and more images are generated every moment around the world. These images cannot be utilized effectively for various purposes unless there is a system to manage the database. Therefore, a system is required to search and index the data for various purposes. Initially, manual annotation was followed in indexing and searching process .However, conventional text based method becomes ineffective when dataset is large. CBIR became an eye catching area for many researchers across the world to resolve the issues of existing methods. In this method, the visual contents like texture ,color, shape etc., are taken out to make the signature or the vector .The resemblance of query image with data base image is considered to explore similar images out of the dataset. In fact, capability of CBIR system mainly relies upon the method to extract characteristics like texture color, , shape, layout etc., [1]-[3].

Among various visual features specified, color and texture provides more discriminating information possessed by an image. The most useful feature of an image is the color since the eye is much sensitive to all colors. Many researchers used various methods to get color feature. Texture is another which deals with the repetitive patterns of any image. Classification and segmentation became very critical in analyzing the texture of an image. In the work [4], use of texture property to classify image was mentioned . Arivazhagan etal [5] presented an approach to classify the texture that uses wavelet transform. WPF and GMM was specified in [6] to classify the texture and segmentation. Gabor wavelets played an important role in classifying the texture for rotation invariant feature because of their closeness to the human visual syatem [7].

1.1 Our contribution

Existing Magnitude Directional Local pattern extrema (MDLEP) extracts directional and magnitude data of edges as per the minima or maxima in vertical, horizontal, diagonal, anti diagonal directions of image. In the paper, a new method is proposed that combines color feature , MDLEP and Hadoop framework to improve the output of existing MDLEP. The paper is arranged as follows. Different kinds of local patterns that are related to the work are reviewed in section 2. Section 3 mentions proposed approach for image retrieval. Sec. 4 shows results and the discussions and conclusions are provided in section 5.

RFID Security Access Control System

Pargi Pradeep
B.Tech
ICFAI University.

Movva Pavani, M.Tech
Assistant Professor
ICFAI University.

Introduction

RFID is an acronym for Radio Frequency Identification. RFID is one member in the family of Automatic Identification and Data Capture (AIDC) technologies and is a fast and reliable means of identifying just about any material object. This project can be used for security purpose where it gives information about the authorized persons and unauthorized persons.

This can be applied in real time systems as such in recording the attendance, in the companies and in industries to know who are authorized. RFID is increasingly used with biometric technologies for security. Primarily, the two main components involved in a Radio Frequency Identification system are the Transponder (tags that are attached to the object) and the Interrogator (RFID reader).

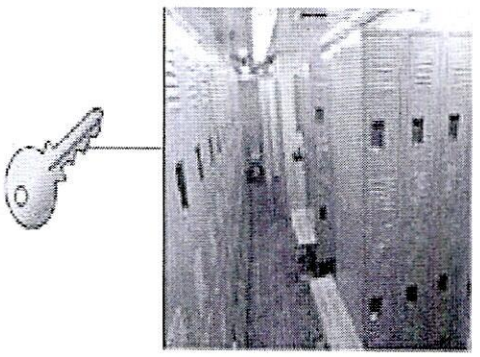
Communication between the RFID reader and tags occurs wirelessly and generally doesn't require a line of sight between the devices.

Existing system

A **locker** is a small, usually narrow storage compartment. They are commonly found in dedicated cabinets, very often in large numbers, in various public places such as locker rooms, workplaces, middle and high schools, transport hub and the like.

They vary in size, purpose, construction, and security.In the present system to get access for any sort of such place is by using key to the fixed locker.

Drawback: This can be duplicated with ease.



Here RFID card acts as key

Proposed system

In this project, the RFID module reader typically contains a module (transmitter and receiver), a control unit and a coupling element (antenna). This module is interfaced with the micro controller and when the card is brought near to the RFID module it reads the data in the card and displays on the LCD. If the data in the card is matched with the data in the program memory then it compares and displays a message that the person is authorized. If the data is not matched it displays unauthorized. For authorized message, the door gets opened and the person gets in after sometime the door gets closed. If it is an unauthorized person it alerts the others through a buzzer.

The RFID module indicates a buzzer whenever it reads the data from the RFID card.

I. INTRODUCTION

Text mining is an emerging area in computer science and is used to access large quantity of unstructured text efficiently. By using techniques like categorization, entity extraction, sentiment analysis etc, efficient text mining can be implemented. These methods are useful to extract useful information and knowledge from hidden text content. Text mining allows searching the data to extract valuable information. There are many techniques available to mine the text. Efficient text mining techniques are surveyed and compared in this paper. The methods involved in text mining are classification and clustering. Classification or categorization methods use keywords to classify the documents. Clustering uses similarity based search to find the similar documents. These two methods are providing powerful tools to mine text data.

II. TEXT MINING METHODS

The methods involved in text mining are classification and clustering. Classification or categorization methods use keywords to classify the documents. Clustering uses similarity based search to find the similar documents. These two methods are providing powerful tools to mine text data. Under classification, Index term selection, Navie Bayes classifier, nearest neighbor classifier, Decision trees, Support vector methods and kernel methods are studied in this paper. Under clustering, statistical measures, mean square error and Silhouette coefficient methods are studied in this paper.

Classification

Classification or categorization methods use keywords to classify the documents. In this method whenever somebody is searching for a topic then task execution starts with training set DOC={doc_1,doc_2,…….doc_n) of documents, these documents are already given with their class names. In classification accuracy can be measured as follows:

$$accuracy = \frac{correctly\ classified\ documents}{total\ number\ documnets}$$

To get high accuracy because the target class covers only a small percentage of documents precision and recall are introduced. Classification precision and recall can be measured as follows:

$$precision = \frac{(number\ of\ relevant) \cap (number\ of\ retrieved)}{number\ of\ retrieved}$$

$$recall = \frac{(number\ of\ relevant) \cap (number\ of\ retrieved)}{number\ of\ relevant}$$

There are some issues regarding precision and recall. If the documents with high degree are assigned to target class means precision is high and if the search is more exhaustive means recall is high. In both the cases text mining cannot be done efficiently. To compromise precision and recall there is a factor called F-score can be represented as:

Hadoop Based Image Retrieval Using CDLEP and Gabor Features

P Rohini1[1] L Koteswara Rao[2]
[1,2]Assistant Professor
[1,2]Department of Computer Science & Engineering
[1,2]IFHE University, Hyderabad, India

Abstract— The Directional Extrema Patterns are used to encode the relationship between the centre pixel and its neighbors by computing the edge information in four directions. The proposed work focuses on developing a feature vector for CBIR system with the combination of color DLEP and Gabor features to make the final feature vector. Local Binary Pattern (LBP) operator has become very useful in image retrieval, where a centre pixel is compared with surrounding pixels to obtain a feature vector. However, the directions are not obtained in this method. In this paper, we propose a new method to improve the performance of the retrieval system with the help of Hadoop framework. The main objective is distribution of image data over a large number of nodes over Hadoop using Map Reduce Technique. Hadoop defines a framework which allows processing on distributed large sets across clusters of computer.

Key words: Color, Gabor Filters, LBP, DLEP, Image Retrieval, Hadoop, Mapreduce, Precision, Recall

I. INTRODUCTION

In recent times, due to the rapid growth in the Internet and allied areas huge number of images are created and stored across the globe in every second. Hence there is a need for a system which can search and index the images for various applications. The conventional text based annotation method becomes inefficient when the database size is large. Content based image retrieval(CBIR), has become an active area of research as an alternative to the existing methods in which, the visual contents such as color, texture, shape etc., are extracted to form a feature vector .The similarity between query image and the data base image is measured to retrieve more relevant images from the database. However, the efficiency of any CBIR system depends on the extraction of features such as color, texture, shape etc., to index and retrieve the images [1]-[3].

Among the features mentioned ,texture provides more discriminating information.It is a visual feature that refers to the innate properties of the surface in an object and the relationship to the surrounding environment. Many techniques to classify and segment the texture can be found in the literature based on statistical analysis and structural methods. In[4],use of texture feature for classification of images was discussed. Arivazhagan et al[5] proposed texture classification using wavelet transform. In [6] texture classification and segmentation was proposed using wavelet packet frames and Gaussian mixture model. Gabor wavelets were used in texture classification for rotation invariant features[7].

Gabor filters have been used in the field of Image processing and texture analysis[10] for many years .It is a linear, band pass filter which is similar and close to human visual system. It gives the spatial frequency information.

A. Contribution

The existing directional local extrema pattern (DLEP) derives the directional edge information based on local extrema in 0°, 45°, 90°, and 135° directions of an image. In this paper, we propose combination of features such as color DLEP and Gabor to improve the performance of the existing Directional Local Extrema Pattern. The organization of this paper is as follows. The Section II reviews different types of local patterns .Section III explains Gabor feature. Section IV covers the proposed work for retrieval system. Section V contains the results. The conclusions are given in section VI.

In the proposed system we COMBINE CDLEP AND GABOR FEATURES for the efficient and effective retrieval of the image which incorporated with Map-Reduce framework such as Hadoop for fast calculation and return the result in shorter time. The Map-reduce framework works in parallel manner which processes on very large image collection of petabyte of storage.

B. Related work

A method based on Local Binary Pattern was introduced by Ojala et. al [8],the concept of LBP was extended to face recognition and other applications in [9].However, LBP has the limitation of rotational invariance in classifying the texture present in an image. Local Derivative pattern by considering the nth order Local Binary Pattern was proposed by Zhang et. al[11]. Subramanyam et al[12] proposed Directional Local Extrema Pattern as a feature vector for texture analysis of an image. An improvement to DLEP was proposed by Koteswararao et al [14],[15]. The DLEP is different from the existing Local patterns and other extensions in terms of directional information.

II. LOCAL PATTERNS AND VARIATIONS

A. Local Binary Pattern (LBP)

Local binary pattern was introduced by T Ojala [8] .In this, the value of the centre pixel is considered as threshold and the difference between centre pixel and its surrounding neighbors is taken into consideration to assign a binary 0 or 1. The method is repeated till all the pixels surrounding the centre pixel are covered in the process.

$$LBP_{P,R} = \sum_{p=0}^{p-1} k(g_p - g_c)2^p, k(x) = \begin{cases} 1 & x \geq 0 \\ 0 & x < 0 \end{cases}$$

where g_c represents the gray value of center pixel and g_p represents the gray value of P equally spaced pixels on circumference of the circle with radius R.

B. Local Directional Pattern (LDP)

Local Directional Pattern[14] is based on LBP which uses the edge response of neighborhood pixels in order to encode the texture in an image. It assigns an eight bit binary code to each pixel of an input image.

ABSTRACT

The injury caused by trauma, burns, or disease often results in soft tissue getting damaged which leads to improper function and permanent destruction in human body. For regeneration of damaged tissue, temporary structures are required to guide the growth of new tissue. These structures are known as scaffolds. Scaffold must provide temporary mechanical function within a tissue defect during tissue regeneration.The scaffolds have three-dimensional porous structures. This porous scaffold with interconnected network is needed to guide cell attachment and growth. Additive Manufacturing or popularly known as 3D Printing is an innovative technology that allows complex physical prototypes to be directly constructed from 3D-CAD model. It is widely used in many applications including in medical applications such as tissue engineering. The aim of this research work is to design and fabricate a bio medical scaffold for soft tissue using FDM 3D printing technology that helps to improve the growth of new tissue. The tissue considered in this work is soft tissue i.e. human skin.

KEYWORDS: Scaffold, Tissue Engineering, Additive, Manufacturing, Fused Deposition Modeling

Tissue engineering is an emerging area of science. It's a novel, interdisciplinary field that combines basic principles of engineering and biology in order to replace or improve biological functions. Referring to clinical applications, the most important goal of tissue engineering is to overcome the numerous limitations of current treatments that are based on organ transplantation and biomaterial implantation. Tissue Engineering involves basically three elements: scaffolds, cells and biomolecules. Therefore, it is necessary to carefully choose which combination better fits for the desired application [1].Tissue engineering uses support structures or scaffolds for regeneration of tissue.The scaffold should contain interconnected holes to satisfy required porosity level. Porosity is an essential parameter to ensure sufficient supply of nutrients and metabolites. The design of the scaffold plays an important role in maintaining the strength of the scaffold. CAD software is used to create many such porous structure models with different pore size. The scaffold is required to be designed for mechanical capacity. The material selection depends upon the closeness to the properties of soft tissue i.e. human skin. For any bio compactable material to act as a good scaffolding material, the properties of the scaffold implant material should be same as that of the natural tissue.

LITERATURE REVIEW

Antreas Kantaros et.al [2] in his work fabricate a cubic specimen of 35 mm × 35 mm × 35 mm (width ×height× length) using P430 ABS material. Saito E et.al [3] explained the need for soft tissue scaffolds with controlled porosity and mechanical properties. They developed a wavy fiber scaffold design, also fabricated these complex scaffold architectures from the biodegradable polymer polycaprolactone (PCL). These scaffolds have tightly controlled porosity, yet exhibit a controlled range of moduli and yield strains that fall within reported values for many soft tissues. Derek H. Rosenzweig et.al [4] compared the fabrication of large-pore 3D-printed acrylonitrile butadiene styrene (ABS) and polylactic acid (PLA) scaffolds for cell in growth, viability, and tissue generation.

PROBLEM DEFINITION

The aim of this research work is to design and fabricate bio medical scaffold for soft tissue using Fused Deposition Modelling (FDM) Additive Manufacturing (AM) process. Following are the objectives of the current study:

- To develop 3D CAD model of the scaffold structures
- Finite Element Analysis of modeled scaffold structures
- Calculation of porosity of modeled scaffold structures
- Fabrication of scaffold using FDM Additive Manufacturing Process.
- Conducting compression test on UTM (Universal Testing Machine)
- Validation of FEA results with compression test

Optimal Spectrum Utilization and Flow Controlling In Heterogeneous Network w Reconfigurable Devices

Syed Shakeel Hashmi, Dr. Syed Abdul Sattar, Dr. K Soundararajan

Abstract

Fairness provisioning in heterogeneous networks is a prime issue for high-rate data flow, wherein the inter-connectivity property among different communi higher throughput. In Hetnet, optimal resource utilization is required for efficient resource usage. Proper resource allocation in such a network led to highe for real-time applications. In view of optimal resource allocation, a resource utilization approach for a reconfigurable cognitive device with spectrum sensin this paper. The allocation of the data flow rate at device level is proposed for optimization of network fairness in a heterogeneous network. A dynamic app optimization is proposed to provide fairness in dynamic data traffic conditions. The simulation results validate the improvement in offered quality in compa optimization.

Published online 4 April 2017

Abstract PDF

Abstract

In the contemporary world, the sustainable production systems are considered not only as essential but imperatives to achieve sustainable development. The purpose of this paper is to search for some definitions of sustainable production systems by capturing the diverse perspectives and outline the boundaries from the study of some diverse case examples. The findings propose some interesting facts for researchers and practitioners. We see the needs for: 1) bridging various engineering disciplines and improving managerial relevance of scientific findings; 2) making more sense of production strategy as a means to approach sustainability in a more professional manner; 3) increasing our capability to tap into new areas of interdisciplinary research, which rely heavily on collaborative capabilities for integrating the triple bottom line such as: profit, planet, people.

Urban Air Pollution Monitoring Using Wireless Sensor Networks: A Comprehensive Review

Movva Pavani, P.Trinatha Rao

Abstract

Air pollution is evolving as a severe environmental concern due to its enormous impact on the well being of the people, universal environment and also on the global economy. Conventional air pollution systems are not able to provide air pollution data of high spatiotemporal resolution due to non-scalability and limited data availability. With the advances in the areas of Micro Electro Mechanical Sensor (MEMS) and Wireless Sensor Network (WSN), the researchers had implemented various state-of-the-art air pollution monitoring systems with better and efficient results. A comprehensive review of continuous air pollution surveillance of both indoor and outdoor pollution by employing WSN was presented. In the proposed paper attempts to provide the details related to the existing methods for measuring major air pollutants like CO_2, CO, O_3, SO_2, VOC and Particulate Matter (PM). It presents the various methods, algorithms and dedicated network designs in air pollution monitoring which are useful for generating new solutions to improve the performance through WSN. A comprehensive and detailed review of the existing methods of Air Quality Monitoring systems using WSN was done along with their comparisons

Task scheduling

ABSTRACT

In cloud computing resources are considered as services hence utilization of the resources in an efficient way is done by using task scheduling and load balancing. Quality of service is an important factor to measure the trustiness of the cloud. Using quality of service in task scheduling will address the problems of security in cloud computing. This paper studied quality of service based task scheduling algorithms and the parameters used for scheduling. By comparing the results the efficiency of the algorithm is measured and limitations are given. We can improve the efficiency of the quality of service based task scheduling algorithms by considering these factors arriving time of the task, time taken by the task to execute on the resource and the cost in use for the communication.

1. INTRODUCTION

Interface and infrastructure together forms a cloud environment [1]. The resources are provided by the cloud service provider and user can access them as a service by using the service models (PaaS, IaaS, SaaS). The organization can deploy the cloud based on their requirement by using deployment models (Private, Public, Community, and Hybrid) [2]. Even though cloud is a good servant to the user in turn many security issues involved in it. It involves risk to put all the data in cloud and application runs at different place [3]. The cloud architecture contains Users, SLA resource locator, VMs and Physical machines [4]. In cloud computing resources are considered as services hence utilization of the resources is done in an efficient way by using task scheduling and load balancing [5]. In cloud computing multiple users sends the requests in same time hence using scheduling the resources are allocated to the tasks [6].

Quality of service is an important factor to measure the user's satisfaction in cloud environment. Using quality of service in task scheduling will address the problems of security in cloud computing. Parameters considered for the algorithms studied in this paper are QoS, make span, accepted rate, cost, fairness completion time, minimum completion time. The existing algorithms can be improve the efficiency by considering these factors arriving time of the task, time taken by the task to execute on the resource and the cost in use for the communication. In the following section quality of service based task scheduling algorithms are studied and compared their advantages and disadvantages.

V Mnssvkr Gupta
Assistant Professor, SRKR Engineering College, Andhra Pradesh, India

Abstract –

Business depends on Data. Now a days we are dealing with large amounts of data, like petabytes. IT teams receive continuous requests from the users in the issues related to handling data. so the key objective now is, how we are going to handle data in an efficient manner , and how to represent that data in an understandable format. One of the available solution is using data visualization- an art of presenting the data in a manner that even a non-analyst can understand[1] . The most popular tools for visualizations / data discovery are Qlikview and Tableau. In this paper we are going to focus on One of the fastest evolving Business Intelligence (BI) and data visualization tool is Tableau . In short, Tableau - helps the people see and understand their data. In this paper we are going to introduce about Tableau and represent an organizational data by using this Tableau , Then we will focus on creating views and analysis of data.

Keywords - Data Visualization, Tableau, Business Intelligence.

I. INTRODUCTION

There is a tremendous increase in the number two and four year degree colleges in India . This study identified factors that influence students' choices among in-state, out-of-state,. The study utilized exploratory factor analysis to identify appropriate factors and multivariate analysis of variance to determine differences in college choices among the groups. The results of this research will be beneficial to colleges in the development of appropriate promotions to differentiate themselves in a meaningful way to potential students, not just in the United States but also over the world.

The college enrollment decision has become increasingly complex during the last 25 years, as higher education has transformed in many ways. The higher education has grown from a collection of small, local markets to regional and national markets[11]. The higher education environments have become competitive and institutions increasingly have to compete for students in the recruitment markets[5] . Institutions are now bringing students from all over the world. The purpose of study was to identify factors that influence students' choices and to understand the differences in college choices among in-state students, out-of-state students. For this purpose, the current research employed a case study to understand college students' choices, by selecting a deemed university located in Hyderabad.

Free Vibration Analysis of Curved Cantilever Sandwich Structure

P. Ravikanth Raju[#1], Ch. Rajesh[#2], Mohammed Zuber[#3], R. Venkat Reddy[#4]
Department of Mechanical Engineering, Hyderabad, India
[1,3,4] Anurag Group of Institutions, Venkatapur (V), MedchalDt., Telangana, Hyderabad, India
[2] IFHE University, Hyderabad, Telangana,India

ABSTRACT
Structural sandwich construction is used in many air and space vehicles, cargo containers, boats and ships. Sandwich construction offers high strength to weight ratios, good buckling resistance, formability to complex shapes and easy reparability, which are of extremely high importance in aerospace applications. The most common sandwich structure is composed of two thin face sheets with a thicker lightweight, low-stiffness core. In this work an attempt has been made to develop the formulation to find free vibration analysis of a curved cantilever three layered sandwich beam. The formulation for curved sandwich beam is developed using linear displacement field at face layer and non-linear displacement field at core layer. The face layers are assumed to behave according to Euler-Bernoulli theory and the core deforms in shear only. The governing equation of motion is to be derived using Hamilton's principle in conjunction with dynamic finite element method.The formulation is to be developed for a number of different numerical cases by varying the thickness of core layers and face layers and studied under the fixed free cantilever boundary conditions. The analytical results of the sandwich beams are to be compared with available literature values.

Keywords: Euler-Bernoulli theory, Face and core layers, Finite element method,Hamilton's principle,Sandwich beam.

Date of Submission: 19-12-2017 Date of acceptance: 28-12-2017

I. INTRODUCTION

The study of free vibration is an important prerequisite for all dynamic response calculations for elastic systems. The current trend in the aerospace industry of using composites and sandwich material to lighten aircraft in an attempt to make them more fuel efficient has caused a recent resurgence into research to develop a reliable method of predicting the vibration behavior of sandwich structures.K M Ahmed [1], investigated the flexural vibration characteristics of curved sandwich beams by using the finite element displacement method.The free vibration characteristic of a curved sandwich beam is analyzed by him using the principle of minimum total potential energy.Finally, he concluded that the element with four degrees of freedom per node is relied upon yield reasonable estimates of the natural frequencies of curved sandwich beams.S HE and M D Rao [2], described an analytical model for the coupled flexural and longitudinal vibration of a curved sandwich beam system. The governing equations of motion for the forced vibration of the system are derived using the energy method and Hamilton's principle. They used Rayleigh- Ritz method for solving system resonance frequencies and loss factors. To evaluate the effects of curvature, core thickness and adhesive shear modulus a parametric study was conducted by them on the system for resonance frequencies and loss factor.Bozhevolnaya and J Q Sun [3],evaluated numerical analyses of free vibrations of simply supported and clampedcurved sandwich beams and investigated effect of the curvature on the Eigen modes and their frequencies. They derived linear equations of motion and the boundary conditions with the help of calculus of variations. A coupling coefficient is introduced to study the dynamic coupling for different types of motions in an eigen mode.J R Banerjee and A J Sobey [4], investigated a dynamic stiffness theory of a three-layered sandwich beam and subsequently used to investigate its free vibration characteristics. They imposed displacement field so that the top and bottom layers behave like Rayleigh beams, while the central layer behaves like a Timoshenko beam. Using Hamilton's principle the governing differential equations of motion of the sandwich beam are derived by them.

The boundary conditions for responses and loads at both ends of the freely vibrating sandwich beam are imposed to formulate the dynamic stiffness matrix, which relates harmonically varying loads to harmonically varying responses at the ends.R

Micro Level Analysis of Stabilized Expansive Soil

Manisha Gunturi[1], M.Srinivasa Reddy[2]
[1& 2]*Department of Civil Engineering, Faculty of Science & Technology, IFHE, Hyderabad, India*

Abstract: An effort is made to stabilize the expansive soils with the addition of chemical additive at different curing periods & different quantities of additive. Apart from Index and Engineering properties, Chemical composition, XRD and SEM analysis were conducted on both untreated and treated soil sample. The test results of the engineering properties were compared with the chemical and micro level analysis to get a better understanding.

Keywords: SEM, UCS,CBR, XRD.

I. INTRODUCTION

Construction of safe and economic structures is the current need of the hour. For a structure to be safe, apart from the materials used for construction, the foundation and the soil on which structure is built, plays a vital role. Similarly, treating the existing unsuitable soil such as clay (for construction purpose) instead of transporting it from a distant site becomes more economical in some cases.

The stresses induced in the clayeysoilbecause of their peculiar swell-shrink behavior, results in significant damage to the structures built on them. These soils tend to swell in wet weather conditions and shrink in dry weather conditions. The high swell potential of these soils make them unsuitable for construction purpose. Hence these soils need either to be replaced or treated in order to make them suitable for construction purpose.

Series of experimental investigations were done on such expansive soils over the past many decades using different types of additives. Katsutada ONITSURA *et al.*[12],Lakshmi Keshav*et al.*[13], LasledjAbdelmadjid*et al.*[14], carried out similar investigations on the expansive soils using various additives and found satisfactory results.BibhaMehto*et. al.*[1],K.V. Madhurwar*et. al.*[11], Lekha B.M *et. al.*[15], Pallavi H.N*et. al.*[16],and Venugopal*et. al.*[17]did similar studies on clayey soils using RBI grade 81 as stabilizer and found improvement in soil properties.

In the current study, an attempt has been made to improve the properties of expansive soil in order to make it suitable for construction purpose by adding chemical additive RBI grade 81.

II. MATERIALS AND EXPERIMENTAL SETUP

(a) Soil samples:

Two soil samples were collected to carry out the study and their properties were determined after drying the samples in proper manner. Preliminary tests such as grain size analysis, specific gravity, consistency limits, free swell index, compaction test, CBR and UCS were conducted on the soil samples. Apart from the index properties, micro level analysis was done with the help of XRD and SEM.

Percentage of clay was found to be 70% and 66% for sample 1 and 2 respectively. Similarly, Liquid limit, Plastic limit, shrinkage limit, free swell index were 2.36 and 2.65, 75% and 72%, 38% and 39%, 7% and 6%, 110% and 105%. From standard proctor test, the maximum dry density (g/cc)were obtained as 1.6 and 1.54 & optimum moisture content (%) was found to be 20 and 24.5. The unconfined compressive strength (kPa) of the samples were found to be 138 and 122 for sample 1 and 2 respectively.

Based on the test results of the soil properties, the soil samples can be categorized as expansive soils of high to very high degree of expansion in accordance with IS:1498 classification system.

In addition to the tests for index and engineering properties, analysis for the chemical composition of the soil samples was carried out. Chemical composition results of the soil samples are given in table 1. It is clearly observed that the sample contains high silica, alumina content and a small fraction of organic content. But calcium oxide content in the given soil samples is very less.

Table 1: Chemical composition of soil samples

Description %	Sample 1	Sample 2
Loss on ignition	13.67	13.00
Insoluble residue	67.92	84.92
SO_3	0.34	0.12

ABSTRACT

Nozzle is the device which is used to control speed, rate of flow and pressure of stream exhaust from them. Nozzle are of different shapes but most used nozzle types are conical and bell nozzle. The present paper deals with the CFD analysis of conical and bell type nozzle from which the better nozzle among them will be suggested. The analysis has been performed on Ansys 18 AIM using geometric considerations like pressure, velocity and temperature.

Key Words: ***CFD, Bell nozzle, Conical nozzle.***

INTRODUCTION:

NOZZLE:

Nozzle is a device which increases the velocity of the fluid at the expense of pressure. It is part of rocket which is used for expansion of combustion gases from it so that it can produce maximum thrust. Nozzle converts pressure energy into kinetic energy. During combustion of fuel the chemical energy is converted into thermal and pressure energy. The gases of such high pressure expand through nozzle where the pressure energy is converted into kinetic energy producing maximum thrust force. Nozzle should serve two purposed one is to control back pressure and second is to convert pressure energy to kinetic energy and thereby increasing the exit velocity.

Generally, there are three types of nozzles conical nozzle, bell nozzle and Aerospike nozzles. The variety of flow field can be generated among these nozzles.

In this paper, I had analyzed the nozzle on assumption of isentropic flow of ideal gas.

CONFIGURATION OF NOZZLE

Nozzle are generally of circular cross section and they consist of converging, throat and diverging sector. Nozzle throat is the most important to achieve high performance. The wall surface of nozzle should be smooth and shiny to minimize friction, adsorption, radiation and convective heat transfer

Based on the configurations nozzles are divided into

1. Convergent
2. Divergent
3. Conical
4. Convergent and Divergent
5. Contoured

Based on shape they are classified as

1. Conical
2. Bell
3. Annular Nozzle

CONICAL NOZZLE

It is simple in construction, it gets from the name from the wall that diverge in constant angle. Conical nozzle is heavier, longer and most complex to build. At the other extreme, size and weight are minimized by a large nozzle

Performance Prediction of Domestic Refrigeration System using R436A Refrigerant as alternative Refrigerant to R134a with ANN

Mandala Vaman Reddy [1], C. Chandra Sekhar [2] D.V.Raghunatha Reddy [3]

P.G. Student, Department of Mechanical Engineering, MREC, Hyderabad, Telangana, India[1]

Assistant Professor, Department of Mechanical Engineering, MREC, Hyderabad, Telangana, India[2]

Assistant Professor, Department of Mechanical Engineering, ICFAI Tech School, IFHE, Hyderabad, Telangana, India[3]

ABSTRACT: Refrigeration industry is changing fast owing to the continuing debate on environmental issues such as global warming, the depletion of the ozone layer and energy efficiency. It results in new refrigerants appearing in the market as replacements for eco-friendly refrigerants. The most commonly used refrigerant in small hermetically sealed units is R134a, but it has highGlobal Warming Potential (GWP). In this scenario, research has to be carried out to develop an eco-friendly refrigerant mixture with low ODP and low GWP values with performance that is as good as R134a. In present work, attempted to find a binary mixture of refrigerant R436A (R290/R600a)(54%/46%) which could be an alternative to R134a. Efforts have been made to specify a particular composition of binary mixtures and to study their performance compared to R134a.By using experimental values to generate the enthalpies values at a different processes are analysed using REFPROP 9.0 refrigerant software. It has been found that pure hydrocarbon refrigerants cannot replace R134a.Hence the binary mixtures of R436A (R290/R600a) (54%/46%) and CARE30 (50%R290/50%R600a) with the mass fractions are considered. The performance characteristics such as refrigeration effect, compressor power, Coefficient of Performance (COP) and pull down time of the proposed mixtures were compared with those of the R134a. Back Propagation Neural Network (BPNN) algorithm with bipolar sigmoid activation function is used for validation of experimental values. BPNN constructs with the input-output mapping based on both human knowledge and stipulated input-output data pairs. It is observed from the simulation results that the ANN approach gives accurate results in predicting the performance of Domestic Refrigeration System. The proposed mixture R436A seems to be an appropriate and ecofriendly alternate refrigerant for replacement of R134a.

KEYWORDS: GWP, ODP, R436A, COP, Back Propagation Neural Network (BPNN) ANN.

I. INTRODUCTION

Domestic refrigerators are major energy consuming appliance in household environment [1]. R134a is the most widely used refrigerant in domestic refrigerators, due to its excellent thermodynamics and thermo physical properties. But, it must be phased out soon according to Kyoto protocol due to its high global warming potential (GWP) of1, 300 times more than CO2. Many researchers [2–4] have reported that GWP of hydro fluorocarbon (HFC) refrigerants is more significant even though it has less than that of chlorofluorocarbons (CFC) refrigerants. Regarding the issue of high GWP of R134a, thermal storage using secondary refrigerants or phase change materials can relieve this issue by reduction of R134a charge for domestic refrigerators [5–7]. Another option for this issue is to find promising environmentally-friendly R134a alternatives. Some R134a refrigerant substitutes that meet these requirements are a key process in this investigation. Many researchers have reported that hydrocarbon-mixed refrigerants are found to be an energy efficient and environmentally-friendly alternative option in household refrigerators. Pure hydrocarbon refrigerants are not suitable as drop-in substitutes for R134a due to its mismatch in volumetric cooling capacity and

Double-diffusive convection in an inclined porous layer with a concentration-based internal heat source

Received: 12 April 2017 / Accepted: 11 August 2017 / Published online: 14 September 2017
© The Author(s) 2017. This article is an open access publication

Abstract The thermosolutal instability of double-diffusive convection in an inclined fluid-saturated porous layer with a concentration-based internal heat source is investigated. The linear instability of small-amplitude perturbations to the system is analyzed with respect to transverse and longitudinal rolls. The resultant eigenvalue problem is solved numerically utilizing the Chebyshev tau method. It is shown that an increasing inclination angle causes a strong stabilization in the transverse rolls irrespective of the internal heat source or vertical solutal Rayleigh number. Furthermore, substantial qualitative changes are demonstrated in the linear instability thresholds with variations in the inclination angle and concentration-based heat source.

Keywords Inclined porous layer · Linear stability analysis · Heat source · Porous medium

1 Introduction

The investigation of thermosolutal convection driven by a concentration-based internal heat source with an inclined porous layer is vital due to its importance in real-life applications such as groundwater transportation, geothermal reservoirs, oil recovery, food processing and the transport of pollutants (Bendrichi and Shemilt [1], Chen and Angui [2]) and in more general environmental processes (Gill [3]).

The inclined porous layer was first studied by Bories and Combarnous [4] and later extended by Weber [5] and Caltagirone and Bories [6]. In more recent contributions, Rees and Bassom [7] investigated the thermal instability properties of Darcy flow in an inclined porous medium, highlighting the complex geometry of the neutral curves, and various asymptotic limits. The unicellular flow model in an inclined porous layer is explored in Barletta and Storesletten [8], with a constant heat flux boundary on the inclined porous channel further investigated by Rees and Barletta [9], and the thermal instability of Darcy Hadley flow in an inclined channel further explored by Barletta and Rees [10]. Nield [11] also commented on the inclined porous layer for preferred patterns of the natural convection, and thereafter, Nield et al. [12] studied the effect of the viscous dissipation influence on the onset of instability in an inclined porous channel. A collection of comprehensive theories on the inclined porous layer is surveyed in the recent book of Nield and Bejan [13]. Further surveys on porous media convection can be found in Ingham and Pop [14] and Vafai [15].

Published online 25 July 2017

Abstract PDF

Abstract

Machining performance during electro discharge machining (EDM) on Inconel 718 has been experimentally investigated. Based on six factor-three level L27 orthogonal array design of experiment, machining responses in terms of material removal rate, tool wear rate, roughness average and surface crack density of the EDMed work surface have been studied by varying controllable process parameters viz. gap voltage, peak current, pulse-on time, duty factor, flushing pressure, etc. along with three different electrode tools made of brass, graphite and copper, respectively. The work aimed at determining the most favourable setting of controllable process parameters along with a particular tool electrode to satisfy conflicting requirements of multi-performance yields. An integrated optimisation route, i.e., principal component analysis (PCA), fuzzy inference system (FIS) in conjugation with Taguchi method has been attempted herein.

A Study on Text Mining Methods and Applications

Harika Devi Kotha[1] and Avinash Malladi[2]
[1,2](Assistant professor, IFHE-FST, Hyderabad, India)

Abstract: *Text mining is a branch of artificial intelligence. Text mining allows searching the data to extract valuable information. There are many techniques available to mine the text. Efficient text mining techniques are surveyed and compared in this paper. The methods involved in text mining are classification and clustering. Classification or categorization methods use keywords to classify the documents. Clustering uses similarity based search to find the similar documents. These two methods are providing powerful tools to mine text data. Under classification, Index term selection, Navie Bayes classifier, nearest neighbor classifier, Decision trees, Support vector methods and kernel methods are studied. Under clustering, statistical measures, mean square error and Silhouette coefficient methods are studied.*

Keywords: *Text mining, Classification, Clustering*

I. INTRODUCTION

Text mining is an emerging area in computer science and is used to access large quantity of unstructured text efficiently. By using techniques like categorization, entity extraction, sentiment analysis etc, efficient text mining can be implemented. These methods are useful to extract useful information and knowledge from hidden text content. Text mining allows searching the data to extract valuable information. There are many techniques available to mine the text. Efficient text mining techniques are surveyed and compared in this paper. The methods involved in text mining are classification and clustering. Classification or categorization methods use keywords to classify the documents. Clustering uses similarity based search to find the similar documents. These two methods are providing powerful tools to mine text data.

II. TEXT MINING METHODS

The methods involved in text mining are classification and clustering. Classification or categorization methods use keywords to classify the documents. Clustering uses similarity based search to find the similar documents. These two methods are providing powerful tools to mine text data. Under classification, Index term selection, Navie Bayes classifier, nearest neighbor classifier, Decision trees, Support vector methods and kernel methods are studied in this paper. Under clustering, statistical measures, mean square error and Silhouette coefficient methods are studied in this paper.

Classification

Classification or categorization methods use keywords to classify the documents. In this method whenever somebody is searching for a topic then task execution starts with training set DOC={doc_1,doc_2,…….doc_n) of documents, these documents are already given with their class names. In classification accuracy can be measured as follows:

$$accuracy = \frac{correctly\ classified\ documents}{total\ number\ documnets}$$

To get high accuracy because the target class covers only a small percentage of documents precision and recall are introduced. Classification precision and recall can be measured as follows:

$$precision = \frac{(number\ of\ relevant) \cap (number\ of\ retrieved)}{number\ of\ retrieved}$$

$$recall = \frac{(number\ of\ relevant) \cap (number\ of\ retrieved)}{number\ of\ relevant}$$

There are some issues regarding precision and recall. If the documents with high degree are assigned to target class means precision is high and if the search is more exhaustive means recall is high. In both the cases text mining cannot be done efficiently. To compromise precision and recall there is a factor called F-score can be represented as:

Design and Analysis of In-Pipe Inspection Robot

Shaik Himam Saheb[1], Dr. G. Satish Babu[2]

[1]Assistant Professor, Department of Mechanical Engineering, IFHE, ITS, Hyderabad, India

[2]Professor, Department of Mechanical Engineering, JNTUCEH, Hyderabad, India

ABSTRACT

Many kinds of pipes are being utilized to construct important lifelines such as water and gas supply in our contemporary society. Also pipes are widely used in chemical industries and in gulf countries for carrying petrol, diesel, oil etc. But after some years these pipes get damaged and defects are occurring in pipe. If the defects in the pipe are caused by rust and nature calamity, it is difficult to find out the defects and the location of the defects, and also there is great amount of loss of fluids and gases. Thus scheduled inspection must be done. If we decide to do this inspection manually then large amount of time, effort and labour is necessary to grub up the pipes that are buried in the ground. If the robot can inspect inside the pipes, fast and accurate examination will be able to be done at low cost. Size and shape adaptability will be achieved by chuck-jaw mechanism.

Keywords : In-Pipe Inspection, Chuck Jaw Mechanism, Pipeline Exploration Robot, Laws Of Robotics, Big Rocker Double Pole Switch

I. INTRODUCTION

Robotics is one of the fastest growing engineering fields, presently they are used for wide variety of works especially in manufacturing industries eg. spot welding, loading, and unloading of the tool and workpiece, painting etc. Primarily robots are designed in such way that they reduce human intervention from labor intensive and hazardous work environment; sometimes it is also used to discover inaccessible workplace which is generally impossible to access by humans. The complex internal geometry and hazard content constraints of pipes require robots for inspection purpose. With these constraints, inspection of the pipe becomes so more necessary that, tolerating it may lead to some serious industrial accidents which contaminate environment and loss of human lives also. For inspection of such pipes, robot requirement is must especially in order to check corrosion level of pipe, recovery of usable parts from pipe interior, for a sampling of sludge and scale formation on pipe internal surface etc. Designing of a new in-pipe inspection robot is carried out in this research work. It involves kinematic and dynamic analysis of screw drive type robot. Kinematic calculations are performed to find the trajectory of rotor motion and to also to analyze the motion of the robot in the straight and curved pipeline. From the dynamic equation of robot, the effect of frictional force, drag force, and mass of the robot are analyzed on the robot to find the required minimum motor torque for moving in horizontal, inclined and vertical pipelines. After performing design steps, the solid model is prepared in CATIA V5 of the proposed robot. Motion simulation and experimental study are performed with the help of this solid model and an initial robot prototype.

A. Problem Statement

To design and develop pipe inspecting robot which will travel in the pipe and provide its actual video footage to the operator. To guarantee excellent performance in pipe inspection we implemented chuck jaw mechanism. Mathematical modeling will be done in CATIA V5 and analysis will be done on ANSYS 14.5 rigid body dynamics. To improve the reliability of the product the actual model will be built. This robot model will be used as the base robot model for in pipe inspection robot. It

Generation of Manipulability Ellipsoids for Different Configurations Using the Yoshikawa's Manipulability Index and Manipulability Ellipsoid

A. Chandrashekhar
Asst. Prof., Mechanical Engineering Department,
The ICFAI Foundation for Higher Education, Hyderabad, India.

Dr. Garlanka Satish Babu
Professor, Department of Mechanical Engineering,
JNTUH College of Engineering Hyderabad, INDIA

Abstract

In this paper, we study different manipulating ways which can be used in Robotic Devices, to make the Robots Responsive to Obstacles while performing a given Task. Differential kinematics and the kineto-static manipulability indices of multiple cooperating robot arms, including active and passive joints and actuators are given efforts and researched for developing enhancive Robots. Therefore, manipulability analysis is done to check the performance of the robots. It has been shown that the ZMP manipulability ellipsoid can improve the humanoid-robot design process by choosing appropriate actuators. Algorithm to calculate the manipulability index results new manipulability indices which take into account under actuation and compliance.

Abstract

The Heterogeneous network has the advantage of utilizing multiple wireless architectures to exchange information over a wireless medium. In coordination with multiple devices, long range data transmission is achieved. The advantage of multiple network utilization has brought out the significance of higher service applications for any network device with the advantage of using multiple networks for communication. In this network, the demand for proper resource utilization arises due to a shift to multiple networks. As the network switches from one network to another, and observed issues like fairness, power, spectrum utilization in the resources are varied, which impacts the flow of data. Hence it is required to optimize the resource utilization to achieve a fair and efficient communication. Towards achieving the objective of fairness in an heterogeneous network with cognitive devices, a multi objective coordination approach for optimal resource utilization is proposed. The resource utilization problem is

Abstract

This paper presents the design of low cost compact coaxial fed rectangular patch antennas with the Defected Ground Structure (DGS).The proposed two metamaterial DGS antennas operate at resonating frequencies of 4.7 GHz and 2.4 GHz, and they showed the reduction in size while having considerable performance. A microstrip patch antenna finds its application in WLAN, WiMAX and Wi-Fi in wireless communication services.The performance measures of conventional and DGS antennas had been simulated and analysed in Computer Simulation Technology Microwave Studio (CSTMWS). Prototypes of the coaxial fed rectangular patch antennas operating at 4.7 GHz and 2.4 GHz are fabricated and measured for the experimental validation of the simulation results of the designs. Both the simulation and measurement results showed that the DGS structures improved the performance of the proposed model and the results suggest that DGS reduced the antenna size up to 34.3% for 4.75 GHZ and 80% for the 2.4 GHz.

Abstract

This study analyzes the effect of stress relaxation on the mechanism of instability of the thermal convection. It is also worked-out the effect of heat source on the onset of Hadley- Prats flow in a horizontal fluid saturated porous medium with inclined temperature gradients. This investigation is analyzed by using linear stability analysis for a large number of parameter values. The horizontal components of these inclined gradients induce a Hadley circulation, which becomes unstable when vertical components are sufficiently large and this instability is analyzed using three dimensional normal modes. The vertical thermal Rayleigh number is treated as the eigenvalue. The system that constitutes the eigenvalue problem. Which is solved by using Chebyshev tau-QZ method for various modes of thermal instability.

EFFICIENT HYBRID QOS DRIVEN TASK SCHEDULING ALGORITHM IN CLOUD COMPUTING USING A TOOLKIT: CLOUDSIM

Sirisha Potluri, Dr. KattaSubba Rao

Abstract:

Cloud computing allows to share the resources using the internet. To provide on-demand service cloud computing uses task scheduling. Task scheduling is a set of rules used to control the order in which works are achieved by the computer system. There are many scheduling algorithms and task/job scheduling is one of them. Using the task scheduling algorithm high performance, maximum utilization of resources and best system throughput are achieved. QoS is a measurement factor to guarantee the promised level of performance QoS attributes provides the classification needed by the customers to select more efficient CSP based on Cost, performance, assurance, security, usability, agility, accountability. QoS is expressed by using the factors: make span, execution price, latency, packet loss rate, reliability, and throughput. There are many algorithms based on QoS based task scheduling. So many algorithms are proposed to do scheduling effectively by the task scheduler. A genetic algorithm is one of the evolutionary algorithms used in task scheduling. 18 task scheduling algorithms

Abstract

The main objective of this paper is to ameliorate the performance of direct torque control of induction motor for a wide range of speed control using fuzzy logic. The major drawbacks of conventional direct torque control are high torque, flux ripples and poor dynamic response at low speed. In this paper the CDTC is improved by fuzzy logic switching controller and fuzzy logic duty cycle controller. In FDTC with FDCC the selected voltage vector is applied only for the duty cycle time period (δ) determined. Simulation results validate that the proposed scheme shows improved dynamic performance of the drive for a wide range of speed (0–100 rad/s) and the torque and flux ripples are reduced by 90% compared to CDTC.

Keywords: Direct torque control (DTC); Fuzzy Direct Torque control (FDTC); Fuzzy duty cycle controller (FDCC); Induction motor (IM); Membership function (MF)

1. Introduction

Over the years direct torque control (DTC) of induction motor emerged as an alternative to field oriented control of induction motor (Takahashi and Naguchi, 1986). DTC is employed for high performance and quick response drives (Takahashi and Ohmori, 1989). Compared to field oriented control, DTC has following advantages like (a) simple and quick response control, (b) absence of co-ordinate transformation and current controllers, (c) PI controllers in flux and torque control loops (Sudheer et al., 2011; Zalman and Kuric, 2005). The conventional DTC (CDTC) suffers from major disadvantages like (a) high torque and flux ripples, (b) accurate estimation of torque and flux, (c) sluggish speed

Synthesis, Characterization and Thermal Property of Phosphate and Sulfate Mixtures (Article)

Swain, T.[a], Brahma, G.S.[b]

[a]Indic Institute of Design and Research, Khurda, Odisha, India
[b]Faculty of Science & Technology, IFHE, Hyderabad, Telangana, India

Abstract

View references (34)

Two inorganic mixtures of copper and sodium compounds have been synthesized and characterized with different measurement techniques. The thermal property of these mixtures has been studied to low temperature up to 223 from 573 K with DSC. The specific heat capacity of this mixture has been measured in atmospheric O_2 at a rate of 10 K min^{-1} from 573 to 223 K and vice versa in two thermal cycles. The net specific heat capacity of these mixtures is found endothermic in first and second thermal cycles. The net specific heat capacity of $0.5Cu_2(PO_4)(OH)$; $3.5CuH(PO_4)_2 \cdot H_2O$; $2NaHSO_4 \cdot H_2O$ (CuPHS) during first thermal cycle is –71203.05 J kg^{-1} K^{-1} and in second thermal cycle is –73881.67 J kg^{-1} K^{-1} between temperature range of 303–223 K. The net specific heat capacity of mixture $0.5Cu_2(PO_4)(OH)$; $3.5CuH(PO_4)_2$; $2Na_2SO_4$(CuPS) in first thermal cycle is –21158.37 J kg^{-1} K^{-1} and in second thermal cycle is–45739.92 J kg^{-1} K^{-1} between temperature range of 298–573 K. As both mixtures are endothermic in nature in all cycles, it can be used as heat storage material.The average crystallite size of mixture $0.5Cu_2(PO_4)(OH)$; $3.5CuH(PO_4)_2 \cdot H_2O$; $2NaHSO_4 \cdot H_2O$ and $0.5Cu_2(PO_4)(OH)$; $3.5CuH(PO_4)_2$; $2Na_2SO_4$ is ~47 and ~17.3 nm, respectively. © 2016, Springer Science+Business Media New York.

Abstract

In this paper we present an interesting magnetic property of ilmenite $NiTiO_3$ material prepared by sol-gel mediated slow evaporation induced self-assembly (EISA) method using Pluronic F127. Two oxide samples were prepared using Ni:Ti 1:1 and 1:2 M ratios under similar reaction conditions. It is observed from powder XRD anal

Abstract

The present research work explores the joints of various dissimilar metals produced by ultrasonic spot welding. The weld strength, interface temperature, weld area and microhardness were measured as well as the quality of weld revealed for different weld times. The tensile shear and T-peel failure load increased with increasing weld time and reaching the highest values of 1512 N and 280.83 N respectively for Al-Cu joints followed by Al-UNS C27000 brass and Al-AISI 304 steel combinations. With further increase in weld time, the interfacial temperature was far above than the recrystallization temperature of Al, showing a substantial loss in joint strength. An axisymmetric type hardness distribution was also noticed across the joint interface and the microhardness values increased with increasing in weld time. The highest interface diffusion layer of thickness 1.5 μm was observed for Al-Cu weld coupon combination. Moreover, some intermetallic compounds such as Al_2Cu, Cu_5Zn_8 and $FeAl_3$ were formed during the welding of Al-Cu, Al-Brass and Al-SS sheets and the correlations of the presence of these compounds with the joint strength were also described.

Effect of Brass Interlayer Sheet on Microstructure and Joint Performance of Ultrasonic Spot-Welded Copper-Steel Joints

Journal: Journal of Materials Engineering and Performance > Issue 7/2017

Authors: Mantra Prasad Satpathy, Abhishek Kumar, Susanta Kumar Sahoo

Abstract

Solid-state ultrasonic spot welding (USW) inevitably offers a potential solution for joining dissimilar metal combination like copper (Cu) and steel (SS). In this study, the USW has been performed on Cu (UNS C10100) and SS (AISI 304) with brass interlayer by varying various welding parameters, aiming to identify the interfacial reaction, changes in microstructure and weld strength. The highest tensile shear and T-peel failure loads of 1277 and 174 N are achieved at the optimum conditions like 68 µm of vibration amplitude, 0.42 MPa of weld pressure and 1 s of weld time. The fractured surface analysis of brass interlayer and AISI 304 stainless steel samples reveals the features like swirls, voids and intermetallic compounds (IMCs). These IMCs are composed of CuZn and FeZn composite-like structures with ~1.0 µm thickness. This confirms that the weld quality is specifically sensitive to the levels of input parameter combinations as well as the type of material present on the sonotrode side.

Machining performance optimization for electro-discharge machining of Inconel 601, 625, 718 and 825: an integrated optimization route combining satisfaction function, fuzzy inference system and Taguchi approach

Rahul[1] · Kumar Abhishek[3] · Saurav Datta[2] · Bibhuti Bhusan Biswal[1] · Siba Sankar Mahapatra[2]

Received: 21 February 2016 / Accepted: 19 October 2016 / Published online: 5 November 2016
© The Brazilian Society of Mechanical Sciences and Engineering 2016

Abstract Nickel-based super alloy (such as Inconel) is widely used in aerospace, nuclear, and chemical industries because of its excellent mechanical and chemical properties at elevated temperatures. Inconel comes under the category of "difficult-to-cut" materials. Difficulty is faced whilst machining of Inconel because of its poor thermal conductivity, high toughness, high hardness, and extremely high work hardening behaviour. Moreover, it contains highly abrasive carbide particles which tend to stick on the tool surface, resulting in inferior surface finish. Moreover, enormous heat is generated during machining which leads to reduction in tool life. Hence, machining and machinability aspects of Inconel have become a predominant research agenda today. Technological advances have led to an extensive usage of high strength, high hardness materials in manufacturing industries. In course of machining of "difficult-to-cut" materials, conventional manufacturing processes are increasingly being replaced by the advanced techniques such as electro-discharge machining (EDM), ultrasonic machining, electro-chemical machining and laser machining. Amongst these, EDM has found widespread application in micro-electro-mechanical systems; tool and die, automobile and aerospace industries. Therefore, promoting the quality of the EDMed product and thereby achieving satisfactory machining performance; a thorough understanding of the relationship between the EDM parameters and the machined surface integrity in consideration with the tool-work combination has become an important research focus. EDM is an electro-thermal machining process, where electrical energy is used to generate electrical spark and material removal mainly occurs due to thermal energy of the spark. It has become an excellent option to machine "difficult-to-cut" materials and high temperature resistant alloys; super alloy Inconel, in the present case. An experimental investigation on assessing machining performance during EDM of Inconel 625, 718, 601 and 825 has been delineated herein. Attempt has been made on evaluating optimal machining parameters setting to achieve satisfactory machining yield. Based on 5-factor-4-level L_{16} orthogonal array, experiments have been carried out by varying gap voltage, peak current, pulse-on time, duty factor and flushing pressure (each varied at four discrete levels) to examine the extent of machining performance in terms of material removal rate, electrode wear rate, surface roughness, and surface crack density of EDMed end products obtained by utilizing different parameters settings (for Inconel of different grades, respectively). An integrated optimization route combining satisfaction function approach, fuzzy inference system in conjugation with Taguchi's philosophy has been proposed for simultaneous optimization of aforementioned multiple performance indices. The most favourable machining parameters setting have been obtained as: [gap voltage = 90 V, peak current = 5 A, pulse-on time = 200 μs, duty factor = 70%, flushing pressure = 0.6 bar] for Inconel 625; [gap voltage = 90 V, peak current = 5 A, pulse-on time = 200 μs, duty factor = 85%, flushing pressure = 0.4 bar] for Inconel 718; [gap voltage = 80 V, peak current = 7 A, pulse-on time = 500 μs,

Abstract

Restarting automaton is a type of regulated rewriting system, introduced as a model for analysis by reduction. It is a linguistically motivated method for checking the correctness of a sentence. In this paper, we introduce a new definition of normal restarting automaton in which only one substring is removed using the DEL operation in a cycle. This DEL operation is applied to reverse the insertion operation in an insertion grammar. We use this 1-normal restarting automaton to solve the membership problem of insertion languages. Further, we introduce some interesting closure properties of 1-normal restarting automata.

Abstract

Green synthesis of silver nanoparticles has been demonstrated using an aqueous extract of the pericarp of *Sapindus mukorossi* fruit as a reducing agent as well as a stabilizer. The reducing power of the extract has been evaluated by Cyclic Voltammetry (CV) experiments. The as-synthesized colloid is highly stable and the particles remain dispersed even after one year of storage. The existence of metallic silver nanoparticles was confirmed by UV-Vis spectroscopy and selected area electron diffraction (SAED) patterns obtained from high resolution transmission electron microscopic (HRTEM) analysis. TEM study shows that the particles are almost spherical with an average diameter of 3.32 ± 0.58 nm. The as-synthesized silver colloid (Ag-colloid) exhibits antibacterial activity against *Bacillus subtilis*, *Staphylococcus aureus*, *Escherichia coli* and *Pseudomonas aeruginosa*. The catalytic efficiency of the Ag-colloid has also been evaluated and reported in terms of the catalytic activity parameter (κ) and turn over frequency (TOF) against the degradation of the common environmental pollutants 4-nitro phenol and Eosin blue.

Experimental investigation on Linz-Donawitz slag filled polypropylene composites using teaching-learning based optimization approach

Pravat Ranjan Pati ✉, Mantra Prasad Satpathy, Alok Satapathy

First published: 23 May 2017
https://doi.org/10.1002/pc.24434

Abstract

Linz-Donawitz (LD) slag is a major solid waste generated in huge quantities during steel making. It comes from slag formers such as burned lime/dolomite and from oxidizing of silica, iron etc. while refining the iron into steel in the LD furnace. This article reports on the erosion wear performance of a new class of hybrid composites prepared by reinforcement of short glass fibers (SGF) in LD slag filled polypropylene (PP) matrix. In this investigation, composites with different LD slag content (0, 7.5, 15, and 22.5 wt%) in a polypropylene matrix base with 20 wt% SGF reinforcement are prepared by injection molding technique. The composites are characterized in regard to their density, porosity, micro-hardness, and strength properties. Erosion trials (ASTM G 76) are conducted on the composite samples following a well-planned experimental schedule based on Taguchi design-of-experiments. Significant process parameters predominantly influencing the rate of erosion are identified and the LD slag content in the composites is found as most significant among various factors that influence the wear rate. The metaheuristic approach like Teaching-learning based optimization (TLBO) reveals the minimum erosion wear rate as 11.94 mg/kg at the optimal parametric combination. POLYM. Highlights

- A temperature modulated boundary drives convection in a granular fluid.
- Nearest neighbor spatial velocity-velocity correlation is a measure of convection.
- Amplitude and wavelength of temperature modulation are crucial parameters.

Abstract

Rayleigh-Bénard convection in normal fluids shows interesting variation when a boundary is temperature modulated. As granular fluids show quite good resemblance to normal fluids, it is expected that they exhibit similar variation in convective dynamics under such a condition. A study of convection in granular fluids by injecting spatially non-uniform energy through a boundary is done in this paper. Emphasis is made on the dependence of onset and strength of granular convection on the relevant dimensionless parameters characterizing the convective state. The non-uniform energy injection is modelled by spatially periodic modulation of the lower boundary. It is seen that the amplitude and the wavelength of the periodic modulation are two new important parameters characterizing the dynamics.

Graphical abstract

A granular fluid driven by a spatially modulated thermal boundary can show thermal convection in otherwise conductive state of the system.

3D Metal Printing Technologies: A Review

Avinash Malladi* and SBS Sarma**

3D printing is a branch under additive manufacturing, where converting the design to manufacturing model is done. Breaking the boundaries of traditional manufacturing process of complex structures, 3D printing has helped the industrial designers by enabling the design components based on functionality. The researchers are extending their research in identifying the new technologies in 3D printing to their full potential with respect to materials and process specialization for industrial end users. This paper provides information on various industry-based 3D printing technologies and also presents a comparison of them.

Keywords: 3D printing, Metal Printing, Laser

Introduction

3D printing has become a viable route in manufacturing industrial parts with the use of high performance metals and polymers, and a parallel competitor to traditional manufacturing, as 3D printing has become easier to manufacture and use. This technology enables the user even to assemble the parts. Through valid design for assembly, 3D printing can print or make prototypes, including the mechanisms. In continuation, a new terminology came into existence as Design for Additive Manufacturing (3D Printing) for making real-time prototypes or functional parts out of 3D printing with valid design.

2. 3D Printing Technologies for Industrial Products

In the 3D printing process, the availability of engineering materials and their concurrent technical data help the designers in making the products. The shape-making capability of 3D printing technologies enables the designers to come out of the traditional prototypes, helping them to create final functional parts instead of form, fit and functional prototypes. The new buzz about 3D printing metals like

Li-Fi Technology in Wireless Communication†

Nilesh Sharma and Movva Pavani***

Light Fidelity (Li-Fi) is one of the future technologies in wireless communication sector. Li-Fi refers to 5G Visible Light Communication (VLC) systems using light-emitting diodes as a medium to high-speed communication in a similar manner as Wireless-Fidelity (Wi-Fi). These days when Internet has become a major attraction, people are in need of Wi-Fi hotspots. Li-Fi or New Life of data communication is a better alternative to Wi-Fi in wireless communication. This paper proposes a survey on Li-Fi technology. Li-Fi has more capacity in terms of bandwidth in visible region, therefore it does not poke its nose in other communication which uses radio frequency range without taking its frequency bands. Li-Fi has thousand times greater speed than Wi-Fi and provides security as the visible light is unable to penetrate through the walls, which proposes a new era of wireless communication. The concept of Li-Fi is data communication on fast flickering of light which is not detected by human eye but it is focused on photo detector which converts the on-off state into binary digital data.

Keywords: Light Fidelity (Li-Fi), Wireless Fidelity (Wi-Fi), Light Emitting Diode (LED), Visible Light Communication (VLC), Wireless technology, Line of Sight (LOS), Photo detector

Introduction

As we know, nowadays, Internet has become a major attraction and people are in constant need of Wireless Fidelity (Wi-Fi) hotspots. Light Fidelity (Li-Fi) technology uses light rays instead of radio waves to transmit information. The other name given to it is optical version of Wi-Fi (Akshit, 2014). It is one of the latest technologies that uses Light Emitting Diodes (LEDs). It is a 5G technology of visible light communication system. It provides us better efficiency, bandwidth, security and availability than Wi-Fi. It predicts the future where the data for smartphones, laptops and tablets is transmitted and received through the light in a room and it would be highly secured, that is, if you cannot see the light, you cannot access the data. It can be used in high security military areas.

Abstract

View references (7)

Let d be a squarefree integer. We prove that (i) $\sum_{n} \mu(n)\, d(n')$ converges to zero, where n' is the product of prime divisors of n n with $(n, d) = +1$. We use the Prime Number Theorem. (ii) $\prod_{(dp)=+1} (1 - p^{-1-s})$ is not analytic at s=1, nor is $\prod_{(dp)=-1} (1 - p^{-1-s})$. (iii) The convergence (i) leads to a proof that asymptotically half the squarefree ideals have an even number of prime ideal factors (analogue of Ramanujan's assertion). © Soc. Paran. de Mat.

Abstract

The face is the fundamental basis for the identification/recognition of a person. Recognition of a individual by the face data and methods to extract the unique facial feature points from the facial image have been significantly increased during the last decade. The periocular region has become the powerful alternative for unconstrained biometrics with better robustness and high discrimination ability. In this paper, multiple descriptors are used for deriving the discriminative features of the periocular region and city block distance is used to compute the similarity between the feature vectors. Feature extraction techniques employed in recognition using the periocular region are Local Binary Patterns (LBP), Local Phase Quantization (LPQ) and Speeded Up Robust Feature (SURF). Results of Periocular modality are then compared with the results of face patterns. Periocular region showed significant accuracies compared to face with only using 25% of the full face. Experimentations are carried on FRGC database, and accuracies of both the periocular and face regions are compared.

ABSTRACT

Now a days at the receiving end in the applications of Cognitive Radio, Tele medicine, wireless networking, and in receiving system of multiple channels Electro Encephalo Gram (EEG) collected data, Wireless Brain Machine Interfacing Radio Frequency (RF) wireless data receiver system, and in RF Radar communication systems receiver's noise performance is very critical. For noise performance Signal to Noise Ratio (SNR) is a Key parameter. SNR has to be calculated right after the receiving of the data, or at the intermediary stages of the Digital Signal Processing of the system. In many of such systems one of the most important approaches is to have a dedicated hardware at the receiving end, where a DSP processor which processes the required data processing. In these Dedicated Digital Hardware systems SNR Hardware plays a critical role. In this research we have implemented Digital Hardware for a highly efficient Novel Signal to Noise Ratio (SNR) mechanism & it is a frequency domain SNR. Due to SNR hardware requirement in many advanced applications, and keeping in mind of the novel formula's efficiency, and as it has never been implemented in hardware we have got motivated towards implementing this SNR mechanism onto Xilinx Field Programmable Gate Arrays, especially to find its speed of operation and compatibility for the current ongoing technologies. In this research work we have developed two different types of architectures a) Sequential data processing architectures b) Parallel data processing architectures. During this hardware design we have developed a novel Full Adder (Faster Full Adder) for addition digital circuit, which makes the Ripple Carry Addition (RCA) process much faster than regular RCA process (Faster RCA). Parallel architectures are working faster than sequential architectures both in terms of total delay and clock speed, at the expense of somewhat more hardware and power utilization. Both architectures are working at ***high GHz*** rates than current real-time digital technologies sampling rates and system clock speeds, and hence are very useful for all ongoing real time technologies. These speeds are highly useful even for future real-time technologies. We did this implementation on Xilinx Artix-7 FPGAs using Xilinx Vivado 2015.2 Design suite. Verilog Hardware Description Language (HDL) is used for programming this hardware.

KEYWORDS: Digital Hardware, SNR, RCA, Artix-7, FPGA, Xilinx, Verilog HDL.

I. INTRODUCTION

Finding Signal-to-Noise Ratio (SNR) is most important in most DSP applications such as in RF communications, in Speech Processing applications of Voice Activity Detection (VAD) [13], in biomedical applications – EEG de-noising [10,11,12]; Voice Activity Detection (VAD) in Speech Auditory Brainstem Responses [10,11,12]. Wireless communications applications, RF IC Design for Brain Machine Interfacing.

In EEG data collections, the noise is very high when compared to the signals of interest, in such cases SNR value of the signal has to be very high [1]. SNR calculations play essential role in telemedicine satellite systems [15], wireless sensor networks [14].

The noise performance and hence the SNR is most important in Radio receiver. SNR is of prime importance in simple broadcast receivers, in cellular/wireless communications, fixed or mobile radio communications, two way radio communication systems, satellite radio and plenty more applications [2, 4]. In radio receivers, the overall SNR performance depends on the front end RF stage. In this noise introduced by first RF amplifier will

VOICED AND UNVOICED SEPARATION IN SPEECH AUDITORY BRAINSTEM RESPONSES OF HUMAN SUBJECTS USING ZERO CROSSING RATE (ZCR) AND ENERGY OF THE SPEECH SIGNAL

Ranganadh Narayanam*
Assistant Professor, Eece, Its, Ifhe - India

DOI: 10.5281/zenodo.892088

ABSTRACT

In speech signals two activities - voiced & unvoiced - are prominently observed, in both the cases of "production speech" from mouth, and "hearing speech" passed through ears-brainstem-and brain. These speech signals are broadly categorized into these two regions: Voiced- nearly periodic in nature; Unvoiced – random noise like in nature. For many speech applications it is most important to distinguish between Voiced and Unvoiced speech. We have collected Speech Auditory Brainstem Responses (ABR), from healthy human subjects, for "consonant-vowel" stimulus, using single electrode EEG – having Brainstem Speech Evoked Potentials data of voiced and unvoiced combined regions. For this Speech ABR we have proposed two simple & best approaches to detect the Voiced & Unvoiced regions in the EEG Data - first approach is Zero Crossing Rate (ZCR) & Second approach is Short Time Energy (STE). We have collected real time data from 20 different healthy human subjects in an audiology lab of University of Ottawa. We have collected the data at the sampling frequency of 3202 Hz (3.202 KHz). For this research article, we did the Voiced/Unvoiced separation experiment on the Auditory Evoked Potentials (AEP) data for 2 different human subjects. We observed that even for Speech Auditory Brainstem Responses the combined algorithm of ZCR & STE is very good solution for the separation of voiced/unvoiced parts

KEYWORDS: ABR, ZCR, EEG, Auditory Evoked Potentials, Voiced, Unvoiced, Audiology.

I. INTRODUCTION

Speech processing is one of the largest growing research areas in signal processing. Each year billions of pounds are being spent on supporting research in speech processing. The ultimate aim of this research is to provide an interactive man-machine communication [1, 2, 3]. The human apparatus concerned with speech production and perception is complex and uses many important organs - The lungs, mouth, nose, ears controlling muscles and the brain. It is remarkable that this apparatus has developed to enable not only the speech production but also serves other purposes such as breathing or eating. It was discovered that various specific areas in the brain are regarded to be of prime importance for speech and language [2]. These are called the speech centers - damages to any of these areas causes disruption to speech. The vocal tract and vocal cord play a major role in speech production. The vocal tract consists of several organs and muscles which are regularly monitored and carefully controlled by the speech centers. The precise controlling is achieved by internal feedback in the brain [2]. As an example auditory feedback helps us to ensure that we are producing the correct speech sounds and that they are of the correct intensity for the environment. During the past few years, the vast number of research and development in speech processing brought up changes in our everyday life. There are commercially available products which are based on Automatic Speech Recognition, Speaker Verification, Speaker Identification and Speech Synthesizer [5, 7].

A. Motivation

The Scientists and Engineers have understood the basic concepts behind the anatomy and physiology of speech production and perception. **But the lack of understanding of the interaction of the brain with vocal tract and auditory apparatus prevents Engineers from designing machines, which will be able to understand and speak like ordinary human beings [2, 4, 7].** Due to this we found it to be an excellent area of research to find the techniques, algorithms & applications of mouth production speech, whether they are applicable to

Modal Analysis of Power System and study of oscillatory instability

Digvijay V Nair, M.S.R. Murty

Abstract—**Power systems and study through modal analysis has yielded important results and critical information in the area of stability both for steady state and transient state condition. This paper explores application of such an modal analysis in bringing out information on system model, eigenvalues, participation factors of generating machines and controls, small signal changes in various inputs and its effects on outputs through a simulation carried out on IEEE 39 Bus 10 Machine New England Power System model.**

Keywords— Eigenvalues, , small signal stability, oscillations and damping.

I. Introduction

Power system dynamics simulation has evinced interest from researchers during last several decades. It continues with same vigor even today. Power systems are complex vast integration of several components from main energy sourcing synchronous machines, their controls to network of transmission lines. Challenges in managing and operating power systems have never been felt before as much in the present scenario. The tremendous increase in the loads and power consumption especially in the developing countries have lead the operations near to their upper safe limits of the systems. Margins between operating line and stability have become narrower and it is operated for optimum condition and to the hilt. Any unattended undesirable operation may lead to severe undermining of the performance of the system even leading to its instability. It is due to this reason that power system dynamic studies continue to attract attention from both industry practioners and researchers with increased thrust. The swinging of machines leading to electro-mechanical oscillations have constantly generated interest for last decades and numerous papers have been published in this area. Several papers have explained under-lying reasons and causes for these oscillations along-with ways of their control[1-7]. These oscillations are inherent part of the system response to the continuous changes system gets subjected through-out day. In the context of the present day system and near to the upper load limit that system operates oscillations become significant and should not be allowed to cause instability in the system. Eigenvalues are important in analysis system stability. Small signal stability analysis is determined by eigenvalue determination. Eigenvalues near to the jw axis are critical ones. Identifying the critical eigenvalues have different approaches and methods [8-10]. Though the eigen modes causing such oscillations are not always the critical ones they effect power system and its performance in several ways. Small signal stability analysis has seen several methods of determining stability boundaries. Some of the prominent methods in use are Arnoldi method, Subspace based methods, Dominant pole sensitivity, Jacobi Davidson method. Stability assessments involve determining points of bifurcations between the eigenvalues crossings and the jw-axis in the complex-s plane. Notably two such bifurcation points are of interest saddle node (SN) and hoff bifurcation (HB). SN results when one of the eigenvalue lands into the origin and HB for pair of eigenvalues meeting jw-axis. Both the events are crucial and critical since it brings the system on the brink of instability. Any further continuation of the parameter variation in the same manner leads to highly undesirable and unstable operations of the systems. In this eigenvalues locations and movement with the change in system parameter (may be line power, control parameters) becomes important. Power system dynamic studies try and relate the eigenvalue information with effecting major controls on system operations. Eigenvalues leading to eigenvectors and participation factors help in determining various mode shapes and their observability and controllability w.r.t system inputs and outputs. Participation factors further provides information leading to positioning of controllers (PSS & FACTS) on the appropriate locations of system.

The growth of PS over the last decades and economic constraint of laying new lines while interconnecting more geographically long separated areas has not only lead to binding more generating machines to each other but as well to rise of various oscillations especially inter-area oscillations. Damping these oscillations becomes important in ensuring stable operations and efficient transmission over the lines. These oscillations can never be eliminated or stopped before occuring but can only be controlled and damped. There are several instances in history where these oscillations have lead to power outages and tripping of the systems [22].

II. Power-System Modeling

A. Power-System State Matrix

The nonlinear power system model can be described as

$$\dot{x} = f(x, y, p)$$
$$0 = g(x, y, p) \qquad (1)$$

where $x \in \Re^n$ *and* $y \in \Re^m$ are the state and algebraic variables respectively and p is the system parameter. The non-linear power system modeling is reduced into linear model at

Experimental and numerical studies on ultrasonic welding of dissimilar metals

Mantra Prasad Satpathy[1] · **Susanta Kumar Sahoo**[2]

Received: 19 December 2015 / Accepted: 15 June 2017 / Published online: 4 July 2017

Abstract Ultrasonic metal welding (USMW) is gaining popularity for joining thin and dissimilar metal sheets and foils. In the present study, a new type of booster and horn is proposed and modeled with adequate precision. The modal analysis module of finite element method (FEM) is used to analyze the effects of different step lengths and fillet radius on its natural frequency. The dynamic analysis has also been performed to find out the stress distribution in both parts under cyclic loading conditions. It enables to locate the highly stressed nodal regions (hot areas), and the relevant temperature field is consequently determined. A 0.02 and 0.008% errors have been noticed for horn and booster while comparing FEM results with the experimental values respectively. The experiments are conducted on the 0.3Al-0.3Cu specimens with the designed parts to study the effects of various controllable process parameters like vibration amplitude, weld pressure, and weld time on the tensile shear and T-peel strengths. Intermetallic compound of Al_2Cu with a layer of 1.5-μm thickness has been formed for the good weld samples, and it is very much sensitive towards the parameter combinations. This paper provides an insight not only to produce high-quality welds but also to solve many industrial issues by explaining the comprehensive background theories on fatigue and vibro-thermographic analyses of the booster and horn along with detailed microscopic analyses of fractured surface.

Keywords Ultrasonic metal welding · Finite element method · Dynamic analysis · Cyclic loading · Tensile shear strength · Microscopy

1 Introduction

The demand for joining of lightweight components with high precision has enforced the development of new and emerging techniques, and ultrasonic metal welding (USMW) is one of them. The applications of this technology have the range from the microelectronics industry to aeronautical fields. This welding technique is based on the solid-state joining concept in which two metal sheets are fastened together under the melting point of these materials. The typical components of the USMW system are represented in Fig. 1. Recent years have witnessed a remarkable rise of research in the USMW field to explore the effects of various process parameters on the performance measures. Annoni and Carboni [1] have successfully joined AA 6022-T4 aluminum sheets and performed mechanical testing of welded parts for their best use in the practical situation. Meantime, Chen et al. [2] described the same concept and also compared this technique with conventional welding like resistance spot welding (RSW). Furthermore, Watanabe et al. [3] concluded that weld strength decreased with high weld pressure and longer welding time while the joining aluminum with magnesium. Regarding the different types of failure modes in USMW that were concerned, Zhou et al. [4] developed a lobe that contains pull out failure and interfacial failure of the ultrasonic metal welds. Similarly, Zhu et al. [5] conducted experiments with titanium and aluminum alloy to explain that at the end of the weld time, the hardness around the weld zone was increased compared to the base metal, and some diffusion also appeared across the weld interface. Al-Sarraf and Lucas [6] revealed the design of

Abstract

Now-a-days manufacturing industries are contemplating to develop new technologies for production of complex end use parts possessing high strength and low product development cycle in order to meet the global competition. Fused deposition modelling (FDM) is one of the proficient technologies having the ability to build accurately 3D complex geometry parts, with reasonably less time and material waste. Due to the build mechanism (layer-by-layer), the compressive strength of FDM build part is largely influenced by the selection of FDM process parameters. Therefore, using a design of experiment (DOE) approach, effect of six controllable process parameters such as layer thickness, part orientation, air gap, raster width, contour number and raster angle on the compressive strength of the FDM build is experimentally studied. The significance level of each process parameters are checked and analysed using analysis of variance (ANOVA) table. One empirical model is developed relating process parameters with the compressive strength of the FDM build parts.

Title: Effect of deep cryogenic treatment on machinability of Inconel 718 in powder-mixed EDM

Authors: Chinmaya P. Mohanty; Siba Sankar Mahapatra; Manas Ranjan Singh

Addresses: Department of Mechanical Engineering, Faculty of Science and Technology, IFHE University Hyderabad, India ' Department of Mechanical Engineering, National Institute of Technology, Rourkela, India ' Department of Mechanical Engineering, Silicon Institute of Technology, Bhubaneswar, India

Abstract: The study presents experimental investigation to assess influence of cryogenic treatment of electrodes on machinability in powder-mixed electrical discharge machining (PMEDM). Response surface methodology is used to extract maximum process related information with less number of experimental runs. The machining characteristics of the process are evaluated in terms of material removal rate (MRR), electrode wear ratio (EWR) and surface roughness which are function of machining parameters viz. open circuit voltage, discharge current, pulse-on-time, duty factor, concentration of fine graphite powder and cryogenically treated work tool pair. The study reveals that discharge current, pulse-on-time, concentration of powder and work-tool pair exhibit significant effect on all the performance measures. It is also observed that treatment to both the electrodes results in more beneficial in comparison to treatment of either the tool or work piece. Finally, a novel multi-objective particle swarm optimisation algorithm (MOPSO) has been proposed in order to achieve optimal Pareto front.

Keywords: powder-mixed EDM; deep cryogenic treatment; DCT; MOPSO; NSGA II; surface roughness; electrode wear ratio; EWR; material removal rate; MRR.

Abstract

The present work demonstrates a multi-response optimization problem for selection of optimal cutting parameters (optimal process environment) for machining (turning) of nylon 6; by using Principal Component Analysis (PCA) followed by fuzzy linguistic reasoning in combination with Taguchi's robust design technique. In this study, three controllable process parameters: cutting speed, feed, and depth of cut have been considered for obtaining desired Material Removal Rate (MRR) of the process and favorable multiple surface roughness features for the machined product; based on L_9 orthogonal array experimental design. The study has been aimed to search an appropriate process environment for simultaneous optimization of quality-productivity favorably. Various surface roughness parameters of statistical importance (of the

Abstract

Recently, machining of carbon fiber reinforced polymer (CFRP) composites has become a vital concern for the modern manufacturing companies due to the widespread applications of CFRP machined parts especially in automobile as well as aerospace industries. Owing to the necessity of mass-production of CFRP component parts, it is indeed essential to optimize the machining process parameters in order to improve process performance yields in terms of product quality economically. Overall performance of the machining (turning) process is influenced by different process parameters such as spindle speed, feed rate and depth of cut. In machining of CFRP composites, Material Removal Rate (MRR), surface roughness and tool-tip temperature are generally considered as the output responses. In the present work, the extent of process performance has been evaluated in turning of CFRP composites using PVD coated carbide tool. For optimization of multiple responses, a Fuzzy Inference System (FIS) has been u

Machining performance optimisation during EDM of Inconel 718: a case experimental investigation

Rahul, Kumar Abhishek, Saurav Datta, Bibhuti Bhusan Biswal and Siba Sankar Mahapatra

Published Online: 25 Jul 2017

Abstract

Machining performance during electro discharge machining (EDM) on Inconel 718 has been experimentally investigated. Based on six factor-three level L27 orthogonal array design of experiment, machining responses in terms of material removal rate, tool wear rate, roughness average and surface crack density of the EDMed work surface have been studied by varying controllable process parameters viz. gap voltage, peak current, pulse-on time, duty factor, flushing pressure, etc. along with three different electrode tools made of brass, graphite and copper, respectively. The work aimed at determining the most favourable setting of controllable process parameters along with a particular tool electrode to satisfy conflicting requirements of multi-performance yields. An integrated optimisation route, i.e., principal component analysis (PCA), fuzzy inference system (FIS) in conjugation with Taguchi method has been attempted herein.

Abstract

Random graphs are extensive, in addition, it is used in several functional areas of research, particularly in the field of complex networks. The study of complex networks is a useful and active research areas in science, such as electrical power grids and telecommunication networks, collaboration and citation networks of scientists,protein interaction networks, World-Wide Web and Internet Social networks, etc. A social network is a graph in which n vertices and m edges are selected at random, the vertices represent people and the edges represent relationships between them. In network analysis, the number of properties is defined and studied in the literature to identify the important vertex in a network. Recent studies have focused on statistical and structural properties such as diameter, small world effect, clustering coefficient, centrality measure, modularity, community structure in social networks like Facebook, YouTube, Twitter, etc. In this paper, we first provide a brief introduction to the complex network properties. We then discuss the complex network properties with values expected for random graphs.

Abstract

An experimental investigation has been performed on wire-EDM of Inconel 718 by using zinc-coated brass wire as tool electrode. Based on L_{27} orthogonal array, the studies have been conducted by varying five process parameters (such as taper angle, pulse on-time, wire speed, wire tension, and discharge current), within the selected experimental domain. The following machining performance yields (viz. angular error and surface roughness) have been investigated during this study. The angular error (AE) and surface roughness (Ra) have been critical responses in die making industry. Simultaneously, the mathematical model has been developed by using nonlinear regression analysis for correlating with various process parameters and performance characteristics. Finally, JAYA algorithm has been applied individually to find out the satisfactory machining performances. Application and potential of JAYA algorithm have been compared with

Abstract: Now a days, researchers focused on use of Nano additive refrigerants in vapour compression refrigeration system (VCRS) because of their remarkable improvement in thermo-physical and heat transfer capabilities to enhance the Coefficient of Performance (COP) and reliability of refrigeration system. Based on results available in the literatures, it has been found that Nano additive refrigerants have a much higher and strongly temperature-dependent thermal conductivity at very low particle concentrations than conventional refrigerant. This can be considered as one of the key parameters for enhanced performance for refrigeration systems. In this review, we summarized the performance enhancement of vapour compression refrigeration system using Nano additive refrigerants reported by different researchers. Moreover, challenges and future directions of performance enhancement of VCRS using Nano additive refrigerants were presented.

Keywords: VCRS, COP, Nano Additive Refrigerants, Performance, Thermal Conductivity

1. Introduction

The coefficient of performance (COP) of a refrigeration system is defined as the ratio of heat removal rate on the evaporator side to the mechanical work input on the compressor side. The COP can be upgraded in two ways: firstly, by increasing the heat removal rate at the evaporator side, and secondly, by decreasing the compressor work. Many researchers have investigated the possibility of introducing nanoparticles in refrigerants to develop a new class of Nano fluids called "Nano refrigerants". Use of Nano-refrigerants will increase the heat transfer in refrigeration systems and thus enhance the system performance with the rapid advancement in nanotechnology; it becomes possible to obtain Nano sized particles (1 to 100 nm.) of metals, oxides and carbides. These nanoparticles having high thermal conductivity are suspended in conventional heat transfer fluids which lead to emerging of new generation of heat transfer fluids called nanofluids. Nanofluids have been introduced by Steve Choi of Argonne's Energy Technology Division and Jeff Eastman of the Materials Science Division on Argonne National Laboratory in 1995. Thermal systems like refrigerator, air conditioners etc. consume large amount of electric power. Many researchers have been carried out in last decade to enhance the heat transfer rate, to improve performance of the systems. To improve thermo physical and heat transfer capabilities of the system, nanoparticles are either suspended in the refrigerant or lubricating oil. Nano fluids have the following characteristics as compared to normal solid liquid suspensions.

A) Higher heat transfer between the particles and fluid due to high surface area of the articles.
B) Better dispersion stability.
C) Reduces particle clogging.
D) Reduces pumping power as compared to base fluid to obtain equivalent heat transfer.

Nanoparticles could be of metal like copper, nickel, aluminum. Oxides like aluminum oxide, titanium oxide, copper oxide, silicon oxide. Base fluids are the thermo fluids like water, ethylene glycol, propylene glycol, engine oil and refrigerants. [2] Nano fluids are prepared by production of nanoparticles and then its dispersion in the base fluid. There are two methods used for the preparation of Nano fluids

LARGE SCALE URBAN AIR QUALITY MONITORING USING WIRELESS SENSOR NETWORKS

Movva Pavani and K. Kishore Kumar
Department of Electronics and Communication Engineering (ECE), Faculty of Science and Technology, IFHE, Hyderabad, India
E-Mail: pavanimovva@ifheindia.org

ABSTRACT

In the proposed paper, a wireless sensor platform was developed to addresses the problem of air pollution monitoring at a large scale. It is a Microcontroller PIC 16F877 based core with off the shelf sensors to detect gases like Sulphur Dioxide (SO_2), Carbon Monoxide (CO), Ammonia (NH_3), and Particulate matter (PM_{10}) in the air. It consists of Global System for Mobile Communications (GSM) wireless link and also a low-cost ZigBee module. Wireless sensor network formed with ZigBee links can be scaled up using the GSM connectivity to interface with the external world. Air Pollution monitoring is performed using a system of sensor nodes with the help of wireless communication via ZigBee protocol. A prototype version of the platform is realized and tested. The major problem of power consumption by the sensor nodes in the designed wireless sensor network is addressed. The results showed that the proposed system can provide fine quality of air pollutants information through the WSN technology.

Keywords: air quality monitoring, ZigBee protocol, wireless sensor networks, power consumption, sensor calibration, global system for mobile communications (GSM).

INTRODUCTION

With the rapid urbanization and industrialization process across the world, the problems related to environmental pollution become universal. Air Pollution [1] is the presence of harmful contaminants or pollutants in the air. Inhaling the pollutant air is dangerous for the human health causing difficulty in breathing, coughing and leading to many respiratory problems. Looking at the adverse effects of air pollution on the human health, design and development of low-cost air monitoring systems is the need of the day and attracting many researchers to work in this area.

Air pollution monitoring systems [2] will help the local governments or the policymakers to enforce laws for controlling the air pollutant levels for the well being of their citizens. Even though the traditional air pollution systems offer highly reliable and accurate data, they cannot provide the air pollution on the real-time basis. The drawbacks of conventional methods are their massive weight with tremendous size and expensive which provides only low resolution sensing data. These systems are not able to provide air pollution data of high spatiotemporal resolution due to non-scalability and limited data availability.

With the recent developments in the field of Integrated circuits and communications paved the way for the development of Wireless Sensor Networks (WSNs). WSNs are used extensively in the real-time applications without the human involvement to gather and examine the data smartly. In the present day, Wireless Sensor Networks [6] are widely used in all the commercial, industrialized and military applications. Wireless Sensor Network based air Quality monitoring systems are low cost, battery operated and capable of collecting the data on the real-time basis and received data can be made available on the internet to a broader audience.

Some of the existing air pollution monitoring solutions are presented as below:

Cambridge Mobile Urban Sensing, CamMobSense [3] is a low-cost system with low power ZigBee transceiver and a Data logger on board. It transfers the collected data to the central server through the gateway. It monitors temperature, humidity, noise, CO, NO_2, vehicle occupancy, position, movement. It is part of MESSAGE project, the collaboration between Cambridge University, Imperial College London, Leeds University, Newcastle University and Southampton University.

RAE systems [4] provided the solutions which have multi-gas sensing capability and are battery powered. These solutions are costly which a limitation for its large-scale deployment. Recordum solutions require higher power, form factor and weight of the device hinders its massive scale and ease of implementation.

ENVIROMOTE, [5] capable of detecting gases like CO_2, CO, NO_2, SO_2, and humidity. It is based on TI's MSP430 microcontroller core with off-the-shelf sensors. It supports a broader reach GSM network in addition to a low-cost ZigBee wireless link. Suitable for the large-scale deployment.

In the proposed paper, a prototype version of ZigBee based air quality monitoring system using the wireless sensor network technology is realized and tested. The experimental results showed the proposed system can provide fine quality of air pollutants information in real-time [9] through the WSN technology.

PROPOSED DESIGN

A. Hardware description

It is a battery operated wireless platform developed on Microcontroller PIC 16F877 with off the shelf sensors to detect gases like SO_2, CO, NH_3, and PM_{10} in the air. It consists of GSM wireless link and also a low-cost ZigBee module. Wireless sensor network formed with ZigBee links can be scaled up using the GSM connectivity to interface with the external world.

Abstract

Coffee is the natural gift of Ethiopia. Generally the export quality washed coffee beans of Ethiopia are classified into two grades and sundried coffee beans into five different grades based on their number of defects. The objective of the research is to extract the features of green coffee beans from the images which would be helpful on classifying the coffee beans to different grades by an automated system. Different image processing techniques are applied on the images to perform preprocessing, segmentation and feature extraction. The extracted features of the coffee beans from images are broadly classified as morphological, textural and color. The morphological feature includes area, perimeter, major axis length, minor axis length, Eccentricity. Energy, Entropy, contrast and homogeneity are the information relevant to texture. Individual color component values of the three primary colors, along with its hue, intensity and saturation values are extracted for color features of the coffee beans. Automated classification and machine learning algorithms needs a data set for further processing. Data mining applications for discovering different patterns for various grades and knowledge discovery need a highly accurate dataset. Hence preparing such data set by applying image processing

An Investigation into the Usability of Blockchain Technology in Internet of Things

Sandeep Kumar Panda, D. Chandrasekhar Rao, and Suresh Chandra Satapathy

Abstract Internet of Things (IoT) has been the primary way for assuring the usable devices becoming smart and intelligent. The main challenge in IoT is to identify effective IoT issues. There are many challenges and difficulties have to face with this technology in the area of security and storage. In this regard, it is the responsibility to assure the user that devices are trustworthy. Blockchain technology is the key technology to provide every kind of security to Internet of Things using the decentralized architecture and peer-to-peer network connection. Cloud storage technology is very much reliable about the data storage. In this paper, we proposed a novel model for smart home application which focuses about the challenges while integrating blockchain technology with Internet of Things.

Keywords Internet of Things · Blockchain · Decentralized architecture

1 Introduction

Process of making your home, village, cities, devices into smart home, smart village, smart city, and smart device, respectively, by connecting it to the Internet is Internet of Things (IoT). Nowadays, IoT plays a vital role to make thing smart, reduce man power, saves time in every field. In this cutting edge technology, things are able to share their data with each other easily through Internet. Devices and objects are

Abstract--- Traveling Salesman Problem (TSP) is an optimization problem, with an objective function for finding the Hamiltonian path with shortest length or the minimum cost. Several authors made attempts on finding the optimal solution for the same. In this paper, a method for finding optimal solution using a Greedy design strategy is provided and also compared with other design strategies. Some remarks on the existing methods are made.

Keywords--- Traveling Salesman Problem, Algorithm Designs Techniques.

I. Introduction

Let there are '*n*' cities and the costs for traveling from one city to another city are known, then What should be the least traveling cost, for an Hamiltonian cycle of length n, if the traveler starts from any one of the city and visits each city exactly once and has to reach the starting city. Such a problem is said to be Travelling Salesman Problem (TSP) introduced in 1930's and it belongs to the category of nondeterministic polynomial time (NP-hard) problems. Many methods have been designed to solve this problem. Few of the methods are based on the algorithm design strategies like Divide and Conquer, Greedy, Dynamic Programming, Branch and Bound, Back Tracking, Graph Traversal techniques like Depth First Search and Breadth First Search etc. The standard popular iterative algorithms are Hungarian method, Karp algorithm, Random insertion, Lexicographic search etc.

Let the cost of travel from city i^{th} to city j^{th} be C_{ij} (i,j = 1,2, ... n) and let X_{ij} be the variable takes the value 1 if the path from i^{th} city to the jth city is selected otherwise it takes the value 0. The objective function is the total travelling cost should be minimum and The additional restriction are, can be chosen that, start from any one city and visit each city exactly once (except the starting city) and return to the starting city, The mathematical formulation is

$$\text{i.e Minimize } \sum_{i=1}^{n}\sum_{j=1}^{n} C_{ij}Xi_{j} \,. \qquad (1.1)$$

$$\text{i.e } \sum_{i=1}^{n} X_{ij} = 1 \text{ and } \sum_{j=1}^{n} X_{ij} = 1 \;\forall \text{ i and } \forall \text{ j} \,.$$

The algorithm design strategies are presented below.

1.1: Divide and Conquer Design: Divide and Conquer is a paradigm used to solve a set of problems in the approach that, the problem is break into several sub problems that are similar to the original problem but smaller in size, solve the sub problems recursively and then combine these solutions to create a solution to the original problem. Let 'P' be the problem to be solved. It is divided into 'k' smaller sub problems $P_1, P_2, \ldots P_k$ same as that of the original problem. Let n be the size of a P and let $n_1, n_2, \ldots n_k$ are th sizes of $P_1, P_2, \ldots, P_k$.

1.2 Greedy Design: The greedy design technique is one of the straight forward designing technique, which will works in stages. At each stage we use three functions: Select, Feasible and Union. **Select** is a function that selects an input from the array A and removes the selected input from the array A. This selected input value is assigned to x. **Feasible** is a Boolean valued function that determines whether x can be included into the solution vector or not. The

Importance sampling studies of helium using the Feynman-Kac path integral method

Show affiliations

Datta, S. ; **Rejcek, J. M.**

In the Feynman-Kac path integral approach the eigenvalues of a quantum system can be computed using Wiener measure which uses Brownian particle motion. In our previous work on such systems we have observed that the Wiener process numerically converges slowly for dimensions greater than two because almost all trajectories will escape to infinity. One can speed up this process by using a generalized Feynman-Kac (GFK) method, in which the new measure associated with the trial function is stationary, so that the convergence rate becomes much faster. We thus achieve an example of "importance sampling" and, in the present work, we apply it to the Feynman-Kac (FK) path integrals for the ground and first few excited-state energies for He to speed up the convergence rate. We calculate the path integrals using space averaging rather than the time averaging as done in the past. The best previous calculations from variational computations report precisions of 10^{-16} Hartrees, whereas in most cases our path integral results obtained for the ground and first excited states of He are lower than these results by about 10^{-6} Hartrees or more.

ORIGINAL PAPER

Stride towards aging problem in face recognition by applying hybrid local feature descriptors

Kishore Kumar Kamarajugadda[1] · Trinatha Rao Polipalli[2]

Received: 8 June 2018 / Accepted: 14 October 2018 / Published online: 29 October 2018

Abstract
In our proposed research, we developed a discriminative model for addressing the challenge of face recognition with respect to age variation by utilizing periocular region. Initially, we represent each face by using a densely sampled local feature description technique, in which multi-block local binary pattern (MB-LBP) and weber local descriptor (WLD) are adopted as the local descriptors. In this approach, extract the feature of entire facial image by the aid of both local descriptors. Since the feature space of both the MBLBP and WLD is vast, we develop an advanced multi-feature discriminant analysis to process these two local feature spaces in a unified framework. By random sampling, the training set as well as the feature space, multiple linear discriminant analysis (LDA) based K-nearest neighbor (K-NN) classifiers are constructed and then combined to generate a robust decision via a fusion rule. In the proposed method, the MORPH and FG-NET datasets are utilized for the experimental evaluation. In the MORPH dataset, our proposed method is compared with existing methods such as SIFT, Multi scale method based on morphology, signed grey level difference (SD), LBP, scale-invariant classification, gabor, hidden factor analysis (HFA), modified HFA (MHFA) and learning discriminant face descriptors (LFD). The accuracy of face and periocular region for our method is 98.83% and 98.32%. The existing method such as sparse null linear discriminate analysis (SNLDA), direct LDA, principle component analysis + LDA, cross-age reference coding (CARC), HFA and sparse representation classification (SRC) are compared with the proposed method and obtained the recognition rate is 96.74% and 97.89%. In parameter evaluation we get following values: recall is 93.34% and 96.56%, precision is 95.49% and 94.76%, F-score is 94.40% and 92.17% for face and periocular region. In the FG-NET dataset, our proposed method is compared with existing methods such as SIFT, LBP, MLBP, MWLD and multi-feature discriminant analysis (MFDA). The average accuracy in face region and the periocular region is 65.32% and 68.92%. Our proposed method produce recognition rate as 98.11% and 97.87% for face region and periocular region when compared with SNLDA, DLDA, SRC, PCA + LDA and Coupled Auto-encoder Networks (CAN). In parameter evaluation we get following values: recall is 90.85% and 91.65%, precision is 92.35% and 94.56%, F-score is 91.59% and 90.84% for face and periocular region. Our Method has error rate as 1.7% and our error rate is less when contrasted with Agarwal et al. (21%), Wallis et al. (11.5%), Wang et al. (4.515%) and Leibe et al. (2.5%) techniques.

Keywords Face recognition · Multi-block local binary pattern (MB-LBP) · Weber local descriptor (WLD) · Linear discriminant analysis (LDA) · MORPH and FG-NET

1 Introduction

In the domain of biometric research, face image recognition is an important and significant task (Xie et al. 2017; Li 2017). Some helpful information is taken from a face image, such as gender, expression, identity, approximate age etc., (Best-Rowden and Jain 2017; Bereta et al. 2013b) for the purpose of identifying individuals. In the field of visa confirmation, picture recovery, driver licenses, missing are distinguishing proof and so on (Xu et al. 2017; Li

Generalization of Contraction Principle on G-Metric Spaces

G Sudhaamsh Mohan Reddy

Department of Mathematics, Faculty of Science and Technology

ICFAI Foundation for Higher Education, Hyderabad-501203, India

Abstract

In this paper, we prove certain fixed point theorems of G -metric spaces using the generalized contraction principle on G -metric spaces.

Key words: G-metric space, Cauchy sequence.

Mathematics Subject Classification: 54H25, 47H10

1. INTRODUCTION AND PRELIMINARIES:

Metric fixed point theory is an important Mathematical discipline because of its applications in areas such as variation and linear inequalities, optimization and approximation theory, etc..,. The generalization of metric spaces were proposed by Gahler [5] (called 2-metric spaces) and Dhage [2, 3, 4] (called D-metric spaces). Hsiao [7] showed that every contractive definition, with $x_n = T^n x_0$, every orbit is linearly dependent, thus giving fixed point theorem in such spaces. However HA et. al. [6] have pointed out that the results obtained by Gahler for his 2-metric spaces are independent, rather than the generalizations of corresponding results in metric spaces. While Mustafa and Sims [8] have proved that the Dhage's notion of D-metric space is fundamentally incorrect and most of the results claimed by Dhage and others are invalid.

Mustafa and Sims [8] in 2003 have introduced a more appropriate and robust notion of generalized metric spaces as follows:

1.1 Definition: (See [8])

Let X be a non empty set and let $G: X \times X \times X \to [0,\infty)$ be a function satisfying the following axioms:

Fixed Point Theorems for (ε, λ)-Uniformly Locally Generalized Contractions

G. Sudhaamsh Mohan Reddy

Faculty of Science and Technology, ICFAI Foundation for Higher Education
Dontanapalli, Shankarpalli Road, Hyderabad-501203, India

Abstract

In this paper, we define a class called (ε,λ)-uniformly locally generalized contractions and establish a fixed point theorem for such contractions.

2000 Mathematics Subject Classification. 54H25. 47H10.

Key words and phrases. Fixed point Theorem, Contraction, Convergence.

Introduction:

1. **Definition:** A selfmap f of a D^*-metric space (X, D^*) is called a (ε,λ)-***uniformly locally generalized contraction***, if there is a number q with $0 \le q < 1$ and a positive constant ε, such that

$$D^*(fx, fy, fz) \le q.D^*(x, y, y) + r.D^*(x, fx, fx) + s.D^*(y, fy, fy) \quad (1.1)$$
$$t.\{D^*(x, fy, fy) + D^*(y, fx, fx)\}$$

for all $x, y \in X$ with $D^*(x, y, y) < \varepsilon$, where $\underset{x, y \in X}{Sup}\{q + r + s + 2t\} = \lambda < 1$.

We now prove

Main Theorem:

2. **Theorem:** Suppose f is a (ε,λ)-uniformly locally generalized contraction of a D^*-metric space (X, D^*) and X is f-orbitally complete. Then for every $x \in X$,

ABSTRACT Network lifetime maximization is the primary challenge in the wireless sensor network (WSN) due to its resource limitations. E^2R^2 routing algorithm uses a hierarchical WSN model to minimize energy consumption in the WSN. However, it increases complexity, time consumption, and energy consumption due to the hierarchical model. To resolve these problems, this paper proposes a novel ring partitioned based MAC (RP-MAC) protocol for the energy-efficient WSN with a mobile sink node. Energy efficiency is achieved by the following phases: clustering phase, MAC scheduling phase, data aggregation phase, and routing phase. Clustering phase is initiated by a weighted Voronoi diagram (WVD) algorithm by assigning a weight value for each node. Energy consumption due to idle listening is minimized by enabling novel RP-MAC scheduling in each cluster. Involvement of RP-MAC protocol also achieves collision-free data transmission in the network. A two-fold data aggregation (TFDA) scheme is proposed for the data aggregation phase to minimize energy consumption by reducing the number of transmissions. Routing phase supports both intra-cluster routing and inter-cluster routing. For intra-cluster routing, a hybrid chicken swarm optimization algorithm is proposed. For inter-cluster routing, position-based routing tree is constructed based on the sink node's position. Our proposed RP-MAC protocol minimizes energy consumption in all possible ways for improving the network lifetime. Extensive simulation in ns-3 shows that the RP-MAC protocol achieves promising results in the following performance metrics: the number of dead nodes, average energy consumption, network lifetime, and throughput.

INDEX TERMS Voronoi diagram, data aggregation, MAC protocol, intra-cluster routing, inter-cluster routing, mobile sink.

I. INTRODUCTION

Wireless sensor network is a typical wireless network with spatially distributed sensors that can communicate with each other through wireless links [1]. WSNs widely adapted for many applications such as civil infrastructures, health monitoring, smart grid, agriculture, safety applications, and industrial applications and so on. However, the lifetime of WSN depends upon following constraints: communication medium, resource limitations, coverage and connectivity, fault tolerance, quality of service (QoS) requirements, mobility and deployment [2]. Here energy efficiency is major cause for network lifetime minimization. Energy efficiency in WSN is achieved with the support of mobile sink or mobile base station in which sink node moves around the network [3]. In the presence of mobile sink, sink relocation [4], and route adjustment [5] schemes are focused by authors. Cluster formation and routing algorithms are considered as major solutions for energy efficiency in WSN [6], [37]. Some of the significant routing protocols categories are proactive, reactive, hybrid, flat, hierarchical, location based, multipath, query based, negotiation based, QoS based and probabilistic algorithms. Some researchers concentrated on clustering process to improve energy efficiency in WSN [7]–[9]. For cluster formation multi-objective fuzzy clustering algorithm [7], enhanced particle swarm optimization (PSO) algorithm [8], and fuzzy logic algorithm [9] are utilized. The major aim of these algorithms is to minimize energy consumption in the network. An improved ant colony optimization (ACO) algorithm uses received signal strength indicator (RSSI) for route selection in WSN [10]. The distance computation is

Abstract

Internet of Things (IoT) , where physical systems are connected over network to exchange information among themselves and with their surroundings. IoT helps in developing most powerful industrial systems. It finds its various applications in house hold, agriculture, and in various industrial systems. In an effort to understand the growth of IoT , this paper reviews current research trends of IoT , key technologies, and its major applications, and identifies key challenges of IoT. This paper mainly summarizes the applications of IoT in industries

Keywords: Internet of Things (IoT); Near field communication; Protocols; RFID; Wireless sensor Networks.

1. Introduction

As an off-promising technology IoT provides solutions to transform the operation of many existing industrial systems. For example, when IoT is used in creating smart systems for aqua-culture, then the farmer can easily monitor the information regarding water ,i.e., pH of water, its temperature and other details. Using which the farmer can predict what has to be done for the growth of fishes.

IoT allows all the existing systems to connect to a network, using which they can communicate among themselves and with the surroundings such that some action to take place. Connecting all the devices to a network can be done by using a unique ID called IP address. IP address helps to identify and locate a device on the network and routes the information. Today commonly accepted definition for IoT is

"A network of physical objects or 'things' that can interact with each other to share information and take action." or: "The Internet of Things (IoT) is the interconnection of uniquely identifiable embedded computing devices within the existing Internet infrastructure." [1]

Initially IoT, used radio-frequency identification (RFID) technology for identifying the connected devices. Later on IoT locate devices by using sensors, actuators, and mobile devices. Specifically, Integrating sensors, RFID tags and communication protocols serves as the foundation for IoT [2] .

Research shows that there is tremendous growth in the area of IoT. The industries are trying to work on more projects related to IoT in the fields of health care, agriculture, aqua-forms, transportation and others. Statistics shows that there will be around 22% growth in profit for the industries that are working on IoT [3]. Not only industries are focusing on IoT, but in the recent years it has been observed that number of publication on IoT are also increasing.

The organization of this paper is as follows: In Section II the Background and current research of IoT is provided. Section III provides the information regarding IoT Architecture. Section IV covers the technologies of IoT. Section V gives the information regarding applications of IoT .Section VI covers the challenges of IoT. And finally conclusions are presented in section VII.

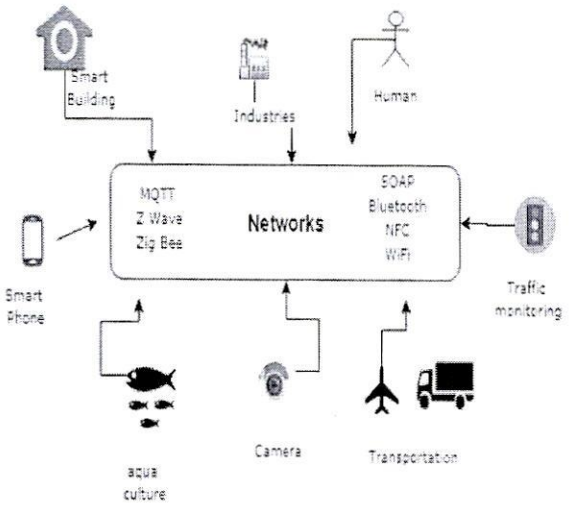

Figure. 1: Illustration of ' things ' in IoT

2. Background and Current Research of IoT

During initial days of IoT, RFID served as the foundation technology, which allows user to send or receive information using radio - frequency signals. The connected device should be attached with RFID tags, which contains reader and transmitter. With help of RFID reader , people can locate and monitor the devices [4]. Main application of RFID is transportation

Collaborative Filtering Recommender System (CFRS): Comparative Survey on Cold-Start Issue

S. Vairachilai*

Department of Computer Science and Engineering, Faculty of Science and Technology, The ICFAI Foundation for Higher Education (IFHE), Hyderabad – 501203, Telangana, India; vairachilai@ifheindia.org

Abstract

Objectives: To analyze the issue of cold-start (user cold-start and item cold-start) in Collaborative Filtering Recommender System (CFRS) and to compare its solution with various approaches are summarized in this paper. **Methods/Statistical Analysis:** The manuscript discussed about the cold-start issue in which the recommender system cannot recommend items to the new user because no ratings made by the new user (user cold-start) as well as for the newly added items, the system cannot be able to provide recommendations to the user because the system has no ratings for the newly added item (item cold-start). The solutions for cold-start issue are analyzed based on the model based approach, demographic data, ask-to-rate technique, and Social Network Analysis (SNA). **Findings**: The comparative review of the aforementioned approaches provides the detail about how to implement the model based approach, how to collect the demographic data from the new user, how to apply the ask-to-rate technique and how to make use of the SNA concept to solve the cold-start issue in CF recommender system. **Application**: The recommender system on Amazon helps the user to purchase books, Compact Disks (CDs), Netflix helps the user to choose CDs to purchase/rent and Epinions, helps the users to decide to purchase based on user reviews.

Keywords: Ask-To-Rate Technique, Cold-Start, Collaborative Filtering Recommender System, Demographic Data, Model Based Approach, Social Network Analysis

1. Introduction

With an increasing market size, electronic commerce is a driving force for a business to enable a firm or individual for online shopping or marketing over an electronic network, typically the internet. Because it reduces the transaction cost, low energy cost and provides access to the global market. At the same time, the explosive growth of the Internet has increased the volume of information. Thus, e-commerce applications to confront the information overload problem in which users are finding the right information at the right time is difficult. From the business point of view, recommender systems have the potential to solve the information overload problem. The recommender system task is to recommend items and also help the user in selecting/purchasing items from an overwhelming set of choices. The collaborative filtering recommender system is one of the most successful approaches in an e-commerce website. Collaborative filtering is a method that provides personalized recommendations, based on preferences expressed by a set of users and calculates the similarity between customer preference ratings to identify like-minded customers and predict their product preferences.

Although the collaborative filtering recommender system successful, it undergoes a major issue such as

Abstract: Nowadays, manufacturing business may not sustain in the competitive business without the support of Information Technology and Computer Aided Capabilities. Cloud computing can improve the PDE, ERP, MRM, MPM by providing an optimized solution. Cloud computing provides manufacturing resources and manufacturing capabilities as manufacturing services on-demand thereby providing the feasible solutions for all kinds of users involved in the whole lifecycle of manufacturing. This paper discusses the various cloud models used in the manufacturing sector to automate the manufacturing process and how to measure the quality of service in manufacturing systems using cloud.

Keywords: Cloud computing, Manufacturing process, Quality of service.

1. Introduction

Due to the rapid growth of data, many industries are using the cloud to compute their activities [1]. This technology enables on-demand self-service, network access, rapid elasticity, measured service and resource pooling. The two types of models used in the cloud are deployments models and service models. Using deployment models a cloud can be deployed in an organization in four ways i.e. private cloud, public cloud, community cloud and hybrid cloud. Cloud architecture contains software, hardware, and other resources can be delivered to the user as a service. IaaS, PaaS, SaaS, BPaaS etc. are cloud service models and users are charged based on the usage [2]. As technology increases the risk factor in industries has also increased. Cloud computing became more applicable and become a need in automation [3]. In mechanical industries, the application of cloud computing provides the automation of the plant and provides control from anyplace by using service models [4]. Cloud computing can improve the PDE, ERP, MRM, MPM by providing an optimized solution. Cloud computing provides manufacturing resources and manufacturing capabilities as manufacturing services on-demand thereby providing feasible solutions for all kinds of users involved in the whole lifecycle of manufacturing. Due to Industry 4.0, Internet of things the data collected from different devices and machines is increasing rapidly then to process it takes much time and greater complexity involved in it [5]. Cloud enabled manufacturing platform gives a better solution to this problem.

2. Existing system:

The existing system is maintained manually by onsite engineers and with an automated sensor system. The decision has been taken based on system parameters by comparing with automated sensor system and onsite engineers. The operation management is completely will

ABSTRACT

In general plate girders are designed using two different theories : design using beam theory and tension field theory. Until the latest revision of IS 800-2007 tension field theory was not popular in Indian Engineering Industry. But the present code allows the user to adopt the tension field theory for girders in engineering construction. This paper is focusing on analytical investigation on the ultimate load behavior of beam member designed using tension field theory. The frame is subjected to different load conditions. A parametric study was carried out with slenderness ratio of the web as parameter. The present study concluded that the member with slenderness ratio 150 to 175 can be used in seismic prone areas, as it have more reserve strength due to post buckling and tension field action.

Abstract: More and more automobile companies are going for weight reduction of their vehicles for fuel economy and pollution control. The objective of the present study is to determine the effect of blank temperature on forming behaviour of sheets and damage factor of aluminium sheet alloys of 6061 and 7075 at elevated temperatures. Although the aluminium alloys have high-strength to weight ratio and good corrosion resistance, the low formability of aluminium sheets limits their use in some products with complex shapes, such as automotive body parts. The elevated forming process is intended to overcome this problem. An insight into such a study will throw light on the different temperatures required by the above materials when they are made into TWBs. Using ANSYS a series of simulations were carried out in the present investigation on the formability behaviour of deep drawing of aluminium alloys in the temperature range 200-500°C.

Keywords: Aluminium Alloys, Forming, Damage Factor, ANSYS

1. Introduction to Forming Processes

Casting, machining, welding and metal forming are the main methods of manufacturing. The other methods of manufacturing are powder metallurgy, heat treatment and finishing. In casting a liquid material is poured into a mold and then allowed to solidify in order to take the desired shape. By casting, big and complex parts can be manufactured. The second manufacturing process is machining. This process can be defined as removing material (chips) from the workpiece. Machining is one of the most used processes in manufacturing. Cutting tool is used for removing material from the piece while cooling fluid dissipates the heat generated from the process. Another method is welding. In this method, two or more metal pieces are joined together by melting or fusing them with the help of heat. Welding is generally used in shipbuilding, automotive manufacturing and aerospace applications. The last method is metal forming. In this process, applying force to the piece forms the material shape. Metal forming is used for achieving complex shape products and improving the strength of the material. During forming, little material is wasted compare to other manufacturing processes. Bulk forming and sheet metal working are the two main groups of forming processes based on raw material used in the process. Rolling, forging and extrusion in bulk forming can be done cold, warm and hot. The other forming process is sheet metal forming. In this method, applying pressure through dies shapes thin sheets of metal. Sheet metal forming is very important for metals because nearly 50% of metals are produced in sheet metals.

Sheet metal forming is done by many ways such as shearing and blanking, bending stretching, spinning and deep drawing. Those methods are widely used for producing various products in different places of industry. The parts manufactured by sheet metal forming are widely used in automotive and aircraft industries.

Deep drawing is one of the most important sheet metal forming processes. A 2-d part is shaped into a 3-d part by deep drawing. According to the definition in DIN 8584, "deep drawing is the tensile-compressive forming of a sheet blank to a hollow body open on one side or the forming of a pre-drawn hollow shape into another with a smaller cross-section without an intentional change in the sheet thickness."

Path Planning of A Parallel Manipulator Using A* Algorithm

A. Harish [1], Dr.Chandrashekhar.A [2], Dr.G. Satish Babu [3]

Asst. Prof., Mechanical Engineering Department, CMR College of Engineering & Technology, Hyderabad, India[1],

Asst. Prof., Faculty of Science & Technology, ICFAI Foundation for Higher Education, Hyderabad, India[2].

Professor, Department of Mechanical Engineering, JNTUH College of Engineering, Hyderabad, India[3]

ABSTRACT:

Manipulators are now used in many fields as automation became a most important part of all the fields. Manipulators are being used mostly in many hazardous places where it is dangerous or laborious for a man to work in that places like industries, hospitals, rescue operations etc. Manipulators have a great application in industries where they are used for carrying loads, pick and place and assembling. Two types of manipulators are in use they are Serial and Parallel manipulators. In this paper I am going to deal with Parallel Manipulators and their advantages over serial manipulator and also do path planning for a parallel manipulator that is used in industries using an artificial intelligence algorithm called A algorithm. This algorithm helps a robot to find the optimal path on its own depending on the obstacles present and layout of the industry.*

1. INTRODUCTION:

Robots or Manipulators are playing a very important role in fulfilling human needs. Generally, manipulators are of two types Serial and Parallel. Serial manipulators are the most common industrial robots. They are designed as a series of links connected by motor-actuated joints that extend from a base to an end-effector. Often they have an anthropomorphic arm structure described as having a shoulder, an elbow and a wrist. Serial robots usually have six joints, because it requires at least six degrees of freedom to place a manipulated object in an arbitrary position and orientation in the workspace of the robot. n its most general form, a serial robot consists of a number of rigid links connected with joints. Simplicity considerations in manufacturing and control have led to robots with only revolute or prismatic joints and orthogonal, parallel and/or intersecting joint axes.

Whereas a parallel manipulator is a mechanical system that uses several computer-controlled serial chains to support a single platform, or end-effector. Perhaps, the best known parallel manipulator is formed from six linear actuators that support a movable base for devices such as flight simulators. This device is called a Stewart platform or the Gough-Stewart platform in recognition of the engineers who first designed and used them. A parallel manipulator is designed so that each chain is usually short, simple and can thus be rigid against unwanted movement, compared to a serial manipulator. Errors in one chain's positioning are averaged in conjunction with the others, rather than being cumulative. Each actuator must still move within its own degree of freedom, as for a serial robot. However, in the parallel robot the off-axis flexibility of a joint is also constrained by the effect of the other chains. It is this closed-loop stiffness that makes the overall parallel manipulator stiff relative to its components, unlike the serial chain that becomes progressively less rigid with more components.

Asst. Prof., Faculty of Science & Technology, ICFAI Foundation for Higher Education, Hyderabad, India[2].

Abstract:

This paper proposes a method to optimize the workspace of the hybrid robot using Genetic Algorithm (GA). One of the crucial factors to consider in the operation of a robot is its workspace, it plays an important role to plan a trajectory. For a robot the main objective is to complete a task accurately, by consuming less energy, at a minimal operational time, by avoiding the collision with the obstacles. Finding an optimal workspace where the robot has the shortest trajectory length can achieve the above factors effectively. As an instance, a 2 DOF Hybrid robot is used and considered a leg of that robot to do the analysis, the kinematics of this leg are evaluated, which will be used to evaluate the objective function. The objective function is developed in such way that it minimizes the workstation of the manipulator. Genetic algorithms are in general the most robust type of evolutionary algorithms, so it is used in this work to fulfill the requirement. The average eigen value obtained from the Analytical Hierarchy Process (AHP) is used as weighing factor in the objective function to regulate the deviation, if any, occurs due to the genetic algorithm from the realistic values. AHP is solved by giving the priorities to the control attributes that effect the robot motion. In this work it is concluded that the use of this optimization algorithms in the kinematics of the hybrid robot will achieve the required task most effectively and efficiently.

Keywords: Hybrid robots, Kinematics of the robot, Genetic Algorithm, AHP, Optimization methods.

1. Introduction:

Over the last decades, walking machines have posed an interesting field of research, due to their great potential features. Mobile robots have a wide range of applications such as: inspection, service, defense, manufacturing, cleaning, remote exploration, rescue and entertainment. In general, they can be grouped into two main types, legged and wheeled robots, with important differences in features, as regarding to mechanical design and control systems.

There is rapid development of robot technology and thus more and more applications for robots are designed with different configuration. This paper is concerned of hybrid robot, applications of which have been increasing at a rapid rate. In the near future, robots will interact with human beings in the same environment, which means that the robot design should be suitable for moving in an environment whit stair, obstacles, and so on, where humans live. However, it is difficult to generate humanlike walking motion automatically. Humans can walk not only on flat surface but also on rough terrain, such as steps, obstacles, or slopes. One of the most important advantages of legged robots is the ability to move over

Asst. Prof., Faculty of Science & Technology, ICFAI Foundation for Higher Education, Hyderabad, India[2].

ABSTRACT:

In Industrial ergonomics a manipulator is a lift assist device used to help workers lift, maneuver and place articles in process that are too heavy, too hot, too large or otherwise too difficult for a single worker to manually handle. Manipulators are of two types, Parallel and Series manipulator. In a Parallel manipulator several links are used to control a single platform. The subject of this paper is to study Kinematic analysis and Design synthesis of a 3 link Parallel manipulator and to determine the movement of the end effector and workspace of a 3 link parallel manipulator with identical links. The designing is done using CREO and numerical analysis is done using Freudenstein approach.

KEYWORDS: Parallel manipulator, Freudenstein approach, CREO Parametric.

1.1 INTRODUCTION

Parallel Robot (Manipulator) is a mechanical system which is made up of links and joints to support a moving platform using actuators. The main aim of this paper is to design and analyze a 3 DOF parallel manipulator. In this design we focused on maximizing the work volume and minimizing the singularity. To achieve that three identical links are designed to enlarge work volume by reducing the links interference. This study analyzed the Kinematic analysis, both inverse and forward, dimensional synthesis and velocity analysis.

ABSTRACT

Gasification is a promising eco-friendly technology to meet the current and future energy demands. One of the main issues of gasification is the presence of major greenhouse gas CO_2 in the product gas. The aim of this paper is to study the effect of parameters on sorbent-enabled gasification process to reduce CO_2 emissions. Experimental investigation of the effect of parameters Equivalence Ratio(ER), Steam to Fuel Ratio (SFR), a Sorbent-to-Fuel Ratio (SOFR) and a Coal-to-Biomass Ratio (CBR) on syngas composition in the co-gasification of coal and biomass is performed in a lab-scale biomass gasifier. Results indicated that the addition of sorbent during gasification decreases the CO_2 content and increases H_2 yield. An increase of 21.5% in H_2 and reduction of 24.3% in CO_2 emissions is achieved at CBR of 0.25/0.75.

INTRODUCTION

There is a growing concern over increasing environmental issues such as global warming, depletion of fossil fuels due to increasing energy demands. While coal and biomass are abundant in India, an eco-friendly technology is necessary to utilize these resources effectively with minimum environmental impact and maximum efficiency. Gasification had been the focal point of many researchers across the world for the past two decades. One of the disadvantages of gasification is the presence of major greenhouse gas CO_2 in the product gas. Several methods have been proposed by researchers to increase H_2 production, and reduce the CO_2 content. Majority of the works have been on modeling the process with different gasifiers, biomass feed stocks, and sorbent materials. Nicholas et al [1] reported one of the initial works on enhanced H_2 production using CaO sorbents in

ABSTRACT

As industry 4.0 refers to the importance and the ruling capacity of Cloud in various areas, in which the Design & Manufacturing as the most important domains in-service platform under it. Cloud computing playing an important role in data collections, synchronization, easy accessibility and also majorly on computing technology. With this support, various researchers had started implementing the same in the area of Design & Manufacturing by laying a new path in doing business by providing flexible and scalable services through internet. It creates new solutions and opportunities for modern enterprises, including the manufacturing industry. In this paper, the essential features of Cloud Computing models are discussed which helps us to understand the Cloud-Based Design & Manufacturing (CBDM).

INTRODUCTION

The industrial revolution has brought around various supports in the manufacturing industry. While starting from the first industrial revolution how does the man started using machines which termed as mechanization, by running the machines with the use of power generated from water & steam. In continuing the same second industrial revolution started concentrating on the mass production by using the electricity based machine work, and also implementing the assembly line. Whereas in the next industrial revolution i.e., third revolution the involvement of Computers has brought change in the face of manufacturing into automation and making the availability of productivity in a short time.

ABSTRACT

This paper represents the comprehensive synthesis of the latest results on the possible mechanical architecture, on their analysis by using sensitivity indices and possible uses of this analysis for selection of better precise manipulators. In this study, the importance of sensitivity is discussed, as high sensitiveness leads to poor unexpected performance. For better orientation and position of robot end effectors, the sensitivity analysis of the robot is needed, with the proper position of robot can work effectively comparatively less cost.

KEYWORDS: Position, Orientation, Serial and Parallel Manipulator & Sensitivity Analysis

Received: May 17, 2018; **Accepted:** Jun 07, 2018; **Published:** Jul 03, 2018; **Paper Id.:** IJMPERDAUG201822

A Review

INTRODUCTION

In industrial automation the parallel and serial manipulators are considered as the alternative to the conventional manufacturing, to achieve precise positioning, Mass production, high load carrying capacity, high accuracy and better dynamic performance, which leads to higher quality products and economical. However the automation plays a major role in the industries, the process like grinding, drilling, milling, surface grinding, polishing etc require high stiffness, Rigidity, sensitivity, precise positioning and accuracy which are cannot be possible in the serial manipulator because of cantilevered structure, so parallel manipulator is the better alternative for high load carrying capacity

Motivation and Importance of Present Work

Parallel manipulator applications are evident even the serial manipulators have more industrial applications, In this paper, the parallel manipulator sensitivity analyzed to select a better configuration of the serial manipulator in the workspace.

Stephane Caro et al(2009) Conducted kinematic sensitivity analysis of three RPR parallel planar manipulator. The variations within the geometric parameters helped to pick out the best orientation and position of a parallel manipulator. They have calculated the sensitivity coefficients and indices for the manipulator.

Abstract: We obtain asymptotic estimates for the partial sums $\sum_{1<n\leq x} a_n$ for $a_n =$ (i) $\frac{(logn)^{log2}}{d(n)}$ (ii) $\frac{2^{\omega(n)}}{(logn)^{log2}}$ (iii) $\frac{1}{d(n)}$ (due to Ramanujan-Wilson). These are based on Delange's Tauberian theorem. We deduce that the normal order of Hardy-Ramanujan's approximation to $d(n)$ is more often lower than $d(n)$ as asserted by them.

AMS Subject Classification: 11A25, 11B99, 11N56

Key Words: divisor functions, normal order, Abel summation, Delange's Tauberian theorem

1. Introduction

In his interesting lecture on "Round Numbers" ([2], Ch3), G.H.Hardy describes how he and S.Ramanujan arrived at the approximations $\omega(n) \approx loglogn$ "usually" and $d(n) \approx (logn)^{log2}$ "usually". These were later expressed probabilistically by P.Turan([3]). Our Proposition below supports their claim that "Round numbers are rare": most numbers tend to have a small number of prime divisors.

ARCHITECTURE, APPLICATIONS AND CHALLENGES OF INTERNET OF THINGS

[1]Manisha Gunturi, [2]Dr. M. Srinivasa Reddy, [3]Nagamani Shankar K
[1]Assistant Professor, Faculty of Science & Technology, IFHE, Dontanpally, Hyderabad – 500008
[2]Director, Faculty of Science & Technology, IFHE, Dontanpally, Hyderabad – 500008

Abstract

This paper provides a general review and outline of the Internet of Things. Internet of things can be defined as a global network of interconnected and interoperable things embedded with sensors and actuators. This paper provides a basic outline of the internet of things, its components, device identification and connecting techniques, applications and challenges.

Keywords: IoT, Sensors, RFID.

1. Introduction

From ancient ages to present digital date, we have witnessed advancements in all the fields where man has been equipped with the finest technology and ready access to any kind of information. With the advancements in the technologies and digitalization, this has become simpler than ever. But the current need of the hour is to come up with a more sophisticated system which can provide a much simpler life. Such an innovative and advanced technology is the use of internet of things or in short IoT.

Internet of things is a common term used to specify the usage of gadgets in everyday life leading to a fully automated world. The basic principle of IoT is interconnectivity of the devices so that information can be exchanged effectively and corresponding actions can be performed. This can be achieved in two ways, first one is the traditional method of communication like man to thing where the input will be given by man such as operating TV or a washing machine manually. In the second method, the communication is done by thing to thing, thing to man. This smart system can be achieved by the use of smart devices. There is no doubt in this, that the internet of things has made the daily lives easier.

Internet of things makes use of devices that are linked to the internet to sense and generate data to interact with other smart devices. After establishing a proper connection with the surrounding devices, data will be transferred and required task can be executed. This looks simple but the actual process is way more complex. The first issue that rises is the connectivity of devices as there are number devices, identifying and connecting to a specific device may be the primary challenge. Secondly, data management becomes the issue of concern as we are familiar that the sensors embedded in smart devices are too small and hence they may not be able to store such a large data. Hence processing the collected data and converting into meaningful information before transferring becomes more crucial. Thirdly, most of the smart devices are mobile in nature, establishing a proper connection or connectivity to the internet is another problem.

In spite of its drawbacks, IoT is gaining a huge attention and has become a burning topic as it can bring technological revolution globally. The scope of Internet of Things is not only limited to connecting the entities but it also allows the exchange of information or data which can be used to execute meaningful applications.

The Internet of Things is therefore considered as a global network that facilitates the communication and information exchange between human-to-human, human-to-things and things-to-things. The connectivity between the things can be done by unique identification of the devices using various methods such as tracking by RFID (Radio Frequency Identification), near field communication, barcodes, QR codes and digital watermarking.

This paper mainly focuses about an overview of the Internet of Things, its connecting and communication technologies, applications and challenges.

2. Components of IoT

From the last few decades, the use of smart devices and smart systems is growing by leaps and bounds worldwide. To develop such a sophisticated management system that would revolutionize the lifestyle of humans, devices with embedded systems are required.The following are the major components of IoT system that are responsible for its effective and uninterrupted services:

1. Sensors and Actuators
2. Networking
3. Internet
4. Data base or Backend services

A Profile Based Face Recognition across the Ages for the Forensic Applications

[1]K.Kishore Kumar, [2]P.Trinatha Rao
[1]Department of ECE, Faculty of Science and Technology, IFHE, Hyderabad, India
kkishore@ifheindia.org
[2]Department of ECE, School of Technology, GITAM, Hyderabad
trinath@gitam.in

Abstract

In this paper, profile-based face recognition across the ages is proposed. The performance of the biometric systems depends on the amount of data available in the query image. Accuracies of these systems will be significantly affected by the availability of partial face data, intentional or unintentional occlusions and noncooperative persons. Intentional facial occlusions occur when a particular person is trying to hide his identity by hiding his face and appearance from the security cameras. The current paper is more about helping forensic teams to verify facial images of different ages and identifying the possibility of face match with that of the existing database. In the proposed paper the profiled face is created from an original image, and these profile faces are used in the query process. Nose and eye surroundings are the active regions in the recognition process. The periocular region is performing better than half faces, and T part is more promising to periocular as it has information of nose as well when tested on various algorithms. The current paper concentrates on information scarcity in the query image, especially where the query image being less informative. The methodology is about producing a confidence score for face identification (one to many analysis) which reduces face verification load (one to one analysis).

Keywords: Periocular region;non-cooperative and occluded person;forensic applications; FG-NET database; confidence scores;Cross Eye distance-factor;Periocular length ratio.

1.Introduction

Existing biometric systems use the face as the biometric trait [1] which had shown the promising performance over the decades. The biometric systems require the frontal facial images, and their performance is significantly affected by the unavailability of the frontal faces, subjects with different poses, facial expressions, aging process, varying illumination, occlusions and noncooperative subjects. In the surveillance applications, the complete face of offenders is often not visible as they mask their faces in the scenarios of crime. The design of the robust biometric systems is a challenging task when only the partial face data is available, i.e., the region around the eyes, that is the periocular region is the only visible biometric.

Periocular region based person identification is gaining importance day by day as it offers various advantages such as (i)Periocular region is less affected by the variations in pose, expressions (ii) aging process [2]. Periocular Region is the most discriminating portion of the face, gaining significance as a useful biometric modality under the non-ideal conditions, supplement to the traditional face and iris biometric systems. Periocular Region based recognition is still a comparatively new area which is cost-effective and doesn't require any extra storage space. The periocular region is captured along with the face and Iris during the biometric acquisition process. For obtaining the better recognition accuracies, the periocular region can be used as in fusion with face/Iris modalities. In the design of age-invariant face recognition systems, the periocular region is less affected by the aging process [4] than compared to the face. Periocular Biometrics uses small periocular region templates which use only 25% of the full face image when compared with the full face models makes them faster in the recognition process.A periocular region can be acquired from a larger distance by surveillance cameras even for the non-cooperative subjects whereas iris biometric requires the subjects to be

The Icfai Foundation for Higher Education, Hyderabad
(Deemed to be University under section 3 of UGC Act, 1956), INDIA

[3]CTW, Military College
Secundrerabad, 500015, INDIA

Abstract: We give four formulas for $d(n^2)$ in terms of arithmetical functions ω, μ, d_3 and d:

$$d(n^2) = \sum_{k|n} d(k)\mu^2(\frac{n}{k}) = \sum_{k^2|n} \mu(k)d_3(\frac{n}{k^2}) = \sum_{k^2|n}(\sum_{m|n} d(m))\mu(k) = \sum_{k|n} 2^{\omega(k)}.$$

We estimate the partial sum

$$\sum_{n\leq x} d(n^2) = (\frac{1}{\zeta(2)} + \circ(1))xlog^2x$$

using Tauberian theorem. Similarly, we estimate the partial sums for $\frac{1}{d(n)}$, $\frac{logn}{d(n)}$, and $\frac{\sigma(n)}{d(n)}$.

AMS Subject Classification: 11M06, 11M41, 11M45
Key Words: arithmetical functions, divisor functions, Tauberian theorem

1. Introduction

We consider some arithmetical functions whose mean is not finite; in such cases the order of growth of the partial sums is determined. Our examples are (i) $d(n^2)$ (ii) $\frac{1}{d(n)}$ (iii) $\frac{logn}{d(n)}$ (iv) $\frac{\sigma(n)}{d(n)}$. Our main tools are Abel's summation formula and a generalized Tauberian theorem, due to H. Delange.

A COMMON FIXED POINT THEOREM ON COMPLETE $G-$ METRIC SPACES

G. Sudhaamsh Mohan Reddy
Faculty of Science and Technology
Icfai Foundation for Higher Education
Dontanapalli, Shankarpalli Road, Hyderabad, 501203, INDIA

Abstract: In this paper, we obtain common fixed point theorem for two self maps of complete $G-$metric spaces.

AMS Subject Classification: 54H25
Key Words: $G-$metric space, $G-$Cauchy sequence, altering distance function, contractive mapping

1. Introduction

Metric fixed point theory is an important Mathematical discipline. The generalization of metric spaces was proposed by Gähler [3] (called 2-metric spaces) and Dhage [1, 2] (called D-metric spaces). Hsiao [5] showed that every contractive definition, with $x_n = T^n x_0$, every orbit is linearly dependent, thus giving fixed point theorem in such spaces. However HA et. al. [4] have pointed out that the results obtained by Gähler for his 2-metric spaces are independent, rather than the generalizations of corresponding results in metric spaces. While Mustafa and Sims [6] have proved that the Dhage's notion of D-metric space is fundamentally incorrect and most of the results claimed by Dhage and others are invalid.

Abstract We construct and study various aspects of coherent states of a polynomial angular momentum algebra. The coherent states are constructed using a new unitary representation of the nonlinear algebra. The new representation involves a parameter γ that shifts the eigenvalues of the diagonal operator J_0.

Keywords Higgs algebra · Coherent states · Statistical properties

1 Introduction

Polynomial generalisations of Lie algebras have been increasingly making an appearance in physics over the years. One of the earliest known appearance of these algebras has been in the study of Kepler and isotropic oscillator problems on an N-dimensional spherical geometry [1, 2]. The polynomial algebra that arose in the above study is a cubic one, presently called Higgs algebra, and is given by the following commutation relations

$$[J_+, J_-] = 2\alpha J_0 + 4\beta J_0^3, \qquad [J_0, J_\pm] = \pm J_\pm. \tag{1}$$

Here α and β are some parameters. Note that there are higher order terms of J_0 in the commutation relations hence, such algebras are called polynomial algebras.

Abstract— The process of designing a marine propeller for under water applications involves various complex analysis. Analysis are of iterative in nature which makes it cumbersome and inefficient to understand. A part of the research work entitled in this paper is concerned with the material effect and stress behavioural characteristics of a marine propeller blade subjected to cantilever condition. Designing and Analysing the behaviour of an anisotropic composite material is one of the most important technologies in the area of marine propulsion. Based on the FEM the conventional and composite material marine propeller blades are analysed. To simulate the blade layup and to determine the stress characteristics, ANSYS software with shell 181 elements are taken for reference. A study has also been carried out for determining the stress and deformation pattern arising due to varying ply layup and material. The obtained numerical results are then compared and summarised in. Computational efficiency and integrity of the presently adapted method in this work are determined by several case studies.

Keywords— Composite; Deformations; Finite elements; Marine; Static analysis; Propeller;

1. INTRODUCTION

Thousands of years ago, Locomotive device ships were started as simple lugs or bundles of reeds. Today the same has been developed as huge size vessels. During 19th century, the principle of mechanical propulsion was started in ships. The 1st Iron hulled ship launched in 1840 by the Great Britain was with the traditional material wood. Later the traditional material was replaced with Iron followed by Steel and later this technique was gradually employed for manufacturing large ocean going ships. As the geometry of the blade is complex and its boundary conditions are more complicated makes computations more difficult in performing Structural Analysis. Hence for these complex geometries, the structural analysis can be carried out by relating the classical theory approach applied to a curve beam, plate and shell elements, where propeller blade can be considered as a cantilever beam rigidly fixed to the boss.

2. LITERATURE REVIEW

Many of the researchers have used most popular available FEM. As the blade geometry is considered to have an aerofoil cross section with an asymmetric and Pre-twisted profile containing taper along its length, a technique named elementary beam theory was first proposed by Taylor [1]. Here a blade is treated as a cantilever attached to the propeller hub and, thereby recommending the stresses are to be calculated for cylindrical blade sections containing a neutral axis parallel to the nose-to-tail (pitch) line of the expanded section. Cantilever beam theories have yielded reasonable estimates of stresses at certain selected points of relatively straight and narrow blades. Some modified forms of beam theory have been proposed for wide- bladed propellers with blade width-to-length ratios of about 1. The shell theory approach was first proposed by Cohen [2]. He has treated a simplified propeller blade model as a helicoidal shell with variable thickness and infinite width. (However, when this approach was applied to the problem of a shell of finite width, it was impossible to produce a solution to satisfy the boundary conditions.) Later studies included those of Connolly and others [3, 4]. Shell-type theories which incorporate broad assumptions do not appear to offer tangible improvement; more-over, they are rather involved for routine design purposes.

Analytical methods which was an attempt to predict blade stresses based on conventional mechanics was not a successful one. Considerable efforts have been devoted for measuring blade strains on both the model and prototype propeller blades [3, 5, 6, 7]. Certain cases have fetched good agreement b/w the obtained between beam theory and measured data. However, utmost care must be taken in drawing general conclusions from limited measurements, as large number of factors are involved. The trend in ship building to full after bodies for mammoth tankers and bulk carriers and to higher speeds for modern naval vessels has been accompanied by large irregularities and fluctuations in ship wakes. As a result, propellers experience increased

Abstract

Direct torque control (DTC) is a simple and robust control algorithm for high performance industrial applications. The conventional DTC suffers from major drawbacks like high torque and flux ripples, variable switching frequency, current distortions during changes in switching sector and poor performance during low speed operations. The problem of the variable switching frequency and the reduction in torque and flux ripples can be achieved using space vector modulation based direct torque control (SVM-DTC). The dynamic performance of the SVM-DTC is improved by replacing the constant gain PI speed, flux and torque controllers with fuzzy controllers. In this paper, both SVM-DTC with PI controller and fuzzy controllers are implemented using FPGA. The complete VHDL code for both DTC with PI and Fuzzy controllers is initially developed and simulated and then synthesized using Xilinx ISE 14.3 design tool. The complete developed code of the proposed algorithm is implemented on Spartan 6 XC6SLX25 board. The experimental results depict that an improved dynamic response of the induction motor is achieved in the SVM-DTC of the induction motor using fuzzy logic

Material Effect on Stress BehaviouralCharacteristics of Composite Rectangular Plate

M.L.Pavan Kishore[1], D.V.Raghunatha Reddy[2], M.Sreenivasa Reddy[3]
1, 2 Assistant Professor, Dept. of MechEngg,FST-IFHE, Hyderabad,India.

[3]Professor, Dept. of Civil Engg, FST-IFHE, Hyderabad, India.

Abstrac t: A nu merical study has been carried out to examine the effects of the material on stress behavioural characteristics of a rectangular plate with and without cutout for a conventional and composite material plate subjected to pressure loads using finite element method.Further, this paper addresses the effect of various boundary conditions applied to the plate. A comparison has been made between the conventional and composite material with and without the cutout. It is observed that the application of pressure loads and boundary conditions have a substantial influence on stress behavioural characteristics of a rectangular plate with and without cutout on both the materials. The results obtained from numerical simulat ion are compared and found that simu lation results are in good agreement with the previous studies.

Keywords: Boundary conditions, Composite plate, Fin ite element analysis, Pressure, Quasi-isotropic rectangular cutout, symmetrically laminated plates.

1. Introduction:

An immense literature survey has been done on the stress analysis of a plate with considering stress concentration as a major parameter by varying position of holes, materials, applied load and boundary conditions. Since the analytical solutions for the determination of three-dimensional stress distribution around a stress concentration for an isotropic plate with arbitrary thickness have been studied by various researchers which are based on generalized plane stress theory. The application of rectangular plate in engineering and technology is universal which becomes predominant to determine the strength of the component in terms of its stress distribution around holes and analyze its load-bearing capacity for these structures.The plates are the structural elements with very small thickness when compared to other dimensions. The thickness to width ratio is less than 0.1.Holes is made in plates to obtain desired results and relieve highly localized stresses. Configuring the structures with cutouts is one of the most important factors in constructing primary structural elements in Aerospace, Mechanical, Civil engineering and Marine structures.

To study the static behaviour of plate Sieme [1] used Kirchhoff plate theory using a finite element method as the basis. A computer programme in FORTRAN has been developed to carry out the simulation using triangular element formulation. An exact solution for the deflection determination of a

Relative Kinematic Analysis of Serial and Parallel Manipulators

Shaik Himam Saheb[1] G.Satish Babu[2] N.V.Subba Raju[3]

[1]Assistant Professor, FST, ICFAI foundation For Higher Education, Hyderabad.

[2]Professor, JNTU College of Engineering, Hyderabad.

[3]Professor, SRKR Engineering College, Bhimavaram, Andhra Pradesh.

Abstract: Day by day the applications of parallel and serial manipulators become evident and with high industrial applications in the fields of manufacturing, space equipments, pick and place robots and medical equipments. In this paper a comparison is made between kinematic analysis of serial and parallel manipulator is made in terms of workspace, position, synthesis, orientation and applications. In this article sensitivity comparison of serial and parallel manipulator with different actuator positions taken as parameter.

Key words: Serial manipulator, Parallel Manipulator, kinematic analysis, Comparison.

1. Introduction:

The robot manipulators are classified into serial type open loop kinematic chain and parallel type closed loop chains. Robot was born out with integration of two earlier technologies NC milling machines and teleoperators which were used during the days of Second World War to clear hazardous materials. Robot should be pointed out that the implementation of robotics is not limited to those industrial jobs where the robot is replacing a worker.

The parallel manipulator has more applications in recent days, because of parallel manipulator posse's large load carrying capacity and precision and accuracy. Whereas serial manipulators have large workspace and adroit transportability,Serial manipulator has cantilevered structure that made the serial robot as susceptible to bending at heavy loads and also high vibrations at high speed. As industries are need of high load and high precision manipulators thus the usage of parallel manipulator is obligatory

2. Motivations and need of Parallel Manipulator

In industrial automation the Parallel Manipulators were considered as an alternate to the traditional automation to achieve high load carrying capability, smart dynamic performance and precise positioning that provides higher quality and more economical processes. The most recent innovation within the field of artificial intelligence is that the Parallel Manipulator that finds its application altogether areas, especially for its high load carrying capability and superior positioning

Robust Power System Stabilizer Design Under Wide Area Control Using Linear Matrix Inequality Technique

D V Nair*

The paper shows the design of a robust Power System Stabilizer (PSS) capable of damping electro-mechanical oscillations of unstable open loop plant in the presence of uncertainty in the system model, which is of both deterministic and stochastic nature. Load uncertainty to random signal in the form of noise is taken care of in the design of robust PSS, such that the system performance is largely unaffected. The design consideration involves Linear Matrix Inequality (LMI) framework with various robust control features from H_∞, H_2 norm criterion to regional pole placements for effective damping in the system. The designed PSS is a Dynamic Output Feedback Controller (DOFC) with state matrices as controller parameters. Robust PSS successfully improves damping in the system and also meets improved performance even under transient conditions when the system is subjected to input disturbances at different nodes.

Keywords: Robust power system stabilizer, Dynamic output feedback controller, Closed loop pole placements, H_∞, H_2 norm, Minimum damping, Linear Matrix Inequality

Introduction

The growing importance of wide area measurements and controls in today's electrical power system is fast becoming a reality. Integration of generating areas geographically separated over several hundreds of miles running through countries and spanning across the continent is taking place across the globe. It is important to secure tie lines and use them to their full thermal limits, allowing maximum power flow and transfer. Power oscillations are produced due to incidents in one generating area connected with other areas through tie lines (Rogers, 2000a and 2000b; and Prasertwong *et al.,* 2010). These oscillations are of two types: local oscillations (from 0.8 to 2 Hz) and inter-area oscillations (from 0.1 to 1 Hz). Inter-area oscillations prohibit full power transfer capabilities used for tie lines. If left unchecked, they may grow and cause power blackouts (Prasertwong *et al.,* 2010). Damping of power oscillations through fast acting power electronics equipment directly and indirectly modulating power flow like FACTS, HVDC and excitation systems has gained prominence (Sadikovic, 2006; Majumder *et al.,* 2006; and Korba and Larsson, 2012). Wide Area Control (WAC) deals with the damping of power oscillations

Health Record Data Analysis Using Wireless Wearable Technology Device

Sirisha Potluri, Avinash Malladi

Abstract:

Using wireless-enabled wearable technology device the health record details can be extracted for data analysis. The data is extracted for continuous intervals of different time periods and analyzed by using a data analysis tool. This paper explains about big data properties and big data analytics architecture. There are enormous sources for big data from where the data will be generated every time. Data can be generated from day to day activities, cloud applications, public, mobile, legacy documents, social networks, transactions, sensors, and enterprise. Form these available sources in this paper using wireless-enabled wearable technology device the data is analyzed.

Abstract

Inconel 718 is a nickel-based superalloy having high strength and low thermal conductivity. Due to its properties, wire electrical discharge machining has been selected. The paper reports an experimental investigation of Inconel 718 using zinc-coated brass wire electrode. Based on [Formula: see text], Box-Behnken design of response surface methodology has been adopted to estimate the effect of process parameter on the machining responses. Four controllable process parameters (viz., wire tension, wire speed, discharge current and pulse-on time) vary, each at three discrete levels, between parametric domains. The following machining responses, in terms of material removal rate (MRR), surface roughness ([Formula: see text]) and corner deviation ([Formula: see text]), have been investigated. Finally, an evolutionary computation method has been used based on non-dominated sorting genetic algorithm (NSGA-II) in order to find out the optimal set of solutions for rough-cutting. Experimental data have been used to develop regression models to optimize the process. The adequacy of the developed mathematical model has also been tested by the analysis of variance results. Pareto-optimal settings obtained through NSGA-II have been ranked by gray relation analysis to identify the best optimal set of solutions to avoid lengthiness and impreciseness in the judgment. Confirmation tests have been conducted for optimum machining parameter from the set of Pareto-optimal solutions for proving betterment.

Abstract- Internet of Things (IoT) finds its major application in the field of healthcare. Especially, with the invent of wearable technologies generally known as smart-watch, like fit bit, reflex others, one can easily monitor his/her health and avoid chances of getting risk. A wearable IoT, is embedded with various kinds of sensors using which different human activities like movement , walking, pulse rate , calories burnt etc.. Information can be gathered. Wearable IoT allows two way communication. Using wearable IoT a patient record is extracted and analyzed. Data is generated from day to day activities and collected at regular intervals of time. This paper aims in explaining about IoT, wearable IoT, and its architecture and finally presents the analyzed results.
Keywords: IOT, Cloud, Sensors

1. Introduction

Recent advances in the field of technology have prompted the researchers to claim that we have entered a new era, "an era of technological revolution". The rise of ICT (information and communication technologies) that includes computers, software's , telecommunications etc. have a major influence on the functioning of a society. For the past few decades, innovation in the field of digital space and recent introduction of IoT (internet of things) has made it possible to enhance the day to day activities with the help of technology. IoT has been implemented in many industrial sectors such as smart cities, smart transportation, smart parking, smart building, irrigation and agricultural systems, medical field and even for fitness at individual level.

Increased utilization of smart devices such as smart phones, smart televisions and other smart electric appliances, smart watches etc. have enabled the IoT to reach a new level of advancement. These smart devices are generally embedded with sensors and actuators and are capable of establishing a two way connection with the nearby compatible devices or networks via wireless protocols such as Bluetooth, NFC, Wi-Fi etc.

One of the major applications of these smart devices is in the field of healthcare where fitness in terms of physical activity, pulse, sleep data etc. can be monitored on a daily basis with the help of wearable devices such as smart watches, smart bands.These devices when worn collect near - real time data, enabling continuous monitoring of physical activity. These devices are not only easily available but also they are user friendly, this has become an added advantage for the increased use of these gadgets. In addition to that, these devices can enable communication between patients, family members and in case of emergencies, alert messages can be sent to family members and health care providers.

Smart watch like any other smart device is embedded with sensors such as accelerometers, gyroscopes, optical sensors, contact sensors, ambient light sensors etc. these sensors are able to record a wide range of physical activities such as step count, sleep data, gestures, postures, pulse, body temperature etc. This recorded data can be used to analyze the health of a patient. In addition to that, using these devices, one can set a goal that he/she wants to attain well in advance and perform the exercise or physical activity to reach it while keeping a track of all the activities. For instance, if a person wants to walk for a distance of 2 km per day, the same can be set as a goal in the watch. The sensors in the watch will record the activity and once the goal is reached, a notification will be sent to the connected device.

Performance Analysis of Energy Aware Routing Protocols For Infrastructure less Networks

*Syed Shakeel Hashmi

tract:

Wireless mobile ad hoc network (WMANET) is an infrastructure less network, which contains wireless mobile nodes (WMN) distributed in the radio communication area. Establishing efficient routing protocol is an active research area in WMANET Due to constraint resources of WMN. Routing protocols act as an important role for successful communication in any network environment. In literature number of routing protocols developed for WMANET based on different parameters and characteristics of WMN. One of those routing protocols is energy aware routing protocol based on the residual status of WMN. To provide an inclusive understanding of energy aware routing protocols developed for WMANET and overlay the lane for imminent research; in this paper the performance of energy aware routing protocol based on residual status is analyzed in details. Qualitatively, based on performance analysis parameters such as packet delivery, network lifetime and to and delay: performance is analyzed with the help of network simulator 2.

Thermal Analysis of a Small Power Permanent Magnet DC Motor

*A. Chandrashekhar, Chandra Shekhar Kaushik Palla, P. Abhilash

Abstract:

This paper presents a 3D numerical analysis of the thermal behavior of a small permanent magnet DC motor, performed by Finite Element Method (FEM) using the Solidworks Simulation Software. The motor was analyzed using a transient heat transfer numerical model. Numerical simulation was chosen for the analyses of the heat transfer process because it is a valuable tool that provides great flexibility in studying the temperature distribution inside such motors, under various load conditions. The PM DC motor studied in this paper is intended to be integrated into low power modular intelligent drives such as processing devices in automated tools and unconventional technologies, robotics, motion control and positioning systems, actuators, etc.

A Survey on Recommendation System: Collaborative Filtering

S. Vairachilai*, Shubhangi Urkude, J.Hemalatha

Abstract:

With the explosion of World Wide Web (WWW), the information available to the user is enormous. With so much of information, the users often turn to recommendation services to highlight the items that will be most interest to them. Recommender System (RS) deals with the information overload problem and also helps them to find which items the user would like to purchase at Electronic commerce (E-commerce) sites. A recommendation system has its applications in almost every field. For example, a recommender system on Amazon, helps the user to purchase books, CDs (Compact Disks), and various other items based on other users has liked in the past, Netflix & CD now helps the user to choose CDs to purchase (or rent) based on other users has liked in the past and Epinions, helps the users to decide to purchase based on user reviews about variety of items such as electronic items, books and home appliances. This survey paper explains the recommendation process of collaborative filtering recommender system and its major technical issues.

A New Secure Group Key Transfer Protocol in Big Data

Kartheeban Kamatchi *, Hemalath Jeyaprakash, S.Vairachilai

Abstract:

In recent days big data presents a tremendous opportunity for enterprises across industries. By tapping into new volumes and varieties of data, scientists, executives, product managers, marketers and others can start making more informed plans and decisions to discover new opportunities for optimization and deliver breakthrough innovations. Due to the rapid development of group-oriented services over big data, lack of right security and encryption solutions big data can mean big problems so it needs novel solutions to ensure big data security. The existing protocols based on secret sharing scheme use traditional threshold schemes to compute a t-degree interpolating polynomial equations and uses these polynomial equations to encrypt and decrypt the secret group key. This approach increases the computational complexity in terms of time d. In this paper, we construct efficient and secure group key transfer protocol based on secret sharing over big data. We first present a Key Management Centre (KMC) based group key transfer protocol, which is based on DH key agreement and a perfect Linear Secret Sharing Scheme (LSSS). The confidentiality of the group key transfer phase of this protocol is ensured by the LSSS and the information is theoretically secure. Furthermore, this protocol can resist potential attacks and also significantly reduces the overhead of system implementation. This kind of protocol is important for many group-oriented applications over big data.

A facile route for the syntheses of Ni(OH) $_2$ and NiO nanostructures as potential candidates for non-enzymatic glucose sensor

Nabanita Pal [1], Sangam Banerjee [2], Asim Bhaumik [3]

Affiliations
PMID: 29367062 DOI: 10.1016/j.jcis.2018.01.027

Abstract

In modern world, diabetes is one of the most leading diseases that cause human death and disability. Continuous effort to control and manage diabetes by acute monitoring of the blood glucose concentration requires the development of an efficient and reliable glucose sensing device. Although both enzymatic and enzyme-free methods of glucose detection are available in the market, non-enzymatic biosensors are more significant due to certain drawbacks in enzyme based sensors. In this article, a stable non-enzymatic sensing platform for d-glucose based on nickel hydroxide and nickel oxide nanomaterials has been described. $Ni(OH)_2$ and NiO were synthesized through a facile hydrothermal route followed by the heat treatment. Detailed morphological and structural characterizations were carried out using GIXRD, transmission and scanning electron microscopy) (TEM and FESEM) which reveal that hexagonal β-$Ni(OH)_2$ and cubic NiO phases have been formed. TEM image of NiO has shown that the nanomaterials consist of ca. 10 nm sized rod like pattern distributed uniformly. Both $Ni(OH)_2$ and NiO have shown excellent electrocatalytic activity towards enzyme-free glucose sensing under ambient condition. Glucose sensing investigation based on amperometric i-t curve performed in 0.2 M NaOH medium shows a good sensitivity of 12.09 μA mM^{-1} cm^{-2} and 24.0 μA mM^{-1} cm^{-2}, respectively for $Ni(OH)_2$ and NiO nanostructures. Interference test was done using reagents like ascorbic acid, uric acid and dopamine to confirm the selectivity of nickel hydroxide and oxide nanomaterials towards glucose analyte. So, the proposed $Ni(OH)_2$ and NiO based electrodes can be used as a cost-effective, stable and non-air sensitive platform for non-enzymatic glucose detection.

Abstract | References | Citations | Supplementary Data | Suggestions

The cloud environment and the service providers suffer from the problem of service selection and struggle with throughput achievement. To solve these problems there is many service selection approaches has been discussed earlier but could not achieve the quality measures. We propose a novel selection approach using dynamic location centric service selection. The method performs the service selection based on the location of the user and the service point. The method computes various measures to perform the service selection and the service selection is performed based on the value of the A^3 measure. The proposed method computes availability, accuracy, and adaptability for each service available and based on the computed A^3 value a single service will be selected. The selected services are composed to form a complete bundle of services to service the user request. The proposed method reduces the overall time complexity and improves the accuracy of service selection and improves the throughput of the overall multi-tier cloud environment.

Complex network exhibits the concept of community structure within the network. In recent years, detecting communities have become a very important in complex networks. Many algorithms like Girvan-Newman, fast greedy, spinglass, label propagation, and walktrap are used to detect the communities in complex networks. In this paper, we present an overview of widely adopted various community detection algorithms along with comparative analysis in order to compare and analyze the quality of the algorithm with respect to modularity value. The community detection algorithms are tested against with complex social networks and random networks. The experimental results show that the quality of the community detected by the spinglass algorithm is much better than other algorithms with respect to modularity value.

Implementation of Robust Direct Torque Control of Induction Motor using FPGA Spartan-6 Board

This paper presents the implementation of space vector modulation-based direct torque control of an induction motor using a low-cost Spartan-6 XC6SLX25 FPGA board. The major advantages of FPGA compared to a DSP processor for the implementation of advanced control algorithms are parallel processing and less execution time. Most studies have employed FPGA for the implementation of a part of a control algorithm such as flux and torque estimators and torque and flux controllers. In this study, a complete control algorithm is executed in Spartan-6 board using VHDL code. The complete control algorithm is developed, which is independent of third parties such as Matlab/Simulink-based Xilinx system generators. The complete experimental setup is developed using a speed sensor; Hall effect current voltage sensors are used for estimating the torque and flux of the motor. Based on the output of controllers, the PWM signals are fed to the VSI-fed induction motor. Xilinx ISE (Integrated Synthesis Environment) 14.1 is used to simulate synthesis and perform an analysis on the Spartan-6 board. The performance of the developed model is measured by perturbations in reference speed and load on the induction motor. The experimental results show that using FPGA, we can achieve fast speed response due to less execution time.

1. Introduction

Over the last decade, direct torque control (DTC) evolved as an alternative to the field-oriented control (FOC) of induction motors for fast torque response in industrial applications [1–2]. Compared with FOC of induction motors, DTC has advantages like simpler and robust control scheme, absence of coordinate transformations, and current regulators. However, conventional direct torque control (CDTC) suffers from major disadvantages such as a) high flux and torque ripples predominantly during starting and at low-speed operation [3–5]; b) variable switching frequencies due to hysteresis bands and variable motor speeds [3–4]; and c) current and torque distortion when the sector changes [5]. To overcome these disadvantages, several techniques have been developed such as direct self-control, DTC with space vector modulation (SVM), and DTC-SVM with neuro-fuzzy logic controllers, as given in [6]. Improved CDTC with multilevel inverters, matrix inverters, and sensorless drive has been proposed in [7–8]. In recent years, artificial intelligence (AI) techniques, such as fuzzy logic, neural networks, and neuro-fuzzy for DTC, have been employed by researchers. The execution of the CDTC switching table with fuzzy logic is given in [9–11], which results in the reduction of torque and flux ripples to some extent. To reduce torque ripples, space vector modulation was proposed by researchers, but it increases switching complexity [12–13]. In general, digital signal processors (DSPs) or dSPACE is employed for the implementation of high-performance

A mixture of anhydrous sodium sulfate, hydrated nickel phosphate, and sodium phosphate has been synthesized and various techniques used to characterize it. Differential scanning calorimetry was used to investigate the thermal properties in both O_2 and N_2 atmosphere at rate of 10 K min^{-1}. The specific heat capacity was calculated from 298 K to 573 K and vice versa in two thermal cycles in both atmospheres, revealing values of 18,931.64 J kg^{-1} K^{-1} in O_2 atmosphere and 15,568.39 J kg^{-1} K^{-1} in N_2 atmosphere in the second thermal cycle, being exothermic in nature in both cases. This exothermic behavior of the mixture indicates its potential use as a heat-dissipating material. The crystallite size of this inorganic heat-dissipating mixture was found to be 22.9 nm.

Optimized Image Retrieval Using HSV Color Space, Local Edge Binary Patterns and Zernike Moments

[1]G. Sucharitha and [2]Ranjan K. Senapati
[1]Department of ECE, Faculty of Science & Technology, ICFAI Foundation for Higher Education, Hyderabad, India
[2]Department of ECE, VNR Vignana Jyothi Institute of Engineering & Technology, Bachupally, Hyderabad, India

Abstract: This study presents a new approach for image retrieval in extracting and integrating the color, texture and shape features. The proposed descriptor converts the RGB color image into HSV color space. HSV color space is used in this approach make use of color, intensity and brightness of the color image. From the Hue (H) and Saturation (S) color features are extracted and from value color space texture features are extracted. To extract the texture features from the value component Local Maximum Edge Binary Patterns are applied (LMEBP). Apply Zernike moments on gray scale image to extract the shape features. To extract the feature vector all the histograms are concatenated three experiments have been carried out in demonstrating the worth of our approach. The presented method is tested on two databases, Corel-10k and MIT-Vistex. The retrieval performance has shown a significant improvement in terms of precision and recall as compared with Center-Symmetric Local Binary Pattern (CS-LBP) Local Edge Pattern for Segmentation (LEPSEG) and Local Edge Pattern for Image Retrieval (LEPINV) and other existing transform techniques in image retrieval system.

Key words: Local features, local edge binary pattern, Zernike moments, HSV color space, Corel-10k database, Mit-Vistex database, histogram

INTRODUCTION

Image retrieval has become active research area, since, 1990. Generally, image retrieval system is based on two techniques. First is based on annotation method. As manual image keyword is an annoying process it is very difficult to annotate all images for large databases. Furthermore, due to the multiple contents of the image and multiple subjectivities of human discrimination it is also difficult to make the same annotation to the same image for different users according to their perception. To overcome these difficulties, Content-Based Image Retrieval (CBIR) attempts to mechanize the process of annotating images in the database. The CBIR uses the visual contents of an image like color, shape, texture, spatial layout etc., to represent and index the image in the database. The image features can further classify into general features which contain color texture and shape. The feature extraction plays animportant role in CBIR whose efficiency depends on the methods adopted by methods used for extracting the features. The comprehensive and extensive literature survey is presented on CBIR (Datta *et al*., 2008; Rui *et al*., 1999; Smeulders *et al*., 2000; Liu *et al*., 2007).

Color and texture analysis has been attracting a great deal of attention due to its potential value in computer vision and pattern recognition. The use of combined color texture in texture feature extraction has given successful results in color texture analysis. Texture feature is based on the local intensity of an image. Therefore, neighborhood and statistical features are exposedfor texture pattern. The color feature represents the distribution of intensity in different color channels, so that, color histogram, color correlogram color coherence vector, etc., used to propose as color feature descriptors. Palm (2004) used the correlation between textures of different color channels calculated and applied for content-based image retrieval system. Ahmadian and Mostafa (2003) used wavelet transform for texture classification. Do and Vetterli (2002) proposed Discrete Wavelet Transform (DWT) based texture feature extraction using generalized Gaussian density and Kullback-Leibler distance. However, DWT can extract the features only in three directions. Therefore, rotated wavelet filters (Kokare *et al*., 2007) Gabor transform (Manjunath and Ma, 1996) a combination of dual-tree complex wavelet filters (Kokare *et al*., 2005) and Dual Tree Rotated Complex Wavelet Filters (DT-RCWF) (Kokare *et al*., 2006) had proposed to extract the more directional features which are not present in DWT.

The concept of coloris one of the important features in the field of CBIR if it is maintained semantically impact

MHD Flow of Micropolar Fluid in the Annular Region of Rotating Horizontal Cylinders with Cross Diffusion, Thermophoresis, and Chemical Reaction Effects

G. Nagaraju, S. Shilpa and Anjanna Matta

Abstract The influence of magnetic field, thermophoresis, and the first-order reaction of a dissipative micropolar flow involving two coaxial inner rotating horizontal cylinders are studied both analytically and numerically. The motion of the fluid is generated due to the rotation of the inside cylinder with a constant angular velocity. The internal and external cylinders are kept maintained at different uniform temperatures and concentrations. The transformed systems of differential equations are solved systematically using modified Bessel functions and numerically with the fourth-order Runge–Kutta scheme along with a shooting method. The temperature and concentration are examined for a variety of parameters which govern the flow through graphical illustrations. The results obtained are in very good agreement with benchmark solutions for a particular case.

Keywords MHD flow · Micropolar fluid · Hyper-stick condition · Soret parameter · Chemical reaction

1 Introduction

The studies of fluid involving two horizontal cylinders through inner rotating walls have received the topic of a vast interest for its significance as an idealization of numerous industrial applications. In the design of cooling systems for electric

Abstract

The performance of the biometric face schemes suffers severely due to the variation in the subject's aging. Designing the face recognition systems which are invariant to the aging process is challenging as the age patterns are different for the different individuals and also limited databases are available. The aging-based face recognition is still an open challenge for researchers as none of the existing methods are on par with human ability in recognizing the similarity across two faces. In the proposed paper, the age-invariant features of the face are derived using the local descriptor, local binary pattern (LBP). Preprocessing techniques like enhancement and denoising are applied to the images to enhance the accuracy of the designed system. Chi-square distance is used as a classifier to find the matching score between two feature vectors of the probe and gallery images on four unique, challenging datasets. Publicly available face datasets such as FG-Net, FRGC, FERET, and Georgia Tech are used for the experimentation, and the results prove that the proposed system is robust to the changes in age and outperforms most of the existing systems.

Sensorless Direct Torque Control of Induction Motor Using Neural Network-Based Duty Ratio Controller

H. Sudheer, S.F. Kodad and B. Sarvesh

Abstract Improvements in the sensorless direct torque control of an induction motor by employing fuzzy logic switching controller (FLSC) plus neural network-based duty ratio controller (NNDRC) are explained in this paper. The conventional direct torque control (CDTC) of an induction motor suffers from major drawbacks such as high ripples in motor torque and flux response, poor performance during low speed and starting, and switching frequency variations due to hysteresis bands. Duty ratio controller evaluates the time for which active switching state is applied (δ), and for the remaining time period, zero switching vector is applied. The simulation results show that by using FLSC with NNDRC, considerable reduction in torque and flux ripples and improvement in dynamic response of drive compared to CDTC are achieved.

Keywords Induction motor (IM) · Direct torque control (DTC)
Neural network (NN) · Fuzzy logic switching controller (FLSC)
Duty ratio controller (DRC)

1 Introduction

Direct torque control was first introduced by Takahashi and Naguchi for the fast response and high-performance applications [1, 2]. Over the years, DTC gained popularity over field-oriented control due to advantages such as an absence of

Experimental study on Influence of Filler Rods in Gas Tungsten Arc Welding

Shaik Himam saheb[1, a] Chandrashekhar A[2]

[1, 2]Assistant Professor, Faculty of Science and Technology, Icfai Foundation for Higher Education, Hyderabad.

[a)] Email: himam.mech@gmail.com

Abstract: Advancement in manufacturing process is in progress since very old age as the human needs go on increasing. Welding is a process of joining two metal pieces by the application of heat. Welding is the least expensive process and widely used now a days in fabrication. Welding is an essential part of everyday life. From cars to high rise office buildings, airplanes to rockets, pipelines to highways, none of it would be possible without welding. It is essential for young engineers to have a very well knowledge of welding as this science has endless future with endless human needs that needs to be quenched. There are various types of welding like, Gas welding, Arc welding, resistance welding, solid state welding and few more. In this report Tungsten Inert Gas welding has been covered in detail more specifically about the filler rods used in GTAW process. There needs the skills to produce a required weld joints with precision as if lacks in quality entire structure may fails. The projects objective is to study the influence of filler rods used in TIG welding process as it considerably effects the welded structure. Various testing like hardness, bending and Nondestructive testing (NDT) have been performed for different filler rods used and influences caused by filler rods have been studied and conclusions are noted.

Keywords:-Gas welding, GTAW/TIG welding, non-destructive testing, welding process, Hardness testing, Filler rods.

INTRODUCTION

The project entitled Influence of filler rods in Tungsten Inert gas welding is to understand and analyze which filler rods should be selected to best suit the welding process exclusively for joining Mild Steel plates. In our course of project we will be using two kinds of filler rods Mild steel of diameter 2.5 mm and Stainless steel of diameter 2 mm. Two kinds of tests will be performed, destructive and nondestructive testing. All the necessary mechanical parameters like stress, strain, hardness etc. will be calculated and best possible conclusion will be documented at the closing of this document. Himamsaheb et al designed and fabricated gokart with the different welding techniques

Sameer Ahmed et al done the research on Experimental Analysis of Effect of Different Filler Rods on Mild Steel by Shielded Metal Arc Welding, he used Parent metal as Mild steel and welding using three filler rods Austenite stainless steel, Ferrite stainless steel and Mild steel for 60 degrees groove butt joint and analysis has been done using Hardness and Tensile test.

PROPOSED MODEL

Finally we have done the welding of plates and it would be further carried for testing those arc non-destructive as well as destructive testing to understand and analyze its capability and suitability in real world applications. Liquid penetrate testing Inspection is then performed under appropriate lighting to detect indications from any flaws which may be present. After doing the testing we have made the observations from both the destructive and nondestructive testing. And we refer first specimen as mild specimen welded with MS as filler rod and second specimen as specimen for the mild steel specimen welded with SS as filler rod.

Abstract

Now a days, an efficient arithmetic operations are important to accomplish the high performance. In every one of these applications, multiplier is an important arithmetic operation. Usually multipliers are utilized to evaluate the square operand. A square operation is faster than a multiplication. This paper proposes a high performance and area efficient square architecture using Anurupya Sutra of Vedic Mathematics. The proposed method is efficient method, which divided the large magnitude number into smaller magnitude numbers and concatenated smaller magnitude numbers. The proposed architecture is synthesized and simulated using Vivado design suite 2018.3 and implemented on Kintex-7 FPGA board. The results revealed a high

ABSTRACT

This Research paper discusses the second analysis of Magnetohydrodynamics (MHD), a dissipative micropolar fluid by the annulus of horizontal internal rotating cylinders in the presence of chemical reactions and cross diffusions. The fluid movement is produced at a steady angular velocity from the inner rotation of the cylinder. The flow of heat and mass transfer equations are solved by RK4 shooting technique. The impact of different geometric parameters on azimuthal velocity, micro-rotation, temperature, concentration, Bejan and entropy generation numbers are shown through graphs. The results show that the entropy generation number decelerates with an increase in the temperature difference near the inner pipe, while it increases as the concentration difference parameter increases. The Brinkmann number increases the profiles of the temperature and reduces the concentration.

Keywords: micropolar fluid, MHD, hyper stick condition, soret and dufour parameter, joule heating, entropy.

Nomenclature

v	Tangential velocity
P	Fluid pressure
N_1	Micro-rotation vector
σ	Electrical conductivity
μ, κ	Viscosity coefficients
β, γ	Gyro viscosity coefficients
$\alpha = \frac{K}{\rho C_p}$	Thermal diffusivity
K	Thermal conductivity
K_T	Thermal diffusion ratio
D	Diffusion coefficient
Cs	Concentration Susceptibility
T_m	Mean temperature
k_1	Rate of reaction.
ρ	Density
Be	Bejan number
Br (=$Ec.Pr$)	Brinkman number
B_0	Magnetic flux
Ns	Entropy generation number,
S_G	Local volumetric entropy
Pr	Prandtl number
Ha	Hartmann number
Sc	Schmidt number
N_H	Entropy generation, Heat transfer
N_F	Entropy generation, fluid friction
N_M	Entropy generation, magnetic field
N_D	Entropy generation, mass transfer across finite concentration difference.
Cp	Specific heat
λ	Diffusive constant parameter
T_d	Temperature difference number.
C_d	Concentration difference number.
ϕ	Irreversibility ratio
c	Parameter of the coupling vorticity
s	Couple stress parameter
δ	Another rheological parameter
Re	Modified Reynolds number
Df	Dufour number,
Cr	Cemical reaction parameter
Sr	Soret number.

INTRODUCTION

The fluid studies involving the horizontal coaxial internal rotating cylinders have received the subject of great interest because of the importance of numerous industrial applications. In the design of electric machines, oil drilling, diabatic flow in an annulus (Becker and Kaye [1]), swirl nozzles, porous bearings, airborne applications, combustion chambers and heat generated in a electric generator. Different researchers have examined the problem of Newtonian/non-Newtonian flow bounded by coaxial rotating cylinders. Coney and Shaarawi [2] are the first to study the boundary layer flow at the entrance between two horizontal cylinders with internal rotation. Mishra *et al* [3] examined the flow of Bingham plastic between two cylinders. Richard *et al.* [4] investigated the viscous flow through the annular gap between vertical inner rotating cylinders with an imposed pressure gradient. Maia and Gasparetto [5] studied flow of power law in a circular pipe. Ravanchi *et al.* [6] examined the viscoelastic flow of annulus with internal rotation. They identified that the increase in weissenberg number increases the slope of the velocity near the inner cylinder.

The magnetohydrodynamic (MHD) study has received more interest for its wide range of industrial applications in geophysics, MHD pumps, fire engineering, geothermal energy extraction, nuclear reactors. Kumari and Nath [7] examined the unsteady free convection

E-Mail: pavanimovva@ifheindia.org, kkishore@ifheindia.org

ABSTRACT

In this paper, a cost effective system using wireless sensor networks (WSN) is developed for monitoring air pollution at a large scale. The proposed system has the potential to collect information air related to pollutants on a real time basis comprising Audrino based core with off the shelf pre-calibrated sensors to detect gases like Sulphur Dioxide (SO_2), and Ammonia (NH_3) in the air. This design is made up of Audrino board with gas sensors, Global System for Mobile Communications (GSM) wireless link and a low-cost ZigBee module as well. These wireless sensor motes are utilized for to monitor urbansulphur dioxide and ammonia emissions on a realtime basis. Wireless sensor network formed with ZigBee links can be scaled up using the GSM connectivity to interface with the external world. Air Pollution is monitored using a system of sensor nodes with wireless communication via ZigBee protocol. A static Wireless Sensor Network to monitor air pollution through the use of WSN implemented over the zigbee protocol is proposed in this study. A prototype version of the model is realized and tested. Experimentation with the developed wireless air pollution monitoring system under different physical conditions has produced reliable fine-grain pollution data.

Keywords: air pollution monitoring, Zigbee protocol, WSN mote, pre calibrated sensors, static wireless sensor network.

1. INTRODUCTION

In today's date the exercise of urbanization and industrialization has become expeditious. The world is depending more on machines and this mechanization has resulted in contamination of air leading to environmental havoc. Air pollution [1] occurs when detrimental matters like poisonous gases, particles and biological molecules are present or come in contact with the aerosphere. Living in such a pollutant environment and drawing in of the impure air on daily basis is threatening to the well-being of mankind. Intake of polluted air can result in many health issues like respiratory problems, which can lead to heart failure as well. Considering the adverse effects of air pollution on the human race, animal and plant kingdom; the need of the hour demands for an affordable air monitoring system. More researchers should show interest in developing an economical device which will work for the improvement of the environment.

Air pollution monitoring system [2] will make it easier for the local government or the policy makers to get assistance and implement the laws for controlling the level of air pollution. Although the customary air pollution systems provide thoroughly dependable and accurate data, they cannot extend to air pollution on the real-time base. The pitfalls of conventional techniques are their massive weight with tremendous size and expense, which deliver low resolution sensing data. These systems are inadequate in providing data on air contamination in high spatio-temporal resolution due to non-scalability and restricted amount of data.

With the present-day progress in the discipline of integrated circuits and communication, there is a significant growth in Wireless Sensor Networks (WSN) [10]. WSN is extensively used in the real time application to gather and examine the data in a smart and better way, without the need of human participation.

2. RELATED WORK

Cambridge Mobile Urban Sensing, known as CamMobSense [3] is an economical platform, comprised of a data logger and a ZigBee module, transfers the gathered data to the central server through gateway. It monitors temperature, humidity, noise, CO, NO_2, vehicle occupancy, position, movement etc. RAE systems [4] are battery operated solutions consisting of multiple gas sensors on their boards. These solutions are voluminous, entail high energy and somewhat exorbitant, which hinders their extensive operation on a large scale. ENVIROMOTE [5] is capable of detecting gases like CO_2, CO, NO_2, SO_2 and humidity. It is a micro controller, TI's MSP430 platform, with multiple sensors on the board, suitable for the large scale deployment as it exploits the capabilities of GSM network and ZigBee. Environment Observation and Forecasting System (EOFS) [6] uses adaptive sample rates [7] for the geo-sensor system with proper controls. These systems are unsatisfactory for massive deployment, because of their sizes and high initial costs. RESCATAME [8] is a project for traffic management in the city of Salamanca, Spain; which uses prediction model for the WSN based environment monitoring. IIM, Kolkata, initiated the WSN based environmental monitoring for the protection of public places in India. IIM, Pune, undertook a vital project named "System of Air Quality Forecasting and Research (SAFAR)" [9].

3. PROPOSED DESIGN

To obtain the air pollutant data of the gases, a real-time air pollution monitoring system [10] using static wireless sensor networks was designed and developed. Wireless using the multi-hop meshes network architecture [13] as shown in the Figure-1

A new octahedral cobalt(III) complex of 1,5-*bis*(2-hydroxybenzamido)-3-aza pentane was synthesized and characterized by elemental analysis, UV-visible, IR, mass spectrometry and thermal analysis methods. Oxidative behaviour of the complex towards the physiologically abundant tripeptide, glutathione(GSH) was studied by UV-visible and FT-NMR techniques. Kinetics of electron transfer between the complex and GSH was studied at $25.0 \leq t/°C \leq 45.0$, $0.025 \leq [H^+]/mol\ dm^{-3} \leq 0.20$ and I = 1.0 mol dm^{-3} ($NaClO_4$). NMR spectra of the reaction mixture were taken as a function of time. Changes observed in the NMR-spectrum during the period of scanning are the initial disappearance of the fine structure and subsequent broadening of the signals of GSH protons. Peaks at (δ, ppm): 2.93 and 2.98, characteristics of Cys-CH_2 δ protons in GSH get disappear slowly and new peaks develop at (δ, ppm): 3.33 and 3.38, corresponding to resonating frequencies of Cys-CH_2 δ protons in GSSG. Likewise, the peak at (δ, ppm):2.93, characteristic of Cys-CH_2 δ proton in GSH is replaced by the resurgence of two peaks at (δ, ppm): 4.3 and 4.1 ppm, commensurate with the resonating frequencies of same set of protons as that of GSH but in a dimeric environment. The time dependent NMR simulation of the reaction reveals that GSH reduces the Co^{III} moiety successfully, while it gets converted into the dimer, GSSG. The relatively fast transformation of GSH to GSSG as evident from both electronic spectra and NMR studies together with the activation parameters obtained from the temperature dependence of reaction rate suggest that there is no involvement of any bridging group for electron transfer and the redox process may be taking place *via* outer sphere mechanism.

Keywords: Glutathione, Redox activity, Kinetics, Co(III) complex, Phenol-amide-amine coordination, NMR.

INTRODUCTION

Synthesis and isolation of multidentate carboxamido ligand containing N_4O_2 donor atoms in the form of amide, amine and phenolate groups have remained a long standing challenge [1-6] owing to their varied functionality during complexation. These ligands have proved to be excellent complexing agents for several metal ions such as $Mn^{III/II}$ [6], $Fe^{III/II}$ [7-10], Cr^{III} [11], $Co^{III/II}$ [12-14] and Cu^{II} [15], *etc*. It has been shown that the amide ligands have allowed the preparation of complexes with unusual geometries, oxidation and spin states [16,17]; and also these ligands improve the resistance of the complex to undergo an oxidative degradation [12-14], which makes them superior over other ligands. There has been a great surge of interest in the recent years on the study of the amide complexes of metal ions due to their ability to model active sites present in some metalloproteins [18-21].

In recent times, cobalt complexes are mainly in the focal point due to their role in biological domain [22] and also in the point of interest in experimental cancer therapy research because of their capacity to redox-dependent targeting the malignant tissue of solid tumors [23]. These complexes are also well suited for use as bio-reductive prodrugs, having a very inert oxidized cobalt(III) state and very labile reduced cobalt(II) state [24].

Of late, a series of substituted *bis*(thiosemicarbazone) cobalt(III) complexes were synthesized [25] and characterized by mass spectrometry, X-ray crystallography and multinuclear NMR spectroscopy. These compounds were proved to be potential anticancer agents in normoxic and hypoxic conditions [26] and believed to act as chaperones for the cytotoxic compounds [27].

Glutathione reduced (GSH), a biological reducing agent in thiol dependent enzymatic reactions has recently been

Abstract

Sodium, Samarium substituted Strontium Bismuth Titanate ($Sr_{1-x}Na_xSm_xBi_4Ti_4O_{15}$ –SNSBT where x=0.1, 0.2, 0.3, 0.4) piezoelectric ceramics are synthesized by solid-state sintering route using high energy planetary ball mill for 20 h in presence of Acetone and Aqua media. Calcination and sintering are carried out at 800 °C and 1160 °C respectively in Air using programmable furnace. 1 mm thickness and 10 mm diameter circular pellets are prepared by uniaxial hydraulic press at 4 tons/cm^2 pressure. Larger surfaces of the sample are coated with silver in order to have good electric contact for properties study. X-Ray Diffraction and Scanning Electron Microscopy studies are carried out to identify the orthorhombic structure, grain size and grain orientation. SEM shows densified and plate like structure of SNSBT. Experimental density is found to be more than 95% of theoretical density. Tolerance factor is decreased with increase of Na, Sm concentrations of SNSBT ceramics. Dielectric measurements are conducted as function of temperature at various frequencies and phase transition temperature (T_c) is enhanced by addition of Na, Sm of SBT.

Abstract

Sr_{1-x} $Sm_xNa_xBi_4Ti_4O_{15}$ lead-free piezoelectric ceramics are prepared by solid-state sintering method using high energy Ball- Mill and ground for 10 h. The single phase of the compound is confirmed by X-ray Diffraction and highest intensity peak (1 1 0) is observed at 30°. Diffraction peaks shifted towards higher angles with an increasing concentration of Sm^{3+} and Na^{1+} of SBT. Grains orientation and grain size are analyzed by Scanning Electron Microscope. Temperature and frequency dependent AC conductivity studies are carried out using impedance spectroscopy in the temperature range of 30 °C–650 °C using Wayn-Kerr LCR meter. At lower frequencies, conductivity is independent of frequency. The variation of Z″ with frequency shows peaks shifting towards higher frequencies with an increase of temperature. The resistance of grains (R_g), grain boundaries (R_{gb}) are calculated and it is found that grain resistance is greater than grain boundary resistance ($R_g > R_{gb}$). Relaxation times of grain and grain boundaries are calculated.

Abstract

Additive manufacturing (AM) is also known as "3D printing." AM creates the physical model by construction of succeeding layers using the input material. Each succeeding layer is attached to the preceding layer to form the physical AM model. Medical industry requires the error-free exact anatomy of the patient for diagnosis, surgical planning, surgical guides, implants, etc. Since every patient has unique anatomy, AM suits as best fit for medical industry. AM medical model provides advantage of customizing each model according to the patient's specific requirement, which is not so easy in conventional way. The current work aims to explain the importance of AM medical model in the medical industry for various scenarios.

Mitigating Hotspot Issue in WSN Using Sensor Nodes with Varying Initial Energy Levels and Quantification Algorithm

R. Balamurali[1], *K. Kathiravan*[2], *T. Krishnan*[1]

Abstract: *A typical Wireless Sensor Network (WSN) uses multihop communication rather than direct transmission. In a multi-hop communication, the sensor node communicates the sensed data to its neighbor node, which is comparatively closer to the sink and the receiving node will forward the data to its neighbor node. This process continues until the data reaches the sink. Due to the multihop communication, the nodes closer to the sink have to transmit and receive more data and control packets compared to other nodes. Hence, the nodes closer to sink may deplete their energy at a faster rate and may die soon. This may create network isolation. This issue is called as the Hotspot problem. In this paper, we are proposing a Quantification algorithm for Sensor Nodes with varying Initial Energy Level to mitigate the Hotspot effect.*

Keywords: *WSN, hotspot, multihop, tier, SMAC (Sensor MAC), RIMRP (Refined Integrated MAC and Routing Protocol).*

1. Introduction

A Wireless Sensor Network (WSN) is a set of sensor nodes deployed in a given area to sense environmental parameters like heat, pressure, temperature, light intensity etc. These sensor nodes can auto configure to form a WSN (Fig. 1). Each sensor node is equipped with limited Computing, Communicating and Sensing capability. Most commonly, WSNs are used for remote surveillance; typical examples are Forest Fire Surveillance, Battlefield Surveillance, and Structural Health Monitoring etc. The sensor nodes are battery powered. Hence, energy is a scarce resource in WSN and efficient energy utilization is one of the core research objectives of WSN. The hotspot is an issue related to uneven or inefficient energy consumption. Based on the type of sensor nodes used, a WSN can be classified as Homogeneous WSN or Heterogeneous WSN. Sensor nodes are likely to have identical sensing, computing, communication and energy capabilities in a Homogeneous WSN. The sensor nodes have varying

Abstract

The synthesis, characterisation, density and dielectric properties of Sm and Na substituted $SrBi_4Ti_4O_{15}$ (SBT) piezoelectric ceramics are systematically studied for possible applications at high temperatures. The existing piezoceramics have temperature limitations. Samarium (Sm) and Sodium (Na) modified Strontium bismuth titanate $Sr_{1-x}Sm_xNa_xBi_4Ti_4O_{15}$ (SSNBT-Strontium Samarium Sodium Bismuth Titanate) where x = 0.1, 0.2, 0.3 ceramics are prepared by solid state double sintering method using planetary ball mill for 10 hours duration in presence of Acetone media. Single phase is formed after calcination at 800 °C for 2 hours. Pellets are made with 1 cm diameter and 1 mm thickness using uniaxial Hydraulic press at 5 tonnes/cm^2 pressure.

All the samples are sintered at 1160 °C for 2 hours. The entire calcination and sintering processes are done in a programmable furnace. Orthorhombic structure of compound

Abstract

Analysis of internal heated and gravity effect on the onset of Hadley-Prats flow in a horizontal porous layer with inclined temperature gradients is investigated using the linear and nonlinear instability analysis. The transformed eigenvalue problem is evaluated numerically to find the eigenvalue, which is treated as a vertical thermal Rayleigh number (Rz). It is evaluated by applying shooting and Runge-Kutta method. Also, the critical Rz is investigated for different parameters governing the flow. A theoretical study is made to understand the influence of gravity field on the mechanism of mono-diffusive instability of Hadley-Prats convection in a fluid saturated horizontal porous layer. Nonlinear stability is evaluated by using energy functional. The comparison between linear and nonlinear instability results are presented and it is noted that linear theory of instability may not be useful to capture the complete picture of stability and instabilities may arise before one attains the linear stability threshold. This subcritical instability region is identified between the linear and energy thresholds in the parameter space of the problem considered.

NATURAL CONVECTION OF A NON-NEWTONIAN FLUID IN A VERTICAL CHANNEL WITH WALL TEMPERATURE IN THE PRESENCE OF HEAT SOURCE

G Sudhaamsh Mohan Reddy et al.

Abstract

The phenomenon of convective heat and mass transfer has been intensively investigated due to many industrial applications, such as air conditioning of room, material processing, cooling of nuclear reactors and many other practical situations. The natural convection heat transfer of liquid metals in a confined enclosure is considered an important problem to passive cooling system. Fluids with additive/suspension are considered non Newtonian, which can be fully described by the theory of micro polar fluids first developed by Eringen [1]. Chamkha et al. [2] was the first to study the fully developed free convection of a micro polar fluid in a vertical channel. This study was further extended by Cheng [3] to include mass transfer, Natural convection in an enclose field with fluid-saturated porous medium. The purpose of this article is to extend the work of Cheng by taking the vertical channel. The solution of the boundary value problem will be obtained by using exact method. In this work we aim to study the fully developed heat and mass transfer by natural convection of as micropolar fluid inside a plane vertical channel for asymmetric wall temperature in presence of heat source. The closed form exact solutions are derived and the effect of the vortex viscosity parameter on the flow, heat transfer and mass transfer characteristics such as the velocity, microrotaion, volume, flow rates ,total heat rate added to the fluid and the total species rate added to the fluid are examined.

Slip Flow of MHD Casson Fluid Past a Stretching Sheet with Non-Uniform Heat Source and Sink Effects

Mahantesh M. Nandeppanavar[1], Shilpa J.M[2] and G Sudhaansh Mohan Reddy[3]

[1,2]*Department of Studies and Research in Mathematics, Government College, Kalaburagi-585105, Karnataka,India.*

[3] *Department of Mathematics, Faculty of Science and Technology, The ICFAI Foundation for Higher Education, Hyderabad-501203, India.*

Abstract

The present study investigates the slip effects on the flow and heat transfer characteristics of a non-Newtonian Casson fluid due to the linearly stretching sheet under the influence of external magnetic field. The effects of viscous dissipation and non-uniform heat source/sink on the heat transfer characteristics of casson fluid are analysed. Suitable similarity transformations are used to convert the governing non-linear partial differential equations of momentum and heat transfer into non-linear ordinary differential equations and then solved numerically by using Runge-Kutta integration scheme of fourth order along with the shooting technique. The heat transfer analysis is made for two different cases of boundary heating conditions, namely constant surface temperature (CST case) and prescribed surface temperature (PST case). The influence of governing non-dimensional parameters on flow and heat transfer characteristics are discussed graphically. It is found from the present analysis that, the increasing Casson fluid parameter upsurges the temperature field. Also, enhancing magnetic field decreases the velocity of the fluid. Finally, the present numerical solutions are validated with the previously published results and found to be in good agreement.

Keywords: Casson fluid, slip flow, non-uniform heat source/sink, stretching sheet, magnetic field.

Introduction

The mechanism of flow and heat transfer analysis over a stretching sheet/surface has captivated the attention of many of the researchers due to its large scale industrial and engineering applications, viz. extrusion of plastic sheet, glass fibre production, wire drawing, paper production and petroleum production, annealing and thinning of copper wires, cooling of metallic plate in a cooling bath and so on. In such processes, there are two important

Abstract: *In this present study, a numerical analysis is developed to evaluate the base fluid and mixture ratios influencing on the heat transfer coefficient and flow characteristics of nanofluids in the turbulent range of Reynolds number employing in the investigation. This analysis formulated with the help of Eddy diffusivity equation of Van Driest. The properties of Aluminum dioxide (Al_2O_3) nanofluid with a low fluid Ethylene Glycol (EG) -Water (W) mixture of 60:40 ratio is employed in a wide range of concentrations of 0.5% to 2% on a bulk temperature range of 20^{oC} to 90^{oC}.The influences of density and temperature effect on heat transfer coefficients are determined. The maximum concentrations for which the heat transfer enhancement can attain are estimated to be 1.5% and 2.0% at 30^{oC} and 80^{oC} respectively under turbulent range. The temperature effect and concentration ratios are influencing on a heat transfer coefficient of nanofluids were analyzed and observed that the heat transfer coefficients enhances with concentration and decreases with temperature.*

Keywords: Aluminum dioxide, ethylene glycol, Nanofluids, properties of nanofluids and turbulent region.

I. INTRODUCTION

In any automobile device, the cooling system is considered a crucial role to act as an efficient condition. Based on the above context to cool the engine continuously, then the engine parts are with the help of base fluid and cooling agents. In an automotive engine component's heat must be removed from the elements to the cooling medium. However, conventional fluids are very poor to extract the heat from ingredients. This is a limitation for a traditional liquid to improve the heat transfer is the aim of the present investigation. To overcome the above problem, the nanofluids are used in a base fluid to increase the heat transfer coefficients.

Nanofluids are nothing but the dispersions of nanoparticles in liquids uniformly with metal or metal oxide nanometer-sized spherical particles. Nano particles studied (Ahuja, 1975; and A. E. Bergles, 1985) based on his studies to improve the higher heat transfer rates, the application of nanotechnology have been employed successfully. Recent trends suggest that using nanofluids dispersed in EG and water mixture as the base liquid has proved to be beneficial for low-temperature applications (Vajjha et al., 2009; Vajjha and Das 2009; Vajjha and Das 2009) have presented various experiments to find the properties of Al_2O_3 CuO, SiO_2 and ZnO nanofluids. Namburu et al. (2007) have determined the properties of CuO nanofluids. Sundar et al. (2014) have investigated the improvement of thermal properties of Nanodiamondfluids with base fluids. Sahoo et al. (2009, 2012) carried out experiments with SiO_2 and Al_2O_3 nanofluids to find the properties of nanofluids. Kulkarni et al. (2008) performed experiments for the estimation of viscosity with SiO_2nanofluid. Vajjha et al. (2010) calculated the nanofluids characteristic with forced convection heat transfer coefficients in the turbulent region as a condition and with Al_2O_3 (45nm), CuO (29nm), and SiO_2 (20, 50, 100nm) for a maximum concentration of 10.0% for temperature varying from 20 to 90^{oC} in base liquid EG-water mixture in 60:40 ratio. They have reported the enhancement of 8.74% in heat transfer for Al_2O_3 nanofluid at a concentration of 10%.

Abstract: *The current study analyzes the rate of entropy generation in the MHD flow of couple stress fluid through the horizontal inner rotating cylinder is implemented by using the thermodynamics second law. For the governing equations an analytical result is evaluated using the theory of Modified Bessel's functions. The influence of couple stress parameter, Magnetic parameter, Brinkman number, Soret and Dufour number, Temperature and concentration difference parameters on the velocity, temperature distribution, entropy generation rate and Bejan number are investigated and the results were presented graphically. It is concluded that, the solutal diffusivity has a major conclusion on the rate of entropy generation and it is not an irreversible process of heat in the flow of a couple stress fluid.*

Keywords: MHD flow, Thermodynamic analysis, Soret and Dufour effects, Couple stress fluid.

I. INTRODUCTION

Throughout the period, the thermodynamics of heat flow exchange have been founded on the analysis of the second law and its structure associated the idea of minimization of entropy generation. The entropy generation and proficiency estimation utilizing the thermodynamics second law are additional dependable than first law-based counts. Bejan (1982),presented the study of minimization of entropy generation in a warm framework, he also clarified that the minimization enhances the effectiveness of a framework by enhancing the exergy. From that point, a few specialists hypothetically considered entropy generation in heat and mass flow frameworks under numerous physical circumstances (Bejan, 1979; Shohel et al., 2003; Ali Mchirgui et al., 2012; Omid et al., 2012; Srinivas et al., 2016; Nagaraju et al., 2017; Srinivas et al., 2017; Sameh et al., 2017; Nagaraju et al., 2018).

Most of the investigations revealed in the writing managed the conventional Newtonian fluids. A few fluids utilized in designing and modern procedures, for example, polymer fluids and melts, suspensions of arrangements and strands, surfactants, slurries, paints, sustenance and restorative items, body fluids, cleansers, inks, natural materials, cements, and so on., display stream properties that can't be clarified by a Newtonian liquid stream demonstrate. To clarify the theological conduct of the above mentioned fluids, various numerical models has been proposed. One among these models is couple stress fluid model presented by Stokes. The couple stress fluid classical has particular highlights, for example, non-symmetric stress tensor and body couples. The couple stress fluids display more confounded volume-subordinate impact than those in Newtonian fluids. A few analysts have contemplated, for the most part numerically and scientifically the convective stream of couple stress fluid in the course of rotating cylinders. Kaladhar and

Abstract: *In this study, analyze the thermal convection with the effect of heat source and variable gravity in an infinite length of horizontal porous layer. Both the boundaries are considered to be inclined temperature gradients with bottom wall heating and top wall cooling. For a better understanding the combined influence of variable gravity and heat source is investigated by using linear stability analysis. This thermal study is evaluated by applying shooting and Runga-Kutta methods for the velocity, temperature and vertical thermal Rayleigh number (R_z) corresponding to different flow parameters. Increasing in the horizontal Rayleigh number, which caused the strong stabilization irrespective of gravity and mass flow effects. The asymmetric nature velocity and temperature profiles are observed due to enhance the heat source.*

Keywords: Thermal convection, variable gravity, heat source, horizontal porous layer.

I. INTRODUCTION

The theoretical study of thermal convection induced by an internal heat source and mass flow is a source of interest for many researchers, in the last few decades, due to its important applications in daily existence. In this analysis the additional effect of gravity in a horizontal porous layer is investigated. It has many real life practical applications are geophysical problems, underground transport of pollutants, gas reservoirs, crystal growth, environmental problems and cooling of nuclear reactors (Chen and Li, 2014; Kwon et al., 2014) etc.

A detailed survey of theoretical analysis and experimental investigations on thermal convection in porous medium can be found in the recent book of Nield and Bejan (2013). Nowadays, studying the effect of gravity on fluid flow in the presence of porous medium has brought attention by many researchers. The influence of gravity modulation in a fluid medium was first analyzed by Gresho and Sani (1970). Different problems of gravity-driven flows in a porous layer are described by Bear (1988). Due to the horizontal temperature gradient a thermogravitational flow occurs, which is known as Hadley circulation. For the first time an overview of the Hadley circulations has been discussed by Hart (1972 & 1983). Thermal convection in a horizontal porous layer with the inclined temperature gradient has been investigated by Nield (1991 & 1994). Further, Manole and Lage (1995) have been studied both the Hadely-flow and evolution of heat transfer beyond supercritical regimes. The influence of variable gravity field on the Hadley-flow induced by inclined thermal gradient is investigated by Alex and Patil (2002).

Several authors written report on convection as a result of internal heat sources. Few papers of Schwiderski et al. (1971), tveitereid (1977), Yoo and Schultz (2003) and Tritton et al. (1967) are pertaining to the experimental investigations. Roberts (1967) and Thirlby (1970) did a theoretical analysis on the results of Schwiderski et al. (1971) and Tritton et al. (1967). Parthiban and Patil (1995) studied the thermal convection because of nonuniform heating along the boundaries in addition to inclined temperature gradients, after that, they study the extension of anisotropic porous bed in their article Parthiban and Patil (1997). Articles of Alex and Patil (2002) are to be referred for general theory and daily life applications. Matta et al. (2016) and Matta (2019) studied the heat source effect on a horizontal porous layer. Recently Matta (2019) investigated the Hadley-flows flow in a

Annular Apertures in Point Spread Function of Amplitude Anodization Filters in Central Obscuration

G SUDHAAMSH MOHAN REDDY
Faculty of Science and Technology,
Icfai Foundation for Higher Education, Hyderabad- 501203, INDIA

Abstract:

In this manuscript the importance of investigating the Point Spread Function (PSF) of an optical system with annular apertures is too well-known to need any introduction. In the present study, we have considered an annular aperture in which the Peripheral is clear and the central part is apodized with a pair of complimentary filters. The results obtained have been presented graphically and in tabular forms.

Key-words: *Annular Apertures, Cascaded Filters, Point Spread Function etc...*

1. INTRODUCTION:

In instrumental Optics, specially when working with astronomical telescopic objectives, the use of an annular aperture is more advantageous than a full circular aperture [1]. For an example, the resolution capabilities of an astronomical telescope objective increases significantly with annular pupils. In this paper, we have studied the Point Spread Function of an optical system with an annular aperture having a pair of complementary cascaded filters. It is assumed that the peripheral is clear and the obscuration is in its central region.

2. EXPRESSION FOR POINT SPREAD FUNCTION:

The pupil function of an annular aperture with peripheral obscuration and cascaded with two complimentary amplitude apodization filters considered for our present study can be mathematically expressed as:

$$f(r) = \beta r^2(1-\beta r^2) \quad for \quad 0 \le r \le \varepsilon \le 1$$
$$= 0 \quad for \quad r > \varepsilon > 1 \qquad (1)$$

In the above equation (1), the parameter ε has been introduced to indicate the radius of the annular aperture within the pupil of radius unity. Further, using the definition of the pupil function for an annular aperture as given in the expression (1), the expression for the resulting intensity distribution can be explicitly written as [2]

$$B_p(y,z) = \left|2\int_0^{\varepsilon} \beta r^2(1-\beta r^2)\, e^{-\frac{iyr^2}{2}} J_0(zr) r\, dr\right|^2 \qquad (2)$$

In the focused plane of observation corresponding to y=0, expression (2), becomes

$$B_p(y,z) = \left|2\int_0^{\varepsilon} \beta r^2(1-\beta r^2)\, J_0(zr) r\, dr\right|^2 \qquad (3)$$

We have evaluated the expression (3), for various values of ε and β for y=0.

Abstract: *In this article, we derive the notion of almost Z_G- contraction and give the fixed point theorems of almost Z_G- contraction using simulation functions in G-metric spaces and also give an application to integral equations.*

1.Introduction.

Mustafa and Sims [14] introduced the concept of G-metric spaces in the year 2004 as a generalization of the metric spaces. In this type of spaces a non-negative real number is assigned to every triplet of elements. In [3] Banach contraction mapping principle was established and a fixed point results have been proved. After that several fixed point results have been proved in these spaces.

Berinde .[4,5]. extended the class of contractive mappings, introducing the notion of almost contractions and Babu et al.[2]. demonstrated that almost-contraction-type mappings have a unique fixed point under conditions that present the notion of B-almost contraction. Very recently, Khojasteh et al. [10] presented the notion of Z-contractions involving a new class of

Abstract
Norms of square free ideals in a quadratic field are recognized to be cube free integers. The proportion of norms among cube free integers is estimated (in a finite interval)

INTRODUCTION.

We consider a quadratic field $K = Q(\sqrt{d})$ and norms of square free ideals (**Def 1.1** below) in the ring of integers O_K. Our results are that such norms are cube free integers and that a certain simple fraction of cube free integers arise as these norms in any finite interval (**Lemma 1.1** and **Proposition 1.1** below). We may choose d to be the discriminant of K ([1], p142, Th7.1.3).

Let us examine first the case of prime ideals. The norm $N(P)$ of a prime ideal P is either a prime or the square of a prime ([1],Th10.1.2). A prime ideal P contains a unique prime number p and $N(P) = p$ if the Legendre symbol $\left(\frac{d}{p}\right) = +1$ or 0 and $N(P) = p^2$ if $\left(\frac{d}{p}\right) = -1$. It is known ([3], Proposition14.ChVI) that the analytic density of primes with Legendre symbol -1 is 1/2. So " half the primes are norms of prime ideals ".

Title: A method to minimise the energy consumption of an industrial robot

Authors: Aiamunoori Manmadhachary; P.S.M.C. Chanakya

Addresses: Department of Mechanical Engineering, ICFAI Tech School, IFHE University, Hyderabad, Telangana, India ' Department of Mechanical Engineering, ICFAI Tech School, IFHE University, Hyderabad, Telangana, India

Abstract: This paper presents an efficient methodology for minimising the energy or power consumption of industrial robot arm. A popular industrial robot is taken as an example to do the analysis, the dimensions of this robot are used to find the joint angles through inverse kinematics, these are used to form energy function. The energy function is dependent on joint angles of the arm, which are derived from the inverse kinematics, and control attributes like friction between joints, movement, settling time and forces acting on the joints. Optimising the energy function will give a set of joint angles which consume minimal energy to perform the required task and also help to predict which optimisation technique (genetic algorithm, artificial neural networks and analytical hierarchy process) is suitable or gives better results for the desired need. In this work the energy function value is reduced by 11% from the original base value.

Keywords: industrial robot; energy consumption; inverse kinematics; genetic algorithm; GA; analytical hierarchy process; AHP; artificial neural networks; ANN.

Quality of Chrome Plated Compression Rings: An Empirical Study

Sashikala Parimi, Srinivaasa Vijay Datta Banoor, Pavan Kishore. M. L

Abstract: The chrome thickness data would be acquired using a delta-scope in case of plain compression rings. A process with measurement errors becomes incapable in making improvements to the process and may make matters worse. In the process of obtaining measurements and data there may be variations and produce defects. This paper aims at the quality control aspects of chrome plated compression rings and increase the quality levels of the rings. The control charts of Shewart were used to check whether the thickness is within the standards. Further, Analysis of variance (ANOVA) is used to test whether the measurement of thickness in at the three different positions is significantly different or not. It was observed that, from the X –bar chart, all the averages of the cells are falling within the control limits for all the positions and so the process in control and the average thickness of the rings in all cells are within the specified limits whereas from the Range Chart, the range values of the cells are falling within the control limits for 3'O clock position and 6'O clock position but not in the case of 9'O clock position. Further from ANOVA there is no significant difference in the thickness at all the three positions

Index Terms: **Chrome coating, control charts, quality, ANOVA**

I. INTRODUCTION

Automobiles have been around since 1808. The first car powered by an internal combustion engine was designed by Francois Isaac de Rivaz. It was Karl Benz in 1885, who developed the petrol-powered automobile which was considered to be the first production car. Internal combustion engines are discernibly the most important components for any automobile. May it be a motorcar or an aircraft. Internal combustion engines are the power houses of every kind of automobile there is. Today, since a long time, internal combustion engines are used in all land, sea and air vehicles. Though the construction and design details differ for each type of application, the basic working principle remains the same. Air and fuel are mixed and sent into a combustion chamber: which is supposed to be perfectly air tight; and combusted with the help of a heat source (spark plugs; only in case of petrol engines). The products of this combustion process should be carefully guided to the outside of the engine; failing which, there would be a lot of turmoil and commotion leading to complete engine failure. DieselNet (2016). The major parts of an internal combustion engine comprise of pistons, piston rings, gudgeon pins, connecting rods, crankshaft, cam shaft(s) intake and exhaust valves and manifolds, cylinder sleeves, spark plugs (petrol), crank case. Pistons are the main parts which undergo linear reciprocating motion due to the combustion forces, transferring motion from the combustion thrust to the crank shaft via the connecting rods1. The combustion process takes place in the volume between the valves and the piston inside the cylinder. In order to prevent combustion gases from seeping into the crankcase which may lead to various problems like contamination of engine lubricant, loss of torque, loss of power, loss of fuel economy and so on; perfect air tight sealing has to be achieved. Piston rings play a major role in doing so. They sit in the grooves present on the surface of the piston which is in contact with the cylinder wall, essentially nullifying the contact between the piston and the cylinder wall. Hence, it is observed that the first major function of a piston ring is to maintain the sealing between the combustion chamber and the crank case and also to reduce the friction generated between the piston and the cylinder wall essentially by reducing the area of contact. There are many more functions a piston needs to carry out. As the piston rings have a very small or; in perfect scenarios; no gap from the cylinder, it can be helpful in maintaining the right amount of lubricating oil in between itself, the piston and the cylinder wall. The rings which are designed to do this specific operation apart from partly contributing in sealing the combustion chamber from the crank case; are called oil scrapper rings. The rings which are designed to solely perform the function of sealing and are placed in the top most grove (towards the combustion chamber) are called Compression rings, or simply Top rings. In highly demanding high performance application, another type of ring apart from these are used; which is placed in between the top rings and the oil scrapper rings. The oil scrappers are always at the bottom, the reason being; the oil is in large quantities present in the crank case (also referred to as the oil sump). Being placed close to the oil aids the ring to perform it function more effectively. It is also known that there is a gap in the circumference of the ring. Considering the amount of time for which a ring has to perform its job, the ring gap is designed in such a way that the pressure exerted by the surface of the piston ring on the cylinder wall is always at its maximum. Ring gap, along with the ovality are the major parameters which decide where it would be used. A ring with negative ovality: the case of ovality where the pressure exerted by the ring is minimum near the edges of the ring gap; would be best suitable in case two stroke engines. Whereas, a ring with positive ovality is best suitable for Four stroke engines.

Reversible Data Hiding in Digital Image

Karpagaselvi Subramanian, S.Vairachilai

Abstract: The growth of multimedia technologies and the attractiveness of internet are dramatically increasing. All kinds of multimedia information like audio, video and images can be obtained freely and copied even edited then transmitted as one wishes. At the same time, this makes the integrity, reliability, and security of data transmitted under threat. The information security has always been a major concern. As one of the ways to solve the security problem is data hiding technology that embeds the secret data imperceptibly into the cover media by slightly modifying some of the cover elements. This paper discusses the basic principle s of reversible data hiding (RDH) as a method of covert communication in order to understand how information is embedded in the graphical representation and covers the in-depth discussion on image compression.

Key words: Reversible data hiding, JPEG, Compression, discrete cosine transform, Quantization.

I. INTRODUCTION

Traditional data hiding techniques usually introduce irreversible distortion in the cover media which cannot be recovered after secret data extraction. However, the distortion may be not allowed in the medical, military and legal fields. To overcome this problem, reversible data hiding has been proposed as a new solution where both secret data and the original cover media can be extracted and recovered without any distortion.Moreover, data hiding techniques can be applied to other aspects such as embedding patient's information into medical images and embedding geographic information into remote sensing satellite images [1].

A flurry of research works has been contributed by researchers about lossless data hiding scheme for Joint Photographic Experts Group (JPEG) images within in the last few years. Some of the data hiding techniques on JPEG images uses standard quantization table to embed data into an image while others embed data by modifying the quantization table. The JPEG images processing algorithms vary according to the purpose of embedding. Some uses lossless algorithms while others use reversible watermarking embedding techniques. In the lossy algorithms, the embedded data will be recovered where as in the lossless techniques both the message and the data will be recovered [2]. In reversible data hiding in JPEG, the discrete cosine transform (DCT) coefficients is based on four general data hiding approaches [2].

The first one is lossless compression based which was proposed by Fridrich [3] for secret data embedding. In this approach, a space is preserved by compressing the redundant component of the image. Since message capacity is too small, this method takes less attention of researchers.

The second approach is quantization table modification approach which was proposed by Fridrich [4] to authenticate digital image. Later, Wang et al. [5] proposed a method which is based on modifying the quantization table and quantized DCT coefficients. In this approach, some elements of the quantization table are divided by an integer while the corresponding quantized DCT coefficients are multiplied by the same integer and added by an adjustment value to make space for embedding the data. This result shows an improvement on the Peak Signal to Noise Ratio (PSNR) value over previous works. This approach is basically works by preprocessing the quantized DCT coefficients to create space for secret data embedding. This is done by making the selected DCT coefficients a multiple of an integer k. If D is quantized DCT coefficients then D' (preprocessed DCT coefficients) is multiple of D and k, where $k \in \{2, 3 \ldots\}$. The corresponding quantization table entry again divided by k to compensate multiplication side effect on image distortion. The remainders of the quantization table division padded to the main message as side information so that decoder will use it to construct the original values. The binary secret message is changed into k's based number format is another part of the method to have high capacity embed ability efficiency. Finally, according to the embedding algorithm encoder can embed secret data in the modified DCT values. Using the pre-defined integer, decoder can easy apply modulo operation on modified DCT coefficients to get the embedded secret message, divide DCT coefficients and multiply quantization table entries to get the original DCT and quantization table values respectively.

The third method is based on modification of Huffman table which was proposed by Mobasseri et al. [6]. In this method, data embedding is performed by mapping variable length code (VLC) to an unused VLC. The Qian and Zhang's scheme [2] is another research work related to data embedding on JPEG images. The work can be seen from the point of JPEG bit stream structure and the scheme perspectives. From the JPEG bit stream structure perspective, an input gray-scale image is compressed into the JPEG format by the JPEG encoder and saved in the form of bit stream. It starts with an Start of Image (SOI) marker and ends with an End of Image (EOI) marker. The Huffman data is used to generate the Huffman table. The scheme is based on Mobasseri et al.'s method which works by flipping one or more bits of the non-zero AC Coefficients. This work also improved of mobasseri et al.'s method [6], but still the payload is too small.

The fourth method is based on modifying the quantized DCT coefficients. This coefficients modification approach is proposed by Chang et al. [7] and Xuan et al. [8]. Sakai et al. [9] improved Xuan et al. [8] method by block selection approach and get better visual quality of the image. Li et al.

Abstract

The present study analyzes the effect of heat source on thermal convection in an inclined porous layer and also examines the Hadley flow in an inclined porous layer by applying the linear stability analysis. The stability of small-amplitude distributions is studied with corresponding longitudinal rolls using three-dimensional normal modes. The corresponding eigenvalue problem is analyzed numerically by applying the Chebyshev-Tau method for evaluating the critical thermal Rayleigh number (Rz) corresponding to various flow parameters.

Abstract

Biometric systems are gaining importance significantly in the present day automated systems especially in the areas of authentication, access control, security, and forensic applications for the identification of criminals. Existing biometric systems using the face and iris regions had reached the state of maturity with almost having high performances of 100% accuracy provided the images of the subjects are acquired in the cooperative scenarios. The periocular region is one of the most promising biometric traits providing better robustness and high discrimination ability. Periocular region-based biometric recognition systems are well suited for the wild environments where the subjects are not cooperative. In the proposed paper, the pixel-based LBP and patch-based LBP variants are used as local descriptors for the feature extraction of discriminative features from the full face and periocular regions. Euclidean distance is used to find the matching score between two extracted feature vectors. The experimentation is performed on FRGC, FERET, and Georgia Tech face databases to compare the performance of both periocular and face biometric modalities. It showed that the periocular region has almost the same level of performance of the face region using only 25% data of the complete face.

Abstract

In the present work the experimental investigation of a household refrigerator was calculated by simultaneously changing the refrigerant charge (mr) and length of capillary tube (Lc).The recent literature review shows the consistent research in the field of new refrigerants for usage in the refrigeration and air conditioning systems due to increased need and importance on the climate change effects faced by the humankind. The recent decades show the replacement of CFCs with HFCs, later with mixture of HFCs. But the high GWP value of HFCs paved the way for the development of new refrigerants using Hydro carbons or hydrocarbon mixtures. The present paper presents the experimental investigations on the domestic refrigerator using two different hydrocarbon mixtures, viz., R50/50(R290/R600a) and R436Awith mass fraction of 56/44of R290 and R600a. The experiments are conducted by changing the refrigerant charge (m_r) and length of capillary tube (L_C) at different evaporator temperature (T_e).Continuous consecutive lyand cycling tests are performed on the refrigerator under steady state situations. The pressure at the inlet and

Analysis of Performance Indices of Planar Parallel Manipulators

P. Abhilash and A. Chandrashekhar*

Mechanical Department, FST-IFHE, Hyderabad – 501503, Telangana, India; abhilashperu@gmail.com

Abstract

In this paper the performance analysis of one of the most commonly used parallel manipulator is been discussed. Performance analysis explains the difference performance factors of parallel manipulators like Condition number, Manipulability index, Transmission index, Minimum singular value, Stiffness index etc. In this Paper we are going to deal with indices like Transmission index, stiffness index and condition number. Three different structures are considered for the analysis. In each structure, for the entire dexterous workspace best postures of the manipulators are identified based on the performance measures.

Keywords: Condition Number, Parallel Manipulators, Performance Analysis, Stiffness Index, Transmission Index

1. Introduction

Manipulators have been used in most the fields now a days. The main classification of robots is series robot and parallel robots. Out of these series robots are simple and easy to use but parallel are little complex in building and analysis but they are more robust then series manipulators. In recent days research is going on usage of Parallel manipulators in many fields like even in medical fields. Parallel manipulators are classified based on their number of legs (the joints connecting the base pod and movable pod) as 3 legged, 4 legged, 5 legged, 6 legged etc and based on the joints as prismatic, revolute etc. In this paper I am working on a manipulator with 3 legs with RPR (Rotating-Prismatic-Rotating). This is a spatial manipulator. I developed an inverse kinematics for the manipulator and for out the performance. By plotting the performance indices at different structures we can select the best structure for that particular configuration. This method can help us to find the best manipulator for different environment and different usage.

1.1 Planar 3RPR Parallel Manipulators

2. Geometry of 3RPR Manipulator

This planar 3 degrees-of-freedom parallel manipulator can also be built using prismatic joints. Here actually the 3R architecture of the legs is changed to an RPR architecture where the prismatic joint is the one that is actuated. This is shown in Figure 1, where, the distance between each of the Mi's -which do not refer to motors here but to free pin joints-is set equal to unity. The assumption of symme-

Abstract

In present investigation to analyzed the effects of tool electrode on machinability of Inconel 718 using wire electrical discharge machining. An L_{16} orthogonal array has been used for experimentation by considering machine controllable factors (i.e. pulse on time, wire speed, flushing pressure and discharge current). The influence of the process parameters on the responses, such as, surface Roughness and corner error were studied. From the results, it has been observed that tool material has the significant nature on determining performance variables. It has been also observed that zinc coated brass wire have better performance on surface roughness and corner error than the uncoated brass wire.

Abstract

The objective of this study is to investigate the effects of different turning parameters like spindle speed (N), feed rate (f) and depth of cut (d) on different output performance parameters measures during dry turning of AISI D2 Steel using PVD coated carbide tool. An experiment has been conducted according to L9 orthogonal array in order to evaluate the turning performance characteristics like material removal rate (MRR) and surface roughness (Ra). An Effort was put to convert the multi responses into equivalent single response i.e. overall grey relation grade by using grey relational analysis. The present study also developed a mathematical model for overall grey relation grade in terms of the machining parameters. Here, improved version of the latest evolutionary algorithm such as harmony search (HS) has been implemented in order to evaluate the optimal machining condition. The results are also compared to genetic algorithm to validate the efficiency of aforesaid approach.

Abstract

Manufacturing sector considered as the backbone for economic development of any nation. For competing in the global market and registering high growth we need to concentrate on optimal methods of manufacturing. As the cost of Material is occupying a 70 – 80 % of the total cost and with increasing manufacturing costs and decreasing the profit margins, it is more important for the manufacturers to choose right type of tooling that will produce accurate and precision parts every time at lower costs. The present paper will focus on the hybrid materials, PW30 and GW15, as a tool and various parameters which will affect the tool life. Various parameters that will be considered in this paper are cutting speed, depth of cut and feed rate. The process parameters of different hybrid materials are optimized using Genetic algorithm (GA).

EN This paper concentrates on widespread study of parallel manipulator. It focuses on optimal designing of manipulator which has a large number of application fields. Optimal design is an important criterion to improve the accuracy of a robot. Through optimal design a robot can achieve isotropic configurations where the condition number of its jacobian matrix equals one. In this we are also concentrating on transmission index and stiffness index along with their plots, which can affect the kinetostatic performance of the robot. In this the singularity of Gough Stewart platform is also studied.

Local color oppugnant quantized extrema patterns for image retrieval

L. Koteswara Rao ✉, P. Rohini & L. Pratap Reddy

Multidimensional Systems and Signal Processing **30**, 1413–1435(2019)

184 Accesses | **1** Citations | Metrics

Abstract

A new image feature vector named, local color oppugnant quantized extrema pattern (LCOQEP) is proffered in this paper. In the proposed method, color-texture information between two oppugnant colors planes, RGB and HSV is extracted. The proposed approach is different from the local oppugnant color space extrema pattern that explores the directional extrema in RV, GV and BV spaces of an image. In LCOQEP approach, *quantized extremas* from the oppugnant planes are extracted. Performance evaluation parameters such as precision, recall, average retrieval precision and average retrieval rate are employed to ascertain the efficacy of the devised method. Standard datasets such as Corel (1k, 5k, 10k) and ImageNet-25k are used for experimentation. A substantial improvement in the retrieval performance is observed.

Abstract

This paper presents a new methodology for the performance prediction of domestic refrigeration system with hydrocarbon refrigerant mixture (R290/R600a), which is used as a working refrigerant at different weight combinations. Artificial neural network (ANN) and fuzzy logic system (FLS) techniques are used to predict the system performance of such as coefficient of performance (COP). This paper also describes the experimental test setup for collecting the required experimental test data the experimental values are calibrated at steady state conditions. While varying the input parameters like different masses of refrigerant charge, evaporator temperature and varying length of capillary tube. The ANN and FLS models are working under MATLAB toolbox. The back propagation algorithm with different variants and logistic sigmoid transfer function were used in the network. The outputs predicted from the ANN model agree with experimental values with help of coefficient of correlation ($R^2 > 0.9886$), and the percentage of error is less than 5%. In the comparison of performance, results obtained by experimentally and same has compared with the developed fuzzy model with

Metastability versus collapse following a quench in attractive Bose-Einstein condensates

(Dated: February 27, 2018)

We consider a Bose-Einstein condensate (BEC) with attractive two-body interactions in a cigar-shaped trap, initially prepared in its ground state for a given negative scattering length, which is quenched to a larger absolute value of the scattering length. Using the mean-field approximation, we compute numerically, for an experimentally relevant range of aspect ratios and initial strengths of the coupling, two critical values of quench: one corresponds to the weakest attraction strength the quench to which causes the system to collapse before completing even a single return from the narrow configuration ("pericenter") in its breathing cycle. The other is a similar critical point for the occurrence of collapse before completing *two* returns. In the latter case, we also compute the limiting value, as we keep increasing the strength of the post-quench attraction towards its critical value, of the time interval between the first two pericenters. We also use a Gaussian variational model to estimate the critical quenched attraction strength below which the system is stable against the collapse for long times. These time intervals and critical attraction strengths—apart from being fundamental properties of nonlinear dynamics of self-attractive BECs—may provide clues to the design of upcoming experiments that are trying to create robust BEC breathers.

arXiv:1606.07096v2 [cond-mat.quant-gas] 23 Feb 2018

I. INTRODUCTION

Presently, at least two experimental groups [1, 2] are trying to realize Gross-Pitaevskii breathers [3–8] in attractive Bose-Einstein condensates (BECs) [9]. Their immediate goal is to create conditions such that the system is well-described by the one-dimensional (1D) integrable nonlinear Schrödinger equation (NLSE),

$$i\psi_t = -\frac{1}{2}\psi_{xx} + \eta\,|\psi|^2\,\psi \qquad (1)$$

[10], with $\eta < 0$, and then to excite a *breather*—a "nonlinear superposition" of fundamental NLSE solitons whose centers of mass coincide and which are at rest relative to each other [11]. Experimentally, the effectively 1D approximation is provided by placing the BEC in a elongated, cigar-shaped trap [12]. The breather that is the principal target of the current experimental efforts is shown in Fig. 1. Apart from being objects of interest in their own right, breathers are also potentially useful in atomic interferometry [8].

Breathers may be excited by quenching the nonlinearity strength η in Eq. (1). Here and below, by the "strength" of a negative quantity we mean its magnitude, and, accordingly, by "stronger" and "weaker" we will mean interaction strengths which are larger and smaller in magnitude, respectively. In BECs, the quench can be applied via magnetically tuned Feshbach resonances [13, 14]. Here one may take advantage of a special property of the integrable NLSE: Consider an N-soliton breather, composed of N fundamental solitons with norm ratios $1:3:5:7:\ldots:(2N-1)$ (an "odd-norm-ratio breather"), with their phases synchronized initially. At the point in its breathing cycle at which it is the widest

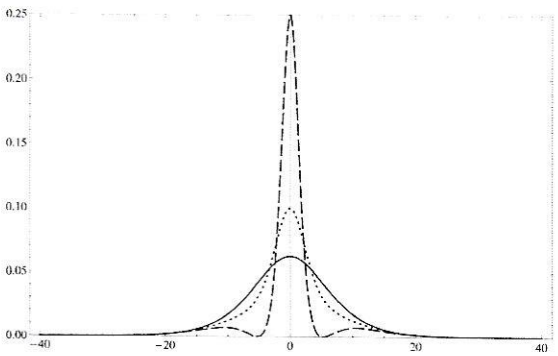

FIG. 1. **The 1:3 breather.** The density profile, at three points of time, of an exact two-soliton solution of the integrable 1D NLSE, built of fundamental solitons with coinciding centers, zero velocities, and norms 1/4 and 3/4. The solid line corresponds to the initial profile, the dotted line to the profile at 1/4 density period, and the dashed line to 1/2 period.

Abstract

Biometric systems have become a vital part of our present day automated systems. Every individual has its unique biometric features in terms of face, iris and periocular regions. Identification/recognition of a person by using these biometric features is significantly studied over the last decade to build robust systems. The periocular region has become the powerful alternative for unconstrained biometrics with better robustness and high discrimination ability. In the proposed paper, various local descriptors are used for the feature extraction of discriminative features from the regions of full face, periocular and city block distance is used as a classifier. Local descriptors used in the present work are Local Binary Patterns (LBP), Local Phase Quantization (LPQ) and Histogram of Oriented Gradients (HOG) and Weber Local Descriptor (WLD). FRGC database is used for the experimentation to compare the performance of both periocular and face biometric modalities and it showed that the periocular region has a similar level of performance of the face region using only 25% data of the complete face.

A green one pot synthetic protocol method for 1-(2-chloropyridin-3-yl)-3-substituted urea derivatives from 2-chloropyridin-3-amine and *tert*-butyl substituted carbamates by using *bis*(trimethylaluminum)-1,4-diazabicyclo[2,2,2]octane (DABAL-Me3) under microwave irradiation is developed. The compound structures established by spectral data such as IR, ^{1}H NMR and mass spectroscopy. All the synthesized compounds were tested *in vitro* antimicrobial activity.

Keywords: 2-Chloropyridinyl urea derivatives, Microwave irradiation method, Antimicrobial activity.

INTRODUCTION

The aryl urea derivatives exhibit a broad spectrum of biological activities such as antitumor [1], antimalarial [2], antidiabetic [3], anti-HIV [4], analgesic [5], antitubercular [6], antimicrobial [7], anti-inflammatory [8] and antiproliferative [9] activities. The urea derivatives are also having diverse applications in various fields including as pharmaceuticals, agrochemicals, petrochemical, organocatalysis [10,11] and also used as dyes for cellulose fiber and hair, in detergents, corrosion inhibitors and additives in fuels [12].

Furthermore, there are several diaryl urea derivatives are on clinical trial or have been used clinically such as sorafenib, regorafenib, linifanib, tivozanib and lenvatinib. Sorafenib is active against cancer activity [13], regorafenib is used for treatment for colorectal cancer and gastrointestinal stromal tumors [14]. Lenvatinib is a multireceptor tyrosine kinase inhibitor and to treat recurrent or metastatic, progressive, radioactive iodine refractory differentiated thyroid cancer [15]. Tivozanib is an inhibitor of vascular endothelial growth factor receptors and metastatic renal cell carcinoma [16]. Linifanib is active against advanced hepatocellular carcinoma [17]. Additionally, methods have reported for the synthesis of urea derivatives such as in general conversion of an amine to isocyanate or carbamate followed by substitution amine [18], reaction of amine with phosgene derivative like triphosgene [19], oxidation of isonitrile and palladium catalyzed cross coupling of aryl chloride *via* isocyanate intermediate [20] and $AlMe_3$ [21]. The reported methods have inherent limitations such as narrow or limited substrate availability, use of corrosive chemicals and multistep reactions and trialkyl alanes have potential risks of pyrophoric character [22]. It suggests that the reaction of carbamates with an amine is more attractive.

In recent years, reports on the microwave assisted organic synthesis reaction condition is promising alternative to conventional methods as these reactions represent clean, effective, safe, economical and eco-friendly procedure and is believed to be a step towards green chemistry [23]. In view of the synthetic methods, biological activity of urea derivatives and importance of *bis*(trimethylaluminum)-1,4-diazabicyclo[2,2,2]octane (DABAL-Me3), we have developed a green one pot synthetic protocol for 1-(2-chloropyridin-3-yl)-3-substituted urea derivatives by using DABAL-Me_3 under conventional heating and microwave irradiation method.

EXPERIMENTAL

The melting points were determined in open capillary tube and are uncorrected. Purity of the compounds was checked

Trajectory planning of a Robot Manipulator using Genetic Algorithm

A. Harish, A. Chandrashekhar, G. Babu · Published 2018

A crucial factor that has to be considered in the operation of the robot manipulators is optimal trajectory planningit has a main goal of generating path from initial to final points in the operation that minimizes the, path travelling distance, energy consumption and avoiding obstacles. As an infinite number of solution can exist to manipulate the operation from one point to other, an optimal time-trajectory must be created to attain high productivity for a particular operation. This paper proposes a hybrid optimization method, which incorporates Analytical Hierarchy Process (AHP) in Genetic Algorithm (GA) to optimize point to point trajectory planning for a manipulator to avoid collision with any obstacles in the robot workspace. The GA objective function aims to optimize the excessive driving force, joint travelling distance, trajectory length and consumed time; the objective function also considers an optimized value obtained from AHP as a weighing factor. The control attributes like travelling space, time and torque are considered in AHP to optimize. In joint space to define the segments that connect initial, intermediate and final point quadrinomial and quintic polynomials are used. LESS

Recent developments in the synthesis of heterocycles by the application of palladium-catalyzed intramolecular heck reaction

Sanjay Nath

Department of Chemistry, Krishnath College, Berhampore, Murshidabad, W.B., India
E-mail: sanjay.ku11@gmail.com

Palladium-mediated cyclization reaction has been recognized as one of the simplest and useful tool for the regio- as well as stereoselective synthesis of carbo- and heterocyclic compounds. In the multi-step synthesis of natural products heck reaction is frequently used as one of the most important steps. In this review article, I have summarized recent developments in the construction of heterocyclic rings in various ways under palladium-catalyzed intra-molecular cyclization.

Abstract- Internet of Things (IoT) finds its major application in the field of healthcare. Especially, with the invent of wearable technologies generally known as smart-watch, like fit bit, reflex others, one can easily monitor his/her health and avoid chances of getting risk. A wearable IoT, is embedded with various kinds of sensors using which different human activities like movement , walking, pulse rate , calories burnt etc.. Information can be gathered. Wearable IoT allows two way communication. Using wearable IoT a patient record is extracted and analyzed. Data is generated from day to day activities and collected at regular intervals of time. This paper aims in explaining about IoT, wearable IoT, and its architecture and finally presents the analyzed results.
Keywords: IOT, Cloud, Sensors

1. Introduction

Recent advances in the field of technology have prompted the researchers to claim that we have entered a new era, "an era of technological revolution". The rise of ICT (information and communication technologies) that includes computers, software's , telecommunications etc. have a major influence on the functioning of a society. For the past few decades, innovation in the field of digital space and recent introduction of IoT (internet of things) has made it possible to enhance the day to day activities with the help of technology. IoT has been implemented in many industrial sectors such as smart cities, smart transportation, smart parking, smart building, irrigation and agricultural systems, medical field and even for fitness at individual level.

Increased utilization of smart devices such as smart phones, smart televisions and other smart electric appliances, smart watches etc. have enabled the IoT to reach a new level of advancement. These smart devices are generally embedded with sensors and actuators and are capable of establishing a two way connection with the nearby compatible devices or networks via wireless protocols such as Bluetooth, NFC, Wi-Fi etc.

One of the major applications of these smart devices is in the field of healthcare where fitness in terms of physical activity, pulse, sleep data etc. can be monitored on a daily basis with the help of wearable devices such as smart watches, smart bands.These devices when worn collect near - real time data, enabling continuous monitoring of physical activity. These devices are not only easily available but also they are user friendly, this has become an added advantage for the increased use of these gadgets. In addition to that, these devices can enable communication between patients, family members and in case of emergencies, alert messages can be sent to family members and health care providers.

Smart watch like any other smart device is embedded with sensors such as accelerometers, gyroscopes, optical sensors, contact sensors, ambient light sensors etc. these sensors are able to record a wide range of physical activities such as step count, sleep data, gestures, postures, pulse, body temperature etc. This recorded data can be used to analyze the health of a patient. In addition to that, using these devices, one can set a goal that he/she wants to attain well in advance and perform the exercise or physical activity to reach it while keeping a track of all the activities. For instance, if a person wants to walk for a distance of 2 km per day, the same can be set as a goal in the watch. The sensors in the watch will record the activity and once the goal is reached, a notification will be sent to the connected device.

Abstract-Modernization and advances in technology gave rise to the most trending topic, "Internet of Things", which aims at providing a quality and simpler lives. IoT enables us to establish a secure connection between various devices (also known as things) within a network. In IoT, two way data transfer among the devices is possible using a set of guidelines called protocols such as zigbee, z-wave etc. The efficiency of IoT depends on the sensors, communicating devices within the network and protocols that is being used for data transfer. In this article, an attempt has been made to explain the basic concepts of IoT in simple terms. This article presents a general overview of IoT, its architecture, applications and challenges involved.
Keywords : IoT, RFID, NFC,IoT Applications, IoT Challenges.

1. Introduction

"The science of today is the technology of tomorrow" were the words of famous physicist Edward Teller. As quoted by the physicist, there is a drastic change in the human's day to day life as well as in working condition ever since the introduction of IT and ITeS. The developments in science and technology have seen many leaps and bounds. One such advancement in the field of IT is Internet of Things (IoT). Peter Lewis in November 1985 coined the term internet of things at a conference hosted by U.S Commerce Department. However, the term became more recognized when Kevin Ashton of Procter & Gamble used the term for linking his new concept of RFID (Radio Frequency Identification) with then burning topic Internet in the year 1999[1]-[4].With the recent advances in the field of Science and Technology, the current need of the hour is to develop an integrated system or a smart system which can work and communicate in an intelligent manner.

Internet of Things aims at improving the quality of life with the usage of gadgets leading to a fully automatic world. In other words, Internet of Things means inter-networking of all the devices around us which we use in our day to day life with the help of embedded sensors, Bluetooth devices, software, network connectivity etc. Hence it is drastic advancement which enables all the devices and machines to communicate with each other without human intervention [5]-[8].

Ever since the invention of internet, its usage has been confined to computers and mobiles. People are familiar with its (internet) usage in their day to day life for communication and exchange of data. Now imagine a world where all the entities (including devices, tools and machines) can be connected with each other with the help of internet. That means all the machines and devices that we see may start communicating to each other without human intervention leading to a smart world [9]-[10]. Talking about the connectivity, soon we can expect our vehicles to send a message regarding refilling of air in tires or putting on your seat belt or wearing a helmet in case of two wheelers, dustbins about the piling up of garbage, stoves regarding over cooked food, oven to teach you cooking by downloading various recipes from internet and so on. All these instances show that the Engineers nowadays are expecting to develop a sophisticated management system that would revolutionize the lifestyle of humans. The scope of Internet of Things is not only limited to connecting the entities but it also allows the exchange of information or data which can be used to execute meaningful applications.

The Internet of Things is therefore considered as a global network that facilitates the communication and information exchange between human-to-human, human-to-things and things-to-things. The connectivity between the things can be done by unique identification of the devices using various methods such as tracking by RFID (Radio Frequency Identification), near field communication, barcodes, QR codes and digital watermarking.

2. Architecture

The Architecture of IoT is complex in nature. There is no universally accepted single specific architecture for IoT. Different multi layered architectures have been proposed by many researchers. Basic architecture starts from a three layered system, four layered system, five layered architecture have also been proposed based on the study, a six layered architecture of IoT is described in this article (figure 1). Basically, the architecture which is described here is a FOG computing based architecture.

Fog computing, extends the features of cloud computing. Using Fog computing, processing and analysing of information will be carried at edges (local computer or any computing device) only. Since the processing done prior the fog computing is also popularly known as edge computing.

Abstract:
This paper presents implementation of space vector modulation based direct torque control (SVM-DTC) of induction motor using economical Spartan-6 FPGA board. The major advantage of FPGA compared to DSP processor for implementation of advanced control algorithms like DTC is parallel processing and less execution time. The major drawbacks in practical implementation of conventional DTC are variable switching frequency and high sampling frequency to implement hysteresis controllers. Whereas SVM-DTC operates at constant switching frequency and does not require high sampling as hysteresis controllers are replaced with PI controllers. The VHDL code for SVM-DTC with PI controllers is simulated, synthesized using Xilinx ISE 14.3 design tool. The proposed VHDL code is verified experimentally by interfacing VSI fed induction

*skgrandhi@ gmail.com

Abstract. Biomass gasification is a cost effective, efficient and eco-friendly source of alternate energy. The gasification efficiency depends on several parameters like equivalence ratio, gasification agent, gasifier configuration, etc. Downdraft gasifier isa mostsuitable gasifier for biomass gasification due to inherent advantages like feedstock flexibility, better process control, low tar formation, and simple construction. The aim of this paper is to conduct a comparative study of different configurations and design a 5kW lab scale throat less biomass gasifier using an analytical method.

Keywords: Downdraft gasifier design, specific gasification rate, gasifier efficiency, throatless gasifier

1. Introduction

Gasification is a thermo chemical process of converting solid fuel into gaseous fuel. Biomass gasification is an attractive option for power generation due to abundant availability of feedstock, ease of operation, eco-friendliness and better process control. The primary goal of biomass gasification is optimal energy conversion of the solid biomass into combustible gaseous product known as producer gas. The gasification efficiency depends on several factors like equivalence ratio, biomass properties, gasification agent, and gasifier configuration. Depending on the direction of air flow gasifiers are grouped into three types viz., i) Downdraft, ii) updraft and iii) cross draft gasifier. Figure1 shows the classification of various gasifiers. Downdraft gasifier is also called co-current gasifier. In this, the air is introduced at the center portion of the reactor and drawn from the downside. The oxidation and reduction zones will be just below the point of air inlet. Even though the overall efficiency is relatively less than updraft gasifier, it has a lesser tar forming tendency and higher gas loading capacity. Downdraft gasifiers are further divided into throated (Imbert type) and throatless (Open core) gasifiers. The construction of down draft gasifiers and their relative merits and demerits are given in table 1.

Abstract. Gasification is the cleanest and most efficient process of utilizing fossil fuels for energy production. Gasification efficiency and product gas quality depend mainly on Equivalence Ratio (ER), Steam-to-Fuel Ratio (SFR), and Gasification Temperature (GT). This study aims at developing an Artificial Neural Network (ANN) model for the prediction of optimum parameters and resulting syngas composition. Very few studies have been reported on ANN modeling with a limited scope of predicting the heating value and composition of syngas. However, none of the previous works are reported on the prediction of optimum operating conditions based on fuel properties so far. With the recent surge in the variety of feedstocks, it is increasingly difficult to determine optimum operating conditions and corresponding syngas composition in a conventional manner. In this scenario, ANNs would be handy in faster and accurate prediction of operating conditions. In the present work, a multi-layer feed forward back propagation network has been proposed for modeling gasification process. The first stage of study involves identification of suitable network architecture and its parameters such that the performance measures are achieved. In the second stage, the network is trained with experimental data available in the literature. The accuracy of the network depends on the amount of data. Since available experimental data is limited, training data is generated using Minitab software. The input parameters used in the model are feedstock composition from the ultimate analysis, and output parameters are operating conditions ER, SFR, GT, and syngas composition (amount of H_2, CO, CO_2, and CH_4). A 5-5-1 network is used for estimating optimum parameters and an 8-5-1 network is used for estimating syngas components. The predicted data is in good agreement with experimental results with a correlation coefficient of above 0.91 and mean square error less than 0.001.

INTRODUCTION

Gasification is one of the cleanest technologies to utilize fuels with minimum emissions. It is the thermochemical conversion of fuels within a reactor under controlled oxidizing environment into a gaseous fuel (product gas / syngas) primarily consisting of CO and H_2. Many researchers have studied the gasification process of various fuels and biomasses. The objective of a gasification process is to produce the syngas with higher calorific value and lesser emissions. This can be achieved by controlling process parameters and operating conditions in order to get the required composition of syngas. Syngas composition mainly depends on properties of the fuel, amount of oxidizing agent (Air/O2/Steam) and gasification temperature. The related gasification parameters are equivalence ratio (ER), Steam to fuel ratio (SFR) and gasifier temperature (GT). Prediction of theses parameters for different fuels is a tedious task which necessitates considerable amount time and experimental facilities. In this scenario, Artificial

Influence of process parameters on MRR, kerf width and surface roughness during WEDM on Inconel 718: performance analysis of electrode tool material

Anshuman Kumar and Kumar Abhishek

Published Online: 11 Oct 2018

Abstract

In the present study, an attempt has been made to study the performance of (brass wire electrode and zinc coated brass wire electrode) wire electrodes in relation to material removal rate (MRR), kerf width and surface roughness of machined Inconel 718 obtained by wire electro discharge machining (WEDM) process. Experiments have been conducted using L_{16} orthogonal array with two different types of wire electrodes and by tuning following controllable process parameters; discharge current, flushing pressure, wire tension, and pulse-on time. It has been observed that zinc coated brass wire produces lesser kerf width as well as surface roughness; higher MRR as compared to brass wire electrode. The pulse-on time is found to be the most significant factor on influencing MRR for all electrodes types. Pulse-on time and discharge current is found to be very significant on affecting kerf width for all electrodes types finally, Grey-Taguchi relational analysis have been adopted to establish the optimal parametric combination for both the wire electrode.

Short fiber-reinforced polymer composites are used in numerous tribological applications. In the present work, an attempt has been made to improve the wear resistance of short glass fiber (SGF) reinforced polypropylene composites by incorporation of micro-sized Linz-Donawitz slag (LDS) particles. Composites with different LDS content (0, 7.5, 15 and 22.5 wt%) in a polypropylene matrix base with 20 wt% SGF reinforcement are prepared by injection molding technique. Solid particle erosion trials, as per ASTM G76 test standards, are conducted on the composite samples following a well-planned experimental schedule based on Taguchi design-of-experiments. Significant process parameters predominantly influencing the rate of

KRONECKER'S LEMMA AND A CONVERSE WITH APPLICATIONS

[1]G SUDHAAMSH MOHAN REDDY ,[2]S SRINIVAS RAU, [3]B UMA

[1& 2] *Faculty of Science and Technology, Icfai Foundation for Higher Education, Hyderabad-501203, INDIA*

ABSTRACT

Kronecker's Lemma asserts that the mean of a real sequence $\{a_n\}$ *is zero if* $\sum \frac{a_n}{n}$ *converges. We give a new proof for the case* $a_n \geq 0$. *If* $\{a_n\}$ *is bounded, a partial converse was given by Hlawka et al [5]. We state sevaral applications of this converse from our work.*

KRONECKER'S LEMMA(1886): If $\{a_n\}$ is a sequence of real numbers and $\sum_{n=1}^{\infty} \frac{a_n}{n}$ converges then $Mean\{a_n\} = \lim_{N\to\infty} \frac{1}{N}\sum_{n=1}^{N} a_n = 0$. The standard proof is by direct estimation of the Mean ([4],p73,[7]). We give a different proof for the case $a_n \geq 0$ *for all n*.

Proof:(Special case) Suppose $a_n \geq 0$ *for all n* and $\sum_{n=1}^{\infty} \frac{a_n}{n} = a < \infty$. We first show that the mean c of $\{a_n\}$ is finite and next that it is 0.

A DIRECT PROOF OF CONVERGENCE OF EULER PRODUCT FOR $L_d(1)$

[1]G SUDHAAMSH MOHAN REDDY , [2]S SRINIVAS RAU, [3]B UMA
[1& 2] Faculty of Science and Technology, Icfai Foundation for Higher Education,
Hyderabad-501203, INDIA,
[3]CTW, Military College, SECUNDRERABAD-500015,INDIA

ABSTRACT

A simple proof is given for the convergence of the Euler product $\prod_p \left(1-\frac{\left(\frac{d}{p}\right)}{p}\right)^{-1}$ *for d = discriminant of a quadratic field. The argument holds also for s = 1 + it. The mean of* $\left\{\sum_{p|n}\left(\frac{d}{p}\right)\right\}$ *is deduced to be 0.*

Introduction.

Let $K = Q(\sqrt{d})$ be a quadratic field with discriminant d and Dirichlet L-function

$$L_d(s) = \sum_{n=1}^{\infty} \frac{\left(\frac{d}{n}\right)}{n^s} = \prod_p \left(1-\frac{\left(\frac{d}{p}\right)}{p^s}\right)^{-1} \qquad (\text{Re } s > 1)$$

It is known that the L-series converges for Re $s > 0$ and defines an analytic function there ([1].[5]). In particular the series converges at s=1. Mertens proved that the Euler product converges at $s = 1$ by showing that $\prod_p \frac{\left(\frac{d}{p}\right)}{p}$ converges. This result is not commonly given in text books. It may be proved by using facts

Age-invariant face recognition using multiple descriptors along with modified dimensionality reduction approach

Kishore Kumar Kamarajugadda & Trinatha Rao Polipalli

Multimedia Tools and Applications **78**, 27639–27661(2019)

131 Accesses | **2** Citations | Metrics

Abstract

Face recognition on the basis of age variation is a significant yet challenging issue. One among the effective methods to age-invariant face recognition is to form a face aging model that can be utilized to recompense for the aging process in face matching or age assessment. The periocular region of a face is the most age-invariant facial region, to abstract discriminative local features that are distinct for every subject. Feature vector space can be reduced by utilizing the features only from the periocular region. So, in this article, features are only extracted from the periocular region of a face. For feature extraction, multiple descriptors such as Scale Invariant Feature Transform (SIFT) and then Speeded Up Robust Features (SURF). As the extracted features vector has high dimensionality, it is decreased to the low

Lemp: a Robust Image Feature Descriptor for Retrieval Applications

L Koteswara Rao, P Rohni, M Narayana

Abstract: line edge magnitude pattern (lemp) is proposed in this paper. Line edge distribution is used to denote local region of an image. Popular texture descriptors such as lbp deal with a comparison of centre pixel with neighbors and thus encode the information. In lemp ,pixel at the centre is replaced by edge values of neighbors. Discriminating information provided by line edges makes this method different from many of the existing methods. Magnitude is also added to the line edge information in order to make the feature descriptor more effective and robust. Performance of lemp method is estimated with corel database. Standard metrics such as recall, precision and average retrieval rate are determined for comparison purpose. Experimental values exhibit a notable improvement in the performance.

KEY WORDS – Retrieval , Patterns, Magnitude, Edge.

I. INTRODUCTION

A. Motivation

Due to the advancements in Multimedia and digital Electronics field, numerous images are created, shared every moment . Conventional methods such as text annotation fail to provide a mechanism for effective utilization of imagery data. Content based image retrieval, in short CBIR, resolves all problems in traditional annotation methods. It depends on extraction of inherent features of any image and thus provides an effective mechanism to manage the data. Key step in CBIR is extraction of image features. Effectiveness of this system primarily depends on feature extraction method. Key features of any image are color, shape, texture and layout etc. Since the user captures a photograph is various conditions, there exists no single way of image representation. Survey on CBIR is provided in [1]–[5].

There exists any one feature descriptor or a combination of features .Swain et al. devised color histogram [5] and histogram intersection method to calculate distance between histograms. In [12], Pass *et al.* used CCV to create a coherent or incoherent histogram bin. To represent color distribution as well as spatial correlation, Huang [9] introduced a color featured correlogram.

Texture is an indispensable part of CBIR .In [6],Smith computed Mean and Variance values of wavelet coefficients . Concept of ridgelet transform was devised by Gonde et al[7]. S Murala introduced the correlogram concept to create a feature descriptor [13]. L K Rao proposed the quantized patterns for image retrieval. Researchers introduced many feature descriptors for image retrieval [14]-[19]. All of them are based on the relationship among pixels.

B. Relevant Work

Ojala [23] devised LBP for texture analysis and classification. Guo *et al.*[24] introduced complete LBP scheme for classification. Considering LBP as a point edge, Reddy *et al.* proposed the LEBP [25]. In [25], authors used the sign information to create feature vector.

C. Prime Contributions

Motivated by the pattern described in [20]-[22], We propose a robust and effective feature descriptor. Proposed LEMP extracts more discriminating information.

1. Combination of LEBP and MLEBP is considered for retrieval system.
2. Retrieval efficiency tested on Corel imagery database and precision, recall and avg. retrieval rate (ARR) are computed.

Paper is organized as follows: Brief review of CBIR is provided in section I .Section II covers a review of local patterns, line magnitude patterns. Section III explains framework, similarity measurement. Results of experiments are given in section IV. Section V contains derived observations and conclusions.

II. RELATED LOCAL PATTERNS

A. Local Binary Patterns (LBP)

Ojala *et al.* [21] proposed LBP for image texture classification. LBP is illustrated in fig.1. Derivation of local pattern for a specified region is done as per the equations (1)-(2).

$$LBP_{P,R} = \sum_{i=0}^{P-1} 2^i \times f_1(h_i - h_c) \qquad (1)$$

$$f_1(n) = \begin{cases} 1 & n \geq 0 \\ 0 & else \end{cases} \qquad (2)$$

where h_c is gray level of centre pixel, h_i is gray value of neighbor, P denotes no. of neighbors and R denotes radius of neighborhood.

Student Intervention System using Machine Learning Techniques

Shubhangi Urkude, Kshitij Gupta

Abstract: Now a days, the educational institutes are adopting technologies for betterment of student's quality, in respect to teaching methodologies etc. For which the huge information available with educational institutes can be used to predict student's future in academics. The main objective of this paper is to predict the student performance in the examination and also to predict the student will graduate or not. Hence forth we are using statistical analytical method which is F1 score. F1 score or F measure is used to test the prediction accuracy by considering precision and recall to compute the score. To fulfill this requirement in machine learning, classification technique is used. The dataset used in this analysis contains 395 student records, having attributes, such as age, health, internet, school, father job, mother job etc. Using support vector machines (SVM), Decision Tree and Naïve Bayes (NB) classification algorithms F1 score is calculated for each algorithm. Based on the analysis done the F1 score of support vector machine is giving the better prediction compared to rest of the two algorithms.

Keywords: Support Vector Machines (SVM), Decision Tree, Naïve Bayes (NB), Classification Algorithm, Prediction.

I. INTRODUCTION

In educational institutes like colleges and many universities huge data is collected on daily basis. This data contains examination data, student's internal marks, their personal data, health data, various evaluation components data and logs of student's activity.

The data is caught through learning administration frameworks like Canvas and Edmodo. Canvas and Edmodo are particularly intended for online classrooms, which are getting to be well known in the highereducation.

This huge collection of data can be used to analyze the student's performance in the future to increase the graduation rate. Graduation rates are frequently the criteria of decision for this. Graduation rate is defined as the time when student enters the institution and completed the degree with in four years, it is usually expressed as % graduation rate. To finalize the graduationrate the data collected from different sources should be converted into single form so that this data can be retrieved and analyzed to make specific decision. To take any decision, data is analyzed in such a way that it should able to answer certain questions such as

Who are the students likely to fail?

What is the courses student may fail?

What is the quality of the student'scontribution to the marks he obtained?

Which courses should be focused more to help the student?

What are the easy subjects to get good score?

Revised Manuscript Received on 14 September, 2019.

Shubhangi Urkud, Department of Computer Science and Engineering, Faculty of Science and Technology The ICFAI Foundation for Higher Education, Hyderabad.

Kshitij Gupta, Department of Computer Science and Engineering, Faculty of Science and Technology The ICFAI Foundation for Higher Education, Hyderabad

Based on the answers collected in the analysis phase, the perfect decision can be made by using different machine learning techniques and students can be guided in a particular direction without diluting educational standards.

Student's academic performance influenced by numerous components, like personal, financial and other environmental variables. Learning about these factors and their impact on student performance can help dealing with their impact. Recently, much aid has been paid to educational mining research. Educational Data Mining (EDM) concerns techniques, tools, and research planned for automatically extracting meaning from big repositories of data generated by or related to people learning activities in educational surrounding. Anticipating student's performance turns out to be all the more challenging because of the expansive volume of information in educational databases.

Forecasting of academic performance is widely explored. The ability to foresee student performance is important in educational institutions. Expanding student's achievement is a long-haul objective in every single educational institute.Predicting student'sacademicperformance ahead of schedule before their last examination is really a great achievement. At this point additional measures can be taken by educational institutes to orchestrate appropriate help for the low performing students to enhance their studies and help them to progress. On the other hand, distinguishing characteristics that influence course achievement rate can aid courses enhancement. Recently created web-based educational technologies and the use of quality standard offer researchers' novel chances to contemplate how students realize and what ways to deal with learning lead to progress. The main objective of this paper is to distinguish the two factors that influence student's performance, courses achievement rate and student's achievement rate. By considering these components as early indicator analysis can be done and necessary action can be taken to improve.

II. LITERAYURE SURVEY

Many researchers have used statistics and machine learning algorithms for predicting the student's performances in educational institutes.

Edin Osmanbegovic etal. [1]uses three supervised learning algorithms, Bayesian, Decision trees and Neural Networks on the assessment data to predict number of students got success in a course and the performance of the teaching,learning methods were evaluated based on their predictive precision and ease of learning and user-friendly features. It is proved that this method can be used to benefit students and teachers to progress student's performanceand decrease failing ratio by taking proper steps at right time to improve the quality of education.

FPGA IMPLEMENTATION OF NOVEL ARCHITECTURES FOR DIGITAL IMAGE PROCESSING CONVOLUTION FILTER: DEVELOPMENT OF NOVEL QUARTILE DIVISION ARCHITECTURES

Ranganadh Narayanam
Assistant Professor, ECE department, Faculty of Science and Technology, The ICFAI Foundation for Higher Education, Hyderabad, (Deemed to be University under section 3 of UGC Act, 1956), India

DOI: 10.5281/zenodo.2578164

ABSTRACT

Image convolution is a very important operation in signal and image processing. It is general purpose filter effect and an algorithm used to filter images. In this the mathematical concepts of convolution and the kernel matrix are used to apply filters to images, to perform functions such as blurring, sharpening, embossing, extracting edges and reducing unwanted noise. Convolution could operate in 1D (e.g. speech processing), 2D (e.g. image processing) or 3D (video processing). Image Convolution finds applications in the specialized areas of Digital Image Processing such as Computed tomography, Image recognition, Imaging Spectroscopy, Artificial Intelligence, feature extraction etc. In this research I have developed 8 different Novel hardware architectures of my own for Convolution Process, which are nowhere in literature before, and first of their kind. All these architectures are designed and implemented first as a prototypic 16 by 16 image and 3 by 3 integer kernels; 32 by 32 image and compared. The programming is done using Verilog HDL and implementation is done on Xilinx Artix-7 FPGAs using Vivado 2015.2 Tool.

1. INTRODUCTION

In Digital Image Processing, the spatial domain processing is a visually rich area of study deals with pixel manipulation techniques. Different operations can be performed over images in this spatial domain. All these matrix-based operations are performed between a larger matrix, which represents an image, and a smaller matrix, known as 2D kernel. The size and associated values in the kernel determine the impact exerted by it on the image considered [2]. The convolution process is one of the spatial domain pixel manipulation technique which is done between an image and a 2D kernel of different sizes such as 3 by 3 or 5 by 5, and the result can be edge detected image, enhanced image, de-noised image, blurred image etc basing on the values in the kernel [2]. There are certain standard kernels are there for each different effect on the image. Basing on the level of enhancement, edge detection, blurring and basing on the application requirement the values in the kernel can be any values and the 2D kernel can be customized, and sometimes it can be integer kernel and sometimes it can be fractional numbers.

Some very important applications of Convolution in Digital Image Processing

Convolution in 2D spatial which is mostly used in image processing for feature extraction and is also the core block of Convolution Neural Networks (CNNs). Convolution is the first step to understand Convolution Neural Networks.

Design of a Flexible PET Based Yagi Dipole Antenna

Kamarajugadda Kishore Kumar, Movva Pavani

Abstract: In the proposed paper, a flexible Yagi Dipole Antenna based on PET Substrate is designed for the RF system-on-package (RF SOP) applications. RF antenna as a smart sensor is designed on a Flexible substrate Polyethylene Terephtalate (PET). It is the more popular and universally accepted thermoplastic polymer belonging to the family of the polyester. It is generally employed in textiles, thermoforming packaging along with glass fibers. In the proposed design Coplanar Strip line (CPS) is used as a feeder and the RF antenna is a Yagi dipole Antenna with a single driven element i.e. director, and a single reflecting element i.e. reflector. It is a linearly polarized antenna which means it radiates in a single direction. The antenna is designed at a resonating frequency of 5 GHz with a return loss of -23 dB. Simulations of the flexible PET based Yagi Dipole Antenna is carried out by using CST Studio Suite software for Return loss, Radiation plot with varied curvatures. The results for designed flexible Yagi Dipole Antenna imprinted with a PET substrate for portable wireless electronics are analyzed.

Keywords: Yagi Dipole Antenna, Coplanar Strip Line, Polyethylene Terephtalate, Return loss.

I. INTRODUCTION

Over the past decade the manufacturing and design of flexible electronics has drawn major attention such as the development of wearable products, flexible displays and smart tags. Functionality integration is feasible in developing flexible microelectronics embedded with new technologies. The flexible Integrated Circuit technology has impacted heavily in the area of portable wireless applications [1][2]. Critical design aspects are integrating passive and active components on the same flexible substrate with reduced physical dimensions which enhances the performances of the microwave device with energy efficient packages.

Various techniques have been proposed by using divergent elements in the design of flexible materials as substrates [3]-[5]. Different polymer constituents like PEI, LCP, and PET are preferred as the substrate material in the design of RF electronic devices due to the striking characteristics of less relative dielectric constants and dissipation factors making them idle materials for making the laminates [5]. In the recent years, Polyethylene Terephtalate (PET) polymers have gained wide acceptability in the fabrication and design of Microsystems [6]-[9]. For UHF and microwave applications, Polyethylene Terephtalate (PET) substrate is the best industrial-substrate candidate by varying the substrate density, coating, thickness, texture, etc. RF characteristics of a PET substrate should be evaluated before its realization in the design of UHF antennas.

In the proposed paper, flexible Yagi Dipole Antenna is designed with a low-cost substrate PET and the results are obtained with the CST Studio Suite software for Return loss, Radiation plot with varied curvatures. PET substrate generally finds its applications in textiles, thermoforming packaging along with glass fibers rather for the high frequency applications.

II. PROPOSED DESIGN

In the proposed design Coplanar strip line (CPS) is used as a feeder and the RF antenna is a Yagi dipole Antenna with a single driven element i.e. director, and a single reflecting element i.e. reflector. It is a linearly polarized antenna which means it radiates in a single direction.

The antenna is designed with a resonating frequency of 5 GHz of a return loss of -23 dB. Simulations of the flexible PET based Yagi Dipole Antenna are carried out by using CST Studio Suite software for Return loss, Radiation plot with varied curvatures.

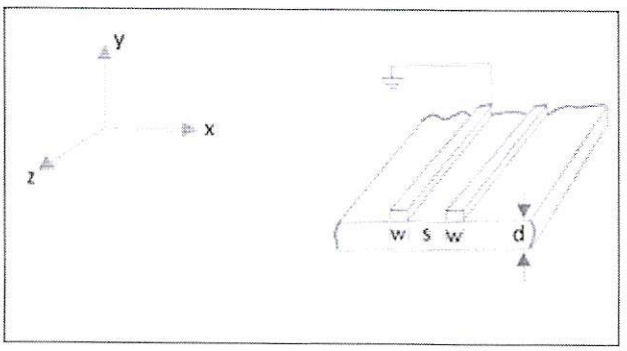

Fig.1.Coplanar Strip Line (CPS)

A coplanar strip line (CPS) comprises of two conducting strips on the identical substrate surface with one strip grounded and with no conducting layer. It provisions quasi-TEM mode providing low dispersive properties. The effects of shunt are completely eliminated by the CPS making them more reliable devices increasing the reproducibility and the production cost is reduced.

Flexible PET Based Yagi Dipole Antenna is designed by combining the both coplanar stripline and Yagi dipole antenna.

Software virtualization using containers in Google cloud platform

Sirisha Potluri, Konda Varshith

Abstract: Virtual machines have been the main source of deployment of production ready applications since the beginning of cloud computing, but virtualization has its negative effects on resource management, due to this operating system-level virtualization called containers are gaining popularity in recent times. Software Visualization in Cloud Computing allows the single computer server to run one or more virtual environments. It is quite similar to virtualizations but here it abstracts the software installation procedure and creates a virtual software out of it. In software virtualizations, an application will be installed which will perform the further task. One of the software is physical while others are virtual as it allows 2 or more operating system using only one computer. Docker is used to separate applications from infrastructure so we can deliver software quickly. With Docker, we can manage your infrastructure in the same ways you manage your applications. Software virtualization can be achieved through this platform. Using Docker containers software virtualization is made simple and results are provided in this paper.

Keywords: Cloud computing, Virtualization.

I. INTRODUCTION

Software Visualization in Cloud Computing allows the single computer server to run one or more virtual environments. It is quite similar to virtualizations but here it abstracts the software installation procedure and creates a virtual software out of it [1-3]. In software virtualizations, an application will be installed which will perform the further task. One of the software is physical while others are virtual as it allows 2 or more operating system using only one computer [4-6]. With Docker, we can manage your infrastructure in the same ways you manage your applications.

II. THEORY

There are many advantages of software virtualization in cloud computing [7-10].

A. **Testing:** After the testing, the VM can move or delete for the further testing.

A. **Virtual machines in Cloud:** GCP's unmanaged compute service is Google Compute Engine. You can think of Compute Engine as providing an infrastructure as a service (IaaS), because the system provides a robust computing infrastructure, but you must choose and configure the platform components that you want to use.

B. **Utilization:** In software virtualization, there is higher efficiency in resource utilization if it tunes correctly.

C. **Efficiency:** It is efficient in a way such that it can run 12 virtual machines and eliminates the use of 12 physical boxes. This is the power cost as well as the cost of maintaining the server.

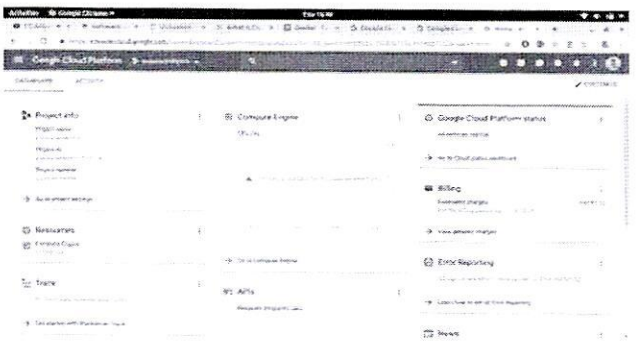
D. **Less Downtime:** The software is upgrading and the upgrade in the VMs can do when the VM is working.

E. **Flexibility:** It provides flexibility to the user so that the user can modify the software as per their demand.

III. RESULTS

Every new Google cloud platform project has: project name, project ID, and a project number, which GCP provides. In this example: DCC-cloud-project is the project name. DCC-cloud-213718is the project ID. 623928125034 is the project number as shown in the result page 1. Each project ID is unique across GCP.

Result page- 1 (Google cloud platform project name space)



B. Google ensures all the factors like availability, reliability, and ready for you to use features.

Connecting to instances: The result page 2, describes some of the most common ways to connect to your Compute Engine Linux instances and Compute Engine Windows instances. For additional ways to connect to instances, we can use Connecting using third-party tools, including PuTTY and Connecting to instances that have no external IP addresses. Access your instance before you start connecting to the system.

A Supervised Learning Algorithm to Forecast Weather Conditions for Playing Cricket

Sandeep Kumar Panda, Sathya AR, Manoranjan Mishra, Suneeta Satpathy

Abstract: Now days, Machine learning is considered as the key technique in the field of technologies, such as, Internet of things (IOT), Cloud computing, Big data and Artificial Intelligence etc. As technology enhances, lots of incorrect and redundant data are collected from these fields. To make use of these data for a meaningful purpose, we have to apply mining or classification technique in the real world. In this paper, we have proposed two nobel approaches towards data classification by using supervised learning algorithm

Keywords: Machine learning, Classification, Supervised learning.

I. INTRODUCTION

After appearing the first edition of machine learning in 2004 [7], it became the favourite target of researchers and scientists throughout the world. It has turned pace and direction of technology towards a new world, in which search engine, recommendation system and spam filtering were the most innovative inventions of machine leaning [7]. It has also affected the computational biology in the field of natural language processing, whose invention was machine translation. It affected almost all the fields such as robotics, medical diagnosis etc [5,18].

Earlier, an algorithm was considered as a fuel to solve a computer related problem [8]. An Algorithm consist of sequence of instructions which gives output based on input data. There may be more than one algorithm exists for the same problem but we consider an algorithm with less time and space complexity. Sometimes, there is a case, in which no existing algorithm can be applied for a particular problem for example, spam filtering problem, in spam filtering problem, a generalized algorithm can not be written because, spam messages vary from individual to individuals. We know input of the problem is set of emails and output is yes/no, if message is spam then yes otherwise no. But, we do not know the method (algorithm) of transforming input data into output. In this situation, machine should automatically extract the algorithm from the past experience of user i.e. called machine learning [7,18].Over the last few years, Machine learning is spreading its arms in Industry, Enterprise world and Academia. In industry, Machine learning is a data processing tool for securely process the data over the distributed network without having any pre-programming concept. In enterprise world, machine learning is widely used in enhancing the relation between producer and consumers [5]. Machine learning projects the clear and quick picture of current market demand. In academia, it is a tool or driving force for radically shaping the economy and the society in the centralized world. Machine learning with artificial intelligence is widely used in autonomous devices such that autonomous car, robots etc [6]. Machine learning is a subset of artificial intelligence where computers algorithms used to learn autonomously from the information. Today, machine learning is enabling the computers to interact with humans [5]. It gives the tremendous effect in fields like pattern recognition [12], image processing in cognitive science [2], data mining [14]and data clustering [14]. For use of machine learning, it needs huge amount of historical and practical dataset for processing different activities in the field of pattern recognition, image processing in cognitive science, data mining and data clustering.

II. MOTIVATION AND CONTRIBUTION

The reason behind to predict the weather conditions is to plan many human activities like agriculture, nature disaster prevention ,plan daily activities and so on. Across the world meteorologist face the challenge in accuracy of weather analysis and prediction[21]. On the other hand researchers had tried to predict different metrological parameters like wind speed, air pressure, humidity, temperature by utilizing different data mining techniques[23]. In this paper we have a taken the application of predicting weather conditions to play cricket as it plays a major role the gaming process.

Most of the machine learning algorithms are based on data classification techniques. Data classification is a process of classifying similar type of objects from the dataset and grouping them together to predict desired output [15]. This process requires pre-processing of data in which feature selection is most difficult task. Feature selection is the process of finding out as much relevant and unique features as possible. Pre-processing of data helps data mining algorithms to operate accurately on dataset. But, to a little extant, features dependency on one another remains in dataset that leads to affect the performance of machine learning algorithm. That is the reason, naive bayes classification technique is being used here that works surprisingly well even though there is a dependency among features because it makes a strong assumption of independency among features. This paper describes a classification technique which is simplest among all techniques i.e. Naive byes classification.

An artificial neural network approach is also applied to predict the wear rate of the composites. The morphology of worn surfaces is then examined by scanning electron microscopy, and possible wear mechanisms are discussed. This study reveals that addition of red brick dust improves the erosion resistance of glass–epoxy composites significantly and thus, makes them suitable for tribological applications.

Prediction and wear performance of red brick dust filled glass–epoxy composites using neural networks

Pravat Ranjan Pati

International Journal of Plastics Technology **23**, 253–260(2019)

96 Accesses | Metrics

ICFAI FOUNDATION FOR HIGHER EDUCATION HYDERABAD

Abstract

Red brick dust (RBD) is the waste or leftover powder, or the powder formed from deformed bricks in the process of their manufacturing. Bricks can be deformed while handling and the deformed bricks cannot be used for construction purposes; hence, they are dumped as waste. This article describes on erosion wear response of a new class of hybrid composites consisting of epoxy reinforced with glass fiber and filled with RBD particulates. Different compositions of composites are prepared by simple hand lay-up technique. Erosion characteristics are studied with the help of an air jet type erosion test rig employing the design-of-experiments approach based on Taguchi's orthogonal arrays.

Android Based Instant Messaging Application Using Firebase

Sai Spandhana Reddy Emmadi, Sirisha Potluri

Abstract: Communication through internet is becoming vital these days. An online communication allows the users to communicate with other people in a fast and convenient way. Considering this, the online communication application must be able share the texts or images or any other files in a faster way with minimum delay or with no delay. Firebase is one of the platforms which provides a real-time database and cloud services which allows the developer to make these applications with ease. Instant messaging can be considered as a platform tomaintain communication. Android provides better platform to develop various applications for instant messaging compared to other platforms such as iOS. The main objective of this paper is to present a software application for the launching of a real time communication between operators/users. The system developed on android will enable the users to communicate with another users through text messages with the help of internet. The system requires both the device to be connected via internet. This application is based on Android with the backend provided by google Firebase.

Keywords: communication; firebase; android; Instant messaging; real-time databases; group messaging.

I. INTRODUCTION

In the real world the communication plays a very vital role. People have been communicating with each other through various applications or mediums. In the beginning people communicated with each other using letters or other sources, as these mediums could take much time to deliver the content. Cell phones are another medium of communication but the drawback is for any limited or small message which need to be passed to another user then phone call is not an ideal way. The developers then looked to implement a text-based communication which would allow an in instant communication service. In 1984, the concept of SMS was developed in the Franco German GSM cooperation by Friedhelm Hillebrand and Bernard Ghillebaert. The limitation of SMS was the limited size i.e., 128 bytes [1] [2], after the rise of smartphones from a decade many messaging applications have been developed. Some are Bluetooth based and some were internet based such as WhatsApp [3], WeChat [4] and others.

Android is an operating system for mobiles which was developed by google. This operating system allows the applications to be used on mobiles. As it was developed by google, android users can develop mobile applications and can be sold through android application stores such as play store.

Firebase is a NoSQL database which make use of sockets which allows the users to store and retrieve the data from the database [5]. An Android version should be greater than 2.3, android studio 1.5 or higher version, and android studio project are the prerequisites to connect the firebase to an android application. Firebase provides a various kind of services such as:

Firebase Authentication [6]: Firebase Authentication is useful to both developers and the users. Developing and maintaining sign-in set-up may be a bit difficult and time taking. Firebase provides an easy API [6] for sign in. It also provides the data backup using real time databases.

Firebase cloud: For storing the data such as video, text, pictures building the infrastructure would be difficult and expensive for a new developer so the firebase provides the platform of cloud storage [7].

Real time database: It is a cloud hosted NoSQL database. Apart from the authentication, cloud service and real time databases firebase also provides a service for crash reporting

Crash Reporting: when some unexpected crashes occur in any applications it may be difficult to conclude why the application crashed. Firebase provides crash reporting service to deal with these crashes.

This paper is concerned of a software application for the establishment of a real time communication services between operators/users. Chat application many-to-many type of communication system where the users will able to exchange the messages among themselves [8]. User can create the chatroom according to the requirement or can also join to the existing chatroom

1.1 Related Work

Most of the internet public messaging, image or file sharing applications are using logic through which the content that has shared publicly will be collected under one reference or name. Instagram or Facebook which has an instant image or video sharing feature uses this kind of mechanism.

The algorithm for this logic is to check whether the text posted by the user contains a special character hash symbol (number sign or pound sign) at the beginning of it. The hash symbol is considered as a key and checks whether the name is already existing or not. If yes then the content posted by the user is shared and shows up to other users when relevant search requests originates. If the name is new then the room is created in the database and the remaining mechanism is same as mentioned.

II. GOALS

The basic goal is to create a system which can create chatroom according to the users and store the related data at a single place.

To implement

Secure Dynamic Groups Data Sharing with Modified Revocable Attribute-Based Encryption in Cloud

Dileep Kumar Murala, Sandeep Kumar Panda, Santosh Kumar Swain

Abstract: Cloud computing provides a flexible and convenient way for data sharing, which brings various benefits for both the society and individuals. But there exists a natural resistance for users to directly outsource the shared data to the cloud server since the data often contain valuable information. Although it causes many security issues, cloud service providers are not at the same level of trust as users. To preserve the privacy of data against non-trusted Cloud Service Provider (CSP) files, current solutions implement Cryptographic methods (for example, encryption methods) and deliver decryption keys only to authorized users. However, data sharing in the cloud among authorized users remains a difficult problem, especially when it comes to dynamic user groups. Most of the research on dynamic group data exchange has been done in the cloud with many algorithms, such as Attribute-Based Encryption (ABE), Ciphertext Attribute-Based Encryption (CP-ABE) to provide better security in dynamic cloud users with multiple authorities, but they still face challenges, either lack of performance or rely on a trusted server, and are not suitable for distribution with the problem of eliminating attributes. Thus, the Revocation user cannot get shared data before and after. To solve this in particular, we first suggest an effective Modified Revocable Attribute-Based Encryption (MR-ABE) system with the quality of ciphertext allocation by applying and integrating both Identity-Based Encryption (IBE) and CP-ABE techniques. It can provide confidential forward / backward of encrypted data by delivering user revocation attributes and updating encrypted text simultaneously. Next, we perform Fine-grained access control and data exchange for on-demand services with dynamic user groups on the cloud. Experimental data show that our proposed system is more efficient and scalable than the latest generation solutions.

Keywords: Attribute-Based Encryption, Cloud Security, Dynamic Group Data Exchange, Fine-grained access, Identity Based Encryption, Privacy, Revocation.

I. INTRODUCTION

Cloud computing is a model that offers large computing space and a huge memory space at low cost. It allows users to get the expected support regardless of time and position on different platforms (for example, mobile devices and personal computers), thus, provides an excellent convenience for cloud users . Among the many cloud computing help, cloud storage help, such as Apple iCloud, Microsoft Azure, and Amazon S3, can help provide an easy and easy way to share data over the Internet, which offers many benefits to our society . But also suffers from various security threats, which are the main concerns of cloud users. First, the outsourcing of data to the cloud server indicates that data is out of control of users. This can cause the user to delay because external data generally includes basic and sensitive data. Second, data is frequently shared in an open and obnoxious environment, and the cloud server will be the victim of attacks [1]. More, the cloud server itself can detect user data for illegal revenue. Third, data distribution is inactive. That is, when user support ends, he/she must no longer control the prerequisites for obtaining shared data before and after. Therefore, when outsourcing data to the server in the cloud, customers must also manage access to such data so that only currently authorized users can receive data outsourcing [8].

One of the medium offerings provided through the project providers is the data garage. Despite the advantages of the garage in the cloud, it faces many difficult situations that can prevent a rapid boom if not solved. Consider a reasonable utility that allows the organization to store data and percentages of its employees or departments across the cloud. With the cloud, the enterprise can free itself completely from the living burden of storing and keeping information. However, this also poses a security risk to the privacy of the statistics. Specifically, customers do not trust CSP at all. At the same time, the log files saved in the cloud can be encrypted and encrypted. To solve this problem, the simple solution is to encrypt the information and then load the encrypted records into the cloud [11]. However, traditional encryption techniques for sharing statistics within the cloud are neither effective nor flexible. An advanced, easy-to-use encryption method that allows you to share garage assets to the fullest and allows you to share data at a certain level. Using Attribute-Based Encryption is one of the most cunning tools for handling certain entries and sharing encrypted data. However, applying ABE without delay to real applications is not always clean due to many practical concerns [2].

On multi-authority cloud storage device, user functions can be dynamically modified. The consumer may be entitled to some new jobs or to cancel some existing jobs [8]. You must change your information to access permissions for this reason. However, modern methods of attribute cancellation rely primarily on a trusted [illegible] for total performance loss and now are not enough to solve

Pacifiurr: An Android Chatbot Application for Human Interaction

Ramya Kondapi, Rahul Kumar Katta, Sirisha Potluri

Abstract*— The objective of this paper is to build an Android Application based on Virtual voice and chat Assistant. The current study focuses on development of voice and text/chat bot specifically. It is specially being built for people who feel depressed and insists them to talk open mindedly which in turn pacifies them. As the name of the application suggests, Pacifiurr: An application to pacify people and make them as happy as a cat would be with his or her mother (the reason why a cat purrs). We will be using Android Studio for the application design and Machine Learning as a part of Artificial Intelligence for Natural Language Processing (NLP), an easiest way to use Machine Learning libraries. At the back-end we will be using a database to store the communication history between the user and the bot. This application will only work on devices with Android operating system version-5.0 and above.

Keywords: Artificial Intelligence, Virtual Assistant, Software Agent, Machine Learning, Natural Language Processing, Android Studio, Chatbot.

1. INTRODUCTION

Chatbot is a computer program which is designed to transcribe conversation with humans. It works on Artificial Intelligence. Chatbots are wontedly used in dialog systems (dialog systems or a conversational agent is a computer system which focuses on discourse with humans for purposes like customer service, providing basic information etc.). The term Chatbot is derived from Chatterbot, originally contrived by Michael Mauldin in 1994. A Virtual Assistant is a Software Agent that can perform tasks or services for an individual. Sometimes the term Chatbot is used as an alias to Virtual Assistants which are generally or specifically those accessed by online chat. Virtual Assistants does work through text, voice, and/or uploading images. Chatbots can be accessed through virtual assistants like Google assistant, Cortana, Siri etc., through messaging apps like Facebook messenger etc., or through individual organizations' apps and websites. Chatbots are categorized into several categories such as conversational commerce which is an e-commerce via chat, analytics, communication, customer support, design, developer tools, education, entertainment, finance, food, games, health, Human Resources (HR), marketing, news, personal, productivity, shopping, social, sports, travel and utilities.

What we are working on will be specifically designed for interaction with the people who are depressed. It urges them to talk with their minds open. For instance, most people who are in depression tend to isolate themselves, they have trouble trusting people around them, they skip meals, and exaggerate situations they have no reason to worry about. The Pacifiurr we are working on helps them to get over all these challenging situations, Pacifiurr pacifies by drawing attention away from their worries. Pacifiurr also helps in their difficult situations by advising them appropriate ways to overcome difficulties.

2. RELATED WORK

MobileCoach, a mobile chat application related to human-bot interaction using text messages based on the concept of the user sending text messages to the bot which charges SMS cost to the person communicating with the bot [1]. Additionally, the application is limited to text interaction with a predefined answer selection to the user; the user will be presented with a set of predicted response from which he is reckoned to choose one as a response to the bot [1]. A mobile application employed with voice detector, ordinarily matched in cancer patients, with the use of prosodic and statistical traits extorted by voice signal for evoking depression [2]. An online free service using a chatbot to motivate an individual in distress, experiencing hard times, serving with a theory of personalized chat that keeps a person involved in a conversation with the chatbot to negotiate ill-effects of depression [3]. Woebot, an Artificial Intelligence therapy chatbot application which works on the principle of imminent text method; suggests appropriate responses based on the conversation between a man and the bot [4]. MOST: Moderated online social therapy, a web application rendering assistance to those who are need of self-esteem, overcoming social anxiety, interacting with people, and recovering early psychosis [5]. A chatbot for mental health counseling, intercommunication with the chatbot using emojis and GIFs while exploring for online help tips [6].

3.PROPOSED WORK

The concepts of papers published earlier recite on the notion of predictive text, imminent GIFs, and emojis, text messages with predefined answer selection, and voice detector matched in cancer patients. The objective of this paper is to formulate a theory related to a chatbot interaction with text and speech output, the responses will be predicted based on a survey conducted by providing a questionnaire to the people who had suffered depression or other mental illness in the past. They are directed to answer a few questions regarding their journey of defeating their

Abstract

This paper proposes the Bat mapping algorithm for efficient application mapping on NoC platform. This approach was assessed by applying it to various benchmark applications. Experimental results revealed that the Bat mapping algorithm has two major contributions compared with existing algorithms: (1) It enables dynamic mapping and efficiently identifies the most favorable mapping system. (2) The simulation tests indicated that the Bat algorithm exhibits higher performance.

Abstract

A convenient one-pot, three-component, and solvent-free procedure for the preparation of substituted (*E*)-1-phenyl-3-[2-(piperidin-1-yl)quinolin-3-yl]prop-2-en-1-ones, which has made a significant improvement of previously reported methods, has been developed. The reaction of chloro aldehydes, ketones, and piperidine under microwave irradiation afforded the corresponding piperidine-substituted chalcone derivatives in high yields in shorter reaction times. All the synthesized compounds were characterized by IR and ^{1}H and ^{13}C NMR spectroscopy, and mass spectroscopy.

Both non-calcined form and calcined form of the phosphate mixtures are synthesized in atmospheric conditions and characterized with different measurement techniques. At low temperature, non-calcined mixture and at high temperature calcined mixture exhibit potential to be used as sensible thermal heat storage material due to their endothermic behaviour. Differential scanning calorimetry (DSC) technique was used to analyse the thermal behaviour. This measurement was done in atmospheric oxygen at 10 K min^{-1}. The composite material was synthesized using calcined mixture with paint emulsion, and its thermal behaviour was studied in two thermal cycles using DSC measurement technique at 10 K min^{-1}. Thermal behaviour of composite material qualifies it to be used as coating material in household applications due to its neutral behaviour towards thermal heat after two thermal cycles. Both non-calcined mixture with E_g = 2.32 eV at λ_{max} 534 nm and calcined mixture with E_g = 2.15 eV at λ_{max} 576 nm show semiconducting behaviour as the respective calculated band gap values fall in the semiconducting region.

217

Introduction

The sensible thermal heat storage materials are the simplest materials as far as the mechanism for storing thermal energy is concerned. At the same time, the heat dissipating materials are of no less importance for harnessing energy from thermal storage. Both of the above factors along with the urge

Fault Diagnosis of Dynamically Loaded Bearing with Localized Defect Based on Defect-Induced Excitation

T. Govardhan ✉ & Achintya Choudhury

Journal of Failure Analysis and Prevention **19**, 844–857(2019)

172 Accesses | **2** Citations | Metrics

Abstract

The defect-induced excitations causing the bearing to vibrate have significant contribution in vibration generated from rolling element bearings. Therefore, in this work an investigation has been made to estimate the excitations caused by localized defects on different elements of a bearing, viz., inner race, rolling element and outer race, subjected to load. The applied load on a radially loaded bearing is often not of pure static nature but has a dynamic component associated with it. The dynamic load on bearing has been considered to be composed of a static and a dynamic component. The dynamic component has been considered to be either harmonic or random in nature. The spectra of excitations have been obtained to correlate with the significant spectral components of respective response. The amplitudes of harmonic

A Novel Hybrid Approach for Providing Data Security and Privacy from Malicious Attacks in the Cloud Environment

Dileep Kumar Murala, Sandeep Kumar Panda and Santosh Kumar Swain

Abstract

With the rapid technological evolution of the Information Technology (IT) industry, an innovative concept is widely explored in the present generation is named as Cloud Computing. The major concerns in the cloud computing environment are to protect the user's data in the cloud server from unauthorized access and perform various computations to protect the data from various internal and external attacks. In this regard, the novel hybrid approach is designed using Rivest, Shamir, and Adleman (RSA), Secure Hash Algorithm-2 (SHA-2) and Advanced Encryption Standard (AES) cryptography algorithms to achieve high data security and privacy from unauthorized access, internal and external attacks occurred in the cloud environment.

A Survey on Cloud Computing Security and Privacy Issues and Challenges

Dileep Kumar Murala, Sandeep Kumar Panda and Santosh Kumar Swain

Abstract

Cloud computing is one of the fastest emerging technologies; it gains wide acceptance from various Business organizations & Information Technology (IT) Industries. Cloud computing provides various services to users through the internet; those services are like Applications, computation, and storage etc. In spite of these advantages, cloud technology faces different types of privacy and security related issues. These issues become major barriers to adopt cloud technology into various organizations. This survey paper addresses the cloud architecture, various security and privacy issues, challenges and threats, attacks, and future research directions to overcome the security and privacy related problems in the cloud environment.

An Approach For Predicting Employee Sustainability Using Machine Learning

*Shubhangi Urkude

Abstract

Today's world everything is treated as business. Business depends on the employees. Employee support is required to run the business. Employees are considered as the most valuable asset of the organization. In today's competitive world, customer satisfaction is the key to get success in any business. As a result, serving customer needs is become a priority for many organizations. To fulfill this requirement support is needed from the employee. Hence, to sustain the good employees is a hard task for any organization. This paper is based on the analysis of the attributes related to employee sustainability, due to which many employees are leaving the organization. Some of the attributes are Department, Job Role, Benefits, Challenging Levels, Facilities, Technology Adopted, Year of Joining, Year of Leaving, and Job Satisfaction etc. In this paper, we analyzed the employee data given by the Human Resource (HR) department of International Business Machines (IBM) containing many attributes such as age, department, education, gender, distance from home etc. The analysis is done using R tool to predict the number of employees leaving the organization based on the selected attribute. The result data is visualized in Power business Intelligence (BI) to give better understanding.

Abstract | References | Citations | Supplementary Data | Article Media | Metrics | Suggestions

Selecting an efficient path between communicating entities in a resource constraint environment is a difficult task, i.e., such as in mobile ad hoc network. The buffer overflow is one of the major constraint factors while selecting a path between communicating entities. The number of routing protocols are developed to establish an efficient route between communication entities, the majority of these routing protocols are congestion non control type, i.e., they did not consider the packet loss due to buffer overflow. Thus, these protocols may lead the situation of a bottleneck intermediate node due to constrained node buffer and drop the packet due to insufficient resources to process the packet. This paper designs a mathematical method to evaluate the possibility of node to become a bottleneck intermediate node due to buffer overflow with the help of a poison probabilistic model. Proposed mathematical method number of packets queued in node buffer and the waiting time of the packet inside the node buffer. This method is used to decide the node behavior regarding its buffer status.

Abstract: Over the last years there has been massive changes that lead to the growth of information in technology, that brought significant changes in the part of cryptography and its applications like confidentiality of data and many such. Privacy and secrecy is what everyone desires for their data or accounts. Encryption is one such method to achieve it. Advanced Encryption Standard (AES), can be used to protect the information. The primary preferred standpoint of AESis , it very well may be can be reproduced or worked with unadulterated equipment. In this paper, Xilinx 9.2i is utilized for recreation and improvement of VHDL code. Integrating and execution of the code is completed on Xilinx - Project Navigator ISE 9.2i suite. Xilinx XC3S500 gadget of Spartan Family and is utilized for equipment usage. This undertaking proposes a strategy to coordinate the AES encrypter and the AES descrypter.
Index Terms: component, formatting, style, styling, insert,VHDL, AES, DES.

1. Introduction

The Advanced Encryption Standard additionally called as AES is a calculation intended for the improvements that are the then earnest needs to make information increasingly secure. Thus the U.S Government held challenges in 1997 to the encryption and unscrambling norms improvement, in which the AES is the victor. The past form called the Data Encryption Standard was observed to be frail in doing this encryption business because of its little key size and mechanical headways in processor control. The following advancement was distinguished in October 2000 which is a somewhat adjusted variant of the Rijndael (this name depends on its two Belgian innovators Joan Daemen and Vincent Rijmen) known as square figure AES underpins square sizes of 128-bits and key sizes of 128, 192, 256-bits. Though unique Rijndael underpins key and square sizes of least 128 to 256-bits, it very well may be any numerous of 32. To scramble messages longer than the square size, a method of activity is picked which is extended at alternate pieces of this article.

1.1 Cryptography: ensures the confidentiality of the information by converting original data into cipher text. A cryptographic system works by transforming plaintext into a cipher text, using key. However, the applications of cryptography go far beyond simple confidentiality [1] .With the use of cryptography one can assure the authenticity and integrity of the information as well as the users [2].

1.2 Overview of Encryption and Decryption

There any many network examples which are the open networks like bank account details, credit card transactions, tax details etc.. which need to be more secured, for this the encryption algorithm is very much useful to make sensitive information of the user safe to transmit over any open network by scrambling into a form that cant be understandable by any hacker. To do this we use mathematical formulas, hence called encryption algorithm, this transforms message bits into an unintelligible form. which the intended recepient having the decryption algorithm can only decrypt to see the original message. Hence using this algorithm the above stated examples are now used more safe and secure manner.

Abstract: In the present world data compression is used in every field. Through data compression the bits required to represent a message will be reduced. By compressing the given data, we can save the storage capacity, files are transferred at high speed, storage hardware is decreased so that its cost is also decreased, and storage bandwidth is decreased. There are many methods to compress the data. But in this paper, we are discussing about Huffman coding and Arithmetic coding. For various input streams we are comparing adaptive Huffman coding and arithmetic coding and we will observe which technique will be more efficient to compress the data.

Index Terms*: *Compression, Huffman coding, Arithmetic coding

1. Introduction

Data compression is widely used in all the fields. The main aim of data compression is to minimize the number of bits required code an information or data , which helps minimize the hardware(inventory) required to transfer or store the given data. It encompasses many hardware and software techniques which have only one in common that is compressing the data. Data compression is used in audio compression, video compression, image processing, data transfer, digital telecommunication network [1] [2] etc.

Basically, Data compression methods are broadly classified into two categories that are as follows:-

- Lossy compression.
- Lossless compression.

1.1 Lossy compression . Lossy compression as the name says, these methods encounter some loss of information while decompressing the compressed information. These techniques can be applied in graphics, images and digitalized voice. Many of them are adjusted to different level of quality, which gives higher accuracy in transfer of less effective compression.

1.2 Lossless compression .Lossless compression techniques code the data and transfer them accurately; there will not be any kind of loss in data while decompressing the compressed information. This is applied to store database records, spreadsheets, word files etc. In general, data compression is done by taking a stream of symbols and they are transferred into codes. For effective coding the code word should contain fewer bits than original stream of symbols. This decision was made by certain models. One of the methods which is used in data compression is Huffman coding.

This paper reviews only lossless compression techniques, such as Adaptive Huffman coding and Arithmetic Coding.

Abstract: One of the important considerations in a sensor network is energy consumption. Cluster-based routing protocols are often proposed to reduce energy consumption. However, clusters are vulnerable due to malicious nodes. Malicious nodes inject fake messages to cluster-header, which increases communication overhead and energy consumption. Secure cluster-based routing is one of the most required solutions to consume more energy during data transmission. In this study, the authors propose a secure cluster-based routing protocol (SCBRP) that uses adaptive particle swarm optimisation (PSO) with optimised firefly algorithms during data transmission in a wireless sensor network. The objective of this study is to minimise energy consumption over an individual node to improve the whole network lifetime. The proposed SCBRP is based on the hexagonal sensor network architecture, and it is designed by three processes to include energy-efficient clustering, secure routing, and security verification. The performance of the proposed SCBRP is evaluated using NS-3, and it is estimated by different metrics such as encryption time, decryption time, energy consumption, packet drop rate, and network lifetime. The simulation results are compared with the previous approaches and finally, the authors' proposed SCBRP is proved that it obtained better performance than previous approaches.

1 Introduction

Wireless sensor network (WSN) is a special kind of network that covered by enormous nodes deployed to collect data from sensing field and sends them to a base station for making for necessary actions [1]. WSN has been concern among civil and military applications. In such a situation, lots of sensors are required [2]. In WSN, the sensor node is the most important part, which is in charge of sensing, collecting and transmitting the detected data to a gateway or any centralised node, but acquiring such sensor data is difficult due to network lifetime, energy consumption and non-rechargeable batteries. Also, security is another basic requirement and necessary in WSN, especially routing security, becomes an emerging issue which needs to be solved. Thus how to minimise energy consumption and improve security in the process of sensing and transmitting data is necessary and also the topology of a network may change due to its dynamic nature [3]. However, the network topology may change due to the following factors: the environmental condition changes, sensor node failures due to the insufficient battery, new nodes added to the network due to the exact requirement. Hence, the topology of WSN is necessary to be able to adapt to these dynamic changes due to lack of wireless communication bandwidth and must have the function to dynamically update technology [4].

Clustering sensor nodes is a very prevalent method to solve this energy consumption problem. In clustering, sensor nodes form into several clusters from their transmission range [5]. To manage the whole cluster, one leader node is chosen which is known as CH (cluster-header) and other sensor nodes collect environmental data and forward to CH, which are called cluster members (CMs) [6]. Cluster communication is divided into two classes: intra-cluster communication and inter-cluster communication. Intra-cluster communications have made by single-hop communication and CMs can directly communicate with respective CHs [7]. While inter-cluster communications have made between CHs. Among the previous methods, low-energy adaptive cluster hierarchy (LEACH) is a popular clustering protocol in which CH is chosen by a threshold value [8]. It is defined by

$$t(N) = \begin{cases} \dfrac{\rho}{1-\rho(R \bmod (1/\rho))} & \text{if } N \in G \\ 0 & \text{otherwise} \end{cases} \quad (1)$$

where ρ is the desired rate of probability to act as a CH, R is the current round and G is the set of nodes which are formed in a group. However, LEACH protocol suffers due to a lack of dependency on the desired probability value [9].

Many clustering algorithms have been presented over the past few years include artificial bee colony (ABC), differential evolution (DE), genetic algorithm (GA), particle swarm optimisation (PSO) and so on [10]. Multi-hop communications are very important for these inter-cluster communications. Due to the energy consumption challenge, energy saving routing is deliberated with the use of limited energy sources, and by the use of energy saving routing, there may be a chance of high communication overhead and packet drop rate. The network structure guarantees the energy efficiency of routing path [11]. Secure models for energy efficient routing in a sensor network is extensively studied in [12–15]. Fig. 1 shows the secure cluster formation and data transmission to the sink node.

The goals of cryptography systems in WSN are as follows [16]:

- *Authentication:* It means that sending and receiving data nodes must be registered and sender and receiver identify must be verified before data transmission.
- *Confidentiality:* It defines how the system is secured and it means that means the authenticated nodes can interpret the data.
- *Data integrity:* Integrity refers to the content of the communicated data needs to be authenticated that do not modify between any points (sender, reply nodes and receiver).
- *Non-repudiation:* It implies that neither the source nor the destination can falsely deny that they have sent a certain message.

In this paper, we propose SCBRP to implement clustering and secure routing in WSN. Our aim in this research paper is to obtain high level security with minimised key maintenance and energy

Comparative study for modal analysis of circular plates with various cutouts and end conditions

Abstract. The applicational use of structural members in engineering and technology may take the form of a circular plate, for such members it becomes important to predict the vibrational characteristics when operated closer to resonance phenomena. In addition to, the effect of the cutout in the circular plate has a significant effect on modal characteristics. The part of the research work entitled in this paper emphasizes on the modal analysis of a circular plate with clamped boundary condition determined by the characteristics equation and mode shapes of the plate using FEM. The effects of inclusion of cut-out on the vibrational characteristics are discussed. The subject of the analysis was a circular plate considered with certain modifications i.e. free circular plate without cutout clamped on the outer periphery, circular plate with cut-out clamped on the outer periphery, circular plate with cutout clamped on the outer and inner periphery. The methodology applied to conventional material based circular plate is extended to Glass epoxy circular plate with the same set of modifications. The values of natural frequencies for various cases are tabulated and corresponding mode shapes are illustrated.

Keywords: circular plate, cutout, glass epoxy, modal analysis, mode shapes, vibration.

1. Introduction

An early investigation, along with a comprehensive, detailed survey on free vibration analysis of circular plates was carried out by Leissa [1] and Liew [2]. These researchers mainly used the classical lamination plate theory and first-order shear deformation theories. These theories neglected the effect of rotary inertia and transverse shear deformation, which led to an overestimation of vibrational frequencies. The percentage of error tends to increase with the increase of thickness in the plate. Later, with the advancements carried out in, Shear deformation and higher-order theories considered the effects of both rotary inertia and transverse shear deformation into account. The vibration behaviour of Mindlin plates of annular type with a set of nine different boundary condition combinations is experimented over outer and inner edges by Irie et al. [3]. He used Bessel functions as the basis for clamped-free, free-free, simply supported boundary conditions for performing the analysis. Based on the differential quadrature method, Han et al. [4] performed the free vibration analysis of moderately thick isotropic annular plates based on Mindlin plate theory. Using First-order shear deformation theory, Lin et al. [5] found out the free vibration characteristics of laminated circular and annular plates. Using the finite element method as the basis Ritz method based on the theory of elasticity was used by Kang et al. [6], Leissa [7], Liew et al. [8, 9], Zhou et al. [10] for studying the free vibration analysis of circular and annular plates. A Third order shear deformation theory used by Hosseini Hashemi et al. [11]. The free vibration characteristics of thick laminated circular plates with an attached rigid core was carried out by Hosseini Hashemi et al. [12]. The analogy based on First-order shear deformation theory. The findings for implementation of this method is to produce an exact form of closed solutions for circular plates. A modified Mindlin plate theory was used by Senjanovic [13] for determining the free vibration analysis of circular plates. The free vibration characteristics of polar

Mechanical properties of cryogenically treated AA5083 friction stir welds

Neelamegam Vasudevan, Govindasamy Bhavani Bhaskar, Tadivaka Srinivasa Rao,

Muthukrishnan Mohandass

https://doi.org/10.3139/120.111430

Abstract

In this investigation, the effect of cryogenic treatment (CT) on room temperature mechanical properties was investigated. 10 mm thick AA5083-H321 plates were friction stir welded and the welds were deep treated cryogenically using liquid nitrogen. The effect of CT on the mechanical properties of the welds was investigated by hardness, tensile, and impact tests. Weld microstructures were also examined by light microscopy and scanning electron microscopy. The cryogenic treatment was found to marginally improve the hardness across the weld. The CT was found to exhibit a minimal improvement in both yield and tensile strengths of the base material and the welded joint. However, the percentage elongation was not affected by the CT process. Tensile failures occurred in the weld nugget and thermo-mechanically-affected zone interface for both untreated and treated welds. The impact toughness was found to decrease after the CT, and the effect is more pronounced in the welds than in the base material. The effect of CT on microstructures was not found to be noticeable. On the whole, it is understood that there is a slight increase in strength and hardness and a slight decrease in toughness as a result of cryogenic treatment.

Abstract

Recent decades improving the quality of the product with respect to the cost is quintessential. For obtaining such type of quality product, it is necessary to develop new manufacturing techniques which can improve the machinability characteristics. In recent years many researchers are investigated sensibly towards improving the machinability characteristics. Ultrasonic vibration assisted manufacturing process is one of them, which has gained a lot of attention due to its sporadic cutting mechanism for achieving a better quality product. In this present paper, concentrates on ultrasonic vibration assisted turning (UVAT) process because turning is one of the important manufacturing processes which can shape the metals by removal of the undesired material to get a required shape and size of the product. For understanding and easy industrial use of UVAT technique, a full factorial design of experiments (125) has been performed. A linear regression mathematical model has been developed to validate the UVAT experimental results.

Keywords:
mass transfer, suction, magnetic field, chemical reaction, Newtonian fluid, HAM

ABSTRACT

This paper examines the impact of reactive diffusion(mass) transport with the application of a magnetic field vertical to the flow direction where the Newtonian fluid is passing over a circular pipe. Uniform suction is applied, externally, across the wall in the transverse direction. A strong analytical methodology, specifically, the homotopy analysis method (HAM) is employed to realize solutions to the non-linear coupled equations. The effect of magnetic parameter(M), suction Reynold number (Re), Schmidt parameter (Sc), first-order chemical reaction parameter(γ) on velocity components and concentration are displayed graphically and explained numerically. The dimensionless of axial concentrationϕ decrease for a given rise in γ. Further, the behavior is inverted i.e. for the cases of radial concentration ϕ increases as γ increases.

1. INTRODUCTION

In recent years, engineers have additionally investigated the modification of Newtonian flows via wall porousness of the channel or pipe. The wall Injection/removal of fluid via pores may be a strong mechanism for flow management. This technology quality vital potential in bio-medical engineering (e.g. artificial qualitative analysis, blood circulation) and in different engineering areas like rocket technology & food process.

Consequently, mathematical modeling of this type of flow through surface mass flux pipes has stimulated some interest in the research community. Intilaly the study laminar flow in 2-D channel was examined by Berman [l], Sellars [2] and Yuana [3]. Later Bansal [4] extended this work through a permeable circular pipe to a steady, viscous flow. He obtained an analytical solution for velocity under the influence of suction/injection parameter and pressure gradient in z-direction. An analytical expression for the Newtonian flow over the pipe underneath uniform wall suction/injection was any reportable by Terril [5, 6]. Tsangaris and Kondaxakis [7] thought of time-dependent Newtonian flow in an exceedingly porous pipe. He obtained an analytical solution for time-varying wall injection/suction concerning the pipe. Cox and Hill [8] examined the Newtonian fluid flow with a Navier slip at the wall through carbon nanotubes. They recognized the maximum flow rate for the standard Poiseuille flow, which happens for steady inward-directed flow across the boundary. Ramana murthy et al. [9] studied micropolar flow developed by a permeable cylinder exhibiting rotary oscillations, they have concluded that the tangential drag decreases with suction parameter will increase. In 2-phase flow between two porous plates, Srinivas and Ramana Murthy [10] studied wall suction effects. They found that Darcy parameter will increase the velocity of the fluid.

Magnetohydrodynamics (MHD) is also an active area of modern engineering sciences and involves the interaction of magnetic fields and conduction of electrical fluids. MHD tube flows arise in ion accelerators, MHD flow management in nuclear reactors, liquid metal fabrication processes, bubble levitation, etc. MHD flows that includes suction/injection wall effects have garnered considerable attention. Terrill and Shrestha [11] found that, with an increase in magnetic number, wall friction increases. Attia [12] investigated the unstable laminar flow of 2-phase non-Newtonian liquids through a circular tube between a pressure gradient at z-direction. He concluded that the velocity and temperature components for both phases decrease as Magnetic parameter increases. Attia and Ahmed [13] computed solutions for unsteady magnetic Bingham plastic flow in a circular tube. They found an increase in the viscosity of the particles and skin friction. El-Shahed [14] examined the impact of the transverse magnetic field in a porous material on the transient viscoelastic fluid flow. In terms of Fox's H-function, he found the solution velocity. Ramanamurthy and Bahali [15] investigated the effects of wall suction/injection on magneto-micropolar transport in a porous circular tube. They recognized that shear stress (skin friction) at wall is boosted with a greater magnetic number. Murthy et al. [16] considered the impact on the micropolar flow in a rectangular duct of the magnetic parameter, wall suction / blowing. They found that larger magnetic fields ecelerate the magnitudes of the flow rate.

Implication of mass transfer study is very important in the fields of engineering, Industries and sciences. Applications of this study are found in many branches of engineering and industry such as the safety of nuclear reactor, reaction

On the Stability of Hadley-Flow in a Horizontal Porous Layer with Non-Uniform Thermal Gradient and Internal Heat Source

Anjanna Matta

Microgravity Science and Technology **31**, 169–175(2019)

120 Accesses | **5** Citations | Metrics

Abstract

The present study deals with the effects of non-uniform inclined thermal gradient and internal heat source effect on the stability of buoyant flows in a fluid-saturated horizontal porous layer. Both linear and non-linear stability analyses have been performed. The non-linear stability analysis has been carried out by using the energy functional. The eigenvalue problems in both cases are solved numerically by shooting and Runga-Kutta methods. It is observed that the preferred mode at the onset of convection is longitudinal stationary mode. Comparison between linear and energy thresholds is given and found that the flow is stabilized at higher horizontal Rayleigh number for linear and non-linear cases irrespective of heat source. For fixed horizontal thermal Rayleigh number, increasing the value of

Abstract

The phosphate-containing cobalt mixtures of non-calcined, calcined, and composite materials were synthesized in atmospheric conditions and characterized by different measurement techniques. Thermal study of these materials was carried out using DSC and TG–DTA techniques. From the study of thermal behaviour, it is observed that the composite material can not only be used as a sensible thermal heat storage material, but also can be used as a heat-dissipating material. The thermal behaviour of calcined mixture indicates its potential application towards use as a sensible thermal heat storage material due to its endothermic nature at high temperature. Average crystallite sizes were

Biomedical image retrieval by using local directional edge binary patterns and Zernike moments

234

G. Sucharitha & Ranjan Kumar Senapati

Multimedia Tools and Applications **79**, 1847–1864(2020)

202 Accesses | Metrics

Abstract

This paper presents an efficient approach with the reduced length of feature vector for biomedical image retrieval by using global and local features of an image. In order to extract the local features, a new algorithm, local directional edge binary pattern (LDEBP) has been designed. It gathers information from all the possible directions, i.e., 0^0, 45^0, 90^0 and 135^0 for every pixel in the image. The directional information is calculated based on the sign code magnitudes of local differences from the center pixel to its directional pixels. For every pixel, four edges will be calculated by using all the directional information. Lower order Zernike moments are used for extracting the global and shape features of an image. The combination of shape and texture descriptors for biomedical image retrieval showed significant results compared to the state of the art

Abstract

Additive manufacturing (AM), generally known as 3D Printing, is one of the manufacturing methods to develop medical models. The AM physical medical models are manufactured by virtual Computer-Aided Design (CAD) models. These CAD models are generated using medical scan data such as, Computed Tomography (CT) and Magnetic Resonance Imaging (MRI), etc. In the process of CT data acquisition and transformation from CT to CAD data, dimensional and volumetric errors occur. In this work, the influence of several CT image reconstruction parameters on the 3D CAD model was evaluated experimentally. The dry mandible has been considered as a phantom from construction of a 3D CAD model. The linear dimensional and volumetric errors in the CT image reconstruction were compared from the dry mandible to the 3D CAD model of the

Investigation on red brick dust filled epoxy composites using ant lion optimization approach

Pravat Ranjan Pati ✉, Mantra Prasad Satpathy

First published: 19 February 2019
https://doi.org/10.1002/pc.25246
Citations: 6

Abstract

This article reports on the characterization and erosion wear performance of a new class of epoxy composites filled with micro-sized red brick dust (RBD) particles. Although a number of ways for its utilization have been suggested in the past, its potential as a filler material in polymeric matrices has not yet been explored so far. In this work, composites with different RBD content are prepared by simple hand layup technique. The composites are characterized in regard to their density, porosity, micro-hardness, and strength properties. Solid particle erosion trials are conducted following a well-planned experimental schedule based on Taguchi design-of-experiments. The morphology of composite surfaces is then examined by scanning electron microscopy. Furthermore, a novel nature-inspired ant lion optimizer (ALO) algorithm is proposed in this work to achieve minimum erosion wear rate. This algorithm mimics the behavior of antlions in nature. It provides a very competitive result over other evolutionary algorithms due to its characteristics like improved exploration, avoidance of local optima, quick convergence and less number of tuning parameters. The wear rate value obtained by ALO exhibit the lowest one as compared to the traditional Taguchi result. POLYM. COMPOS., 40:3877–3885, 2019. © 2019 Society of Plastics Engineers

Quantum Hamilton–Jacobi route to exceptional Laguerre polynomials and the corresponding rational potentials

S Sree Ranjani

Pramana **93**, Article number: 29 (2019)

69 Accesses | **1** Citations | Metrics

Abstract

A method to construct the multi-indexed exceptional Laguerre polynomials using the isospectral deformation technique and quantum Hamilton–Jacobi (QHJ) formalism is presented. For a given potential, the singularity structure of the quantum momentum function, defined within the QHJ formalism, allows us to find its solutions. We show that this singularity structure can be exploited to construct the generalised superpotentials, which lead to rational potentials with exceptional polynomials as solutions. We explicitly construct such rational extensions of the radial oscillator and their solutions, which involve exceptional Laguerre orthogonal polynomials having two indices. The weight functions of these polynomials are also presented. We also discuss the possibility of constructing more rational potentials with interesting solutions.

Abstract:

Slag, generated from basic oxygen furnace (BOF) or Linz-Donawitz (LD) converter, is one of the recyclable wastes in an integrated steel plant. The present work aims at utilization of waste LD slag to develop surface coatings by plasma spraying technique. This study reveals that LD slag can be gainfully used as a cost-effective wear-resistant coating material. A prediction model based on an artificial neural network (ANN) is also proposed to predict the erosion performance of these coatings. The 2.27% error shows that ANN successfully predicts the erosion wear rate of the coatings both within and beyond the experimental domain. In addition to it, a novel optimization algorithm called imperialist competitive algorithm (ICA) is used to obtain minimum erosion wear rate of 12.12 mg/kg. This algorithm is inspired by the imperialistic competition and has several advantages over other revolutionary algorithms like its simplicity, less computational time, and accuracy in predicting the results. A 2.39% error is noticed while comparing the erosion wear rate result of ICA with the experimental outcome.

AN EQUIVALENT FORM OF THE PRIME NUMBER THEOREM

G. SUDHAAMSH MOHAN REDDY, S. SRINIVAS RAU, AND B. UMA

ABSTRACT. A simple proof is given that $\sum_n \frac{\mu(n)d(n)}{n} = 0$ using the Prime Number Theorem. It is shown that this is equivalent to the estimate $\sum_{n\leq x} \mu(n)d(n) = o(x)$ and to the Prime Number Theorem.

1. INTRODUCTION

Let $\mu(n)$ denote the Moebius function and $d(n)$ the divisor function.
The question "$\sum_n \frac{\mu(n)d(n)}{n} = 0$?" was posed in ([4], p 1599). It can indeed be settled positively by applying the estimate in Ram Murty ([3], 4.4.6) $\sum_{n\leq x} \mu(n)d(n) = o(x)$ (see Remark 1.6 below) W.Narkiewicz in a letter indicated that it can be proved by contour integrals. In this note we give one more proof (Prop 1.7).We also show (Prop 1.11) that this convergence is equivalent to the Prime Number Theorem.

Lemma 1.1.

$$\prod_p (1 - \frac{2}{p^s}) = \sum_n \frac{\mu(n)d(n)}{n^s} \ (Re\, s > 1)$$

Proof. For any multiplicative function $f(n)$ we have ([1], Theorem 11.7)

$$\sum_{n=1}^{\infty} \frac{f(n)}{n^s} = \prod_p (1 + \frac{f(p)}{p^s} + \cdots + \frac{f(p^k)}{p^{ks}} + \cdots)$$

Take $f(n) = \mu(n)d(n)$, $f(p) = \mu(p)d(p) = -2$ and $f(p^k) = \mu(p^k)d(p^k) = 0$ for $k > 2$. Hence the equality. □

Lemma 1.2.

$$\prod_p (1 - \frac{2}{p^s}) = \prod_p \{(1 - \frac{1}{p^s})^2\} \prod_p (1 - \frac{1}{p^{2s}(1 - \frac{1}{p^s})^2}) \ (Re\, s > 1)$$

Proof. ([3], 4.4.6) We verify the factorization

Abstract

Education is an unalienable right. It is liberty regardless of where you born, where you grow up. This is the time to ensure that this right is endorsed and education is reaching to everyone, especially, when the communication through technology is developing rapidly; therefore, sharing books is one of the most important forms of dispensing knowledge and education, although it is very annoying and inconvenient task. This paper presents an online platform to share or rent the books. The proposed model intends to solve the book-sharing problem of students or the common public in general. The aim of this paper is to reduce the cost of getting knowledge and information for its users and building a community with an awesome experience. The proposed model is deployed on android-based mobile phones connecting to its users. Some key feature of this model is speech recognition, wallet system, and prediction that give clues to customer's next buy.

Abstract

Virtualization allows the cloud computing environment to execute several tasks with high efficiency. Using quality of service factors, namely makespan, time, cost, and CPU utilization and availability, many algorithms are used in the cloud to measure the service of the cloud service provider. In this paper, a new hybrid task scheduling algorithm is proposed to schedule dependent and independent tasks in a cloud environment. Min-Min task scheduling algorithm can be used to schedule dependent tasks whereas independent TS algorithm can be used to schedule the independent tasks. These two algorithms are compared with hybrid tasks scheduling algorithm by varying the number of tasks. New hybrid QoS-based task scheduling algorithm is giving better results when compared with Min-Min and TS algorithms. These algorithms are implemented and analyzed by using CloudSim simulator.

ABSTRACT

The sensible thermal heat storage mixture containing hydrated cobalt phosphate, anhydrous disodium hydrogen phosphate and sodium sulfate has been synthesized and characterized with different measurement techniques. The specific heat capacity was measured using Differential Scanning Calorimetry (DSC) at heating rate of 10 and 15 K min^{-1} in atmospheric O_2. Both calcined and non calcined mixture show endothermic behaviour. This endothermic behaviour of these mixtures shows their potential to be used as thermal heat storage material. The endothermic behaviour of calcined mixture and also certain paint is reduced by using this mixture with paint in less than 1%. So, this composite material can be used as heat dissipating material. The calculated refractive index of these mixtures is ~2.55. The calculated band gap of both calcined and non calcined mixtures is 2.35 eV.

1. Introduction

Researchers are on the quest of renewable and non-conventional energy sources in order to mitigate the huge demand of energy in modern life. Development of energy storage devices are as important as the quest of new energy sources. The energy storage such as thermal energy storage plays a vital role in day to day modern life. Various advanced techniques are being used for storage of solar thermal energy in order to reduce the emission of greenhouse gases by using conventional fossil fuel for harnessing energy (Baylin, 1979). Use of water as sensible heat storage material in liquid media is considered to be the best due to high specific heat capacity and less expensive (Sharma et al., 2009). This material is used for sensible heat storage up to 373 K and above this temperature other materials such as oils, liquid metals and molten salts are used (Sharma et al., 2009). Use of sensible energy storage devices and latent heat storage devices are thermodynamically selective and economically profitable than thermo-chemical energy storage devices (Zheng et al., 2015). Selection of sensible heat storage materials in solid states such as ceramics, metals, etc. are feasible alternative for energy storage than the other types of thermal energy storage materials (Hasnaina, 1998). Some of the phosphate compounds of transition metals such as cobalt, copper and nickel along with alkali metals such as sodium can be used as sensible thermal energy storage materials. These mixtures were found to be best thermal energy storage materials than the conventional energy storage materials (Hasnaina, 1998). A good number of synthesized metal phosphates are used in diversified field and also their structural chemistry has been very well studied in last few years by many researchers (Wu et al., 2005; Ouchabi et al., 2016; Onoda and Okumoto, 2011; Onoda et al., 2009; Sekar and Suguna, 2011). However, the thermal property of these above synthesized phosphate complexes are not studied using DSC for the utilisation as thermal energy storage materials. The use of heat dissipating material is also as important as the thermal energy storage material for harnessing energy from thermal storage material. The diversified application of many phosphate materials in various technological fields prompted us to study the thermal property of the title mixture for possible utilization as thermal energy storage and heat dissipating materials.

In this context, we use DSC to study the thermal property such as exothermic/endothermic behaviour of calcined and non calcined mixtures in oxygen atmosphere at both high and low temperatures in order to elucidate their utility as sensible thermal energy storage materials.

2. Experimental

The 1:1 M ratio were used to synthesize this mixture using cobalt (II) sulfate heptahydrate ($CoSO_4 \cdot 7H_2O$) and phosphoric acid (H_3PO_4). These compounds were dissolved separately in doubly distilled water. These solutions were mixed and stirred with magnetic stirrer for 48 h in order to form homogeneous solution at room temperature. This

Extract Features from Periocular Region to Identify the Age Using Machine Learning Algorithms

Kishore Kumar Kamarajugadda & Trinatha Rao Polipalli

Journal of Medical Systems **43**, Article number: 196 (2019)

133 Accesses | **2** Citations | **2** Altmetric | Metrics

Abstract

Latest studies done on huge data collected from aging features proved that the performance of facial image based age estimation is low and need to be improved. One of the significant biometric traits for human recognition or search is Human age. Age assessment is very much exigent over other pattern recognition problems since the aging differs from person to person. This paper proposes a new framework that uses periocular region for age feature extraction and application of hybrid algorithm for age recognition. Firstly, preprocessing and periocular region normalization is done to acquire age invariant features. Secondly, the periocular region that underwent preprocessing is analyzed using hybrid approach, a novel machine algorithm that combines both SVM and kNN. The proposed technique generates the best recognition outputs.

Fuzzy-Based Cluster Head Amendment (FCHA) Approach to Prolong the Lifetime of Sensor Networks

Radha Ranganathan, Bhuvaneswari Somanathan & Kathiravan Kannan

Wireless Personal Communications **110**, 1533–1549(2020)

66 Accesses | **1** Citations | Metrics

Abstract

Wireless sensor networks (WSN) consist of large number of sensor nodes that work collaboratively. Sensors segregate groups with similar traits and get arranged in clusters. Each cluster has a cluster head (CH) that is responsible for collecting data from the sensors in its cluster and transmits to the Base station (BS). As the sensors are battery driven, minimizing the energy consumption and maximizing the network lifetime are the important concern for WSN. We propose a fuzzy-based cluster head amendment to decrease the energy consumption and increase the lifetime of the network. Topology among CH is dynamically constructed by the BS. The cluster head which lies in multiple shortest path is expected to drain its energy faster and the scenario becomes worse, when the Cluster Head (CH) acts as an

Articulation Point (AP), so we have chosen the Betweenness centrality, Criticality and Residual energy as the factors for deciding the periodicity of changing the cluster head. We simulate the proposed work using NS-2.35 and measure the performance of sensor network in terms of Network lifetime, Total residual energy, Number of alive nodes and Energy spent and we prove that our approach improves the network lifetime by 10%.

Abstract. The geometric irregularities present inside a structure results in an improper stress distribution caused during manufacturing, which not only affects the strength of the component but also its vibrational behaviour when operated in a fluctuating environment. The emphasis of this paper is to evaluate the stress behavioral characteristics of plates with different cutout shapes. Two different loading conditions with three different types of plates made of Mild Steel are used for this analysis. From the present investigation, it may be concluded that where the max stress occurs. The methodology adopted in this research work is based on the numerical technique of finite element method, which uses SOLID 185 in ANSYS 19.1 solver. For further analysis, the obtained results are validated with previous literature works which were found satisfactory when related to the present study. It may be noted that FEM provides good insight for the determination of stress and deflection, with different parameters.

Keywords: ansys solver, finite element method, mild steel, rectangular plate, stress analysis.

1. Introduction

Plates are the structural members which are generally manufactured for fabrication purpose. The presence of cut out in plates is especially carried out for inserting bolt and nuts. In order to reduce the weight of the structural members, these cutouts play a crucial role. The stress concentration caused due to cutouts with improper alignment in fastening may lead to high stresses, even sometimes it may cause the failure of the structural members. In order to assess the failure of these components stated in terms of deflection and stresses finite element analysis, a numerical method used as an important tool for finding out the stress behaviour characteristics.

2. Literature review

Active researchers in the field of structural engineering carried out enormous work on stress analysis of plates with various configurations. The stress analysis of a rectangular plate with a central hole was carried out by Dhanjal [1]. Using finite element method from the research they observed that the value of SEF tends to increase whereas the value of vonMises stress tends to decrease with an increase in T/D ratio. The calculation of stresses and deflection for a rectangular plate with central hole subjected to transverse loading was done by Jain [2]. He considered both isotropic and orthotropic materials for his analysis. Ahmed [3] used tensile load for assessing the deflection and stresses over circular plate made of isotropic material and orthotropic materials. He used FEM based Ansys tool for performing the analysis. The stress analysis of composite plates with varying cutouts was carried out by Riyah and Ahmed [4]. Various orientation angles in the ply sequence are experimented in their analysis. The Elasto-plastic stress analysis with varying boundary conditions was done by Sayman and Askoy [5]. They used clamped free and simply supported boundary conditions for metal matrix laminated plates positioned with a central hole. The stress analysis has been carried out based on classical lamination plate theory. Using finite

Abstract.
This paper presents a numerical study on the analysis of plates made of different shapes aimed at the prediction of free vibration analysis in terms of natural frequencies and mode shapes. The free vibration analysis provides the basis for designing and modeling of plates employed for structural applications. The baseline design uses two different shapes of plates (rectangular and square) experimented with various central holes. A symmetrical approach has been adopted in the present investigation to find out the mode shapes and natural frequencies. The computational efficiency in predicting the Eigenvalues by using finite element method is determined through a number of case studies. The effect of boundary conditions (clamped free and simply supported) in determining Eigen frequencies applied to the plate and are studied in detail. From the results, it may be observed that the cutout has a significant effect on modal frequencies. The numerical study carried out provides a good insight for predicting the modal behaviour characteristics of plates.

Keywords: cutouts, eigen frequencies, free vibration analysis, mode number, plates.

1. Introduction

Numerous methods have been developed for performing structural analysis of plate-like structures. Theoretical methods give a solution to such structures which are of uniform in nature in case of complexity it may become difficult to obtain a solution which may contain various boundary conditions, geometry, material properties. Consequently, one may confine to approximate numerical methods for obtaining a solution to dynamic problems. Most of the researchers have done extreme work on the free vibration analysis of plates considering various geometries of plates, cut-outs, bluntness, material properties, cut-out orientation, stress concentration factors, aspect ratios etc.

The free vibration analysis of elastic plate structures using an integral approach studied by Tanaka [1] et al. In their approach, they used the boundary integral equation method for finding out the Eigen frequency. For zero determinant value of the system matrix. This new integral equation approach resulted in the determination of the fundamental solution to the static problem. For determining the free vibration analysis of an arbitrary shaped thick plate Liu [2] used a differential cubature method a numerical technique in their analysis a linear differential operator as a continuous function having a linear sum of discrete function values are chosen for the overall domain. The free vibration analysis for frame type structures was carried by Moon and Choi [3], they developed transfer dynamic stiffness coefficient method, based on the concept of transfer of dynamic stiffness coefficient which relates to force and displacement vector at each node.

249

For plate type structures Myung [4] developed a finite element transfer stiffness coefficient method for free vibration analysis using a set of different boundary conditions for Kirchhoff rectangular plates, Lu [5] et al. used differential quadrature method for analyzing the vibrations. A shear deformable triangular plate element was used by Karunasena and Killipornchai [6] for free vibration analysis. A mesh free Galerkin method for unstiffened and stiffened corrugated plates was used by Liew [7] et al for free vibration analysis.

2.1. Problem definition

For present work, plates of various shapes made of mild steel material are taken for reference for predicting the modal behavioral characteristics due to the applied boundary condition. The effect of different cutouts rectangular, square, triangular, circular, elliptical on the two different shapes of plates rectangular, square applied with clamped-free and simply supported boundary conditions are used for predicting the mode shapes. The material properties of the plate are shown in the shown in the Table1. Table 2 gives the dimensional details of plates with different cutout shapes. Fig. 1 to Fig. 2 shows the rectangular plate with rectangular and elliptical cutout.

Table 1. Properties of rectangular plate

Properties	Mild steel
Young's modulus	205 GPa
Poisson's ratio	0.35
Density	7850 Kg/m^3

Table 2. Dimensions of plates with various cutout dimensions

Plate type	No cutout	Cutout shape				
		Rectangular	Square	Elliptical	Circular	Triangular
Rectangular	500×300×25 mm	100×50	100×100	100×50	$D = 75$	100×100
Square	500×500×25 mm	100×50	100×100	100×50	$D = 75$	100×100

3. Finite element method

The application of finite element analysis programme is executed in Ansys18.0. The three-dimensional modeling of the plate along with various cutouts shapes are done in Solid works software, the corresponding iges file exported to Ansys solver for further analysis. The fem mesh was done using solid 185 element type; the element has the capabilities of large deflection, stiffness, plasticity, creep, stress etc.

Abstract

Blockchain is a trusted, distributed, peer to peer, open, public, techno-cryptographic ledger to manage and transfer the value of digital assets, to provide immutability, anonymity and security. Bitcoin is a decentralized virtual, digital and programmable currency. Wallet is an interface to user in bitcoin network where we can store send and receive funds. This paper follows a novel approach in elaborating the underlying technical concepts of a transaction which comprises of locking and unlocking scripts, verification. Additionally, it also presents the details of block header that incorporates the concepts of difficulty, Merkle tree and proof of work. The paper highlights the mechanism of resolving ambiguity when there is more than one chain is available.

A Supervised Learning Algorithm to Forecast Weather Conditions for Playing Cricket

251

Sandeep Kumar Panda, Sathya AR, Manoranjan Mishra, Suneeta Satpathy

Abstract*: Now days, Machine learning is considered as the key technique in the field of technologies, such as, Internet of things (IOT), Cloud computing, Big data and Artificial Intelligence etc. As technology enhances, lots of incorrect and redundant data are collected from these fields. To make use of these data for a meaningful purpose, we have to apply mining or classification technique in the real world. In this paper, we have proposed two nobel approaches towards data classification by using supervised learning algorithm

Keywords: Machine learning, Classification, Supervised learning.

I. INTRODUCTION

After appearing the first edition of machine learning in 2004 [7], it became the favourite target of researchers and scientists throughout the world. It has turned pace and direction of technology towards a new world, in which search engine, recommendation system and spam filtering were the most innovative inventions of machine leaning [7]. It has also affected the computational biology in the field of natural language processing, whose invention was machine translation. It affected almost all the fields such as robotics, medical diagnosis etc [5,18].

Earlier, an algorithm was considered as a fuel to solve a computer related problem [8]. An Algorithm consist of sequence of instructions which gives output based on input data. There may be more than one algorithm exists for the same problem but we consider an algorithm with less time and space complexity. Sometimes, there is a case, in which no existing algorithm can be applied for a particular problem for example, spam filtering problem, in spam filtering problem, a generalized algorithm can not be written because, spam messages vary from individual to individuals. We know input of the problem is set of emails and output is yes/no, if message is spam then yes otherwise no. But, we do not know the method (algorithm) of transforming input data into output. In this situation, machine should automatically extract the algorithm from the past experience of user i.e. called machine learning [7,18].Over the last few years, Machine learning is spreading its arms in Industry, Enterprise world and Academia. In industry, Machine learning is a data processing tool for securely process the data over the distributed network without having any pre-programming concept. In enterprise world, machine learning is widely used in enhancing the relation between producer and consumers [5]. Machine learning projects the clear and quick picture of current market demand. In academia, it is a tool or driving force for radically shaping the economy and the society in the centralized world. Machine learning with artificial intelligence is widely used in autonomous devices such that autonomous car, robots etc [6]. Machine learning is a subset of artificial intelligence where computers algorithms used to learn autonomously from the information. Today, machine learning is enabling the computers to interact with humans [5]. It gives the tremendous effect in fields like pattern recognition [12], image processing in cognitive science [2], data mining [14]and data clustering [14]. For use of machine learning, it needs huge amount of historical and practical dataset for processing different activities in the field of pattern recognition, image processing in cognitive science, data mining and data clustering.

II. MOTIVATION AND CONTRIBUTION

The reason behind to predict the weather conditions is to plan many human activities like agriculture, nature disaster prevention ,plan daily activities and so on. Across the world meteorologist face the challenge in accuracy of weather analysis and prediction[21]. On the other hand researchers had tried to predict different metrological parameters like wind speed, air pressure, humidity, temperature by utilizing different data mining techniques[23]. In this paper we have a taken the application of predicting weather conditions to play cricket as it plays a major role the gaming process.

Most of the machine learning algorithms are based on data classification techniques. Data classification is a process of classifying similar type of objects from the dataset and grouping them together to predict desired output [15]. This process requires pre-processing of data in which feature selection is most difficult task. Feature selection is the process of finding out as much relevant and unique features as possible. Pre-processing of data helps data mining algorithms to operate accurately on dataset. But, to a little extant, features dependency on one another remains in dataset that leads to affect the performance of machine learning algorithm. That is the reason, naive bayes classification technique is being used here that works surprisingly well even though there is a dependency among features because it makes a strong assumption of independency among features. This paper describes a classification technique which is simplest among all techniques i.e. Naive byes classification.

Implementation of DAUBECHIES Discrete Wavelet Filter Banks Using Xilinx FPGAS

Ranganadh Narayanam[1]

[1]*Assistant Professor, ECE department, Faculty of Science and Technology,The ICFAI Foundation for Higher Education, Hyderabad, (Deemed to be University under section 3 of UGC Act, 1956), India*
Corresponding Author: Ranganadh Narayanam1

Abstract: *In the recent decade discrete wavelets have become very popular in Digital Signal Processing area due to their capability of simultaneous representation of time-frequency information of a signal. Wavelet transform is especially very important for processing non-stationary signals. Due to the high demand for real time DSP hardware architectures the demand for high throughput and low power in portable devices requires discrete wavelet hardware implementation also to be efficient. In this research three different advanced polyphase architectures for wavelet filter banking are implemented. Xilinx Artix-7 FPGAs are used for implementation through Vivado 2015.2 design suite. The programming is done using Verilog Hardware Description Language (HDL).*

Keywords: *Discrete Wavelets, Wavelet Filter Banks, FPGA, Verilog HDL*

Date of Submission: 04-09-2019 Date of acceptance: 19-09-2019

I. Introduction

Fast Fourier Transform (FFT) is highly useful in analyzing the signals whose frequency content does not change with time. But it does not represent time based frequency analysis; such a barrier can be filled by wavelets. Wavelets are useful for time-frequency analysis. Non stationary signals such as EEG signals, Speech signals require time-frequency analysis that is where wavelets are highly useful in time-frequency analysis than FFT frequency analysis. Due to better resolution and compression capabilities of Wavelets, these days Wavelets are becoming more popular in various applications of Bio-medical signal processing, Speech signal Processing. Due to the increasing applications of Wavelets in speech, image, audio and video it is essential to concentrate on DWT hardware implementation techniques. These hardware implementations to be efficient in terms of power, area, speed, throughput the design has to depend on pipelining, distributed arithmetic, hence efficient memory storage and global data transfer are important criteria for implementing for such applications. In this research we have considered usage of FPGAs to implement these designs due to its capability of reprogramming/reconfigurable and its market for DSP is very emerging. By using high-density field programmable logic devices (FPGAs), the discrete wavelet transformation obtains higher processing speed and lower costs [5] than other implementation methods.

When it comes to non-stationary signal analysis, along with Discrete Wavelet Transform (DWT), Short Time Fourier Transform (STFT) is also one of the important techniques. STFT gives constant resolution at all frequencies which is a drawback and can be overcome by Wavelet Transform which uses multi-resolution technique in which different frequencies are analyzed with different resolutions. In DWT the width of wavelet function changes with each spectral component, unlike the constant width of STFT window. Due to the multi resolution capability the DWT hardware implementation need has become more important for advancing of the technologies [15]. Discrete form of the Wavelet Transform makes the computation easier, makes it easy to implement on hardware and reduces the required resources and computation time.

1.1 wavelet families

Wavelets are mathematical functions that cut up data into different frequency components, and then study each component with a resolution matched to its scale. These basis functions are short waves with limited duration, thus the name "wavelets" is used. The basis functions of the Wavelet Transform are scaled with respect to frequency. There are many different wavelets that can be used as basis (wavelet) functions; a few of them are discussed here. Wavelets are categorized into orthogonal and bi-orthogonal wavelets [4]. There are various wavelet families are available such as Haar, Mortlet, Mexcian Hat, Meyer, Daubechies (db), Coiflet, Symlet.

Abstract

Now-a-days, the solid wastes are used in many areas of manufacturing. But the utilization of these wastes in polymer composites has rarely been seen. Therefore, exploring new avenues for its application would be an exciting task as far as the materials recycle aspect is concerned. This article presents the fabrication and investigation of physical and mechanical properties of glass fiber reinforced epoxy composites with red brick dust (RBD). RBD is the waste or leftover powder, or the powder formed from deformed bricks in the process of their manufacturing. Bricks can be deformed while handling and the deformed bricks cannot be used for construction purposes; hence, they are dumped as waste. Hand lay-up technique is used for composite fabrication. RBD is varied from 0 to 30% by weight and physical and mechanical tests are performed on the composite samples. X-ray diffractography (XRD) is carried out in order to identify the phases present in raw RBD. This work shows that density, void content, hardness and impact strength of the composites increases with the increase in red brick dust content while the decrease in tensile and flexural properties are observed.

Abstract. This article reports the fabrication and investigation of sliding wear properties of Linz-Donawitz (LD) slag reinforced epoxy composites. Hand lay-up technique is used for composite fabrication. LD slag is varied from 0 to 30% by weight and sliding wear tests are performed. The sliding wear performance of these composites is evaluated at various sliding velocities and normal loads. It is found that the incorporation of increased LD slag content resulted in significant enhancement in sliding wear resistance. This work also shows that LD slag content and sliding velocity are the most influencing factors as far as the minimization of specific wear rate is concerned.

Keywords: LD slag, Epoxy composite, Sliding wear, Taguchi technique.

1. Introduction

Polymer composites find wide applications in automotive as well as aerospace industries due to their high mechanical properties. It has various properties like hardness, strength, wear resistance, conductivity and density. But among all the properties, wear resistance plays a strong role for polymer matrix composites. Due to high strength properties, industrial wastes are oftenly used as reinforcement in polymer composites. Numerous researchers have investigated and described the influence of industrial wastes on wear characteristics of polymer composites. Beside mechanical properties, improvement of the wear resistance of composites is a major challenge for researchers to satisfy the design requirements of the fabricated components when subjected to the sliding environment. Satapathy et al. [1] investigated the sliding wear response of polyester composites filled with titanium dioxide. Sliding wear characteristics of epoxy composites filled with different fillers like TiO_2, rice husk, nano-sillica, SiC/Al_2O_3, fly ash, silicon carbide and graphite has been described by different researchers [2-10]. Gyurova and Friedrich [11] reported the sliding friction and wear properties of polyphenylene sulfide composites. Umeda et al. [12] studied the characterization of wear particles. Purohit and Satapathy [13] developed an epoxy composites filled with LD sludge. Padhi et al. [14] examined the sliding wear behavior of polypropylene composites using BFS particles. Satapathy and Patnaik [15] discussed the wear response of polyester composites filled with red mud. However, the research works on the applicability of LD slag particles as filler in polymer composite yet to be studied. The purpose of the present work is to analyze LD slag as filler material in epoxy composite using hand lay-up fabrication technique and to study the sliding wear properties.

Abstract

In the fast-growing infrastructure, machining plays a vital role in industrial evolution. However, obtaining optimal machining parameters is still a challenging assignment for manufacturers because an inappropriate selection of machining parameters specifically spindle speed (N), feed rate (f), and depth of cut (d) adversely affects the overall machining performance. Therefore, this work attempts to provide optimal parameters setting for machining AISI D2 steel in dry condition with PVD-coated carbide tool. The evaluation of the optimal parameters setting has also been done by means of utility function approach aggregated with the imperialist competitive algorithm.

Abstract:
In this article, a technique has been proposed to extend the common-mode rejection ratio (CMRR) bandwidth of a CMOS differential amplifier. This technique is based on a pole-zero cancellation technique to cancel the dominate pole in the CMRR Transfer function. The differential amplifier tail node swing has been derived under component mismatch conditions, and formulated design methodology for better CMRR. The Circuit has been implemented in 45nm CMOS technology, and simulation results shows CMRR of 114dB at low frequency and 3-dB bandwidth of 30KHz has been achieved, which is approximately 3 times better than conventional technique.

Metadata

Abstract:

A critical review of the Miller compensation technique for a two-stage operational amplifier (op-amp) is presented in this paper. The trade-offs involved in the compensation capacitor value and the small signal parameters of the op-amp are also considered in this paper; that is, the second stage requires a higher bias current, while driving a large capacitive load for a given phase-margin. A technique is presented with a view to increase the g_m of the second stage without increasing the power dissipation, hence improving the phase margin while maintaining the unity gain bandwidth (UGB) of the op-amp. A prototype has been designed in 65nm CMOS technology and post-layout simulations exhibit good performance characteristics of 45MHz UGB with 250fF compensation capacitor, for a supply voltage of 1.2V, and a current consumption of 132μ A. The new technique shows a superior performance to those obtained with an established compensation technique that achieves a 10MHz UGB while dissipating the same power. The total circuit size is 0.00234mm2 silicon area.

Abstract:
This paper describes a novel SRAM architecture to improve read and write stability. Read stability is enhanced by increasing β ratio to 4 and write stability is enhanced by storage node charging and discharging through two transistors. The proposed 8T SRAM architecture is compared with Conventional 6T, decoupled 8T SRAM cell and 10T SRAM cell. 6T SRAM cell required 584.1mV word line voltage to write data into a cell at 1.2V supply voltage whereas the proposed SRAM cell requires only 512.8mV, leakage power is close to leakage power of 6T SRAM cell.

Metadata

Abstract:
Due to life style change, working habits and lack of physical activity many people are suffering from Diabetes and heart diseases. Diabetes is a chronic disease in which the glucose levels in human blood are more than the ideal levels. It is due to deficiency or insufficient insulin which is produced by beta cells in the pancreas. Insulin plays a key role in regulating excess glucose. However, excess glucose levels in the blood over a long period of time causes so many other complications like heard stroke, brain stroke, vision loss, etc. Heart disease is also an incessant disorder. It could be as devastating as possible. Hence, It is better to diagnosis these diseases in the early stages to prevent the loss. So, in this paper, we are proposing a 2-level ensemble framework by combining RBFN, PNN, SVM and logistic regression. The proposed model is validated using benchmark UCI's Diabetes data set called Pima Indian Diabetes data set and the statlog heart disease data set. The results are compared with state-of-the-art techniques in the literature and our proposed model outperforms in terms of accuracy, sensitivity and specificity.

Amplitudes of components in vibration spectra of rolling bearings with localized defects under harmonic loads

Tingarikar Govardhan, Achintya Choudhury

First Published July 21, 2020 | Research Article
https://doi.org/10.1177/1077546320945459

Abstract

In the present work, an attempt has been made to obtain the vibration response with relative amplitudes of the spectral components for a rolling element bearing with localized defect on different elements under the action of harmonic radial load. The bearing has been assumed as a multi-degree-of-freedom system, and the frequency of harmonic load has been considered to be the shaft frequency. The vibration spectra have been obtained using envelope detection technique. The modulating effects of the harmonic load has resulted in additional sidebands at shaft frequency about the components which are otherwise caused by static load for defects on the outer race and the rolling element. For inner race defect, no additional components exist because the modulating frequency is equal to the shaft frequency at which the sidebands appear even for the static load. A detailed experimental investigation has also been carried out in the present work to validate the theoretical results. The results of theoretical and experimental investigations show the amplitudes of spectral components for both the studies are of the same order and their normalized values have fair agreement between them.

Abstract
Fog computing or fog network is designed to support distributed and decentralized computing platform by reducing the burden on cloud computing. Using IoT infrastructure many devices are connected to the fog network to send and receive data. The three layers of fog network are used to sense the data from the IoT devices, to process the data and finally to present the data in the application layer. There are many applications of fog computing such as e-commerce, mobile services, mobile networks, agriculture, smart buildings, self-driven auto mobiles, smart grids and cities, healthcare and image processing etc. This paper gives overview of the fog architecture, hierarchy of different layers, applications, challenges and research directions. A better IoT enabled cloud based healthcare system using fog computing model is discussed in this paper to assist patients in an efficient manner.

INTRODUCTION

Fog computing is treated as an extension of cloud computing. It is aplatform of heterogeneous and decentralized devices to form edge of the network. Fogging or for network is used to provide and handle various services to the devices using cloud service provider to support and provide IoT infrastructure. The objective of fog computing is to assist with cloud computing to reduce the burden of processing. This computing infrastructure provides automation of real time devices to support data analytics by using automation controller. The main advantages of fog computing platform are: reduced latency, decentralization of computing resources and decreased usage of resources [1].

ARCHITECTURE OF FOG COMPUTING

Architecture

The architecture of fog computing environment is shown in the following figure 1. There are mainly three components in this namely cloud computing environment, fog network and IoT. Various devices with unique identification numbers are connected via network to send and receive data with machine to machine interaction. There exist a variety of devices which are connected by using IoT such as computing devices, digital devices, mechanical devices etc. The second module is fog network in which there are three layers. There is a layer in fog network which is given direct access to the devices connected in IoT. The data of heterogeneous devices in IoT platform is taken by sensing network of fog network. This data is being analyzed by edge computing nodes. Intermediate computing nodes network is used to interact with the cloud computing environment to access and deliver the requested services. Cloud computing environment contains number of data centers to satisfy the demands of the consumers. This computing model has many advantages like elasticity, availability, privacy, security, low cost model, demand driven and reliability [2].

This paper consists of a review of Metal powders in Additive Manufacturing. Additive Manufacturing is a layer by layer process that adds up the material to obtain the required component. For use in additive manufacturing, the Metal Powders manufactured by Atomization processes. Hence, by the usage of metal powder in Additive Manufacturing to achieve the desired part, the different types of procedure, pros, and cons, uses are described in this review. The characterizations to be considered for metal powders in AM by metrology methods are reviewed. And also the biomedical applications using AM techniques. Schematic diagrams, charts, and comparative tables presented for better assessment.

ABSTRACT

The lossless image compression methods have high demand, particularly in the medical imaging applications. Therefore, we need to increase the image compression acceleration given the demand in the future than the present demand. General Purpose Graphics Processing Unit (GPGPU) is efficient with the development of computing technologies. Therefore, the GPGPU is useful for lossless image compression algorithms to achieve efficiency and speed in performance. This paper is presented with a wavelet tree-based image compression algorithm based on Compute Unified Device Architecture (CUDA) platform. The encoding phases of the compression algorithm have been changed to parallelism and efficiency. With comparable compression ratios, our algorithm works faster than the sequential lossless JPEG-XR and BCWT algorithms. Currently, the parallel BCWT algorithm is subject to further improvement of speed and flexibility.

Keywords: parallelism, lossless image compression, CUDA, lossless JPEG-XR, GPGPU, BCWT.

INTRODUCTION

In recent days, beneficial compression is still required in medical imaging applications, despite the improvement of computing efficiency and storage costs (DAC *et al.*, 2000). One of the significant applications is Electronic Healthcare Record (EHR) maintenance is the biggest issue since each patient's or citizens full-length record may have huge. Each EHR might have many radiological images, and they can take more memory space. To avoid that the cost-effective image compression model is needed to the tradeoff in all factors (Suda.e*et al.*, 2017).

Discrete Wavelet Transform (DWT) is broadly used in lossless medical image compression (DFS *et al.*, 1998), but algorithms require more compression and speed in performance. DWT based compression usually is [illegible] stages: (1) transition stage and (2) encoding stage. During [illegible] GPU). The GPGPU computational tasks performed significantly to accelerate the existing lossless compression algorithms into parallels, such as JPEG2000 (RLE *et al.*, 2012) and JPEG-XR (MChe*et al.*, 2010). However, some of these standards are not designed for efficient parallelization, since they might not have an internal parallelism in their structure. The MQD encoding is very favorable for parallel compression due to its internal parallelity and simplicity (JGuo et al., 2006). The BCWT algorithm constructs an MQD map in recursive back coding in a pass, which removes all the wavelength trees ahead of the coding (A Said *et al.*, 1996) (DST *et al.*, 2000). See the detailed description of the BCWT in (Guo *et al.*, 2006).

In this paper, new GPU-based stages have proposed for encoding the wavelet trees of [illegible] coefficients with the compact of these steps, parallel multi-

SOME FIXED POINT THEOREMS FOR MODIFIED JS-G-CONTRACTIONS AND AN APPLICATION TO INTEGRAL EQUATIONS

V. SRINIVAS CHARY, G.S. MOHAN REDDY, HÜSEYİN IŞIK*, HASSEN AYDI, D. SRINIVASA CHARY, STOJAN RADENOVIĆ

Abstract. In this article, we establish some fixed point results in G-metric spaces using the modified JS-G-contractions and we provide some suitable examples to support the results. Also, we give an application to solve an integral equation.

AMS Mathematics Subject Classification : 54H25, 47H10.
Key words and phrases : G-metric space, fixed point, modified JS-G-contraction, integral equation.

1. Introduction

The Banach contraction principle (BCP) is the tremendous, most versatile and fundamental result in fixed point theory. Many authors gave different contractions based on the BCP in the literature. Parvaneh et al. [15] initiated the modified JS-contractions and weakly JS-contractions. In this paper, we consider the related contractions in the setting of G-metric spaces (see, [1–8, 14, 16–21]).

Definition 1.1 ([14]). Let Y be a non-empty set and $G : Y \times Y \times Y \to \mathbb{R}^+$ be a function so that:

(1) $G(a, b, c) = 0$ if $a = b = c$;
(2) $G(a, a, b) > 0$ for all $a, b \in Y$, with $a \neq b$;
(3) $G(a, a, b) \leq G(a, b, c)$, for all $a, b, c \in Y$ with $b \neq c$;
(4) $G(a, b, c) = G(b, c, a) = G(c, a, b) = \cdots$ (symmetry in all three variables);
(5) $G(a, b, c) \leq G(a, x, x) + G(x, b, c)$, for all $a, b, c, x \in Y$ (rectangular inequality).

A fuzzy multi-criteria decision-making method for purchasing life insurance in India

Chinmaya Ranjan Pattnaik, Sachi Nandan Mohanty, Sarita Mohanty, Jyoti Moy Chatterjee, Biswajit Jana, Vicente Garcia Diaz

Abstract

Life insurance is an agreement between an insured and an insurer, where the insurer pays out a sum of money either on a specific period or the death of the insured. Now a day, People can buy a policy through an online platform. There are a lot of insurance companies available in the market, and each company has various policies. Selecting the best insurance company for purchasing an online term plan is a very complex problem. People may confuse to choose the best insurance company for buying an online term. It is a multi-criteria decision making (MCDM) problem, and the problem consists of different criteria and various alternatives. Here in this paper, a model has been proposed to solve this decision-making problem. In this model, a fuzzy multi-criteria decision-making approach combined with technique for order preference by similarity to ideal solution (TOPSIS) and it has been applied to rank the different insurance companies based on online term plans. The experimental results show that the life insurance corporation of India (LIC) gets the top rank out of 12 companies for purchasing an online term plan. A sensitivity analysis has been performed to validate the proposed model.

Keywords

Fuzzy MCDM; Life insurance; Multi criterion decision-making approach; TOPSIS

WEAK-INTERIOR IDEALS OF Γ-SEMIGROUPS

Murali Krishna Rao Marapureddy and PRV Subba Rao Doradla

ABSTRACT. In this paper, we introduce the notion of weak-interior ideal of Γ−semigroup and we characterize the simple Γ−semigroup and the regular semigroup in terms of weak-interior ideals of Γ− semigroup.

1. Introduction

Ideals play an important role in advance studies and uses of algebraic structures. Generalization of ideals in algebraic structures is necessary for further study of algebraic structures. Many mathematicians proved important results and characterization of algebraic structures by using the concept and the properties of generalization of ideals in algebraic structures. The notion of ideals was introduced by Dedekind for the theory of algebraic numbers, was generalized by Noether for associative rings. The one and two sided ideals introduced by her, are still central concepts in ring theory and the notion of an one sided ideal of any algebraic structure is a generalization of notion of an ideal.

In 1952, the concept of bi-ideals was introduced by Good and Hughes [**1**] for semigroups. The notion of bi-ideals in rings and semigroups were introduced by Lajos and Szasz [**8, 9**]. Quasi ideals are generalization of right ideals and left ideals whereas bi-ideals are generalization of quasi ideals. Steinfeld [**30**] first introduced the notion of quasi ideals for semigroups and then for rings. Iseki [**3, 4, 5**], Izuka [**6**] introduced the concept of quasi ideal for a semigroup. Quasi ideals in Γ−semigroups were studied by Jagtap and Pawar [**7**]. Henriksen [**2**] and Shabir et al. [**29**] studied ideals in semigroups.

2010 *Mathematics Subject Classification.* 20M14. 20M30.
Key words and phrases. Γ-semigroup, regular Γ-semigroup, simple -semigroup, weak-interior ideal. left (right) weak-interior ideal.

ABSTRACT

268

Product improvement is encountered often in many products especially in automobile due to competition. The manufacture need to attract their customer by improved products and additional features. Hence the customer feedback is playing most important role nowadays. This research focuses such a automobile component of suspension system manifold design and material validation. The materials of Brass, Gray Cast Iron, Copper and Alloy are considered for investigation. The SOLIDWORKS preferred for this investigation. The suspension manifold was numerically investigated and best material preference suggested.

Abstract

This study aims to suggest a recommender System for undergraduate students who desire to seek admission into engineering courses in different Indian Institute of Technology (IITs) in India. Initially, the focus is to purpose a recommender system for admission into the top 10 IIT on a pilot basis in four common branches such as Electrical Engineering, Computer Science and Engineering, Mechanical Engineering, Civil Engineering. Data were collected from different authentic sources from 2016 to 2018. A model was built to predict the ranks for 2019 for each branch of every IITs. This paper illustrates prediction using Time Series Forecasting and recommendation algorithm using classification techniques. A comparative study of Random Forest Classification and K-Nearest Neighbor classification has been done. Finally, the recommendation algorithm shown reliable results with high accuracy in prediction model. It can be diversify and implement other streams as part of future work.

In this paper, a data mining model on a hybrid deep learning framework is designed to diagnose the medical conditions of patients infected with the coronavirus disease 2019 (COVID-19) virus. The hybrid deep learning model is designed as a combination of convolutional neural network (CNN) and recurrent neural network (RNN) and named as DeepSense method. It is designed as a series of layers to extract and classify the related features of COVID-19 infections from the lungs. The computerized tomography image is used as an input data, and hence, the classifier is designed to ease the process of classification on learning the multidimensional input data using the Expert Hidden layers. The validation of the model is conducted against the medical image datasets to predict the infections using deep learning classifiers. The results show that the DeepSense classifier offers accuracy in an improved manner than the conventional deep and machine learning classifiers. The proposed method is validated against three different datasets, where the training data are compared with 70%, 80%, and 90% training data. It specifically provides the quality of the diagnostic method adopted for the prediction of COVID-19 infections in a patient.

The novel coronavirus disease 2019 (COVID-19) is a pandemic outbreak (1). COVID-19 patients are classified essentially based on computerized tomography (CT) lung images, and it is used widely for testing. The healthcare institutions fitted with CT scans help in the process of image acquisition and classification of CT images at a faster

rate. However, the need for an expert medical practitioner is hence required for the verification of the final results, which increases the time of computation (2). On the other hand, the supervised learning models (3–10) can be utilized for classifying the patients from the CT images.

Infections based on CT images are not classified using very little unattended methods (11–24). We have developed a model that mainly includes supervised and unsupervised learning models in order to improve the classification process. The aim is to classify the infected patients automatically based on their CT images.

270

In this paper, a DeepSense algorithm is utilized to diagnose COVID-19 infections among the medical community. The deep learning method is designed as a combination of convolutional neural network (CNN) and recurrent neural network (RNN) that reduces the classifier burden on optimal classification of the multidimensional data features.

The main contribution of the work includes the following:

(a) The authors develop a combined CNN and RNN to classify the medical image datasets.
(b) The experimental results are conducted to measure the correctness in terms of its accuracy, precision, and recall values against artificial neural network (ANN), feedforward neural network (FFNN), back propagation neural network (BPNN), deep neural network (DNN), and RNN.

The outline of the paper is presented as follows: The *Methods* section provides the details of the ensemble classifier. The *DeepSense Model* section evaluates the entire work. The *Results and Discussions* section concludes the work with future enhancement.

Methods

The deep learning model namely DeepSense algorithm is a combination of CNN and RNN designed to improve the performance of the classification accuracy. DeepSense learning is regarded as a module for accurate predictions of lung infections caused by the COVID-19 virus. Figure 1 shows the architecture of the proposed classification model using the DeepSense algorithm.

Figure 1. Proposed model for classification.

Deepsense Model

Figure 2 shows the DeepSense DNN (25) model that has three components, including convolutional, recurrent, and output layer that are stacked upon one another. The convolutional and recurrent layers are regarded as the significant building blocks (Figure 1), and the output layer is considered as a specific layer that classifies the images. The DeepSense DNN model is designed for the classification of input CT images for COVID-19-related infections.

deployed region. Compared to traditional object tracking models, animal tracking in WMSN is a tedious process owing to the harsh, dynamic, and energy limited sensors. This article introduces a new Reliable Multi-Object Tracking Model using Deep Learning (DL) and Energy Efficient WMSN. Initially, the fuzzy logic technique is employed to determine the cluster heads (CHs) to attain energy efficiency. Next, in the second stage, a novel tracking algorithm by the use of Recurrent Neural Network (RNN) with a tumbling effect called RNN-T is developed. The proposed RNN-T model gets executed by every sensor node and the CHs execute the tracking algorithm to track the animals. Finally, the tracking results are transmitted to the cloud server for investigation purposes. In order to assess the performance of the presented model, an extensive experimental analysis is carried out by the use of a real-time wildlife video. The obtained results ensured that the RNN-T model has achieved better performance over the compared methods in different aspects.

SECTION I.
Introduction

Wireless Multimedia Sensor Network (WMSN) includes a set of compact-sized, autonomous, energy limited, and distributed multimedia sensors which can transmit the multimedia data using wireless links. In WMSN, the sensor nodes are linked to the camera to sense and capture the multimedia data [1]. It finds use in several fields in the surveillance and tracking actions such as healthcare, habitat surveillance, military, etc [1]. In general, the sensor nodes are deployed in the harsh environments such as deep forest, hill, or buildings for monitoring or detecting particular events [2]– [3] [4]. The usage of WMSN for surveillance application areas offers a method of monitoring environmental activities like volcanoes, forest fire, landslide, etc [5], [6]. The usage of WMSN in remote areas will be highly beneficial since it is very tedious to observe it because of the problematic and uninhabitable

Abstract:
For optimal use of cloud resources and to reduce the latency of cloud users, the cloud computing model extends the services such as networking facilities, computational capabilities and storage facilities based on demand. Due to the dynamic behavior, distributed paradigm and heterogeneity present among the processing elements, devices and service oriented pay per use policies; the cloud computing environment is having its availability, security and privacy issues. Among these various issues one of the important issues in cloud computing paradigm is DDoS attack. This paper put in plain words the DDoS attack, its detection as well as prevention mechanisms in cloud computing environment. The inclusive study also explains about the effects of DDoS attack

I. Introduction

There are many challenges that exist in cloud computing such as privacy, security and availability due to its dynamic resource provisioning based on the on demand requests from cloud users. There are many mechanisms available for handling these security and privacy issues in cloud computing. But these approaches cannot be directly applied to fog computing due to a mixture of features that treat it different form cloud [1]. Cloud computing is derived from many paradigms like distributed computing, utility computing, service oriented computing and grid computing. For privacy protection there are many approaches available which are being used in cloud computing environment like attribute based encryption, key policy ABE, cipher text ABE, encryption based on hierarchy, searchable technique using encryption and re-encryption based on proxy etc. [2] [3].

rainfall and relative humidity data were collected from period 1991-2015 from Department of Forest and Environment Govt. of Odisha. Support Vector Regression and Multilayer perception implemented for prediction of maximum rainfall in annual and non-monsoon session. Input parameter like average temperature in month, wind velocity, humidity, and cloud cover was conceder for predicting rainfall in non-monsoon session. The performance of the results was measure with MSE (mean squared error), correlation coefficient, coefficient of efficiency and MAE (mean absolute error). The results of SVR were compared to those of MLP and simple regression technique. MLP being a computationally intensive method, SVR could be used as an efficient alternative for runoff and sediment yield prediction under comparable accuracy in predictions.SVR-MLP may be used as promising alternative forecasting tool for higher accuracy in forecasting and better generalization ability.

SECTION I.
Introduction

Rainfall Prediction is the process of predicting the probability of precipitation in a particular region and forecasting of rainfall in future along with estimating the amount of rainfall in specific regions. It takes into account both accuracy of prediction, error in prediction and rainfall volume estimation along with probability of rainfall in that specific region. It is prepared by forecasters by way of collecting, analyzing, verifying, modeling, simulating and doing research on different meteorological data and parameters available. Some basic parameters include Average Mean Monthly Temperature (Minimum and Maximum), Total annual rainfall in mm and Relative Humidity. Understanding the probability of rainfall along with its intensity (heavy/light) helps farmers as well as city population, being alert toward any disaster which can cause damage to life and property. Abstract—**The usefulness of Fractal Analysis (FA) is not limited to a particular area. It is applied in variety of fields and has shown its efficiency towards irregular objects. Fractal dimension is the best measure of the roughness for natural elements and hence, it can be treated as a feature of the natural object. Breast masses are irregular and divers from a malignant tumor to benign; hence breast can be treated as one of the best areas where fractal geometry can be applied. It gives a scope where fractal geometry concept can be used as a feature extraction technique in mammogram. On the other hand, the support vector machine is an emerging technique for classification. The survey shows that few works have done on breast mass classification using support vector machine. In our work two most effective techniques are used in separate operations, FA: Box Count Method (BCM) and Support Vector Machine (SVM) that result well in their fields. Feature extraction is done through Box Count Method. The extracted feature, "fractal dimension", measures the complexity of the input data set of 42 images. For the next segment, the resulting Fractal Dimensions (FD) are processed under the support vector machine classifier to classify benign and malignant cells. The result analysis shows that the combination of SVM and FD yielded the highest with 98.13% accuracy.**

Keywords—Mammography; feature extraction; fractal dimension; box-counting method; classification; support vector machine

I. Introduction

Now a day's most of the women are suffering from Breast cancer, which is the most valid cause of cancer-related death [1]. As women are not treated in an initial stage in urban areas or under growing cities, the survival rate became very less. Women's breast consist of micro-calcifications, which are tiny calcium that deposited in the breast tissues; it makes a small bright spot in the mammogram. Micro-calcification is very small in size, so it is very difficult to detect (range of 0.05-1mm). Image processing is a tool that is widely spread in the field of medicine, mainly for the diagnose of diseases or disruption of the human body. The anatomical structure of breast cancer can be observed through its medical image which can be taken through high-quality imaging tools such as- X-Ray, Mammography, Thermography, Ultrasonograph, Medical Resonance Image.

Mammography and X-Ray are both treated as standard methods for breast cancer detection but, it is noticed that they are unable to detect the whole mass until it works on a specific size. Due to the high radiation, these methods are not preferable for below the age of 40 [2].

To overcome the above limitations a new tool is introduced known as "Thermograph". This tool explores the usefulness of non-ionizing, free-radiation, convenient and beneficial. It is useful for a routine check-up to increase the certainty of breast malignant identification. Due to the convenient and non- ionizing feature, it can work for the urban areas.

Breast cancer & clumps show up as thick locales in mammograms. Generous clumps are round, smooth & all around outlined limits while malignant tumors have speculated, irregular, small dot-like, clustered, various in size, and blurry boundaries. The surface contrasts have been seen among benign & malignant clumps with former being generally homogenous & later show heterogeneous surface [3]. Thermograph technique is used to detect the temperature distribution over the entire surface of the breast. Due to the angiogenesis, the temperature of the skin over the tumor surface is more than the surrounding. It is easy to find the anomalous region with the help of an infrared camera [4-5].

Cancerous tumors exhibit arbitrariness related with their development & is ordinarily sporadic & complex fit as a fiddle. Thus FA can give a decent measure to their intricate examples than the conventional Euclidean geometry. A few PC supported strategies have been created to help specialists to improve the proficiency and precision of mammographic screening programs [6-10]. Different fractal-based methods have been utilized by researchers in different fields for fractal dimension estimation in natural objects such as cloud, trees, deserts. Nguyen. and Rangayyan [12] used fractal study for identification of abnormal sections in the mammogram, before testing in infrared camera. In 2010 Tavakal et al. [13] introduced the concept of FA for segmentation and division of breast thermography as Benign (range <=1) or Malignant (>1).

This paper is organized as follows: Section 1 provides the overall views; Section 2 is dedicated to the related works done in this area and Section 3 represents all the methodologies

Data Analysis and Prediction of COVID-19 Using Machine Learning Models

Dr. E. Laxmilydia,Dr.Pavan Kumar,Vydarsi Sitarama Prasad,Chinmaya

Abstract

Breakout of novel corona virus from China got spread to various countries all over the world. The symptoms of the affected patients were hard to be sorted through self defection. The rapid increase of the virus cases spread through air, physical touch, and direct interaction from one person to another and to things. COVID-19 begins with respiratory illness which also includes fever, sore throat, cough and water from eyes. Increase of patients at various places, this paper identifies prediction model to predict and analyze COVID-19 virus using machine learning Time series forecasting prediction models such as Holt's Linear Model, Holt's winter Model, Prophets Predictions. By comparing the worst affected countries those reside beside India using machine learning prediction models from kaggle Coronavirus COVID-19 repository dataset, we can predict the rapid changes in India.

Face Shape Classification based on Modified Relative Improved Differential Box Count Method

Sumitra Kisan, Sanjay Nayak, Ajay Chawda, Sarojananda Mishra, Sachi Nandan Mohanty

Abstract

The application of Fractal Dimension (FD) is not limited to a single domain; rather its usefulness can be extended to fields like segmentation, classification of shapes and analysis. Through this paper, the idea of classification of face shapes is presented using our proposed method -Modified Relative Improved Differential Box Counting (DBC) method. The method has been compared with the current existing FD calculation method, Improved DBC. The face data set is matched with popular geometric shapes, ellipse, rectangle, oval and triangle and classified according to the minimum FD difference between the face image and the given geometrical shapes. The experiments conducted with face sketch data sets have provided promising results and has also demonstrated that our proposed method can perform better in the field of classification, thus in general indicating that fractal dimension method is effective for classification of face shapes.

Detection of Violence in Videos using Hybrid Machine Learning Techniques

Sumitra Kisan, Baishnabi Sahu, Abhijit Jena, Sachi Nandan Mohanty

Abstract

Surveillance videos are able to capture a variety of real-world anomalies. All kinds of activities like walking, talking, riding a vehicle are considered normal behaviour. But any sort of activity that does not adhere by the definition of normal pattern is considered as abnormal or anomalous. It can be any irregular behaviour like yelling, theft in public, breaking into a house, accident and many more. In this work, the intention is to develop a model that will take videos captured from CCTV cameras on streets, ATMs, police station, roads, hospitals, railway stations, etc., as input and classify them as normal or abnormal (contains anomaly at some point of time). A video which contains anomaly is labelled as positive and normal videos are labelled negative. Change in motion vector, is taken as the key for classification. This research, aims to find several spatial and temporal feature descriptors like Histogram of Oriented Gradients, Histogram of Optical Flow and then use the extracted features in classifiers such as CNNs for HOG and HOF. The aim the proposed method is to return positive hits for portions of video sequences that contain violent content.

Voice Identification in Python Using Hidden Markov Model

Vmnssvkr Gupta, R. Shiva Shankar, Harika Devi Kotha, J. Raghaveni

Abstract

Recognizing the speech is the process for recognizing speech of human by computer and producing output in well written sequence format. During these days applications which are based on speech recognition are receiving enormous popularity because of using Natural Language Processing (NLP) techniques. To help physically disabled people we came up with an idea of building a voice assistant with continues interaction feature. For this, we are using speech API module here. In Our System, we have mainly three modules. One is user module, other is speech API module and the final one is system module. Using this interface, every user can interact with system to complete their works related to Google search and document preparation. Here, the main advantage is user can interact with the system continuously until he or she wants to exit.

Student's Academic Performance Prediction Using Machine Learning Approach

Vairachilai S, Vamshidharreddy

Abstract

Predicting academic performance is an important task for the students in university, college, and school, etc. The factors which affect the student's academic performance are class quizzes, assignments, lab exams, mid, and final exams. The student's academic performance should be informed to the class teacher in advance that will decrease the student's dropout and increase the performance. In this paper, machine learning classification algorithms such as decision tree, Support Vector Machine (SVM), and Naive Bayes are implemented to predict the student's academic performance. The performance of an algorithm has been evaluated based on confusion matrix, accuracy, precision, recall, and F1 score. The obtained result shows that the Naive Bayes classification algorithm performs better.

Energy Efficient Secure Multicast Group Communications For Iot Applications Using WSN

Kartheeban K, Vairachilai S, Shubhangi V Urkude

Abstract

Internet of Things (IoT) is the latest industry buzzwords and it uses actuator networks (WSNs) as its backbone. Using node-to-node communication in the form of multicasting and broadcasting is needed in the energy-constrained nodes in IoT. To make secure group communication for the group of nodes we propose a less energy efficient protocol for making a secured multicast group communication using WSN. The applications of this protocol is examined and rationalized by a systematic analysis of the performance metrics based on three different parameters such as packet loss, overhead and cost using NS3 simulation based on different destination nodes.

ABSTRACT

Highly sensitive application like spring needs some additional care in design. The impact of improvement is very high if its application is high or its significant effects on tangible and intangible benefits. This research identified a part in the automobile clutch system which replaces a massive amount of components from its instantaneous precursor, spring of coil type and clutch cover of lever-type. Such component is none other than helical coil spring of automobile light vehicle Suspension. Its cost is less due to its determined complication in shape and manufacturability. In most cases the mass of the component is the issue in automobile and in particularly such sensitive component of helical coil spring of automobile light vehicle Suspension. Hence here it is focused for material validation. The material validation is main aim of this piece of research. The materials like EN AW – 2011 -3.1655and Wrought Stainless Steel were considered for investigation. The SOLIDWORKS preferred for this study. The helical coil spring of automobile light vehicle Suspension is designed and modeled. The finite element analysis is employed to deploy the material behaviors in the computer aided investigation

Abstract

A simple proof is given that $\sum_n \frac{\mu(n)d(n)}{n} = 0$ using the Prime Number Theorem.

THE ICFAI FOUNDATION FOR HIGHER EDUCATION REGISTRAR (Deemed-to-be-University Under Section 3 of the UGC ACT, 1956)

1.INTRODUCTION

Let μ(n) denote the Moebius function and d(n) the divisor function. The question "$\sum_n \frac{\mu(n)d(n)}{n} = 0$" was posed in ([4], p 1599). W.Narkiewicz in a letter indicated that it can be proved by contour integrals. In this note we use the Prime Number Theorem in the form "$\sum_n \frac{\mu(n)}{n} = 0$ " to obtain one more proof(Prop 1).

A Machine Learning Model to Identify Duplicate Questions in Social Media Forums

Sandeep Kumar Panda ,Vivek Bhalerao, Sathya A.R

Abstract: In recent years, digital platform forums where question and answers are being discussed are attracting more number of users. Many discussions on these forums would be repetitive nature. Such duplicate questions were provided by Quora as a competition on Kaggle. It is observed that the dataset provided by Quora, requires many modifications before training machine learning models to obtain a good accuracy. These modifications include feature extraction, vectorization and tokenization after which the data is ready for training desired models. While analyzing each model after prediction, it gives plenty of information about its efficiency and many other factors. Later, these information of different models are compared and helps to choose the best model. These models later can be combined and used as a single model with best accuracy. In this paper, a Machine Learning model which will predict duplicate questions is proposed.

Keywords : Machine learning, Feature extraction, Vectorization, Efficiency.

I. INTRODUCTION

In present days, the proliferation of online competition is playing a vital role for academia as well as industries. Likewise, Kaggle is one of the platforms which enable anyone to learn and mentor each other on personal, academic, and professional data science journey. This platform conducts competitions, discussions, courses etc. One such open competition is posted by Quora.com [1]. Quora, itself faces challenges like, the presence of questions with same intent called as 'duplicate questions'. These questions make writers to answer in multiple versions. However, Quora uses random forest model to identify these duplicate questions. But, there is need of better model for this recognition. Therefore, this paper presents a hybrid novel approach and delivers a better solution to the problem faced by them.

Various machine learning models intended to identify these duplicate questions are presented in this paper. These identifications have specific accuracy value, using the way of obtaining the results; the model can be improvised as per Quora requirements. Hence for this recognition, three machine learning models were used, and their accuracy is analyzed using various statistical methods such as log-loss, confusion matrix. Such analysis helps to provide a better understanding and a decision to choose the best model.

II. LITERATURE SURVEY

As it is known that, reading each question provided to Quora , searching for its duplicate question and answer the same solution as the previous one is time taking and requires a lot of man power. To solve this problem Quora is currently using random forest algorithm for find duplicate question with certain accuracy. To improve its accuracy it has posted a challenge to identify duplicate questions with better accuracy. This challenge consists of a dataset and information regarding the dataset. The dataset provided is a label dataset consisting of perfect labels provided by professionals.

In the past, many research works were done in finding duplicate texts consisting of Greedy String Tiling Wise, 1996; Mihalcea et al., 2006. A paper by Torsten Zesch et al., 2012 tells that the database contain texts with different words but have same intent if it is looked as a whole text. Whereas, answering a sentence is a task of selecting a text containing the information satisfying that sentence (Lei Yu et al., 2014). Using measures for string similarities by (Lei Yu et al., 2014) proposed that, text from same field domain may contain similarities. Other techniques were also used for recognition of duplicate text which also required modification for better results.

III. DATASET

The dataset provided by Kaggle consist of six columns. These are labeled as id, qid1, qid2 , question1, question2 , Is_duplicate. Here, the dataset consist of 404351 pairs of question and each question has a unique id mentioned. However, the questions provided are repeated and can be discarded. These questions also contain many special characters and need to be analyzed before training the model. The machine learning model cannot understand words or questions in a way present in the dataset. Therefore, they need to be converted in a way such that the proposed model can take these sentences as input. The dataset also provide the information like the given questions pairs are duplicated or not. This shows that, the model training is of supervised type of machine learning.

Revised Manuscript Received on February 06, 2020.

Development of Mobile Application for Faculty Time out Information

Telkapalli.V.S. Ram Kashyap, Kishore Kumar Kamarajugadda

Abstract: *In the trend of mobile applications, the world is surfing through many applications for various personal and professional purposes. In every domain including the cutting-edge technology such as Machine learning, IoT (Internet of Things), representing the data to the user in a proper and understanding manner is very important. This is where mobile applications come to use. Mobile applications can be used to resolve many communication issues especially when communication is between low level to high level and vice versa. This application is made to serve as one of the best ways of communication between faculty and students especially when the faculty is not available in the cabin and the student is willing to meet the faculty at the same time. The mobile application uses Dart Language with Flutter UI Software Development.*

Keywords: *Dart, Flutter, IoT (Internet of Things), Machine Learning, UI (User Interface).*

I. INTRODUCTION

The evolution of mobile application is increasing rapidly in the 20th century. In any sector like bank, industrial, private and public sectors, the use of mobile application changed the phase of data representation completely and the ease of transparency in a sector. Not only in the representation of data, but also it bought the revolution in the process of work getting done especially in the bookings for railways and other means of transport. Showing the way of reduced number of levels in the conventional process in the sectors easy for both the users on both sides to get the required job done. From centuries, there has been a continuous change in the world of internet. During this change, many platforms such as websites were introduced. But occupation of smart phones changed the phase and mobile applications became necessary as they are efficient and as compatible as websites in the computer. The designed and developed mobile application is built for students and for faculty in the university where the faculty sets the reason, day and timings when they are leaving out of the cabin in the application and the students can check if the faculty is available in the cabin if they want to meet the concerned faculty.

In the university setup [1], if the student wants to discuss with the faculty members any student related issues or related with the course/subject, student is unaware of the fact the concerned faculty is in/out of his cabin for the discuss. If the students have information about the faculty availability in his/her cabin, it will save a lot of time for the student. This miscommunication between students and faculty in the university about the availability of the concerned faculty in their respective cabin is leading to some problems to both students and faculty especially at important times such as examinations, admissions. The necessity to solve this problem led to building a mobile application.

Generally, a mobile application [2] can be built using many languages such as android, Dart etc. The language used for building the proposed application is Dart and flutter SDK. Flutter is a user interface software development created and introduced by Google. It is an open source. In flutter, everything is considered as a widget which are divided into two types namely Stateless Widget and Stateful Widget. It uses Dart language which is very easy to adapt for any software developer as it is one of the best high-level language ever created.

A mobile application [3] demands a lot of space, fast, accurate and efficient data retrieval as the number of users increases. Hence, the database used here is Cloud Firestore which was created by Google.

II. REVIEW OF APPLICATION

The existing systems, Learning Management Systems (LMS) provide various facilities for the students such as representing the attendances, the number of courses registered by a student, respective faculty for the registered courses and the corresponding grades achieved by a student [4]. But it does not provide any facility of showing if the faculty is available in the cabin under different situations. Different situation includes the faculty having a sudden meeting, applying for an emergency leave due to any serious reason.

In order to overcome the described problem, the mobile application has been developed so that the students can know about the faculty time out information from the cabin with the reason to maintain transparency.

III. PROPOSED METHODOLOGY

The activity diagram (Fig.1) shows the architecture and the following process that a faculty member and a student will be undergoing in the mobile application [5]. As shown, both the faculty and student will be registered by giving the details and then they are navigated to login where they will be given proper and correct credentials. If the wrong credentials are given, they remain in the Login module.

On successful login, they are navigated to their respective home modules where faculty gives date, to and from timings and students can check their respective faculty time out in their home module.

Revised Manuscript Received on February 2, 2020.

Sketch to Photo Conversion using Cycle-Consistent Adversarial Networks

Kommalapati Abhiroop Tejomay, Kishore Kumar Kamarajugadda

Abstract: It is proposed to use the cycle-consistent adversarial network as a way to convert images of sketches to images of photos. The network learns to perform the mapping from the domain of sketches to the domain of photos and due to its architecture also learns the inverse mapping from the domain of photos to the domain of sketches. The network converts sketches to photos by reducing a weighted sum of the validity, reconstruction and identity losses. The advantage of using a cycle-consistent adversarial network over other network architectures is that it is not mandatory to have aligned image pairs as its training set and works in an unpaired setting.

Keywords: Cycle-Consistent Adversarial Networks, Image-to-Image Translation, Generative Adversarial Networks, Generator and Discriminator.

I. INTRODUCTION

Deep Learning research today has advanced significantly ever since its early days in the 1980s. From early perceptrons that could be used to implement simple boolean logics such as AND, OR and NOT, today's deep learning algorithms are quite adept at performing complex tasks such as image classification, text and music generation, facial recognition etc. Examples of such algorithms are convolutional neural networks [1, 2], recurrent neural networks and the BERT [3] algorithm. The ILSVRC challenge, more popularly known as the ImageNet challenge gave rise to several state of the art architectures like ResNet [4], SENet [5] which are variants of the base convolutional neural networks. These algorithms perform so well that many consider the ImageNet challenge a solved problem.

But the last 3 to 5 years have seen a significant rise in applications of deep learning to generative modeling tasks. A generative model involves generating examples that are almost indistinguishable from the instances in the original training set. A significant advancement in the generative modeling field was the introduction of the generative adversarial network [6] at the 2016 NIPS Conference where the ideas presented are now considered fundamental turning points for generative modeling. Ever since then, several variations of generative adversarial networks have been proposed which has propelled the field to great heights. A generative adversarial network is comprised of two neural networks, one being the generator and the other, the discriminator. The generator tries to synthesize or generate examples that bear similarities to the training set instances where as the discriminator tries to distinguish where a given instance is real, i.e., from the original training set, or fake, one of the generator's forgeries. The key point to note here is that the generator generates these example from random noise. The generator and the discriminator battle against each other and at the end of training, the generator becomes so good at generating examples that closely resemble that of the original dataset that the discriminator is unable to distinguish between real and fake images anymore. Essentially, we need to find the probability density function that mimics that of the training dataset and sample data from it. Figure 1 shows the architecture of a generative adversarial network.

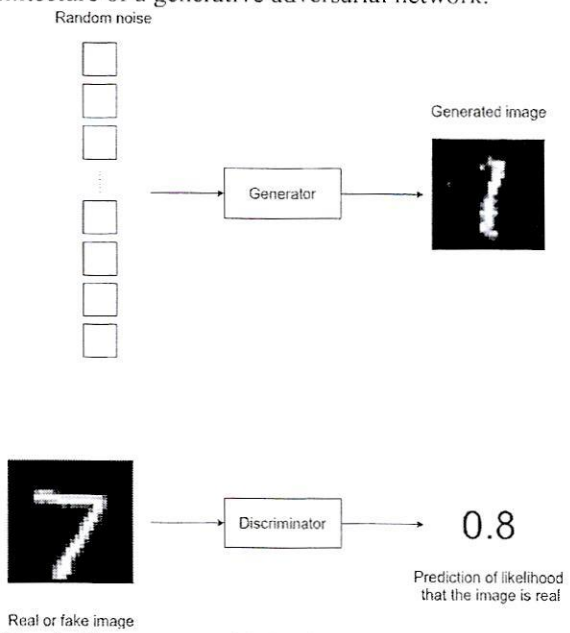

Fig. 1. Generator and Discriminator inputs and outputs in a GAN

One of the interesting problems in generative modeling is Image-to-Image translation. It involves trying to learn a mapping between input and output images using a training set of image pairs that are aligned. We try to learn a mapping from X to Y, i.e., $F: X \rightarrow Y$ where images from the distribution $F(X)$ are so similar to that of Y so much so that they are indistinguishable from one another. This is done by reducing an adversarial loss.

Abstract

Smartphone with the Internet is the most common item today and it provides the best online platform for businesses to trade their goods. Customers are more comfortable with online shopping and banking transactions, which are enough for hackers to cheat. Phishing attacks are now very common for smart phones. These attacks come in a variety of ways to steal customer sensitive information and payment information through fake Short Message Service(SMS) or E-Mail or Uniform Resource Locator (URL) links or applications(APPs). Therefore, the end user needs to know a few precautions to avoid phishing attackers. This paper explicitly discusses phishing attacks by their behavior and proposes a parallel defending approach to classifying messages as harm or spams using the Graphics Processing Unit (GPU) platform, which is achieved in logarithmic time of O(n log n) and also discusses the future scope.

Keywords: Smartphone, Phishing, Mobile Security, GPU, Parallel avNNet, Smishing.

I. Introduction

Phishing is a cyber security threat with the help of social engineering techniques to trick internet users into disclosing personal and confidential information. Phishing attacks on smart phones are increasing day by day. In 2019, 5,4,8,288 phishing sites have reported to the APWG. Agari documented that 62% of BEC (Business E-mail Compromise) attacks demanded funds in the form of gift cards, 56% in the third quarter of 2019 and 65% in Q2. 16% of attacks requested payroll diversions, down from 25% in Q3. 22% of BEC attacks include requests for direct bank transfer [IV]. Most of the areas Sensitive user credentials are essential for every end user to enjoy using the Internet for e-commerce and online banking

Abstract

Ladle furnace slag disintegrates into fine powder during cooling due to phase transformations of di-calcium silicate. This creates an adverse impact on working conditions and the environment by dust generation. In this paper, a short overview on different studies to overcome the disintegration problem is provided. An attempt was also made to study the effects of several different additives and their mixtures on disintegration of slag. Phase equilibria calculations were carried out for some additives using FactSage® to understand the phase changes in the slag. Based on the phase equilibria calculations and literature data, initial laboratory experiments were conducted at 1650 °C with different additives such as boric acid, aluminium, and fly ash. Slag samples were analyzed with X-ray

Abstract

This paper presents the mathematical modeling of 3RRR and 4 RRR Planar parallel manipulator and the performance analysis (Dexterity and manipulability indices) by using direct kinematic solutions, A parallel mechanism consists of the base of mechanism and the moving platform where the end-effectors are located. In this work the moving platform is replaced with revolute joint connected with end effectors, the base and the platform are connected by a series of linkages, first the direct kinematic relations are developed subsequently performance indices are compared for 4RRR and 3RRR parallel planar manipulators, with the addition of redundancy the 4RRR manipulators shows better performance indices than 3RRR parallel manipulators.

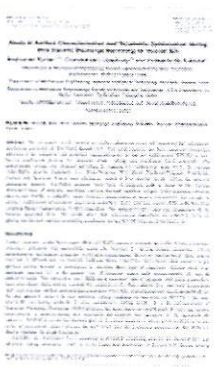
Study of Surface Characterization and Parametric Optimization during Wire Electric Discharge Machining for Inconel 625

79



Abstract:

This presented article focuses on surface characterization and assessing the satisfactory machining condition of WEDMed Inconel 625. This work material has been received remarkable attention to the industrial and academic organization for its end use applications. WEDM is well-known machining process for intricate shape cutting and machining hard materials. The experimental design was planned according to L_{27} orthogonal array (OA), by varying controllable process parameter (i.e. Wire-Tension, Wire-speed, Flushing-Pressure, Discharge-Current and Spark-on Time), each parameter varied at four discrete levels, within the selected parametric domain. WEDMed surfaces have been investigated with a focus to the surface characterization of selected machined surface through captured images from scanning electron microscope (SEM). Eventually, multi-response optimization of process parameters was sought by using a combination of nonlinear regression modelling, fuzzy inference system (FIS) with Teaching Learning-Based Optimization (TLBO) algorithm. The obtained TLBO result was compared with the Genetic algorithm (GA). The results show that optimization algorithms are effective tools for getting satisfactory optimal machining conditions during WEDM process of Inconel 625.

Abstract

Present paper discus with the development models such as Multiple Regression Analysis (MRA) and Artificial Neural Networks (ANN) for a domestic refrigeration system to predict the performance of a system using Hydrocarbon Refrigerant Mixtures (HCRM). The experiments conducted with the changing evaporator temperature (Te), different hydrocarbon refrigerant mass (mr), and variation in capillary tube length (Lc). The ANN model working with the feed backward back-propagation and Levenberg-Marquardt training algorithm is used to develop the model. This model is used to predict the performance considerations such as power consumption, refrigeration effect and COP.

Similarly to develop an MRA and it has been checked for adequacy and significance. Finally, the ANN model is an excellent agreement to a multiple regression model with the coefficient of determinations (R^2) of 0.989. The minimum correlation coefficient obtained with the ANN method is higher than the maximum correlation coefficient obtained from the MRA. Also, the value of the error of the ANN method is much less than the MRA method indicating the higher confidence coefficient of the ANN. These values indicate that the developed ANN model is more reliable and accurate than the multiple regression analysis. Based on the above study reveals that the ANN approach is a better technique than MRA for performance and prediction of domestic refrigeration system with high accuracy

Abstract

COVID-19 pandemic has become the most devastating disease of the current century and spread over 216 countries around the world. The disease is spreading through outbreaks despite the availability of modern sophisticated medical treatment. Machine Learning and Image Analysis research has been making great progress in many directions in the healthcare field for providing support to subsequent medical diagnosis. In this paper, we have propose three research directions with methodologies in the fight against the pandemic namely: Chest X-Ray (CXR) images classification using deep convolution neural networks with transfer learning to assist diagnosis; Patient Risk prediction of pandemic based on risk factors such as patient characteristics, comorbidities, initial symptoms, vital signs for prognosis of disease; and forecasting of disease spread & case fatality rate using deep neural networks. Further, some of the challenges, open datasets and opportunities are discussed for researchers.

Abstract

Conveyor belt is a dedicated machine which is used in transporting the goods in assembly line area. This machine is driven by using a single mechanism for an operation. Here the focus is on the Geneva wheel which is used for this respective operation. Geneva Wheel mechanism here rotates and the index the roller in the conveyor belt one by one step. As we know there is the major drawback of a Geneva mechanism that jerk a lot while the operation is in process due to which it loses its acceleration. Here a symmetrical coupler curve of 4 bar mechanism which run on a Dwell curve is added to avoid the jerk as low as it can. The forces are analysed on the simulated mechanism with meshing method and the result to be presented in a graphical order, which represent the Von Mises stress and displacement.

Abstract

Lightweight materials like aluminum (Al) and magnesium (Mg) alloys are extensively used in automotive industries. The welding between these dissimilar alloys is inevitably essential to produce high-quality and reliable joints. High power ultrasonic metal welding (USMW) technology, which mimics the properties of solid-state bonding, offers a potential solution in welding of these difficult-to-weld materials. The superior characteristics of this welding process, such as low heat input, less weld time, and high production efficiency, reduce the tendency to form brittle intermetallic compounds (IMCs) and enhance the joint strength of Al/Mg dissimilar joints. The current study is focused on obtaining favorable performance measures during the USMW of dissimilar Al/Mg alloys through controlling the dominant input factors. The tensile shear (TS) and T-peel (TP) failure load firstly increased up to a specific limit and decreased further with the rise in weld energy. The compared fatigue strength results of Al/Mg dissimilar joints with other bonding techniques provides an insight into the fatigue failure mechanism. The mechanism behind the weld formation is discussed based on the fracture surface and interface morphologies, microstructure evolution, and IMC formation along the weld interface. At higher weld energy, the elevated interfacial temperature promoted the formation of $Mg_{17}Al_{12}$, Al_3Mg_2 IMCs and accelerated the elemental diffusion at the weld interface. Mechanical interlocking and dynamic recrystallization at the periphery of the weld interface due to severe shear deformation results in refining the grain structure. However, this detrimental interfacial reaction can be reduced by introducing a coating on the Mg surface. Thus, the process engineers can now adopt this technique to get best combinations of input parameters in USMW problems, and there is no need to depend on the manufacturer's handbook.

Abstract

Electrification of vehicles presently grabs attention as an essential factor in most of the automotive manufacturing industries due to continuous upsurge in environmental pollution, unstable fuel prices, and stringent government policies against gasoline fuels. In order to tackle these challenges, a conservative and energy-efficient technique is required. The high power ultrasonic metal welding (USMW) process has been effectively used in the automotive industries for assembling lithium-ion (Li-ion) battery packs and its modules due to its solid-state principle. Aluminum (Al) and copper (Cu) are the two most crucial and commonly employed conductive metals. The joining of these materials by conventional methods is extremely difficult due to its higher thermal, chemical and physical properties. However, USMW yields better quality welds under the influence of optimal parametric conditions. In the current study, the effect of various weld parameters such as weld time, weld pressure, vibration amplitude, and different surface conditions are investigated to study the weld strength and failure behaviour by mechanical and microstructural analyses. The tensile shear and T-peel failure loads of the weld are maximum at the highest vibration amplitude with a moderate amount of weld pressure and weld time. Meanwhile, these weld strengths are decreased with an increase of surface roughness due to the disappearance of relative motion between the Al-Cu sheets. Micro-hardness study reveals the material softening and hardening phenomena during the welding process. The various types of weld qualities are also classified as 'under weld,' 'good weld' and 'over weld' based upon the nature of bond formation and spreading of microbonds across the weld interface at various weld parametric conditions. The future prospects of this USMW field is that the process engineers can now adopt this technique to get best combinations of input parameters in USMW problems, and there is no need to depend on the manufacturer's handbook.

Abstract

The dissimilar joining of aluminum (AA 1100) to brass (UNS C27000) in the electric power industry is highly required to transmit the electricity efficiently. However, it's hard to join these materials using fusion welding process because of the broad differences in their physical, mechanical and chemical properties, and the evaporation of zinc constituent during the welding process. Thus, it is directed the researchers to find a new technique to tackle this problem. It seems that ultrasonic metal welding (USMW) is one such promising method that is developed nowadays. In this study, lap joints of AA 1100 aluminum alloy and UNS C27000 copper alloy have been produced using USMW and the effects of process parameters on the mechanical strength and interface microstructure have also investigated. The tensile shear failure load firstly increases with the rise of weld time up to 0.55 s of weld time followed by a rapid decrement in the value due to excessive plastic deformation in the weld zone. It is confirmed from the energy dispersive X-ray spectroscopy (EDX) and X-ray diffraction analysis (XRD) results that USWed aluminum to brass produces intermetallic compounds (IMC), and its thickness is getting wider with the increase in weld time. A composite eutectic structure of Al and Al_2Cu is the first compound formed in the middle of the weld zone.

Abstract

Ultrasonic spot welding (USW) has received a great deal of attention by the automobile manufacturer to build lightweight structural components. However, the versatility of using this process is still limited due to the substantial instabilities in weld quality. These fluctuations are mainly due to the lack of scientific understanding of this process and poor control of intermetallic compound formation. Therefore, this study is focused on the improving of the joint strength and its quality by ultrasonic welding of Al3003 and SS304 sheets with molybdenum (Mo) and zinc (Zn) powder as interlayers. The results revealed that the optimum thickness for Mo and Zn interlayers are found to be 0.11 mm and 0.15 mm, respectively. In comparison, Al3003/SS304 joints with Zn interlayer exhibits the maximum tensile shear failure load about 626.44 N at 1.5 s of weld time, which is better than those of the joints produced with Mo interlayer. The microstructural morphologies at the weld interface reveal the different characteristics like mechanical interlocking at the outside zone of the sonotrode knurl indentation, wavy type region under the sonotrode knurl, and swirling like diffusion zone inside the sonotrode knurl.

ABSTRACT

The interaction of two counterpropagating plasmas and shockwaves due to a 7 ns laser induced breakdown (LIB) of ambient atmospheric air was studied using the 2D emission and shadowgraphic imaging technique. The effect of separation distance (d) between the two plasma sources and their energy ratio on plasma and shockwave evolution is presented. These low density and low temperature plasma sources form a stagnation layer in the interaction zone that showed an interesting dependence on the input energy of the sources. The interaction dynamics of the two counterpropagating plasma plumes and the shock waves in ambient air are compared with that of the respective single plasma source to explicitly bring out the energy exchange during the interaction. The evolution of a plasma jetlet, studied by 2D emission images and shadowgraphic imaging, has shown very good correlation giving valuable insight into the role of a plasma induced shockwave on the expanding plasma. The propagation of the shock front of the high energy source through the plasma of a low energy source is observed to predominantly lead to the formation of a jetlet and its evolution.

Reconfigurable control as actuator fault-tolerant control design for power oscillation damping

Digvijay V. Nair[1*] and MSR Murty[2]

Abstract

This paper presents design of an self contained actuators unit in wide area damping control of power system in stabilizing system response for both nominal system condition and during actuator faults. First it is presented that use of multiple actuators in wide area control aid in improving damping in power system. A wide area damping controller feeding multiple actuators to satisfy multiple objectives in wide area damping control of power system is designed. Minimization of infinity norm of closed loop transfer function of power system with wide area controller in feedback path & closed loop poles placement techniques are used in controller synthesis. Second a reconfigurable control on the lines of fault hiding principle is added to the controller design to maintain system damping to pre-fault level in case of actuator faults. A reconfiguration component(RC) is activated on occurrence of actuator fault thereby reconfiguring system dynamics and redistributing wide area control signal among remaining active actuators. RC together with remaining active actuators and under same wide area damping controller maintains system damping to pre-fault level thereby preserving system dynamic response. In the reconfigurable control design presented here no new actuators outside the unit of actuators designed for wide area damping control is required. This makes for an self contained actuators unit in wide area damping control of power system both for nominal system condition and for system affected by actuator faults. A two area power system model is considered here for demonstrating effectiveness of designed robust damping controller with multiple outputs feeding multiple actuators in wide area control and illustrating the idea of self contained actuators unit for maintaining system damping in case of actuator faults.

Keywords: Wide area control, Robust damping controller, Actuator fault, Reconfigurable control, Reconfiguration component, Self contained actuators unit, Power oscillations

1 Introduction

One of the major concerns of power system is small signal instability and power oscillations arising out of small changes taking place in power system. Small signal stability is the ability of the system to maintain synchronous operation of generators for constant changes(small in comparison to net generated power in system) in operating conditions of power system. This can be load changes, transmission line outages, generator faults and so on. These constant changes witnessed in power system results in power oscillations mostly of electro-mechanical in nature involving multiple machines with-in same or different areas exchanging power between them [1]. Local oscillations are damped by control units like power system stabilizers(PSS) but for inter-area oscillations involving generators from different areas is difficult to be damped locally. Local controllers lack global observation to see inter-area modes responsible for power oscillations between machines from different areas [2]. With advent of phasor measurement units(PMUs) involved in synchronised and high speed data measurements and transmission from remote locations is made possible [3, 4]. This solves problem of lack of global observation needed for control action to damp out inter-area oscillations [5]. PMUs led to newer controller designs for wide area damping control of power system [6–8]. Dedicated controllers connecting remote signals to local stabilizing units are

Abstract

Additive manufacturing (AM) contributing to increase of National Grass Product (NGP) and National Net Products (NNP) by buy-to-fly ratio, that is saving energy and time, low wastage, eco-friendly, encourages JIT production system and AM is a revolutionary approach in manufacturing industry, as it is a promising method in manufacturing the metal parts so as to overcome the common problems which are associated with conventional techniques. These methods mainly focus on the manufacturing of the multifaceted profiled or contoured parts (e.g., permeable gallows, freeform surfaces, and yawningniche). This concept deals with, adding up material in manufacturing a part than the concept of removal like conventional machining practices. This study focuses the laser AM of metals. The objective of this study to conduct the survey and highlight the research scope by identifying the application areas, methods involved, influencing parameters, possible new research objectives, possibilities of Hybrid manufacturing etc. for further research.

Abstract:

Nowadays Attendance Marking should be considered as the huge factor to both the understudy similarly as the torch of an enlightening affiliation. Savvy Attendance utilizing Real-Time Face Recognition is a genuine arrangement which accompanies everyday exercises of dealing with understudy participation framework. Face affirmation based support for face is to measuring investment by using face biometrics subject to HD screen images and other advancement. In my face affirmation adventure, a PC structure will have the alternative to locate and see human faces smart and absolutely of pictures or records that have being overcome an observation focal-point. Various checks and systems have been conveyed for improving the demonstration of face attestation at any rate the arrangement to be executed here is face-acknowledgment.In face recognition the camera will take the image and store it in the data base for future process. It helps in change of the housings of images with the objective that the substance of the understudy can be successfully seen for their interest so the investment database can be viably reflected thus.

The present study analyze the thermosolutal convection analysis in an inclined porous bed. It is also extended to investigate the influence of heat source. This work is analyzed by using linear stability analysis to examine the Hadley flow in an inclined porous body. The thermal stability of small-amplitude distributions is analyzed with corresponded to longitudinal rolls by using normal modes analysis. By applying the Runge Kutta method the eigenvalue problem is solved. The problem is studied for different flow parameters.

Let d be a squarefree integer. We prove that (i) $\sum_n \frac{a(n')}{n}$ converges to zero, where n' is the product of prime divisors of n with $\left(\frac{d}{n}\right) = +1$. We use the Prime Number Theorem. (ii) $\prod_{\left(\frac{d}{p}\right)=+1} \left(1 - \frac{1}{p^s}\right)$ is not analytic ar s=1, nor is $\prod_{\left(\frac{d}{p}\right)=-1} \left(1 - \frac{1}{p^s}\right)$. (iii)The convergence (i) leads to a proof that asymptotically half the squarefree ideals have an even number of prime ideal factors (analogue of Ramanujan's assertion).

NOTE ON MEET-DISTRIBUTIVE LATTICE MATRICES

Rajesh Gudepu and DPRV Subba Rao

ABSTRACT. In this paper, we extended the notion of meet-distributive lattice matrices. The properties of meet-distributive lattice matrices are studied and various characterizations of them are given.

1. Introduction

The notion of lattice matrices appeared firstly in the work Lattice Matrices [5] by Y. Giveon in 1964. A matrix is called a lattice matrix if its entries belong to a distributive lattice. All Boolean matrices and fuzzy matrices are lattice matrices. Lattice matrices in various special cases become useful tools in various domains like the theory of switching nets, automata theory, and the theory of finite graphs [5]. The basic properties of pseudocomplemented lattices and the representation theorem are discussed by G. Birkhoff [1] and T. S. Blyth [2] in Lattice theory. We know that multiplication of Boolean (lattice) matrices is associative and distributive with respect to join. But, in general it is not true, that this multiplication is distributive with respect to meet. In 1964 T. S. Blyth [3] introduce the concept of meet-distributive Boolean matrices.

In this paper, as an analogue to T. S. Blyth [3], we generalize the concept of meet-distributive Boolean matrices to meet-distributive lattice matrices and we characterize those matrices.

In classical linear algebra, a QR factorization is a decomposition of a matrix A into a product $A = QR$ of an orthogonal matrix Q and an upper triangular matrix R.

Abstract

Despite the fact that most of the data centers are software-defined, the multifaceted network architecture and increase in network traffic make data centers to suffer from overhead. Multipath TCP supports multiple paths for a single routing session and ensures proper utilization of bandwidth over all available links. As rise in number of nodes in data center is frequent and drastic, scalability issue limits the performance of many existing techniques. Segment Routing is vibrant in reducing scalability disputes and routing overhead. Segment routing approach combined with MPTCP traffic result in efficient routing approach. The downfall of the link capacity due to drastic incoming traffic remains as a major concern in data center network which enforces preventing link energy depletion due to high network traffic. Our proposed work, segment routing based energy aware routing approach for software defined data center aims to achieve throughput maximization through preserving link residual capacity and proper utilization of links. As well, our approach shows a decrease in length of segment label stack with respect to maximum segment label depth. Analysis is done by comparing the executions of other existing approaches in a single-controller environment with our energy-aware routing approach in a distributed environment. Distributed controller setup prevents network from single point of

ABSTRACT

Product life especially the high consumer products like mobile phones and automobile is considerably reduced. The lot of use-and-through kind products attracts the customers more. In the recent days, the re-sale value of utilities including automobiles is equivalent to scrap value. On other hand boosting up the driving power with low cost is highly preferred in the automobile industries. One of such key components is turbocharger which boosts up the power as well as helps in pollution reduction by complete combustion, engine size reduction, fuel consumption etc. The Compressor impeller is focuses in this research. The material validation is main aim of this piece of research. The materials like copper, gray cast iron and alloy steel were considered for investigation. The SOLIDWORKS preferred for this study. The impeller is designed and modeled. The finite element analysis is employed to deploy the material behaviors in the computer aided investigation.

Abstract

Rolling element bearings play vital role in the working of rotating hardware or machine. The imperfection-initiated vibration signal estimation and its examination is frequently utilized in deficiency recognition of direction. The crude sign is mind boggling in nature to dissect for deformity highlights, Therefore the sign be prepared to break down it. This article presents different sign handling procedures including canny strategies, for example, Artificial Techniques, Machine learning techniques and so on. The suitability of these strategies, all things considered, depends on the idea of features isolated from the bearing signs. The writing containing procedures utilized by different analysts have been managed in this review. This review may fill in as a kind of perspective for the scientists to go over different strategies in bearing diagnostics.

Abstract

In recent years, robots are utilized in almost all smart applications. The present world is running toward automation, and most of the manual works are automated. Nevertheless, robots are playing a very crucial role in automated industries. Robots have widespread usage in industries for carrying loads, picking and placing, and assembling. Robots work as mechanical components, and it is usually guided by a human to complete their work until the integration of artificial intelligence into the robots. Artificial intelligence has brought enormous developments in all the fields especially where the robots are involved. Before the integration of artificial intelligence with robots, a particular path was given for the movement of robots to take a lot of space in the industry, where it always requires some human guidance. This paper deals with artificial intelligence-enabled robots, which can plan their own path. Artificial intelligence algorithm called as A* algorithm is used in this paper to plan the path of the robot based on the obstacles. This algorithm helps the robot to find the optimized path. Using MATLAB, A* algorithm is coded to fix the source point and destination point in a grid between which the shortest path must be calculated. There are also many obstacles between the source point and destination point.

Fault tolerant-based virtual actuator design for wide-area damping control in power system

D. V. Nair ✉ & M. S. R. Murty

Electrical Engineering (2020)

86 Accesses | Metrics

Abstract

The objective of this article is to enhance the wide-area damping control of a large power system against actuator faults. In specific, damping of low-frequency system oscillations is carried out through centralized MIMO-based dynamic feedback controller (DFC). This particular approach requires multiple actuators, failure of which deteriorates dynamic response of the system. The problem of actuator faults is resolved using online reconfigurable control (RC). A reconfiguration component called virtual actuator (VA) is designed such that it reconfigures the system input and output signals and hides actuator fault from DFC. The process of control reconfiguration on actuator fault is automated without any additional control action. The effectiveness of the control methodology is verified by evaluating the dynamic system response of standard test systems using (1) multiple output DFC in damping control, and (2) online RC in design of fault tolerant wide-area damping controller.

Detecting Multiple Logins In Learning Management System for Online Exams: Moodle

By R. Balamurali, P. Mahesh

July 3, 2020

Introduction: The Need or Necessity

Amidst Covid-19 and lock down we were conducting online exams for students through LMS (Learning Management System) – Moodle. Being a part of the Computer Science and Engineering Department we were asked to tackle the problem of detecting multiple logins by a given user. This information can be manually extracted from the log file, but it is a very tedious and time-consuming operation. Performing it manually on a daily basis will take a heavy toll on the human resource. Hence, we thought of writing a GUI based python program to detect the multiple logins. The log file is a excel file with nine fields: Time, User full name, affected user, Event Context, Component, Event Name, Tell me about yourself, Origin and IP Address.

Sl. No.	Field Name	Description
1	Time	Date and Time of the event. Eg: 6/06/20, 14:03
2	User full name	Name of the user
3	Affected user	Which user gets affected by this task
4	Event Context	Under which item the event was performed, Eg: Course Name
5	Component	Name of the component, Eg: Quiz, Test
6	Event Name	Action/event performed by the user.
7	Tell me about yourself	More details about the action/event performed
8	Origin	Origin of the event Eg: Web
9	IP Address	From which IP address the event is generated.

Table 1: Log File fields and Descriptions

The various fields and its description of the log file is shown in the above table (Table 1). The screenshot of the logfile is shown below in Figure 1.

Abstract

Twitter tweets became a goldmine for data miners. The rationale behind this is that the tweets carry sentiments and emotions. Unlike objective and factual professional publishing, user-generated content is richer in opinions, feelings and emotions. The purpose of the project is to develop a deep learning based framework for recognizing emotions in tweets. It makes use of labelled training datasets in order to have learning process and then classify tweets in order to find emotions. These online expressions can have various practical applications. They have been used to predicted stock market fluctuations, book sales, or movie's financial success. Given some text, emotion recognition algorithms detect which emotions the writer wanted to express when composing it. An algorithm by name Deep Learning for Emotion Recognition (DLER) is proposed and implemented to achieve this. A prototype application is built to demonstrate proof of the concept. The empirical study revealed that the proposed system is better than the state of the art.

Numerical study on indoor temperature in multi-storey buildings

Anjanna Matta, M. Srinivasa Reddy

Abstract

The present study analyzes the thermal distribution inside the multi-storey buildings. This numerical study's importance is to enhance the energy optimization by providing a forecasting information on the heat flow demand. A generalized mathematical modeling is used to find the performance of thermal distribution. The available information from different sources are used. The given model initiates to an optimal number of predefined variables are applied. It can be assist required optimal heat source/sink in multi-storey buildings.

Classification of Lung Tissue Patterns on HRCT Images: Nature of Region of Interest and Classifier Performance

Jatindra Kumar Dash, Gandham Girish, P. Pavan Kumar, E. Sudarshan, Achyuth Sarkar

Abstract

Diagnosis of Interstitial Lung Diseases (ILDs) patterns in High Resolution Computed Tomography (HRCT) image is a challenging and time consuming task because of wide variety of patterns and large volume of data. Computer based detection of ILD patterns may increase radiologist's efficiency in terms of accuracy and time. In this article, we present texture based classification of ILD patterns using discrete wavelet (DWT). The effect of classifier performance due to variation in the shape of region of interest is studied extensively. Three different databases are created with varying shape of region of interest using a popular publicly available data set from University Hospital of Geneva, Switzerland. First type of ROI is irregular or arbitrary in nature covering the entire spread of the disease. These leveling are done by expert radiologists and other two are inscribed and bounding rectangular masks designed with the help of irregular mask. Five different classifiers (viz. Artificial Neural Network, K-Nearest Neighbour, Radial Basis Function Network, Support Vector Machine and Nave Bayes) are trained using the features computed from ROI using Discrete Wavelet Transform (DWT). The optimal parameter values are set for each classifier using extensive experimentations. Finally, a comparative study is performed to find out the best classifier and nature of ROI that provides highest performance.

An Efficient Amalgamation of Computational Models to Ensure a Secure IoT Environment

Sachi Nandan mohanty, A.Radhika, Vandna Dahiya Chinmaya Ranjan Pattanaik, Sujathakrishamoorthy

Abstract

The cloud computing merges with the IoT environments to enhance the scope of developing new applications and distributing these applications to the real world environment. But the current IoT environment faces many challenges in building an efficient IoT applications. In these challenges, ensuring security in the IoT environment plays a vital role.Traditional cloud models tried to solve the security issues in the IoT applications. But they all failed in producing the optimal solution. To solve the security issues of the IoT applications an amalgamation is performed between computing models such as cloud computing and corner society. The proposed system merges the trust examination model and usage template in which this combination solves the load balancing problem in the cloud computing. The corner environment structure which is made effectively and reducing the usage of the resources through the corner protocols to maximize the ability of the trust examination model. The proposed system gives the flexibility of loading the usage template in the cloud and loading the usage grammar template in the corner protocol in which results in the development of the IoT applications.

DETECTING FAKE ACCOUNT ON SOCIAL MEDIA USING MACHINE LEARNING ALGORITHMS

Dr.K.Sreenivasa Rao, Dr.G.Sreeram, DR. B.DEEVENA RAJU

Abstract

In the present generation, On-Line social networks (OSNs) have become increasingly popular, which impacts people's social lives and impel them to become associated with various social media sites [1]. Social Networks are the essential platforms through which many activities such as promotion, communications, agenda creation, advertisements, and news creation have started to be done. Adding new friends and keeping in contact with them and their updates has become easier. Researchers have been studying these online social networks to see the impact they make on the people. Some malicious accounts are used for purposes such as misinformation and agenda creation. Detection of malicious account is significant. The methods based on machine learning-based were used to detect fake accounts that could mislead people. The dataset is pre-processed using various python libraries and a comparison model is obtained to get a feasible algorithm suitable for the given dataset [2]. An attempt to detect fake accounts on the social media platforms is determined by various Machine Learning algorithms. The classification performances of the algorithms Random Forest, Neural Network and Support Vector Machines are used for the detection of fake accounts.

NOVEL QUAD PARALLELIZED ARCHITECTURE FOR DIGITAL IMAGE PROCESSING CONVOLUTION ON FPGAs

Ranganadh Narayanam
Department of Electronics and Communications Engineering, Faculty of Science and Technology, The ICFAI Foundation for Higher Education, Hyderabad, (Deemed to be University under section 3 of UGC Act, 1956), India

DOI: 10.5281/zenodo.3778567

ABSTRACT

The Digital Image Processing convolution is core block for Convolution Neural Networks (CNN) which is used in Deep CNNs and is used for advanced applications of feature extraction, image recognition etc. This paper introduces 2 novel hardware architectures for convolution process one of them is hardware Quad parallelized architecture. Performance comparison is done and I proved that parallelization is highly useful. This parallel one can speed up the process of convolution filtered image data transmission through telemedicine communication network etc. Implementation is done for 64 by 64 size matrix, 3 by 3 Kernel using Xilinx Vivado 2015.2 tool on Xilinx Artix-7 FPGAs using Verilog HDL.

KEYWORDS: Convolution; FPGAs; Kernel, Quad parallelized architecture.

1. INTRODUCTION

In digital image processing Convolution is one of the spatial domain techniques in which manipulating pixels is done between image and a 2D kernel of 3 by 3 or 5 by 5 size, which results in de-noised image, edge detected image, blurred image etc. the values in the kernel can be integers or can be integer kernel multiplied with a common fraction outside the kernel and can be customized depending on the requirement of the application.
In one of my research topics, I found that convolution filter is performing better than all the filters when it is going to higher levels of noise to the images [1]. It is found to be efficient by itself and also when combined with Translation Invariance (TI) algorithm [1]. So, I have got motivated to continue working on Digital Image Processing Convolution. The further motivation is due to its applications in Deep Convolution Neural Networks in the current booming era of Artificial Intelligence. So I have got motivated in developing its hardware.

In this research I have developed 2 different novel hardware architectures for convolution process, nowhere in the literature, and first of their kind [2]. This research is an extension to my research in [2] and to verify for ***higher important and standard size of 64***. The first one is completely sequential process of generating convolution results, and the second one is for improving the speed of the same architecture by parallelizing the process [2]. This hardware Quad parallelized architecture improved the speed of the convolution process. The programming is done using Verilog HDL and implemented on Xilinx Artix-7 FPGAs using Vivado 2015.2 Tool.

In section 2 architectures are explained, the section 3 discusses the implementation results and section 5 concludes the research, useful applications are noted in section 4.

Abstract

Paired transform splits the mathematical structure of many discrete unitary transforms, including the Fourier, Hadamard, Cosine and Hartley transforms, into the minimum number of short transforms. The discrete Haar transform that is very useful in many signal and image processing applications can be also calculated by the fast paired transform. The Haar transform can be considered as the particular case of the paired transforms, namely the 2-paired transform. In this research a Novel Fast algorithm for Haar transform is developed using paired transform: Paired Fast Haar Transform (Paired FHT). For illustration purposes relation between the Haar and paired transforms are described using the examples for 16, 8, 4 – point transforms are analyzed in detail. Finally the novel Haar transform: Paired Fast Haar transform is

Abstract: (740 Views)

Blockchain is a decentralized distributed network which allows peer-to-peer(P2P) communication among the users. As the name indicates, it deals with the group of records called blocks. We are in an era where both it is important to maintain the integrity of data as well as to fasten the process of the transaction. Blockchain helps in doing these by maintaining the timestamp on blocks and time required for a transaction can be reduced by eliminating the need of the third party during the process of the transaction. Bitcoin and Smart contract are the two major applications based on blockchain technology. Bitcoin is the first application which was developed on blockchain Technology and is a popularly known crypto-currency. Satoshi Nakamoto is the person who is behind the development of bitcoin [1]. Smart contract was defined by Szabo as " set of promises, specified in digital form, including protocols within which the parties perform on these promises [2]. This paper aims in bringing a detailed overview of blockchain and its applications followed by a case study on bitcoin.

MACHINE LEARNING APPROACH FOR PREDICTING BODY FAT

Vairachilai S, Shubhangi V Urkude, Gnanajeyaraman R

Abstract

A human body needs a certain amount of fat to function properly. Fat controls the body temperature protects the organs, and store energy for body functioning. For the human body, it is important to assess the current status of the body fat in order to make correct decisions to improve health. Recently, the Machine Learning approach has empowered strong and accurate predictions on many healthcare applications. Regression analysis is one such supervised machine learning approaches which is used to analyze the significant factors which will affect the body depending on the fat content. In this paper, regression analysis techniques such as Multiple Linear Regression (MLR), and Support Vector Regression (SVR) are applied and analyzed to predict the body fat. The performance of the algorithms has been evaluated based on regression models validation metrics such as Mean Absolute Error (MAE), Mean Square Error (MSE) and Root Mean Square Error (RMSE).

Proximity Measures For Link Prediction In Dynamic Network

Shubhangi R Urkude

Abstract

Now a day's growth of social network is gaining more attention from the user in different age group, profession, culture and geographical area in the world. This increasing use of social network attracted industries and academician to study the evolvement of people over time. The social network like Facebook, Twitter, Instagram and Flicker have more complex ties between the people and requires more efficient algorithm to recommend friends to their users in the network. Friend recommendation is one of the applications of link prediction. Link prediction is about forming future links in the social network. In this paper, we discussed various link prediction measures in context to the structural information and other high-level measures.

An Efficient Accident Rescue System using Lora

N.V.K Ramesh, V.Bhagiradh, K.Indravathi, M.Leena Reddy, B. Deevena Raju

Abstract: The road fatalities in India are increasing exponentially. These road fatalities have high impact on any country. The life of the injured person can be saved by providing the medical assistance. The traditional methods mainly concentrate on the transmission of the messages using the cellular network. The methodology of this project is to identify the location of the accident prone area and send that coordinates to the nearest medical help centers. The communication takes place between the rider and the system with the help of the Bluetooth device. GPS device is very well-known for the identification of the current location. The coordinates of the accident prone area will be extracted using GPS. The latitude and longitude coordinates of different hospitals will be stored in the database. The coordinates of the accident prone area and the coordinates of hospitals in the database can be mapped and the distance between them can be calculated. The coordinates of the nearest hospitals can be recognized and the communication can be established with that hospital.

Keywords: GPS device, Bluetooth device, cellular network location, accident prone area.

I. INTRODUCTION

The automobile industry plays a very vital role in human life [1]. Our life is completely dependent on the automobile industry. In our country more than 1, 50,000 people are killed in accidents in a year [2]. It is very difficult to protect a life of a person when he is met with an accident at the place where he cannot receive any help. In India 1 person dies for every four minutes due to accident. The road safety is a major issue in India. Many lives are lost due to road accidents. According to one survey conducted by the World Health Organization one lakh people died immediately at the location of the accident in 2013. The road fatality factor of any country can be reduced by contacting the nearest medical centres [3]. The mechanism present in this paper concentrates mainly on the message transmission to the nearest help centres [4]- [9]. GPS (Global Positioning System) is a device which is used for the location tracking. This device identifies the location through satellite communication. It takes the inputs at least from 3-4 satellites and identifies the locations. The device uses the triangulation method to identify the locations and then the distance calculation is very easy.

Bluetooth module also part of this system. Bluetooth device is used to for short distance communication. Traditional accident system is not concerned about the state of the driver. This proposal is takes the input from the driver. The input from the driver is the base for the further actions. The device uses radio frequency of 2.45 GHz for the communication. The conventional systems use GSM for the message transmission [10]- [12]. This paper presents our research work on implementation of LORA technology in the detection of accident and ensuring the driver's safety. This system uses LORA technology for transmitting the coordinates of the accident prone area to the nearest hospitals, so that the immediate help can be sent by that hospital to the area where the accident has taken place. LORA is a device based on an exclusive spread spectrum modulation technique developed by Semtech. Lora Module is an integration of Chirp Spread Spectrum and Forward Error Correction. The operating frequency of Lora Devices is between 137MHz to 1020 MHz .As a result, the devices can operate in both licensed and also in license free bands. Lora follows star topology. The star topology is a topology in which n-number of s are connected to a single server. Based on the server availability it responds to the client. The Lora module proposed in this system is LORASX1278 Ra-02 which operates at 433MHz. The main purpose of this paper is to propose a methodology that can solve the present problem.

II. LITERATURE SURVEY

A lot of research has been done in the field of accident detection and recovery. Md. Syedul Amin et al proposed a technic based on the speed of the vehicle [13]. This classical system utilizes the potential of GPS and accelerometer to monitor the location and speed of the vehicle. When the downward acceleration is more than a threshold value then it concludes that the vehicle is met with an accident. The system uses the GSM module to convey the location of the accident to the nearest help centres [14] –[18]. The second phase of the system is composed of GPS and GSM modules to send the location of the accident prone area to the nearest medical centres. The major drawback of this technique is that the methodology is not concerned about the state of the driver. There is no necessity that the retardation takes place only after the accident occurs. Naji Taaib Said Al Wadhahi et al has proposed a solution to reduce the number of deaths caused due to the accidents. This proposal is completely based on the working of IR sensors. The methodology proposed by this system contains two phases. The first phase is all about the detection of accident and the second phase concentrates on the prevention of an accident.

$L_d(1)$ IS $\bigcirc(logloglogd)$ FOR ALMOST ALL SQUARE FREE d

G SUDHAAMSH MOHAN REDDY, S SRINIVAS RAU

ABSTRACT. Let d be a square free integer.Using Hardy-Ramanujan's value of normal order of $\omega(d)$ we show that $L_d(1) = \bigcirc(logloglogd)$ except on a negligible set. We note that the proof verifies Robin's inequality $\sigma(n) < e^{\gamma} nloglogn$ (equivalent form of Riemann Hypothesis) for such numbers.

Let d be a square free integer with $K = Q(\sqrt{d})$ the corresponding quadratic field. The Legendre symbol $(\frac{d}{n})$ helps us to define the L-series $L_d(s) = \sum_{n=1}^{\infty} \frac{(\frac{d}{n})}{n^s}$. This series converges for Re $s > 0$ and defines an analytic function [3], [7]. The value $L_d(1)$ is of great importance because $L_d(1) = hk$, h =Class number of K and k =structure constant of K. The estimation of $L_d(1)$ (or its exact value) is of interest [3]. Our main result is

Proposition 1. *$L_d(1) = \bigcirc(logloglogd)$ except for d in a negligible set (i.e., a set of natural density zero)*

To prove this we recall an earlier result of ours ([5]). It is the analogue of density computation for square free integers[2]: density= $\frac{1}{\zeta(2)} = \frac{6}{\pi^2}$

Lemma 1. *The natural density of square free ideals of 0_K (the ring of integers of K) is given by*

$$lim_{s\to 1^+} \frac{(s-1)\zeta_K(s)}{\zeta_K(2s)\prod_{p|d}(1+\frac{1}{p})} = \frac{L_d(1)}{\zeta(2)L_d(2)\prod_{p|d}(1+\frac{1}{p})} \leq 1$$

Hence $L_d(1) \leq \zeta(2)L_d(2)\prod_{p|d}(1+\frac{1}{p}) \leq \zeta^2(2)\prod_{p|d}(1+\frac{1}{p})$

(Here ζ_K is the Dedekind Zeta function and ζ the Riemann Zeta function [7])

In view of Lemma 1 our task is to estimate the finite product $\prod_{p|d}(1+\frac{1}{p})$ as $\bigcirc(logloglogd)$ for almost all d.

Lemma 2. $\prod_{p\leq x}(1+\frac{1}{p}) = c_1 logx + \bigcirc(1)$

Proof. We imitate the proof ([1], Thm 13.13) for $\prod_{p\leq x}(1-\frac{1}{p}) = \frac{k}{logx} + \bigcirc(1)$

Let $P(x) = \prod_{p\leq x}(1+\frac{1}{p})$
So

$$logP(x) = \sum_{1\leq x} log(1+\frac{1}{p})$$

Abstract. In this paper, we have developed a public key cryptosystem by using large abelian group of general linear group over bounded distributive lattice. We have defined automorphisms on lattice matrices by the definition lattice automorphisms. We have replaced the exponentiation by conjugation automorphisms, which are mainly used to define the public and private keys and which allows the calculations to be fast and effective. We also talk about different security aspects against known attacks and it is shown that the cryptosystem is highly secure. We have given the proposed scheme with counter example.

Keywords: automorphism; distributive lattice; general linear group; orthogonal matrix and public key cryptosystem.

2010 AMS Subject Classification: 06D99, 15B99, 94A60.

1. INTRODUCTION

Public-key cryptosystem was introduced by Whitfield Diffie and Martin Hellman [3] in 1976. After that many PKC have been proposed and broken. In 1978, Rivest-Shamir-Adleman [10] introduces the first practical Public key cryptosystem (RSA). In 1985, another practical PKC introduced by ElGamal [4]. Later many other PKCs introduced by many authors which can be seen in [7, 8 and 9]. In 2019, Z.Y. Karatas, E. Luy and B.Gonen [12] introduces a PKC based

Abstract

Smartphone with the Internet is the most common item today and it provides the best online platform for businesses to trade their goods. Customers are more comfortable with online shopping and banking transactions, which are enough for hackers to cheat. Phishing attacks are now very common for smart phones. These attacks come in a variety of ways to steal customer sensitive information and payment information through fake Short Message Service(SMS) or E-Mail or Uniform Resource Locator (URL) links or applications(APPs). Therefore, the end user needs to know a few precautions to avoid phishing attackers. This paper explicitly discusses phishing attacks by their behavior and proposes a parallel defending approach to classifying messages as harm or spams using the Graphics Processing Unit (GPU) platform, which is achieved in logarithmic time of O(n log n) and also discusses the future scope.

Abstract

Wireless sensor network (WSN) comprises a collection of sensor nodes employed to monitor and record the status of the physical environment and organize the gathered data at a central location. This paper presents a deep learning based distributed data mining (DDM) model to achieve energy efficiency and optimal load balancing at the fusion center of WSN. The presented DMM model includes a recurrent neural network (RNN) based long short-term memory (LSTM) called RNN-LSTM, which divides the network into various layers and place them into the sensor nodes. The proposed model reduces the overhead at the fusion center along with a reduction in the number of data transmission. The presented RNN-LSTM model is tested under a wide set of experimentation with varying number of hidden layer nodes and signaling intervals. At the same time, the amount of energy needed to transmit data by RNN-LSTM model is considerably lower than energy needed to transmit actual data. The simulation results indicated that the RNN-LSTM reduces the signaling overhead, average delay and maximizes the overall throughput compared to other methods. It is noted that under the signaling interval of 240 ms, it can be shown that the RNN-LSTM achieves a minimum average delay of 190 ms whereas the OSPF and DNN models shows average delay of 230 ms and 230 ms respectively.

Abstract

The Quantum-Dot Cellular Automata (QCA) is an incipient nanotechnology in contrast to the CMOS technology with appealing features like low power consumption, high speed and reduced size in implementing the architecture for the computations. QCA provides better and well-organised solution with a modern and exclusive result in performing logical computations at Nano-scale. In this paper mainly focused on design and implementation of 8 × 8 Vedic multiplier with the help of 4 × 4 Vedic multiplier using Nikhilam and Anurupayan Sutra. The simulation results achieved with the help of QCA Designer tool shows that the area and delay of the proposed 8 × 8 Vedic multiplier is decreased by an average of 45.8% and 72.6%, 82.5% and 80.7%, and 17.24% and 21% respectively when compared to 8 ×

Abstract:
Cloud computing is an essential computing environment to provide maximum availability of services to users and industry. On demand, various services are provided to the cloud users through the internet and these services are provided by cloud service providers. Task scheduling is most important in the cloud computing environment because the user has to pay for the resources based on the usage and the load is distributed among the available resources by maximizing the utilization time and reducing the task execution time. Many algorithms were proposed in literature to efficiently schedule the tasks, one such algorithm is Particle Swarm Optimization algorithm (PSO). To enhance the performance of PSO algorithm by optimizing task response time a hybrid PSO based task selection and recommended system has been proposed in this paper. Using CloudSim the results are compared with the existing algorithms. In comparison, the proposed algorithm is giving better results than the existing algorithms.

***Keywords**: Cloud computing, Quality of service, Task selection, Recommended system, Particle swarm optimization, Task scheduling.*

1. INTRODUCTION

Cloud computing is a new computing technology to enhance the use of virtualized resources which are designed for end users in a dynamic environment in order to provide reliable and trusted services. Using the concept of virtualization in this computing environment we can improve the utilization of physical resources. This technology allows abstraction and isolation of physical resources and reduces the hardware equipment requirement. Using virtualization, number of virtual machines for a single physical server can be created to execute multiple tasks. Due to this dynamic provisioning of the resources and on demand service of the cloud computing environment, task scheduling always plays a major role. The main objectives of the task scheduling in cloud computing environment are high system throughput, improve load balancing and reduce the task completion time. Usually in any cloud system, there are three main modules namely application, mapping algorithms and virtual machine. From application module cloud users submits a set of tasks to the cloud environment. These tasks are executed on physical resources. When the submitted tasks are to be executed on virtual machine there exist quality factors called quality of service. Using mapping algorithms a set of cloudlets are mapped to resources by estimating the expected time of completion of cloudlets then execute the cloudlets on selected resources [1-2].

Abstract:

Means of $\{\frac{\mu^2(n)\sigma(n)}{n}\}, \{\frac{\sigma(p)}{p}\}$ and $\{\sum_{p|n}\frac{1}{p}\}$ are computed to be $\frac{\zeta(2)}{\zeta(4)}$, 0 and $\sum\frac{1}{p^2}$ respectively. An estimate for $\sum\frac{1}{p^2}$ is given.As a corollary we have the upper bound $\frac{25}{16}$ for the mean value of L-series values $\{\frac{L_d(1)}{L_d(2)}\}_{d\ squarefree}$

Keywords: *measuring, Arithmetic function.*

I INTRODUCTION

Let $\sigma(n)=\sum_{k|n}k$ .Then $\frac{\sigma(n)}{n}=\sum_{k|n}\frac{1}{k}$. The mean of an arithmetic function $f(n)$ is defined to be $Lim_{x\to\infty}\frac{1}{x}\sum_{n\le x}f(n)$.

The mean of the arithmetic function $\frac{\sigma(n)}{n}$ is known to be $\zeta(2)=\sum\frac{1}{n^2}=\frac{\pi^2}{6}$ ([1], Th 3.6). We adapt this method to compute the mean of $\{\frac{\mu^2(n)\sigma(n)}{n}\}_{n=1}^{\infty}$ the sequence of sums of reciprocals of divisors of squarefree integers : the value is $\frac{\zeta(2)}{\zeta(4)}=\sum\frac{\mu^2(n)}{n^2}$ (Prop 1 (a)). For the special choice of subsequence of primes, we find the mean to be 0 (Prop 1 (b)).The "formal guess" $\sum_p\frac{1}{p^2}$ turns out to be the mean of a different function $f(n)=\sum_{p|n}\frac{1}{p}$ (Remark 1). For this we use the Tauberian result in Hlawka et al ([3] p200). We discuss the value of $\sum_p\frac{1}{p^2}$ and an upper bound for it.

Proposition 1

1. $Lim_{x\to\infty}\frac{1}{x}\sum_{n\le x}\frac{\mu^2(n)\sigma(n)}{n}=\frac{\zeta(2)}{\zeta(4)}=\sum_{n=1}^{\infty}\frac{\mu^2(n)}{n^2}=\frac{15}{\pi^2}$

2. $Lim_{x\to\infty}\frac{1}{x}\sum_{p\le x}\frac{\sigma(p)}{p}=0$

Proof. (a)

$$\sum_{n\le x}\frac{\mu^2(n)\sigma(n)}{n}=\sum_{s\le x,ssqfree}(\sum_{d|s}\frac{1}{d})$$

$$=\sum_{d\le x,dsqfree}\frac{1}{d}(\sum_{q\le x/d,qsqfree}1)$$

$$=\sum_{d\le x,dsqfree}\frac{1}{d}\{\frac{x}{d}+\bigcirc(1)\}$$

$$=x\sum_{d\le x,dsqfree}\frac{1}{d^2}+\bigcirc(\sum_{d\le x,dsqfree}\frac{1}{d})$$

$$=x\sum_{n\le x}\frac{\mu^2(n)}{n^2}+\bigcirc(logx)$$

$$(since\ \sum_{d\le x}\frac{1}{d}\le\sum_{n\le x}\frac{1}{n}\approx logx([1],Th3.2))$$

Dividing by x and letting $x\to\infty$ we have the

Abstract:
Nowadays Attendance Marking should be considered as the huge factor to both the understudy similarly as the torch of an enlightening affiliation. Savvy Attendance utilizing Real-Time Face Recognition is a genuine arrangement which accompanies everyday exercises of dealing with understudy participation framework. Face affirmation based support for face is to measuring investment by using face biometrics subject to HD screen images and other advancement. In my face affirmation adventure, a PC structure will have the alternative to locate and see human faces smart and absolutely of pictures or records that have being overcome an observation focal-point. Various checks and systems have been conveyed for improving the demonstration of face attestation at any rate the arrangement to be executed here is face-acknowledgment.In face recognition the camera will take the image and store it in the data base for future process. It helps in change of the housings of images with the objective that the substance of the understudy can be successfully seen for their interest so the investment database can be viably reflected thus.

Keywords: *Attendance, Camera, Matlab, Face- acknowledgement.*

I. INTRODUCTION

The innovation points in bestowing an enormous information situated specialized developments nowadays [1]. Significant Understanding is one of the fascinating space that draws in the machine to set itself up by giving some datasets as information and gives a fitting yield during testing by applying varying picking up figuring [2]. These days marking is considered as a massive factor for both the understudy moreover as the teacher of a lighting up partnership. With the advancement of the gigantic learning improvement the machine consistently observes the assistance execution of the understudies and keeps up a record of those fathered data [3] –[5]. With everything taken into account, the investment course of action of the understudy can be kept up in two unmistakable structures specifically [6] –[8],

- Manual Attendance System (MAS) [9]
- Automated Attendance System (AAS) [10].

II. LITERATURE SURVEY

N.Sudhakar Reddy, et al., [11] explained Electric participation utilizing Face Recognition shows that the Structure is framework dependent on face divulgation and assertion estimations which are utilized to distinguish the understudy face when entering the class and the structure will stamp the organization by recollecting that it is utilizing course order and PCA estimation for highlight affirmation and SVM for demand. Viola-Jones Algorithm was used for facial recognition that perceives human

Abstract
Recent reports show that the millions of people killed each year in the road accidents are due to high density vehicles and traffic environment. The road traffic safety has been an unsolvable problem in recent population. Generally, nodes in vehicle ad hoc networks have a relatively high speed, while there is a major issue to provide the accurate data transmission between two nodes. Many research works have been undertaken to solve these issues by trust based techniques. In this paper, a highly secured QoS aware routing algorithm (HSQ-RA) using optimal trust management scheme is proposed. In HSQ-RA, the multi-hop clustering is performed by improved whale optimization algorithm and the inter-cluster routing is done using the trust values. The multiple constraints are used to calculate the trust of each node and optimized by the trust search algorithm. The simulation result exhibits that the proposed HSQ-RA algorithm provides better quality of service (QoS), delivery rate, faster way to discover routing and reduce loss rate.

Keywords Inter cluster · Multi-hop cluster · Secure routing · Trust management · VANET

Abstract

Phishing in an enterprise is serious issue rising in wide scale and complexity, as phishers use email phishing via obfuscated, malicious or phished URLs and continuously adapt or innovate their strategies to lure victims for identity theft for financial benefits. To gain victim's trust and confidence phishers have started using visceral factors and familiarity cues. Phishing is not always money centric; phisher defame the user's goodwill and character. Defamation in enterprise could be much more traumatic than being embarrassed at a social networking site. It is a challenging task to address this issue. It is evident through literature review that single phishing detection filter approaches are insufficient to detect phishing in enterprise environ. Therefore, a novel anti-phishing model for enterprise using artificial neural network is proposed. In addition, this model effectively identifies whether the phishing email is known phishing or unknown phishing to reduce the trust and familiarity-based email phishing enterprise environ. The feed-forward backpropagation and Levenberg-Marquart methods of ANN are adopted to enhance the URL classification process and with Fuzzy Inference System to get result with imprecise data of social features. The proposed model can accurately classify the known and unknown email phishing via URLs.

Abstract. The conductive hearing loss due to ossicular abnormalities occurs from many causes, including trauma, cholesteatoma, infection, surgery and congenital anomalies. Recent developments in the area of tissue engineering as well as in the area of fused film fabrication promise to profoundly affect the practice of reconstructive surgery. Therefore, a human external ear prototype is built by using the 3D printing technology from the CT scan by conversion using 3D slicer software. Firstly, the human head computer tomography (CT) scanned file of DICOM data format is collected . Then the DICOM data file is converted into NRRD file format by using 3D slicer software and saved in a folder. Then the NRRD file is converted into 3D printable STL file format by using Embodi3D.com website. Here the STL file is imported into 3D slicer for separation of external ear from total head model by using Mesh mixer. Then the STL file of the ear is imported into the 3d printing machine which builds the prototype of ear. The prototype was made with PLA plastic using an FDM 3D printer. During the prototype building, various parameters of printing machine are recorded. The analytical tests were carried on ANSYS by applying various Bio compatible stresses on the ear surface and the results are recoded.

Key words - Infection, Tissue engineering, Dicom, Reconstructive surgery, CT scan, parameters.

1. Introduction

Fused film fabrication is the process of new age manufacturing 3D Printing is a part of fused film fabrication in this process the physical object is printed layer wise with the three-dimensional CAD model, in this process the fabrication is completed in successive layers. with this process the digital object will be converted to physical printed object in the number steps in the form of layers. this process also be called as rapid prototyping. The 3D printing is useful for all special purpose applications like to print intricate shapes and imagination related components, these components have lighter weight and stronger. 3D printing is efficiently utilized in various fields such as aerospace, automobile, medical, construction and in manufacturing of many household products. Before rapid prototyping the preparation of medical models for demonstration of individual patients or to medical student classes was very rare due to the difficulty and cost of generating (usually by CNC machining) complex geometric shape associated with anatomy. The CAD methods gave a good level of accuracy in

ABSTRACT

In automobile manufacturing sector the connecting rod is a important component to change the reciprocating type of motion to rotary type of motion and vice versa. It connecting member between reciprocating piston and rotating crankshaft, it transmits the force on the piston due to fuel combustion to the crankshaft in the form of mechanical work. In common practice the connecting rods were manufactured with the material of different grades of carbon steel, cast iron different aluminum alloys as well as the manufacturing process is dropforging from powder metals or wrought steel. In some cases, casting also used for manufacturing of rods the casted connecting rods have blow-holes which can be determined by durability test and fatigue tests. The main objective of this type of analysis is to study and compare the optimized weight and price reduction of the connecting rod in some compression ignition engines. As the connecting rod is subjected to whipping stresses to design the rod we should study different stresses and various forces to be considered to avoid failure of connecting rods. By considering all these forces, the analysis is useful for better optimized design.

Transient Thermal Analysis of the Turbine Blade

By M. Yashwanth Kumar, Shaik Himam Saheb
& M. Venkata Ramana Reddy

Abstract- Turbine blade is the individual component which makes up the turbine section of a gas turbine or steam turbine. The blades are extracting power from the high temperature, high pressure gas makes by the combustor. The turbine blades are often the limiting component of gas turbines. In general, all solid and non-solid models will deform when certain amount of thermal or structural loads applied within the environmental condition. With specific end goal to discover the progressions of the item or segment analysis software is utilized. In this paper the model is designed concerning all the accessible constraints utilizing like Catia in which all the individual parts are created in part module and assemble each other in assemble module. Later the product record is changed over to "stp" file format (standard exchange of product file) and imported to Ansys workbench to find deformation and analytic value with respect to the model or product definitions. Ansys software finds the precise or estimated solutions.

Machine Learning Approach for Fetal Heartbeat and Uterine Contractions Monitoring

S. Vairachilai, Shubhangi V Urkude, Mondaddula Nivedh Vishnu Vardhana Reddy, T. Krishnan and R. Murugesan

Abstract

Machine learning algorithms in the healthcare domain can improve healthcare and clinical practice ethically and reliably. The fetal heart rate (FHR) and the uterine contraction (UC) activity are recorded by using the technique called Cardiotocography (CTG).It provides support for the obstetricians to obtain complete physiological information about new-borns.In this paper, machine learning classification algorithms such as Artificial Neural Network (ANN), Naive Bayes,Decision Tree, Random Forest, Support Vector Machine (SVM), and Adaptive Boosting (Adaboost) are applied to predict fetal status as normal, suspicious or pathologic. The performance of the algorithms has been evaluated based on training and testing Accuracy, Precision, Recall, Specificity, ROC (Receiver Operation Characteristics), and Kappa Statistics. The obtained result shows that the majority of classification algorithms perform better. It was found that Random Forest has provided the highest accuracy of 99% in training and 93% in testing.

Keywords:
Newtonian fluid, suction, pipe, thermal radiation, cross-diffusions, stream function, homotopy parameter

ABSTRACT

This paper is dedicated to the mathematical analysis of an axisymmetric, steady Newtonian fluid flow through a horizontal pipe within the occurrence of radiation, Dufour, and Soret effects. The flow is exposed to associate outwardly functional constant suction above the pipe along Z-direction. The homotopy analysis methodology (HAM) is utilized to get semi-analytical solutions for the coupled differential equations. The results of diverse rising constraints on velocities, thermal and solutal are discussed and pictured. The flow is studied through streamlines, isotherms and pressure contours area unit likewise shown as pictured. It is identified that the temperature can increase with an increase in Dufour parameter but decelerates with an improvement in the radiation parameter. For the given increase within the Soret number, the concentration decelerates.

1. INTRODUCTION

The study of flow through permeable boundaries has several important industrial applications such as biophysics, lubrication technology, spatial dynamics, blood flow through arteries and veins, and control of boundary layers. From this viewpoint, the porous channel/pipe problems of similar model type have been studied by many researchers (Berman [1], Terril and Shrestha [2], Zaturska and Banks [3]. Bujurke et al. [4], Erdogan and Imrak [5], Devakar and Iyengar [6]). The other interesting problems for porous boundaries with different geometrics can be seen in Ramana Murthy et al. [7], Nagaraju and Ramana Murthy [8], Srinivas et al. [9], and Aparna et al. [10]. It is documented that heat and mass transport are mixed as a result of the fluid density depends on thermal and solutal. In the power and chemical industries, coupling laminar heat and mass transfer can be found. In many engineering applications such as heat exchangers, solar thermal collectors, and boilers, double-diffusive convection in circular tubes in laminar flow occurs. Of explicit interest is the problem of derivation within the thermal entrance incompressible flow along a pipe with a fully improved velocity distribution; this problem is resulted to as the Graetz problem. It has drawn interest not only from engineers but also from mathematicians due to the difficulties in deriving its solution. Ganesan and Loganathan [11] have studied the double-diffusive viscous flow through a semi-infinite vertical cylinder. The Double-diffusive natural convection was examined by Mani Sankar [12] through a vertical open-ended cylindrical annulus. He found that the number of Sherwood is decreasing as the radii ratio increases. Brahim and Jemni [13] investigated a two-dimensional Darcy–Brinkman–Forchheimer heat tube's thermal analysis. Okafor et al. [14] studied the distribution of non-symmetric heat flux through a mixed horizontal convective tube.

The Dufour effect is the heat flux caused by a gradient of concentration that was resulted in 1873 by Dufour as a coupled effect of irreversible systems; it is referenced to as the thermo-diffusion effect. The effect of Dufour is of such magnitude that it cannot be disregarded. On the other hand, the Soret effect (thermo-diffusion) is a phenomenon experimental in mobile particle mixtures where different particle types react differently to the temperature gradient force. The effects of Soret and Dufour are important because the effect of Soret is used for the separation of isotopes, electrostatic precipitators, drug discovery, etc. Several researchers studied and reported results for such fluid flows, due to importance of the importance of the cross-diffusion effects for very light and medium molecular weights fluids (Nabil et al. [15], Rani and Reddy [16], Srinivas et al. [17], Odelu and Naresh kumar [18], Nagaraju et al. [19, 20].)

Yang and Ebadian [21] examined in a circular tube the mixture of axial conductivity and axial radiation. Yih [22] used a convective isothermal vertical cylinder to investigate radiation and porous medium effects. Ganesan and Loganathan [23] examined the effect of radiation on flow past a semi-infinite vertical cylinder that was impulsively started. They identified the radiation parameter increases, the fluid's speed and the temperature rise sharply near the cylinder. The other interesting studies on radiative heat and mass transfer flow by diverse geometries can be found in Govardhan et al. [24], Nagaraju et al. [25], and Abdullah Al-Mamun et al. [26].

The survey exhibits that two-dimensional viscous flow with cross-diffusion and radiation has not been studied elsewhere. Therefore, the objectives of this study are to mathematically solve the steady viscous flow problem through a horizontal

The Impact of Learning Styles Based Writing Instruction on the Perceptual Learning styles of Learners: an Investigative Study

342

Dr. M. Swathi

ICFAI Tech

IFHE – Hyderabad

swathimulinti@ifheindia.org (9966930203)

Abstract

Every learner is unique in various ways, including their learning preferences. Learning styles are an individual's preferred ways of learning. There are various categories under which a learner can be categorized depending on his/her preference of learning. The unique features of each leaning styles helps learners to acquire and assimilate information easily. Understanding the learning styles of learners in a classroom helps teachers to improve the quality of teaching and learning processes. The current study aims to discern the relationship between each of the perceptual learning styles of Reid (1987) to L2 writing skills in ESL context. Forty middle school students are subjects of this study. Perceptual learning styles of these were assessed along with their achievement rates in writing skills (pre-test). A learning styles based writing instruction programme was implemented followed by a post- test. A comparative analysis was made between the pre and post writing scripts of different learning styles to observe if there is any significant improvement. It was understood that there was an overall significant increase in the learners writing skills from pre test to post – test, it was also found that visual learners had a significant increase in the writing proficiency when compared to other perceptual learning styles.

Key words: Learning styles, Homework intervention, mixed ability classroom

1. Introduction

The phenomenon of English as global language has spread across all nations, when an individual masters this language, a new world of opportunities opens up for them. As Tsui and Tollefson point out " English is perceived by language policy makers in Asian countries as a multination tool that is essential for achieving national goal and by individuals as an indispensable resource for personal development" [28].

It has become imperative for the policy makers in India to frame curriculum and design syllabus keeping in mind the significance of this language in the country. The National Curriculum Framework, India provided a curriculum, there it has been pointed out that "Curriculum design must reflect the commitment to Universal Elementary Education, not only in representing cultural diversity, but also by ensuring that children from different backgrounds with variations in psychological and intellectual characteristics are able to learn

Abstract

In this paper, we propose a novel approach of feature learning through image reconstruction for content-based medical image retrieval. We propose an image reconstruction network to encode the input image

ICFAI FOUNDATION FOR HIGHER EDUCATION HYDERABAD

REGISTRAR THE ICFAI FOUNDATION FOR HIGHER EDUCATION (Deemed-to-be-University u/s 3 of the UGC ACT, 1956)

into a set of features followed by the reconstruction of the input image from the encoded features. The robust reconstruction of the input image from encoded features shows that the encoded features can be used as an abstract version of an input image. Thus, we make use of these encoded features for medical image retrieval task. The performance of the proposed method has been analyzed with the help of three benchmark medical image databases. Average retrieval rate and average precision rate are used to evaluate the performance of proposed and existing state-of-the-art methods for medical image retrieval task. Experimental analysis shows that the proposed approach for image retrieval outperforms the other existing methods.

Introduction

In the field of biomedical imaging, there is a large increment in biomedical data because of the use of advanced techniques like X-ray, magnetic resonance imaging, computed tomography. The handling of these enormous data with human efforts is difficult. Thus, there is a need to develop an automatic system for efficient access, search, indexing, and retrieval. Content-based medical image retrieval (CBMIR) aimed at retrieving the medical images which are having similar content to that of input query medical image.

CBMIR system comprises two steps: feature extraction followed by index matching and retrieval task. Initially, researchers make use of local feature

Numerical Study Free Vibration Analysis of Thin Rectangular Plates

M.L. Pavan Kishore, T. Anirudh, Vedanth Bhatnagar

Abstract

engineering applications, all the structural components are subjected to dynamic loading conditions in their working life and the effect of vibration is considerable. Structural components may take the form of a rectangular plate, for such elements the prediction of vibration characteristics becomes important when their associated mode shapes operate closer to resonant modes, stated as a measure of failure. Additionally, the effect of the cutout located in the plate also has an effect on the modal behaviourial characteristics. The research work entitled in this paper focusses on the prediction of the modal vibration characteristics of a rectangular plate applying Finite Element Analysis. The mode shapes of the plate are determined using this base line methodology. Three types of clamped boundary conditions are applied over the plate, Outer periphery constrained without cutout, Outer periphery constrained with cutout, Outer-inner periphery constrained with cutout. The numerical computations carried out for conventional material based Aluminium plate is further extended to Glass Fibre Reinforced Plastic material plate with the same set of boundary conditions applied. From the present study it is noticed that the operating frequencies for both peripheries constrained are more than periphery constrained with and without cutout.

The motive of this work is to determine contact stress of spur gear by application of static analyis. Using Finite element method a numerical study have been carried out to examine the effects of the material on contact stress behavioural characteristics of a gear. The gears used for the analysis are spur gears and the contact stress analysis is performed between pair of mating gear teeth. The benefit of comparing is to calculate the bending stress analysis using Lewis equation and contact stress with principle of Hertz equation. The results found are satisfactory in comparison with the Hertz equation. Furthermore, the analysis is extended for different materials experimented with various modules.

A Machine Learning Model to Identify Duplicate Questions in Social Media Forums

346

Sandeep Kumar Panda ,Vivek Bhalerao, Sathya A.R

Abstract: In recent years, digital platform forums where question and answers are being discussed are attracting more number of users. Many discussions on these forums would be repetitive nature. Such duplicate questions were provided by Quora as a competition on Kaggle. It is observed that the dataset provided by Quora, requires many modifications before training machine learning models to obtain a good accuracy. These modifications include feature extraction, vectorization and tokenization after which the data is ready for training desired models. While analyzing each model after prediction, it gives plenty of information about its efficiency and many other factors. Later, these information of different models are compared and helps to choose the best model. These models later can be combined and used as a single model with best accuracy. In this paper, a Machine Learning model which will predict duplicate questions is proposed.

Keywords : Machine learning, Feature extraction, Vectorization, Efficiency.

I. INTRODUCTION

In present days, the proliferation of online competition is playing a vital role for academia as well as industries. Likewise, Kaggle is one of the platforms which enable anyone to learn and mentor each other on personal, academic, and professional data science journey. This platform conducts competitions, discussions, courses etc. One such open competition is posted by Quora.com [1]. Quora, itself faces challenges like, the presence of questions with same intent called as 'duplicate questions'. These questions make writers to answer in multiple versions. However, Quora uses random forest model to identify these duplicate questions. But, there is need of better model for this recognition. Therefore, this paper presents a hybrid novel approach and delivers a better solution to the problem faced by them.

Various machine learning models intended to identify these duplicate questions are presented in this paper. These identifications have specific accuracy value, using the way of obtaining the results; the model can be improvised as per Quora requirements. Hence for this recognition, three machine learning models were used, and their accuracy is analyzed using various statistical methods such as log-loss, confusion matrix. Such analysis helps to provide a better understanding and a decision to choose the best model.

II. LITERATURE SURVEY

As it is known that, reading each question provided to Quora , searching for its duplicate question and answer the same solution as the previous one is time taking and requires a lot of man power. To solve this problem Quora is currently using random forest algorithm for find duplicate question with certain accuracy. To improve its accuracy it has posted a challenge to identify duplicate questions with better accuracy. This challenge consists of a dataset and information regarding the dataset. The dataset provided is a label dataset consisting of perfect labels provided by professionals.

In the past, many research works were done in finding duplicate texts consisting of Greedy String Tiling Wise, 1996; Mihalcea et al., 2006. A paper by Torsten Zesch et al., 2012 tells that the database contain texts with different words but have same intent if it is looked as a whole text. Whereas, answering a sentence is a task of selecting a text containing the information satisfying that sentence (Lei Yu et al., 2014). Using measures for string similarities by (Lei Yu et al., 2014) proposed that, text from same field domain may contain similarities. Other techniques were also used for recognition of duplicate text which also required modification for better results.

III. DATASET

The dataset provided by Kaggle consist of six columns. These are labeled as id, qid1, qid2 , question1, question2 , Is_duplicate. Here, the dataset consist of 404351 pairs of question and each question has a unique id mentioned. However, the questions provided are repeated and can be discarded. These questions also contain many special characters and need to be analyzed before training the model. The machine learning model cannot understand words or questions in a way present in the dataset. Therefore, they need to be converted in a way such that the proposed model can take these sentences as input. The dataset also provide the information like the given questions pairs are duplicated or not. This shows that, the model training is of supervised type of machine learning.

Optimal Deep Learning Model to Identify the Development of Pomegranate Fruit in Farms

Sripad Joshi, Sandeep Kumar Panda, Sathya A. R.

Abstract: ***In this study, estimating the maturing condition in gardens helps to enhance the process of post-harvesting. Collecting fruits on the basis of their developmental stage will minimize storage costs and maximize market value. Additionally, estimated ripeness of the fruits can be more useful for indicators for detecting water shortage and to determine the water used during irrigation. The purpose of the study is to develop the new direction of technology to detect the ripeness stage between two classes: ripe and unripe. We employ deep Neural Network (DNN) classifiers for the prediction of ripe and unripe class. The results of our proposed classifiers give the sensitivity 96.2%, specificity 94.2% with accuracy of results 94.5%, over a dataset of 200 images of each class. The ROC (receiver operating characteristic) area values curve close to 0.98 in all-class during training. We believe this is a notable performance that allows a suitable non-intrusive maturing prediction that will enhance cultivation techniques.***

Keywords: ***Deep neural network, ripeness estimation, pomegranate segmentation.***

I. INTRODUCTION

Automation in agriculture is thriving today globally, credit to the advancement in the Internet of Things (IoT) and deep learning approaches. The sophistication of deep learning approaches has made it possible for developing solutions to difficult real-life problems. Regarding agriculture, several problems such as plant disease identification from leaf images, appropriate crop cultivation based on several factors like weather, soil-type has been developed successfully. IoT is implemented to automate agricultural tasks such as monitoring humidity of soil, watering crops, etc. Although, only insubstantial work is done in the area of real-time fruit detection coupled with classifying them as ripe or unripe. The meticulous realization of the location of discrete fruits along with the information about their ripening condition contributes greatly to estimating the yield and time remained for harvest respectively. Automated robotic harvesting system can make use of this localization system [2,17].

Revised Manuscript Received on January 05, 2020.

The previous approaches involved considered detecting each ripening stage of the fruit as a YOLO object detection problem [4], which significantly increased the training costs. Hence, in our approach, we break down this problem into two parts. Our approach treats fruit detection as a YOLO object detection problem and ripening state detection as an image classification problem. This perspective benefits with having the flexibility of appending different classification tasks like disease detection of on-the-tree fruits and much more without vowing to much of the training cost.

We, in this paper implement state-of-the-art object detection technology YOLO-v3, to detect and localize pomegranates in the orchards. We then send the detected pomegranate region images into the classifier which classifies them as ripe or unripe. The following comes under the scope of this paper:

- Image data accumulation.
- Annotation of the image data using YOLO mark, a python-based image annotation tool by A.B. Alexey [3]
- Training YOLOv3 on the data with darknet53 weights as backbone.
- Training the image classifier for detecting the ripening stages of the pomegranate fruit.

The structure of the paper is organized as follows
In section 2, we describe data accumulation, annotation tool, and its usage. Literature survey is discussed in section 3. Section 4 presents the proposed approach. In section 5 the experiment and results are detailed. Finally, section 6 concludes with future work directions and limitations.

A. Data Accumulation And Annotation

We primarily used image-net [14] open-source data in addition to google images for pomegranate images. Google's advanced search was used for the refined procurement of pomegranate fruit images from orchards. Total images were aggregated to 780. Below are five sample images from the data set.

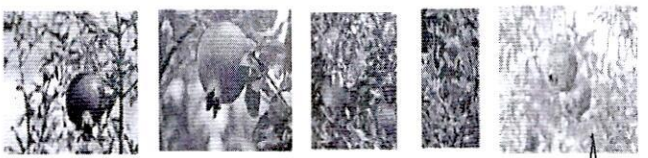

Fig. 1. Images from the dataset in image annotation process. The images were annotated using the YOLO mark, a python based-open-source image annotation tool [3].

Abstract

The following paper describes the behavior of hybrid honeycomb structures over solid-profiled structures. Sandwich panels being a major application of honeycomb structures exhibit very high stiffness-to-weight ratio, low mass–volume ratio, and high energy absorption capacity. The various hybrid hollow structures with finite boundaries (finite width and height), subjected to a uniaxial compressive load, are observed using the finite element method. The stress and deformation characteristics of these structures are calculated using ANSYS® 18.1. Subjected to cantilever conditions, the structures are processed in static structural simulations to obtain the corresponding data. In this paper, a comparison of various hybrid structures is conducted based on the obtained data to conclude their adaptability.

Abstract:
Online reviews became popular as people are taking decisions with the help of them. In this context, the purpose of this project is to develop a deep learning based framework that can be used to classify customer reviews into positive or negative. This process is known as sentiment analysis. It is based on the supervised learning mechanisms where a classifier is built with knowledge of training data and then it is used to classify testing data. A prototype application is built to demonstrate proof of the concept. The success of deep learning highly relies on the availability of large scale training data. A novel deep learning framework for review sentiment classification which employs prevalently available ratings as weak supervision signals. An algorithm by name Deep Learning based Sentiment Analysis (DLSA) is proposed and implemented

ABSTRACT

Bismuth Layer-Structured Ferroelectrics materials (BLSFs) are widely used for many applications like resonators, filters, sensors, actuators and are appropriate for non-volatile Ferroelectric Random Access Memory (FeRAM) applications. The additional advantage of BLSF materials is that in electrical applications in they work at high temperatures. In the case of resonator applications, piezoelectric components are used as inductors. Usually BLSF materials typically have higher Curie temperature than PZT materials, so instead of PZT materials, BLSFs are used for high temperature piezoelectric sensor applications. $SrBi_4Ti_4O_{15}$ (SBT) compound is a member of Aurivillius family Bismuth layered structured Ferroelectrics. The dielectric properties of Sodium and Praseodymium doped SBT, $Sr_{0.2}Na_{0.4}Pr_{0.4}Bi_4Ti_4O_{15}$ (SNPBT), prepared by solid state double sintering method using planetary ball mill, and is studied in the present work. Single phase is confirmed from XRD and microstructure is studied from SEM. The temperature dependence of dielectric constant and dielectric loss are studied at different frequencies. The Curie temperature increased by doping SBT with $Na^{1+}$and Pr^{3+}. Thus this piezoelectric ceramic is suitable for high temperature sensor applications.

1. Introduction

Bismuth layer structured ferroelectrics have attracted much attention because of their applications in piezoelectric and ferroelectric random access memory (FERAMs). BLSF materials exhibit outstanding properties like high dielectric constant, low dielectric loss and high Curie temperature. Likewise these materials are environmentally friendly because they are lead-free Piezoceramics. The general formula for these Bismuth Layer structured materials is $(Bi_2O_2)^{2+}$ $(A_{m-1}B_mO_{3m+1})^{2-}$ where A site can be occupied by Bi^{3+}, La^{3+},Sr^{2+},Ca^{2+} and Na^{+} etc., and B site can be occupied by w^{6+}, Nb^{5+} and Ti^{4+} etc. Here m gives the number of perovskite layers separated by $(Bi_2O_2)^{2+}$layers. $SrBi_4Ti_4O_{15}$ (m = 4) [1,2] has orthorhombic structure and $A_{21}am$ space group [3]. These BLSF materials have been studied by many researchers for resonator and electro-optic application [4–6]. $SrBi_4Ti_4O_{15}$ (SBT) crystals have been grown and their dielectric properties studied along a (b) axis and c axis. The Curie temperature is found to be 520 °C along a(b) axis [7]. Similar studies showed an increase of Curie temperature when SBT was modified using Dysprosium [8].Curie temperature is found to increase due to the substitution of smaller Ca in Sr site [9].

The main focus of this research is to enhance the electromechanical activity and increase the curie temperature of $SrBi_4Ti_4O_{15}$ (SBT) by suitable rare earth modification, making these materials suitable for piezoelectric transducer applications at high temperature. In this study the optimization of electrical properties of BLSF materials by systematic substitution of rare earth cations of different sizes in A site is carried out. Ball milling influence on structural optical impact of mechanical activation on structural, micro structural, thermal, and optical properties of Mg_2TiO_4 (MTO) nanoparticles prepared by high-energy ball milling has been discussed [10]. The material in the present work are prepared by the solid state sintering method starting by ball milling with high purity oxides and carbonates taken in stoichiometric ratios. In this paper, the results of dielectric constant and dielectric loss at different frequencies as a function of temperature have been reported.

Recent Developments in Near Field Communication: A Study

P. Chandrasekar[1] · Ashudeb Dutta[2]

Published online: 26 September 2020
© Springer Science+Business Media, LLC, part of Springer Nature 2020

Abstract
Near field communication, development in radio frequency detection has put its foot in today's life of individuals through sophisticated mobile phones. NFC technology has become very popular due to its transparent and simple integration with a number of applications such as health care, consumer electronics, public transport payment methods, etc. A few new approaches have been attempted to make NFC progressively competent in routine day-to-day applications. This paper discusses the latest development in the use of NFC's in a few implementations and the potential outcomes of the hustle-free implementation of these applications. A systematic analysis of recent research deployment in different areas of use has been clarified and explored.

Keywords Near field communication (NFC) · Health care · Consumer electronics · Public transportation (PT) · Internet of things (IoT) · Contactless payments

1 Introduction

Field communication (NFC) technology has become increasingly important in different real-life settings, beginning with the credit/debit card with embedded NFC to Bluetooth paring. Some common uses include product/asset validation and monitoring, payment methodologies, organizational attendance systems, wireless device pairing, transportation. Other than this, some of the noted applications where NFC technology can be used include networking, tourism, hotels and restaurants, customer support, etc. NFC is an extension of the radio frequency identification (RFID) that can function as an RFID via tap and connect (Fig. 1). Consumer communication of NFC devices is predominantly through taping or touching NFC device/tag. But more than reading or writing unique ID as in RFID, it can share and transmit unique content to/from programmable apps. Exchange of data through NFC are formatted using NFC data exchange format (NDEF). NDEF is the data format which used across all NFC devices [14, 23]. NFC protocol stack has been shown in Fig. 2.

Abstract

The paper proposes a design of robust Wide area Damping Controller (WDC) for improving damping in power system. WDC design involves HY and H2 control, model reduction, and closed loop pole-placements for desired minimum damping. A well-designed controller meeting multiple objectives from pole-placements inside a conic sector in complex s-plane, robust to changing load conditions and minimization of control efforts, is attained. A polytopic representation of system for changing operating point with load conditions called Polytopic Linear Differential Inclusion (PLDI) is considered in the design. Linear Matrix Inequality (LMI) framework is used for obtaining controller parameters. The controller designed is dynamic and is obtained by reducing the order of the original system to smaller value. A benchmark two-area power system is considered for testing the design and establishing its effectiveness in wide area control and damping. The results show the proposed WDC is effective in meeting its stated objectives and robust to changing system condition as well as to modeling uncertainties in design.

ABSTRACT

In many countries, two-wheeler is the most common means of transport. However, because of less protection, this is considered as a highly risky mode of transport. As a solution to this, bike-riders can use helmet to safeguard the head. Upon observing the role of Helmet during the two-wheeler ride, ,many governments made the helmet compulsory for the riders. Many government functionaries follow the manual strategies to identify the violators. Manual means of identification is a time consuming process. Helmet is one of the main protection unit for a motor bicyclist. However, many to conform to the law of wearing helmet. Here, to detect the motorcyclists who are violating the helmet laws, a system using image processing and convolutional neural network is implemented. The system consists of motorbike detection, helmet vs no helmet classification and motorbike licence plate recognition. The motorbikes are detected using the feature vector HOG. Once the motorbike is detected, by means of convolutional neural network, it is determined whether the motorcyclist is driving with helmet or without helmet. Whenever any motorcyclist is identified without a helmet, license plate of the motorcycle is detected using TensorFlow object detection.

KEYWORDS

CNN, object detection, Helmet.

1. INTRODUCTION

According to the statistics, in India about 28 two-wheeler riders die daily on Indian roads in 2016 because of not wearing helmets. In the year 2017, 31 out of 100 people died in road accidents which shows increased rate from 21.6 deaths per 100 accidents in 2005. Also, it is proved that one of every five bike riders who died on roads were not wearing helmet. There are existing methods which use specialized sensors in the ergonomics of the motorbike to check the presence of helmet (Chiverton, 2012; Silva et al., 2013; Silva et al., 2014; Doungmala et al., 2016; Li et al., 2019). But it is impossible to convince every user for installation of sensors on the already existing bikes. Also, the accuracy and integrity of these sensors is questionable. Apart from this, systems that use video processing have very high computational costs. The technologies that were used to build the system very expensive hence making it an economically non-viable choice.

This paper tries to mitigate the aforementioned problems by proposing a potential solution using continuous real time video processing of the traffic video feed. The proposed solution will provide a completely free of cost system once installed. Also, the software was build using free and open source technologies hence it has an overall software cost equal to zero. Every vehicle on the street will be evaluated and a database of the offenders will be generated real time. Hence given that every rider not wearing helmet is prosecuted, there will be an increased awareness in the public.

2. AN OVERVIEW OF THE DIFFERENT R-CNN BASED ALGORITHMS

2.1 R-CNN

R-CNN extracts a bunch of regions from the given image using selective search, and then checks if any of these boxes contains an object. We first extract these regions, and for each region, CNN is used to collect specific features. Finally, collected features are used in object detection. Unfortunately, R-CNN becomes rather slow due to these multiple steps involved in the process. The problem the R-CNN system tries to solve it is to locate objects in an image (object detection). You could start with a sliding window approach. When using this method, you just go over the whole image with different sized rectangles and look at those smaller images in a brute-force-method. The problem is you will have a giant number of smaller images to look at. To our luck, other smart people developed algorithms to smartly choose those so-called region proposals.

Well, this is one fundamental issue with this R-CNN system. You can't train the whole system in one go (This will be solved by the fast R-CNN system). Rather, you will need to train every part independently. That means that the Alex Net was trained before on a classification task. After the training, they removed the last SoftMax layer. Now the last layer is the fully connected 4096-dimensional one. This means that our features are 4096 dimensional.

Another important thing to keep in mind is that the input to the Alex Net is always the same (227, 227, 3). The image proposals have different shapes

ABSTRACT

Technological advancements in the field of multimedia and digital electronics enable the users create millions of images every moment. Many researchers across the world developed algorithms to retrieve the images from a database. However, obtaining the better accuracy is still an open issue in image retrieval. Texture descriptive features like Local Binary Pattern (LBP) depend on the comparison of central pixel and its neighbors. However, the impact of the adjacent pixels is ignored in encoding the binary information. Our approach primarily relies on the fact that neighbors around a specified pixel hold considerable textural .A Horizontal-vertical-diagonal-anti diagonal structure is created from the image. Sign of difference in the intensity of pixels is used to form the patterns. We propose a novel texture descriptor, termed Quantized Neighborhood Local Intensity Extrema Pattern (QNLIEP). Retrieval efficiency of QNLIEP method is evaluated in the form of Precision as well as Recall. Standard image repositories such as ImageNet-25, Brodatz are used to evaluate the efficiency.

KEYWORDS

Image retrieval, quantization, neighborhood, sign, magnitude patterns.

1. INTRODUCTION

An image is a primary source of information in several real time applications such as Computer Vision, multimedia, Pattern Recognition, etc. Technological advancements enable the users create and share millions of images every moment. Identification of similar images from the database is always a tedious task. To address these issues, researchers have developed different types of algorithms (Ciresan et al., 2012; Sanchez et al., 2013; Krizhevsky et al., 2012). From the study, we observed that the texture plays a significant role in identifying a similar image and propose a local structure dependent CBIR system. In the recent past, researchers explored the role of texture in image retrieval (Kokare et al., 2007; Jhanwar et al., 2004). Any texture feature should yield better results against a range of images of any dataset. Local content descriptors in this paper compare a gray value of pixel with central pixel as well as its neighbors. Pattern extracted from a 3x3 kernel proves to be more effective as compared to other methods.

1.2 Relevant work

A simple and popular method known as local binary pattern became the foundation for many methods of retrieval. In this, texture information is extracted from a 3x3 window. Binary pattern represents the encoded structural information. Extraction of Local binary pattern is illustrated in Figure 1.

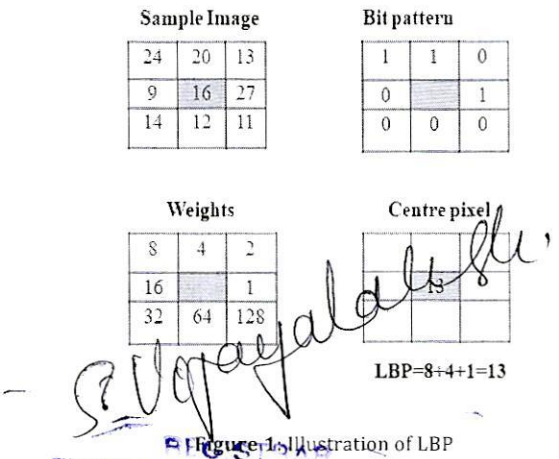

Figure 1: Illustration of LBP

K Raon proposed the quantized extrema patterns for image retrieval (Koteswara et al., 2015; Koteswara et al., 2016; Koteswara et al., 2018). H Kaur et. al presented mesh patterns for image retrieval (Kaur et al., 2017). P. Banerjee et al. extracted the mutual relationship among the pixels surrounding the central pixel (Banerjee et al., 2018). Authors proposed parallel cross pattern for retrieval purpose Intensity patterns are extracted for a 3x3 kernel (Feng et al., 2019). In this work, quantization is

Abstract : In recent days booking through web sites has become very prominent. Almost 70% of bookings or transactions are happening through online. Of all the sales web sites housing websites has become a great platform for sales. Different companies provide different services like selling new house, house rentals, sale of used houses etc. Price matters a lot in any sales. As houses are one time buy in the life for most of the Indians, they do a lot of research related to price, area and facilities while buying a house. The first thing common middle-class person looks at is the price based on their requirement. Integration of Machine learning algorithm to these web sites or application can be a great advantage. This can reduce the manual effort of sending quotations or negotiations. Presently we see many web sites which give us the details regarding the houses and their prices, but a person must invest more time to search the house which fits his necessities and budget. By integrating a machine learning algorithm into these websites, it helps the user just to sort his necessities and saves his time. In this paper the usage of this algorithm is explained practically and how the functionality can help improve the deliverability of the application is also discussed.

1. INTRODUCTION

Presently in India there are many websites and applications through which houses are sold or given for rent. All these websites or applications help the owners to place the photos and cost for that house. This helps the buyers to view the houses based on city, area, type etc. But one of the challenges in this process is user must search a lot to get an idea on the prices of the houses based on locality, type etc. By using machine learning algorithm all this will be analysed by the application and user can just give the information of type and locality and get the estimated price without wasting his time. Below figure 1 shows the general search format in a housing website or applications.

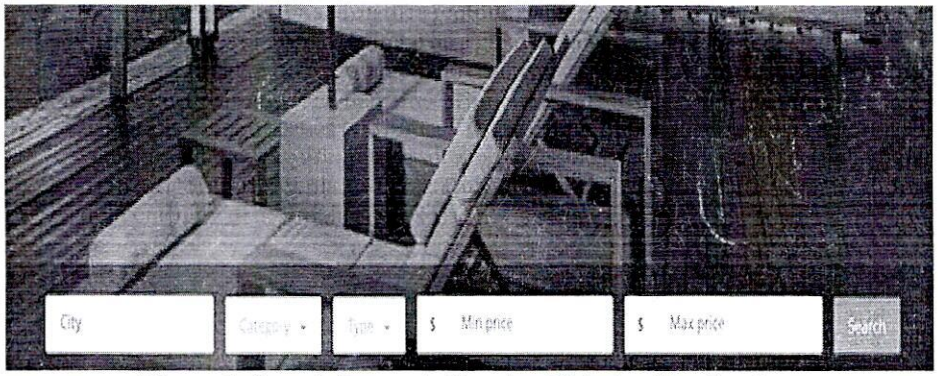

Figure 1. Search format in Housing Websites/Applications

Abstract— **The current paper deals with development of the electric vehicle which will be beneficial for future scope. The battery should be operated at the safe temperatures. Low temperatures or high temperatures can be problematic for the life of the battery as well as the operating of the battery. The commonly used battery is lithium ion battery and it need to be operated at optimal temperatures for efficient operation and maximum lifespan of the battery. This study is about the working of an electric vehicle how it uses the battery to power the vehicle and the parts used to power the vehicle. This study also includes the developments in electric vehicles recently. This paper also describes the comparison between the parts and components in electric vehicles. The major components are battery technology, charger design, steering system, motor technology and braking. The recent developments in the electric vehicles have been shown in this paper and the future of electric vehicles in upcoming years are also been shown in this paper.**

Problem Definition: Charging of Electric Vehicles takes very long time compared to the internal combustion engine which requires only to a minute to refuel the vehicle. Battery weight is heavier compared to the fuel. Cost of the battery is very expensive. Price of the electric cars are expensive compared to internal combustion cars. Some customers find electric car problem to rely. Market is low for electric cars.

I. INTRODUCTION

Electric vehicles working with the help of the electricity stored inside a battery. These are environmental friendly unlike combustion engines these electric vehicles do not produce exhaust gases into the environment. But these electric vehicles must be charged from some renewable sources. For example the energy produced from a wind powered electricity, hydroelectric power and biogas power producing plants. Basically the power from the battery is sent into the electric motor which produces power to move the vehicle. The controller sends the power from battery to the parts further. The controller also sends the power required amount depending upon the acceleration which we give with the help of a pedal inside the car. Here the electric energy is converted into mechanical energy. In the year 1830 the first electric carriage has been built. In the year 1891 the first electric automobile has been built by United states of America. Now the best company that manufactures the electric vehicles is Tesla motors which is built by Elon musk a famous entrepreneur and a private developer. The first car which Tesla manufactured is Tesla model s which has a range of 300 miles which is 485 km which has an acceleration of 0-60mps in 2.5 sec which is impressive.

Ramesh.C.Bansal(2005) examined on "Electric Vehicles" , Battery pack which is the heart of the electric vehicle and generates the energy and fabricated the collision in the components of an I.C Engine and also known as zero emission vehicles. Since there was absence of tail pipes and no chance of combustion taking place in the engine so they are called as environment friendly vehicles. The paper mainly focused on the Battery Management System and applicable in the aerodynamics and safety. Su.Y.Cho(2010) focused on "Recent Trends in the development of online vehicles" . He categorized the wireless vehicle systems into two different parts followed by Vehicle Powered Roadways and Stationary Powered Roadways. The power transmission depends on capacity, efficiency of the vehicle, electromagnetic flux, weight of the vehicle and wireless transmission. Naoki Shinohara(2013) studied on "Progress on Wireless Power Transmission for Electric Vehicles". Wireless Power Transmission is the transfer of the electrical energy from the power source to an electric load without the interconnection of wires. It has the ability to charge the electric vehicles. They divided into two categories followed by Inductive Coupling and Resonance Coupling . Inductive coupling utilises magnetic fields for observing the movement of current through the wires. Bending of the wire into coil amplifies the magnetic field. Resonance coupling used in the computers, laptops and Mobiles. Chaokri Mahamoudi (2014) investigated on "Overview of electric vehicles and power management strategies". Electric vehicles can be driven either in the single source or in the multiple sources. He implemented various methodologies for getting the optimum results. The vehicles can be classified into three categories on the basis of power management Battery Vehicles, Hybrid Electric Vehicles and Range Electric Vehicles. Hybrid Electric system is applicable at low speeds and used in the city traffic systems. Range Electric vehicle have low consumption of the fuel and

Abstract— **Heat exchanger is the device transforming the heat from one fluid to another fluid. Nano fluids are engineered by the nanometer sized particles. Nanofluids can be in the form of oxides and nitrides. The main motive is to determine heat transfer characteristics heat transfer like Reynolds number, thermal conductivity, heat transfer coefficient under the volume concentration in the base fluid and nano fluid. It is used in the shell tube heat exchanger. Thermal Analysis is performed at various positions with the assumption of discharge. The heat transfer coefficient is higher in the nano fluid compared to the base fluid. It is beneficial in the conservation of energy and heat exchanger material. CuO-W is preferred as nanofluid in the current study.**

Keywords— **Nano Fluids, Oxides, CuO-W, Thermal Analysis, Heat transfer coefficient**

Problem Definition: Leaking of combustion gases, appearance of crack from the corrosion and wearing down the metal of the component. Any crack or hole that is big enough to affect combustion will be easily visible to the naked eye. When the cause occur in the heat exchanger we must replace the heat exchanger with the proper dimensions of the furnace which is the center of the furnace.

I. INTRODUCTION

p The implementation of Nano fluids in the heat exchangers in the various industries. Low thermal conductivity is the primary drawback for the expansion of energy efficient heat transfer which is vital for cooling purpose. Nano fluids are engineered by nano particles with average size of 100mm in the heat transfer fluids such as water, ethylene glycol. The main plot in the utilisation of thermo fluids in the heat exchangers minimize the size of the heat transfer equipment. Nano fluids are applicable in the conservation of heat energy and heat exchanger material. The nanoparticles can transport and properties of the thermo fluid. Authors and Researchers have investigated heat exchangers in the nano fluids in the path way of chemical approach balancing the equation in finding the volume fraction in terms of moles. Thermal and CFD analysis have implemented in the shell tube heat exchangers with the assumptions of cases.

H.Chao and H.Jiang(2014) performed on "Effect of Temperature on the effective thermal conductivity of n-tetracedene based nanofluids containing copper nanoparticles". In this study they assumed n-tetracedene as the nanofluid. Thermal conductivity was estimated for the volume fractions ranging from 0.00001 to 0.02 and temperatures from 306.22k to391.06k. Thermal conductivity was decreased after exceeding the 391.06K than compared to 306.22 and 360.71K. Thermal resistance increased with increase in temperature. Thermal conductivity was more at the 452.66k in case of base fluid due nanoconvection induced by nanoparticle at high temperature. Luna.I and Chowdary.Z(2015) examined on "Measurement of Forced Heat Transfer Coefficent low volume fraction CuO-PVA Nanofluids under laminar flow condition". Different samples were assumed for the volume concentration varying from 0.05 to 0.2 with the mean of 0.5. It was prepared with the dispersion of CuO-PVA with an average size of 32.5mm with the Ultrasonic machining and Magnetic Stirring. Forced heat transfer coefficient quantified with the help of Vertical Shell Tube Heat with a laminar flow <2300. It was increase in the heat transfer coefficient nanofluid contrast to base fluid. I.Sharrual and R.Saidur(2016) studied on" Experimental investigation on Al2O3–W, SiO2–W and ZnO–W nanofluids and their application in a shell and tube heat exchanger", They determined the performance of Shell tube and Heat exchanger with Nanofluids in the experimental path with the assumption of two cases. In the case-1 at constant with fluid flow of 4lpm with other different fluid from 2 to 8lpm. Highest performance was observed with fraction volume of 0.3% at 6lpm of ZnO2.Similarly it was found at 7lpm with fraction volume of 0.5%. In case-2 highest performance was observed at 8lpm in all the nano fluids. There was improvement of 35% by ZnO-W(PVP) nano fluid. Apart from that highest performance in case of ZnO2-W and least in case of SiO2-W. Ramtin Barzegarian and Tooraj Yousefi(2017) examined on "Thermal

Abstract

The present paper presents the results of an experimental investigation on nucleate pool boiling heat transfer of pure fluid R-134a and environmentally harmless azeotropic refrigerant mixtures R32/R125 (R-410A) on a plain horizontal copper tube. The experiment has been carried out at saturation temperatures of 5, 10, 15 and 20 °C for heat fluxes ranging from 10 to 70 kW/m^2 with an interval of 10 kW/m^2 in the increasing order of heat flux. The diameter of the test tube was 25.4 mm and an effective length of 130 mm. From experimental results, it is found that the boiling heat transfer coefficient increases with increasing the heat flux and also found that the heat transfer coefficient of refrigerant R-134a was 20–39% lower than that of refrigerant R-410A. Experimental data were compared with empirical correlations available in the literature. The Jung and Gorenflo correlations were well balanced with the present data of both refrigerants at given saturation temperatures. The Jung correlation over-estimates the experimental data of R-134a by 19% and 23% for R-410A where as Gorenflo correlation overpredics the present data of refrigerants R-134a and R-410A about 20% and 50% respectively. The thermal performance of a plain tube was correlated in terms of non-dimensional form having different dimensionless numbers to evaluate the pool boiling heat transfer coefficients of R-134a and R-410A. This correlation showed a good agreement with measured data within an error of ±12 percent.

1. Introduction

Friction stir welding (FSW) [1] is an important new welding technique with potentially significant application in manufacturing industries such as aerospace, automotive, railway and marine. The process offers several benefits over the traditional fusion welding processes. FSW is done by rotating and plunging a specially-designed cylindrical, shouldered tool with a small diameter pin into the joint line between two butted plates. Frictional heat causes the metal to soften and allows the tool to move along the joint line. The FSW process generates three distinct micro-structural zones: the weld nugget (WN), the thermo-mechanically- affected zone (TMAZ) and the heat-affected zone (HAZ). The WN is the region through which the tool pin passes, and thus experiences high deformation and high heat. It generally consists of fine equiaxed grains due to full recrystallization. The TMAZ adjacent to the nugget is the region where the metal is plastically deformed as well as heated, but this is not sufficient to cause recrystallization. The HAZ experiences only a heating effect, with no mechanical deformation.

Aluminium alloy 5083 is a weld able, strain hardening structural material suitable for marine applications due its excellent formability, good strength and high corrosion resistance. Particularly, 8 mm and above is the typical thickness used in shipbuilding [2]. The H321 designation signifies strain hardened and stabilized condition. The alloy 5083 also has very good low temperature mechanical properties which make the alloy suitable for manufacturing liquid natural gas (LNG) carriers, tanks and cryogenic containers.

Friction stir welding of aluminum alloys has been a potential research area and extensively studied in the last almost two and a half decades. Comprehensive re-views carried out by Mishra and Ma [3] and Nandan et al. [4] revealed sizable amount of information on the effects of process parameters, variations in microstructures, and structure-property correlations. More recently, there have been a number of reports [5–10] highlighting the changes in microstructures, dissolution and coarsening of strengthening precipitates in the weld nugget and formation of wide precipitate-free zones in the heat affected zone due to the plastic deformation and frictional heat associated with FSW. Also, several investigators studied the corrosion behavior of friction stir welded aluminum alloys [11-15].

In recent years, a few researchers have confirmed the favourable effects of cryogenic treatment on various metallic alloys [16, 17]. The CT process consists of gradual cooling of samples to cryogenic temperatures, soaking at those temperatures for targeted time and slowly heating to room temperature. Some non-ferrous alloys such as titanium-um alloys [18], copper alloys [19] and aluminum alloys [20-22] have also been treated using this treatment to improve the properties. However, 5xxx series aluminum alloys have rarely been investigated for effects of cryogenic treatment. Specially, the alloy AA5083, which is a candidate material for cryogenic applications, has hardly been studied for possible effects of the CT. Furthermore, in view of the above literature survey, it seems there have been no attempts to study the effect of cryogenic treatment on corrosion properties of AA5083 friction stir welds. Furthermore, there has not been any systematic study ex-plaining the correlation between pH value of the salt solution, time of exposure and corrosion behavior of cryogenically treated AA5083 friction stir welds. Thus, in this investigation, the effect of cryogenic treatment on the salt fog corrosion behavior of 10 mm thick AA5083–H321 friction stir welds was evaluated while changing pH value of the salt solution and time of exposure.

2. Experimental procedure

The base material used in this study was 10 mm thick AA5083–H321 plates, having chemical composition as shown in Table 1. The plates were machined to get a size of 110 mm wide and 250 mm long and cleaned with acetone to remove oxide layer and other unwanted particles. Friction stir welding trials were performed using a specially designed milling machine (Fig. 1, a). The photograph of the welded joint is shown in Fig. 1, b. The details of tool geometry and welding parameters used in this study are presented in Table 2.

In orders to study the effect of cryogenic treatment on corrosion properties of the base material and the friction stir welds, the samples were prepared to accommodate in the

Implementation of Identical Spiral Square Inductive Coils for Wireless EV Battery Charging Application

D. Kishan*(C.A.), P. S. R. Nayak** and B. Naresh Kumar Reddy*

Abstract: In recent years, the popularity of wireless inductive power transfer (WIPT) system for electric vehicle battery charging (EVBC) is always ever-increasing. In the WIPT inductively coupled coil structure is the heart of the system and the mutual inductance (MI) between the coupled coils is the key factor for effective power transfer. This paper presents the analysis of mutual inductance between the spiral square coils based on the cross-sectional area ratio of spiral circular and spiral square coupled coils. The analytical computed MI values are compared with FEM (ANSYS Maxwell) simulation and Experimental computed values. Finally, the designed spiral square coils are implemented in a laboratory prototype model and at the receiver side for effective electric vehicle (EV) battery charging a closed-loop PID controller is implemented for DC-DC buck converter. The effectiveness of the proposed controller has been tested by providing sudden changes in mutual coupling and change in reference value. The proposed system is suitable for both stationary and dynamic wireless EVBC.

Keywords: Inductive Power Transfer, Battery, Electric Vehicle, Mutual Inductance.

1 Introduction

THE fossil fuel vehicles are causing 34% of the air pollution, which brings about expanding global warming [1]. So as to lessen this issue to some extent, it is important to confine the utilization of fossil fuels. Researchers are addressed the electrification of vehicles (EV) to overcome the pollution problem. The main advantages of electrified vehicles are operated smoothly and emission-free [2, 3]. These vehicles are operated on battery rather than fuel. Hence, electric vehicles are used heavily in marker to reduce pollution. One such significant apprehension of EV's is the conductive battery charging (plug-in) applications [1, 2]. The plug-in or conductive battery charging requires vast establishment of charge stations, charging plug and cable can be easily damaged, stolen and sometimes user forget to plug the electric vehicle. The issues related to conductive charging can be overwhelmed by wireless charging. Wireless power can be transferred through the air. Therefore wireless electric vehicle battery charging is to simplify the consumer anxieties and speed up EV adoption [2, 3]. In wireless power transfer system, the coil associated with the source is termed as a transmitter and the coil at the load side is known as a receiver [4]. In WPT system, the power can be transferred in the form of electromagnetic energy or electrostatic energy or radiative energy. In high power rating and medium distance system, power can be transferred more likely through electromagnetic energy, which is called inductive power transfer system (IPTS). The functionality of IPTS is conventional transformer, which is based on Ampere's and Faraday's law.

The most important part of the IPT system is the coupled coil structure which forms the wireless link. The extensive literature has been studied and published over time. The conventional coil structures design employs E-cores and pot cores [4, 5]. However, these core structures are incompatible for electric vehicle battery charging applications. Moreover, these core designs are weighty, sensitive, horizontal

Abstract

Surveillance videos are able to capture a variety of real-world anomalies. All kinds of activities like walking, talking, riding a vehicle are considered normal behaviour. But any sort of activity that does not adhere by the definition of normal pattern is considered as abnormal or anomalous. It can be any irregular behaviour like yelling, theft in public, breaking into a house, accident and many more. In this work, the intention is to develop a model that will take videos captured from CCTV cameras on streets, ATMs, police station, roads, hospitals, railway stations, etc., as input and classify them as normal or abnormal (contains anomaly at some point of time). A video which contains anomaly is labelled as positive and normal videos are labelled negative. Change in motion vector, is taken as the key for classification. This research, aims to find several spatial and temporal feature descriptors like Histogram of Oriented Gradients, Histogram of Optical Flow and then use the extracted features in classifiers such as CNNs for HOG and HOF. The aim the proposed method is to return positive hits for portions of video sequences that contain violent content.

Keywords: *Anomalous activity detection, convolutional neural network, optical flow, Histogram of Oriented Gradients, Histogram of Optical Flow*

1. Introduction

Computer vision and image processing are one of the prime domains of artificial intelligence. Over the years, many advancements have been made in these fields to help computers "see" and "recognize" images as humans do. Image processing is basically a method of performing certain operations on an image so as to obtain an enhanced image or extract useful information from it. Simply, it is a type of signal processing where input is an image and output may be an image or characteristics associated with the image.

Before beginning with image and video classification and diving deep into its techniques, the first thing to understand is what an image is exactly. For computers, an image is a large array of numbers. These are composed of a finite number of elements, called pixels, each of which has a particular value between 0 and 255. Technically, an image is a two-dimensional function f(x, y) where x and y are the plane coordinates and amplitude for any pair of (x, y) gives the intensity of the image at that point. In image classification, an image is assigned a label from a set of categories. However, this task

Abstract:
Segmentation of images plays a key role in Image Processing as it simplifies further processing by separating a broad image into many parts. White Blood Cells (WBC) microscopic images allow haematologists to predict vulnerability to several diseases. Our intension is to identify Nucleus of White Blood cells. Colour is a significant reference point for discerning segmented WBCs from microscopic images. Results reveal that in identifying the nucleus of various types of WBC: including Neutrophils, Lymphocytes, Eosinophils, Monocytes, Basophils. In this study, we will evaluate the efficiency of the Edge detection Algorithm (log & Canny) methods, k-Means Algorithm, Linear Transformed Image, Color-based technique, and will compare the results with the original image. This will allow haematologists for clear identification of WBC. Analysis of the results using Algorithms shows that Edge detection and k-means based segmentation is the most suitable approach for segmenting WBC cells.

Abstract:
With the expansion in service-oriented computing (SOC), Web services are effectively accessible over the internet; we can without much of an effort to offer our data and software with the assistance of web services. Utilizing web services a client can ready to do the complicated task in simple manners. Web service recommendations can help the users to choose the appropriate services and service-oriented software systems. The best strategy to suggest web services with better QoS regard gets a huge amount of thought. Web services are mostly used for building service-oriented applications. The amount of openly accessible Web services is constantly developing the Internet. In any case, this development makes it hard for a client to pick a proper Web service amongst a colossal number of service contenders. An ignoble service assurance may cause various issues for the resulting applications. The investigation and near analysis of recent studies related to Web Service Recommendation is considered in this review. The result of this paper guarantees the different research gaps recognized by the literature review.

Abstract

Cloud computing can be described as a distributed computing framework that provides computational facilities, where information and assets are recovered from cloud service providers via the web, by means of a well-framed online application. But resource sharing often leads to unavailability of resources, resulting in a deadlock situation. One approach to avoid this is by disseminating the workload uniformly between the encumbered and idle machines. This is called Load Balancing. The aim of doing this is to reduce the average response time and maximize resource utilization. Forest Optimization Algorithm (FOA) is based on governance of trees in the forest and survival of distinct trees. These trees have proper geological developing conditions. The proposed Algorithm is an attempt to find these distinguished solutions from the pool to avoid starvation of the tasks, at the same time improving the average response time by utilizing the process of seed dispersal in forests.

Abstract

This chapter talks about the theories connected with information processing and memory. It comprises the descriptions and definitions of important stipulations and models that have been used to represent memory types and workstations (PC, processors). Information processing and communications are investigated in various disciplines: technology, psychology, mathematics, sociology, social science, and plenty of others. Nowadays, human learning has become one of the research interests. This is due to how one acquires new information and retrieve the information, collection of long-term and short-term learning goals, and methods of useful instruction. Therefore, the study of cognition as a psychological area reaches its height, just not in the captivating and recovering information. It has become a wide area of research devoted to the study of mind holistically. Many significant researchers in cognition defined that it is the study of how individuals encode, organize, store, recover, employ, or else learn knowledge. Cognitive psychologists imagine a dominant variable or set of variables between environment and behavior, which shows the difference in behavioral theories.

Abstract:
In this paper miller compensation of opamp has been explained intuitively and discussed the problems existing with this traditional way. Proposed an area/power efficient technique by splitting the second stage has been proposed. The splitting introduces an extra zero in the transfer function such that it will improve the stability. This tech was implemented in 45nm CMOS technology and simulated with Spectre. Simulation results show that the proposed circuit saves 50% of the capacitance area compared to the miller technique. The circuit draws320uA current from 1.5V supply and occupying 0.003108mm2 silicon area.

Abstract:
Bandgap reference using 2 BJT devices are well explored in the literature. Usually, less number of BJT's would reduce the cost of the chip in modern CMOS technologies. A single BJT based reference was discussed here. V_{BE} of the BJT has been used as CTAT voltage and a CMOS differential pair offset voltage based PTAT generation circuit used to generate zero temp coefficient reference. A prototype was developed in 45nm TSMC CMOS technology and post-layout simulationswere performed. Designed for a nominal voltage of 525mV with 10.2ppm/°C temperature coefficient. Its supply sensitivity is 0.4% and works with 1V power supply. The proposed solution consumes 51.8μW power from 1V power supply and occupies 2478 μm ^{2} silicon area.

Abstract:
Pseudorandom Number Generator (PRNG) are used in Built in Self Test (BIST) to reduce testing cost and time. The linear feedback shift register (LFSR) pattern generator is mostly used in generating test vectors for PRNG. LFSRs play a vital role in generating test vectors in hardware verification or testing and they are also employed in the cryptography area. This paper presents the design of 4-bit LFSR with 2 Phase clocked Adiabatic Static CMOS Logic (2-PASCL) and Reversible Logic Gates (RLG). The proposed 4-bit LFSR is synthesized and simulated using Vivado design suit 2018.3 and implemented on a Kintex FPGA board. Compared with the results obtained with well-known LFSR architectures, the proposed method is used to improve the performance, and decrease the power consumption and area of processors.

Abstract

Automated lung tissue characterization of Interstitial Lung Disease is one of the most important aspects of the Computer Aided Disease diagnosis system. The problem remains challenging, even though there has been much research in this area. While deep learning has produced brilliant success in image applications over the past few years, the majority of training is with sub-optimal parameters, requiring unnecessary long training time, setting up hyper parameters. In this paper, we explore the classification of lung tissue pattern affected with interstitial lung disease (ILD) in high resolution computed tomography (HRCT) scans and evaluated different CNN architectures with and without transfer learning. The effect of cyclical learning rates, the hyper-parameters tuning and data augmentation on classification performance are studied using a popular publicly available dataset called MedGift dataset.

Received August 8, 2020; revised August 31, 2020; accepted September 1, 2020

Abstract—The region of Garhwal is one of the most seismically active areas in India. Many destructive earthquakes have occurred there in the past. The current seismic activity in Garhwal is also high. The region is characterized by a high population density; therefore, in choosing ways to develop it, protecting the population and reducing material damage from expected strong seismic events are of utmost urgency. The solution primarily requires using various antiseismic measures during construction, which are selected based on the characteristics of seismic treatments. The purpose of this research is to assess the seismic hazard and seismic treatments in some settlements of Garhwal. To solve this problem, data obtained in previous stages of studies in Western Himalaya are interpreted once again. In particular, the results of geological and geophysical and structural and geological studies have made it possible to reveal the main seismogenerating structures and determine their characteristics. The analysis of the data on strong ground motions in the epicenter areas of the Dharamsala (April 26, 1986, $M_w = 5.5$), Uttarkashi (October 20, 1991, $M_w = 6.8$), and Chamoli (March 28, 1999, $M_w = 6.5$) earthquakes and the study of the attenuation patterns of ground accelerations in the Garhwal region have enabled us to estimate the expected maximum magnitudes, focal depths, and source mechanisms of the earthquakes. A regional model of seismic source zones (SSZs) is proposed. Using the results of seismological and seismotectonic studies, the parameters of ground motions during the maximum credible earthquakes are estimated, such as peak ground accelerations, spectra and durations of vibrations, and the seismic-effect value in the seismic intensity scale points for some settlements in Garhwal.

Keywords: Western Himalaya, Garhwal, seismotectonics, fault, magnitude, source mechanism, distance, ground conditions, strong ground motions, seismic intensity, seismic source zone, peak ground acceleration, seismic hazard, earthquake

DOI: 10.1134/S0001433820110079

INTRODUCTION

Western Himalaya (India) is a part of the Himalayan seismic belt characterized by high seismic activity (Gansser, 1964; Ni and Barazangi, 1984; Molnar and Tapponnier, 1975; Molnar, 1990; Kayal, 2001, 2007; Sivaram et al., 2013). The magnitudes of the strongest earthquakes in Western Himalaya reach $M_w = 7.0–8.2$: the 1505 Kashmir earthquake was $M_w = 8.2$ (Kumar et al., 2006), the 1803 Kumaon earthquake was $M_w = 7.7$ (Rajendran et al., 2018a), the 1905 Kangra earthquake was $M_w = 7.8$ (Ambraseys and Bilham, 2000; Hough et al., 2005), the 1934 Bihar–Nepal earthquake was $M_w = 8.2$ (Kumar et al., 2006; Prasath et al., 2017), the 1945 Chamba earthquake was $M_w = 7.5$ (Srivastava et al., 1987), and the 1975 Kinnaur earthquake was $M_w = 7.5$ (Singh et al., 1976).

However, such strong seismic events have not been known over the last 200-odd years since the Kumaon earthquake at the segment of Garhwal in Western Himalaya, which lies at around 77° and 80° E. Among the most notable earthquakes of the recent past were the 1986 Dharamsala earthquake, $M_S = 5.4$ (Kumar and Mahajan, 1990; Sriram et al., 2005); the 1991 Uttarkashi earthquake, $M_S = 6.8$ (Narula et al., 1995; Cotton et al., 1996); and the 1999 Chamoli earthquake, $M_S = 6.7$ (Rastogi, 2000; Kayal et al., 2003; Satyabala and Bilham, 2006; Xu et al., 2016). Such an absence of seismic events makes it possible to consider the Garhwal region a seismic gap that has formed (Khattri and Tyagi, 1983; Khatri, 1987; Rajendran et al., 2000, 2018b; Bilham et al., 2001; Rogozhin et al., 2009, 2020; Ghosh and Mahajan, 2013). It is known (Fedotov, 1968, 2005) that such zones of seismic gap can be zones of preparation of a very strong earthquake in the future with a magnitude no less than 7.7.

As the history of seismological observations suggests, a seismic event of such a scale may cause significant material damage, destruction, and failures of different structures, as well as a loss of human life. In this regard, assessing seismic hazard and seismic treatments for settlements that may be subject to the action of such an earthquake is evidently necessary and urgent.

Abstract— **The current paper deals with development of the electric vehicle which will be beneficial for future scope. The battery should be operated at the safe temperatures. Low temperatures or high temperatures can be problematic for the life of the battery as well as the operating of the battery. The commonly used battery is lithium ion battery and it need to be operated at optimal temperatures for efficient operation and maximum lifespan of the battery. This study is about the working of an electric vehicle how it uses the battery to power the vehicle and the parts used to power the vehicle. This study also includes the developments in electric vehicles recently. This paper also describes the comparison between the parts and components in electric vehicles. The major components are battery technology, charger design, steering system, motor technology and braking. The recent developments in the electric vehicles have been shown in this paper and the future of electric vehicles in upcoming years are also been shown in this paper.**

Problem Definition: Charging of Electric Vehicles takes very long time compared to the internal combustion engine which requires only to a minute to refuel the vehicle. Battery weight is heavier compared to the fuel. Cost of the battery is very expensive. Price of the electric cars are expensive compared to internal combustion cars. Some customers find electric car problem to rely. Market is low for electric cars.

I. INTRODUCTION

Electric vehicles working with the help of the electricity stored inside a battery. These are environmental friendly unlike combustion engines these electric vehicles do not produce exhaust gases into the environment. But these electric vehicles must be charged from some renewable sources. For example the energy produced from a wind powered electricity, hydroelectric power and biogas power producing plants. Basically the power from the battery is sent into the electric motor which produces power to move the vehicle. The controller sends the power from battery to the parts further. The controller also sends the power required amount depending upon the acceleration which we give with the help of a pedal inside the car. Here the electric energy is converted into mechanical energy. In the year 1830 the first electric carriage has been built. In the year 1891 the first electric automobile has been built by United states of America. Now the best company that manufactures the electric vehicles is Tesla motors which is built by Elon musk a famous entrepreneur and a private developer. The first car which Tesla manufactured is Tesla model s which has a range of 300 miles which is 485 km which has an acceleration of 0-60mps in 2.5 sec which is impressive.

Ramesh.C.Bansal(2005) examined on "Electric Vehicles" , Battery pack which is the heart of the electric vehicle and generates the energy and fabricated the collision in the components of an I.C Engine and also known as zero emission vehicles. Since there was absence of tail pipes and no chance of combustion taking place in the engine so they are called as environment friendly vehicles. The paper mainly focused on the Battery Management System and applicable in the aerodynamics and safety. Su.Y.Cho(2010) focused on "Recent Trends in the development of online vehicles" . He categorized the wireless vehicle systems into two different parts followed by Vehicle Powered Roadways and Stationary Powered Roadways. The power transmission depends on capacity, efficiency of the vehicle, electromagnetic flux, weight of the vehicle and wireless transmission. Naoki Shinohara(2013) studied on "Progress on Wireless Power Transmission for Electric Vehicles". Wireless Power Transmission is the transfer of the electrical energy from the power source to an electric load without the interconnection of wires. It has the ability to charge the electric vehicles. They divided into two categories followed by Inductive Coupling and Resonance Coupling . Inductive coupling utilises magnetic fields for observing the movement of current through the wires. Bending of the wire into coil amplifies the magnetic field. Resonance coupling used in the computers, laptops and Mobiles. Chaokri Mahamoudi (2014) investigated on "Overview of electric vehicles and power management strategies". Electric vehicles can be driven either in the single source or in the multiple sources. He implemented various methodologies for getting the optimum results. The vehicles can be classified into three categories on the basis of power management Battery Vehicles, Hybrid Electric Vehicles and Range Electric Vehicles. Hybrid Electric system is applicable at low speeds and used in the city traffic systems. Range Electric vehicle have low consumption of the fuel and

Abstract— **Heat exchanger is the device transforming the heat from one fluid to another fluid. Nano fluids are engineered by the nanometer sized particles. Nanofluids can be in the form of oxides and nitrides. The main motive is to determine heat transfer characteristics heat transfer like Reynolds number, thermal conductivity, heat transfer coefficient under the volume concentration in the base fluid and nano fluid. It is used in the shell tube heat exchanger. Thermal Analysis is performed at various positions with the assumption of discharge. The heat transfer coefficient is higher in the nano fluid compared to the base fluid. It is beneficial in the conservation of energy and heat exchanger material. CuO-W is preferred as nanofluid in the current study.**

Keywords— **Nano Fluids, Oxides, CuO-W, Thermal Analysis, Heat transfer coefficient**

Problem Definition: Leaking of combustion gases, appearance of crack from the corrosion and wearing down the metal of the component. Any crack or hole that is big enough to affect combustion will be easily visible to the naked eye. When the cause occur in the heat exchanger we must replace the heat exchanger with the proper dimensions of the furnace which is the center of the furnace.

I. INTRODUCTION

p The implementation of Nano fluids in the heat exchangers in the various industries. Low thermal conductivity is the primary drawback for the expansion of energy efficient heat transfer which is vital for cooling purpose. Nano fluids are engineered by nano particles with average size of 100mm in the heat transfer fluids such as water, ethylene glycol. The main plot in the utilisation of thermo fluids in the heat exchangers minimize the size of the heat transfer equipment. Nano fluids are applicable in the conservation of heat energy and heat exchanger material. The nanoparticles can transport and properties of the thermo fluid. Authors and Researchers have investigated heat exchangers in the nano fluids in the path way of chemical approach balancing the equation in finding the volume fraction in terms of moles. Thermal and CFD analysis have implemented in the shell tube heat exchangers with the assumptions of cases.

H.Chao and H.Jiang(2014) performed on "Effect of Temperature on the effective thermal conductivity of n-tetracedene based nanofluids containing copper nanoparticles". In this study they assumed n-tetracedene as the nanofluid. Thermal conductivity was estimated for the volume fractions ranging from 0.00001 to 0.02 and temperatures from 306.22k to391.06k. Thermal conductivity was decreased after exceeding the 391.06K than compared to 306.22 and 360.71K. Thermal resistance increased with increase in temperature. Thermal conductivity was more at the 452.66k in case of base fluid due nanoconvection induced by nanoparticle at high temperature. Luna.I and Chowdary.Z(2015) examined on "Measurement of Forced Heat Transfer Coefficent low volume fraction CuO-PVA Nanofluids under laminar flow condition". Different samples were assumed for the volume concentration varying from 0.05 to 0.2 with the mean of 0.5. It was prepared with the dispersion of CuO-PVA with an average size of 32.5mm with the
Ultrasonic machining and Magnetic Stirring. Forced heat transfer coefficient quantified with the help of Vertical Shell Tube Heat with a laminar flow <2300. It was increase in the heat transfer coefficient nanofluid contrast to base fluid. I.Sharrual and R.Saidur(2016) studied on" Experimental investigation on Al2O3–W, SiO2–W and ZnO–W nanofluids and their application in a shell and tube heat exchanger", They determined the performance of Shell tube and Heat exchanger with Nanofluids in the experimental path with the assumption of two cases. In the case-1 at constant with fluid flow of 4lpm with other different fluid from 2 to 8lpm. Highest performance was observed with fraction volume of 0.3% at 6lpm of ZnO2.Similarly it was found at 7lpm with fraction volume of 0.5%. In case-2 highest performance was observed at 8lpm in all the nano fluids. There was improvement of 35% by ZnO-W(PVP) nano fluid. Apart from that highest performance in case of ZnO2-W and least in case of SiO2-W. Ramtin Barzegarian and Tooraj Yousefi(2017) examined on "Thermal

Optimization of Block Query Response Using Evolutionary Algorithm

Sandeep Kumar Panda, Siba Prasad Dash, and Ajay Kumar Jena

Abstract The term blockchain can be practically viewed as a database as storage, and retrieval of information can be performed within blocks. But database cannot be termed as blockchain. In the simplest definition, it is the time stamped series of data along with heterogeneity which is managed by a cluster of systems with security implementing the cryptographic applications. Practically, it uniformly stores the information in blocks, where each block contains the hashed information from the previous block to provide cryptographic security. This implementation mechanism is absolutely decentralized supporting peer-to-peer storage of data to all the access points. Accordingly, it captures the prerequisite and relevant information logically structured in blocks. Each block is attached to its preceding blocks by applying the cryptographic generic function, where the details of the initial block are required to be focused. Based upon the non-recursive processing of data, it cannot repeat the data already validated in the block. In case of decentralization, rather having faith on single entity, it is essential to focus on other linked entities and to maintain integrity of data during the application. After that as soon as the data is associated with the blockchain, the information can be stored permanently, and the particular block will be associated with the succeeding blocks to update the information. In this paper, it is intended to optimize the response of queries blocks implementing evolutionary algorithms approach.

Abstract Internet of Things (IoT) has been the primary way for assuring the usable devices becoming smart and intelligent. The main challenge in IoT is to identify effective IoT issues. There are many challenges and difficulties have to face with this technology in the area of security and storage. In this regard, it is the responsibility to assure the user that devices are trustworthy. Blockchain technology is the key technology to provide every kind of security to Internet of Things using the decentralized architecture and peer-to-peer network connection. Cloud storage technology is very much reliable about the data storage. In this paper, we proposed a novel model for smart home application which focuses about the challenges while integrating blockchain technology with Internet of Things.

Investigating the magnetohydrodynamic flow of a couple stress dusty fluid along a stretching sheet in the presence of viscous dissipation and suction

Nagaraju Gajjela ✉, Raj Nandkeolyar,

First published: 08 January 2021
https://doi.org/10.1002/htj.22001

Abstract

A computational study for investigating the flow and heat transfer phenomena in the unsteady magnetohydrodynamic couple stress dusty fluid flow over a linearly stretching porous surface in the presence of viscous dissipation effects is presented. The governing equations, in nondimensional form, are tackled by the exploitation of the standard spectral quasi-linearization methodology. The estimations of flow rate and temperature profiles are pictured diagrammatically. In contrast, the local skin friction and heat transfer rates are placed in tabular form for various values of thermofluidic parameters. The numerical results of a current investigation are compared with previously available results and located to be sensible agreement as shown in Tables 1 and 2. It is analyzed that by elevating the specific heat parameter and couple stress parameter, the temperature profile and the resulting thickness of the boundary layer are depressed. In comparison, an increase in thermal boundary layer thickness and a decrease in thickness of the momentum boundary layer were found with the rising magnetic parameter values.

Abstract

In the performance-based structural design, the crucial component is to estimate the uncertainties in the structural responses precisely. The uncertainty may lie in many structural design parameters such as load, material properties, etc. Each parametric uncertainty has led to variation in the structural responses. Currently, structural design is performed considering the constant loading and material properties. But in reality, all these parameters are highly uncertain and can pose a wide variation in the structural responses due to earthquake loading. This study focuses on identifying the uncertainties arising from the different means and their impacts on the responses. The Monte Carlo Sampling (MCS) is employed to quantify the uncertainties in a structural deformation. The Multi-Degrees of Freedom (MDOF) structural model is constructed in the OpenSees program, and non-linear dynamic analysis is performed. The El-Centro earthquake was applied for the structural analysis. The result shows the probabilistic distribution of the earthquake response parameters. This approach is a more realistic representation of structural responses by incorporating the uncertainties in the design parameters.

Design of Autonomous Production Using Deep Neural Network for Complex Job-Shops

Dr. Grandhi Suresh Kumar, Dr. Pratik Gite, Dr. M. Prasad, Dr. Madiajagan M., Dr. S. Selvakanmani, Dr. V. Saravanan

Abstract

Deep Neural Network (DNN) in recent era offers new opportunities to manage the production systems with increasing complexity. In this paper, DNN is trained with discrete event simulation and a process based association to make the job shop an autonomous one. This intelligent system operates well in complex environment with constrained time limits while making optimal decisions. The DNN is henceforth combined with constrained time limits for the process of production control. The system is implemented typically in semiconductor manufacturing industries on complex job shops of a wafer fab case. The DNN is trained in such a way that it operates in complex environment with timing constraints that ships the job in accurate way without flaws in operation. The DNN rewards the selection with reduced time constraint, which tends to operates with most critical batch list. The study therefore shows that the DNN manages well the timing constraints than the standard benchmark technique.

Abstract: Software testing has been attracting a lot of attention for effective software development. In model driven approach, Unified Modelling Language (UML) is a conceptual modelling approach for obligations and other features of the system in a model-driven methodology. Specialized tools interpret these models into other software artifacts such as code, test data and documentation. The generation of test cases permits the appropriate test data to be determined that have the aptitude to ascertain the requirements. This paper focuses on optimizing the test data obtained from UML activity and state chart diagrams by using Basic Genetic Algorithm (BGA). For generating the test cases, both diagrams were converted into their corresponding intermediate graphical forms namely, Activity Diagram Graph (ADG) and State Chart Diagram Graph (SCDG). Then both graphs will be combined to form a single graph called, Activity State Chart Diagram Graph (ASCDG). Both graphs were then joined to create a single graph known as the Activity State Chart Diagram Graph (ASCDG). Next, the ASCDG will be optimized using BGA to generate the test data. A case study involving a withdrawal from the automated teller machine (ATM) of a bank was employed to demonstrate the approach. The approach successfully identified defects in various ATM functions such as messaging and operation.

Abstract

An orbital fracture is a traumatic injury to the bone in the eye socket. These fractures modify the orbital bone dimensions and the functioning of the intraorbital contents. In this study, a surgical method that includes positioning, aligning and fixing implants to restore orbital fractures was adapted. Notably, it is difficult to achieve an original three-dimensional orbital shape through the process of forming and cutting implants; however, this problem was solved by creating customized implants using computed tomography (CT) images of the patient. The objective of this work is to reconstruct the damaged orbital floor defects by means of a 3D printed implant and restore the orbital floor to its original shape. A case study of an orbital fracture has been included in this study. CT images were used to create a computer-aided design (CAD) model of orbital floor implants, which were designed to maintain orbital floor symmetry from right to left and vice versa. Furthermore, the designed implants were manufactured through a material extrusion process with biocompatible material. The application of the material extrusion process with biocompatible material resulted in the fabrication of implants at a minimal cost. Therefore, the customized models used in the patient's intra-operation can minimize the operational time and maximize surgical safety.

Abstract

Single-phase Sodium (Na), Samarium (Sm) substituted Strontium Bismuth Titanate (SNSBTi I-V) ceramics were synthesized by solid-state double sintering approach via high energy planetary ball mill for 20 hours grinding. X-ray diffraction (XRD) study confirms the primary structure and orthorhombic distortion of crystal. Scanning electron microscopy (SEM) shows the grain orientation and densified plate-like grain structure of SNSBTi I-V. The complex impedance spectroscopy method was used to study the temperature and frequency dependent electric properties of the material using a high-frequency LCR meter. Z'' versus frequency plots have shown the peak shifting to higher frequencies with increasing concentration of Na, Sm. It is also found that the magnitude of the peaks decreases with increasing temperature. The grain and grain boundary relaxation mechanisms of SNSBTi I-V have been identified using Nyquist plots; the resistance, capacitance and relaxation times were obtained from Z-view software. It is seen that the grain and grain boundary resistances decreased with the increasing concentration of Na and Sm of SBTi ceramics.

Investigation of the role of Sm, Na in ferroelectric, piezoelectric and conduction behaviour of Strontium Bismuth Titanate ceramics

Show affiliations

Ravikiran, U. ; **Sarah, P.** ; **James, A. R.** ; **Zacharias, Elizabeth**

The manuscript presents a systematic study of ferroelectric, piezoelectric and conduction behaviour of Sm, Na substituted Strontium Bismuth Titanate ceramics, prepared by solid-state reaction method. The structural analysis of Bismuth layer structured ferroelectrics (BLSF) of $Sr_{1-2x}Sm_xNa_xBi_4Ti_4O_{15}$ (SSNBTi) ceramics was done by X-ray Diffraction technique and it showed single-phase formation and peak shifting towards the higher angles. Scanning Electron Microscopy confirmed orthorhombic sheet-like grain structure with random orientation of grains. P-E study and Piezoelectric studies were done at room temperature (RT); improved remnant polarization (P_r = 1.95 μC/cm^2), Piezoelectric charge coefficient (d_{33} = 21.1 pC/N) and electromechanical coupling factor (k_p = 0.71) were achieved by substitution of Sm, Na (x = 0.4) in Sr of SBTi ceramics. The AC conductivity was studied from RT to 600 °C in the frequency range of 1 kHz-100 kHz. The trends shown by Activation energies obtained from Arrhenius plots suggests that the mechanism of conduction is through short-range oxygen vacancies hopping. The combination of improved ferroelectric properties and high piezoelectric constant (k_p = 0.71) make the SSNBTi ceramics suitable for a wide range of sensor, actuator, and transducer applications.

Title: Design of RF planar slow wave interaction structure for THz devices

Authors: K. Kishore Kumar; Movva Pavani

Addresses: Department of Electronics and Communication Engineering (ECE), Faculty of Science and Technology, IFHE, Hyderabad, India ' Department of Electronics and Communication Engineering (ECE), Faculty of Science and Technology, IFHE, Hyderabad, India

Abstract: Micro fabricated planar slow wave structure (SWS) in a travelling wave tube (TWT) has shown a superior performance when compared with the circular helix structure for RF power amplification. The circular helix structure applications are limited to the maximum operating frequency of 70 GHz. In the proposed paper, a rectangular planar slow wave structure operating at terahertz (THz) is designed. Fabrication of the beam interaction system is complex especially operating at higher frequencies as the device dimensions decrease. Use of planar interaction system simplifies the miniaturised fabrication process. The present paper focused on the design of staggered double vane slow wave structure (SWS) and simulated the corresponding dispersion diagram and S-parameters of the model by using CST Studio Suite software. The results for designed RF planar slow wave structure are then analysed.

Keywords: slow wave structure; SWS; travelling wave tube; TWT; waveguide; eigenmode analysis; transient analysis; rectangular waveguide cutoff frequency.

Abstract

The land registry system is one of the very important revenue generator in any governance system that stores land ownership records. There are various issues and loopholes in the existing system that gives rise to corruption and disputes. The digitization of land records is not sufficient to prevent fraud, time delays, and brokers' involvement. Distributed Ledger Technology can be used to make this digitized record more secure and process it in a decentralized way, reducing paperwork in selling and buying of land. This paper presents a scalable and novel blockchain technology-based land/property registration architecture that utilizes a scalable trust based

Abstract

Without a proper mechanism to track and authenticate drugs, both stakeholder and consumer experience dilemmas. The dilemmas arise between stakeholders and consumers are related to of coordination, inventory management, human resource dependency, order management, stock management, expiry of medicines data etc. Stakeholders are unable to analyse the demands, hence becoming incapable of optimizing their production and storage. Likewise, a consumer remains suspicious about the authenticity of the drug. A medical supply chain promotes updating medicine status at each checkpoint, reducing the disputes caused by medicine ' s unseen journey. In the current market, medical supply chains are present, but they are centralized. A centralized medical supply chain is typically tedious and expensive to maintain and does not provide adequate features to analyse markets. Above all, it brands merely a certificate to prove the authenticity of a drug. However, by using a blockchain platform, the medical supply chain problems can be solved efficiently. This

B-series composite propeller blade
Hydrodynamic characteristics
Open water efficiency

ABSTRACT

The aim of the present research work is to investigate the hydrodynamic characteristics (pressure distribution, rotational speed, thrust and torque) of the conventional B-series composite propeller blade. The open water efficiency for the scaled model of composite propeller blade is computed using computational fluid dynamics (CFD) fluent simulation tool. The obtained numerical results show that the propeller will operate at optimum efficiency for the given speed condition and perform with reduced efficiency at other operational speeds. The computed responses are also validated with the standard B-series data which verifies the accuracy and robustness of the present numerical approach in analyzing the performance characteristics of propellers. The deviation in solution ranges from 5 to 15% in the case of thrust, 10-20% in case of torque. Pressure estimation is usually quite accurate with a 5-8% variation. The tabular data of pressure distribution over the propeller blade may be used for further structural analysis.

1. INTRODUCTION

Since 19th century, screw propellers have secured a position in the ship hydrodynamics as the best propulsion system despite of several developments in the propeller design and propulsion system due to its suitable use and higher efficiency over a long period of time. With the rapid advancements in technology, the determination of principal dimensions like ship size, speed for the design of ship using numerical method-based tools has gained much importance. These numerical applied computational methods have gained the closed form of solutions with analytical or experimental methods. The use of Wageningen B-series as base series for marine propeller blades proved desirable for various applications of ocean engineering. Although much research has been done on the optimal design and applications of such series, the baseline lies in determining the open water characteristics of these blades to assess the suitability in underwater conditions. A normal procedure is to design a propeller is based on the diagrams obtained from the open water test of the model series. The marine propeller design and determination of optimum diameter can be made using the data from the polynomials of $K_T, K_Q, B_P, -\delta, B_P$, — diagrams. The alternative is to use mathematical methods like lifting line, lifting surface, Boundary element method, vortex lattice methods. With huge

Summary

Four different mixtures such as complex mixture A, $[Co(H_2O)_4(HPO_4)](C_3H_4N_2)(H_2O)_2 \cdot 0.2(C_3H_4N_2)$, complex mixture B, $[Co(H_2O)_6](H_2PO_4)(OH)(H_2O) \cdot (C_3H_4N_2)_2$, mixture C, $0.34 Co(PO_3)_2 \cdot 0.15(C_3H_3N_2Na)$, and complex mixture D, $0.03Co(PO_3)_2 \cdot 0.25(C_3H_3N_2Na) \cdot 0.1 [Co(H_2O)_6]SO_4.H_2O \cdot 0.6(C_3H_4N_2)$, were synthesized using ortho-phosphoric acid and meta-phosphoric acid with cobalt sulfate heptahydrate and imidazole in ambient conditions. These mixtures have been well characterized by different thermo-analytical techniques. Differential Scanning Calorimetry (DSC) has been carried out at different heating rates such as 5, 10, 20, and 30 K min^{-1} at atmospheric conditions. The specific heat capacity was measured at low temperatures up to 173 K for mixture C at a rate of 10 K min^{-1}. From the thermal analysis, it can be observed that the complex mixtures A and B prepared using phosphoric acid and mixture C prepared using meta-phosphoric acid behave as heat repellent material owing to their exothermic behavior at high temperature. The anomalous negative specific heat capacity exhibited by the mixtures is explained using partial molar quantities. Among all the four complex mixtures, the complex mixture A has been found to be the best heat repellent material. The complex mixture B can be used as heat storage material up to temperature ~550 K due to its endothermic behavior. These phosphate materials can be used for longer period of time due to their stability and insolubility in aqueous media. The heat can be extracted from any system that is coated with these phosphate mixtures using high conductivity copper rod.

Abstract

A mixed metal complex mixture, $[Ni(H_2O)_6](HPO_4)(H_2O).\ 0.25Ni(OH)_2.\ NiMo_4O_{13}\ 2H_2O.\ (C_3H_4N_2)_{40}$ was synthesized and characterized using X-ray diffraction (XRD) and X-ray photoelectron spectroscopy (XPS). From both techniques, the composition of the mixture was determined. The thermal property of the material has been investigated in two thermal cycles, (i) from 300.97 K to 757.44 K (heating) and (ii) from 757.44 K to 303.02 K (cooling) in the oxygen atmosphere using Differential Scanning Calorimetry (DSC). In both the thermal cycles, the material exhibited endothermic property predominantly with the specific heat capacity of –2.13 J/gK. It is observed that the heating process is going through latent heat of fusion at 374.18 K. This phase change is endothermic and the corresponding specific heat capacity is –5.62 J/gK. So, from thermal analysis, it is evident that the material can be used as phase change material. The crystallite size is also calculated as 45.83 nm.

Abstract

A Co-Mo nano-composite material, $Co_2(P_2O_6)\ 12H_2O.\ CoMo_4O_{13}\ 2H_2O.\ (C_3H_4N_2)_{35}$ has been synthesized and characterized by employing X-ray photoelectron spectroscopy (XPS) and X-ray diffraction (XRD). By using these techniques, the elemental composition of the composite material has been established. By means of differential scanning calorimetry (DSC), in O_2 atmosphere, two cycles of thermal studies have been carried on the material to determine its thermal behaviour, (i) from 301.687 K to 735.742 K (heating) and (ii) from 735.733 K to 303.0975 K (cooling). The composite material exhibited predominant exothermic property with the specific heat capacity (C_p) of –52.72 J/kg.K and enthalpy of fusion (exothermic), –44.59 J/g observed at 693.53 K. Also, it exhibited endothermic property from 301.641 K to 361.835 K with C_p of –17.013 J/g.K. Hence this Co-Mo nano-composite can be utilized as thermal energy storage material from 301.641 K to 361.835 K (heating) and heat dissipation material from 361.995 K to 735.742 K.

Abstract

Sensible heat storage mixtures MPM7B containing hydrated manganese phosphate, dimagnesium phosphate and magnesium sulfate and MPM7A containing anhydrous manganese phosphate, dimagnesium phosphate and magnesium sulfate has been synthesized. Characterization was done with various measurement techniques. Elemental composition of mixtures was determined by ICP-OES and CHNS analysis. TGA and DSC were carried out to study thermal analysis which revealed mixtures can be used as sensible heat storage materials because of its endothermic behaviour. Average crystal sizes were evaluated by Debye-Scherrer formula and found 53.57 nm and 47.52 nm for MPM7A and MPM7B respectively.

Abstract

A dominating set D of a graph $G = (V, E)$ is called a certified dominating set of G if $|N(v) \cap (V \setminus D)|$ is either 0 or at least 2 for all $v \in D$. The certified domination number $\gamma_{cer}(G)$ is the minimum cardinality of a certified dominating set of G. In this paper, we prove that the decision problem corresponding to $\gamma_{cer}(G)$ is NP-complete for split graphs, star convex bipartite graphs, comb convex bipartite graphs and planar graphs. We also prove that it is linear time solvable for chain graphs, threshold graphs and bounded tree-width graphs.

Abstract

Let $G = (V, E)$ be a connected graph. A function $f : V \to \{0, 1, 2\}$ is called a *Roman dominating function* if every vertex v with $f(v) = 0$ is adjacent to a vertex u with $f(u) = 2$. If further the set $V_0 = \{v : f(v) = 0\}$ is an independent set, then f is called an *outer independent Roman dominating function* (OIRDF). Let $w(f) = \sum_{v \in V} f(v)$ and $\gamma_{\mathrm{oiR}}(G) = \min\{w(f) : f \text{ is an OIRDF of } G\}$. Then $\gamma_{oiR}(G)$ is called the *outer independent Roman domination number* of G. In this paper, we prove that the decision problem for $\gamma_{oiR}(G)$ is NP-complete for chordal graphs. We also show that $\gamma_{oiR}(G)$ is linear time solvable for threshold graphs and bounded tree width graphs. Moreover, we show that the domination and outer independent Roman domination problems are not equivalent in computational complexity aspects.

Abstract

We construct generalized coherent states for the rationally extended Scarf-I potential. Statistical and geometrical properties of these states are investigated. Special emphasis is given to the study of spatio-temporal properties of the coherent states via the quantum carpet structure and the auto-correlation function. Through this study, we aim to find the signature of the "rationalization" of the conventional potentials and the classical orthogonal polynomials.

Keywords: Exceptional orthogonal polynomials ▪ coherent states ▪ quantum carpets ▪ statistical and geometrical properties

Abstract

An efficient and short approach to the total synthesis of flavoxate hydrochloride, a muscle relaxant in urinary bladder, is reported. The synthesis of flavoxate hydrochloride is accomplished from *o*-cresol in 5 steps with 60.3% overall yield using formylation with formaldehyde, Grignard reaction with ethylmagnesium bromide, oxidation with potassium permanganate, Kostanecki-Rabinson cyclization and esterification with thionyl chloride and piperidinoethanol as linear steps.

Abstract

Dissimilar material welding of SS316L and Inconel625 joints growing in heat exchanger applications like nuclear, power plants and petrochemical industries. The current work reports on multipass welding of SS316L and Inconel625 dissimilar material analysis effect of Gas Tungsten Arc Welding (GTAW) process. Four trials were conducted with L_4 orthogonal array. These welds are prepared by using ErNiCrMo-3 and ERNiCr-3 filler wire. The analysis of weldability, distortion, residual stress, and tensile strength of the weldments. Least distortion was observed for pulsed current GTAW process. Tensile residual stress was spotted at welding zone. Tensile strength shows the fracture occurred in the base plate of the SS316L for all the trails.

Abstract

In the present study, thermography analysis is carried out for SS316L plates with multipass welded using Gas Tungsten Arc welding process. The base material filler wire composition is used for the experimentation. The temperatures are measured in the weldment using the infrared thermography. Distortions in the weldment were measured is taken up by vernier height gauge, and further, the tensile strength study also carried for the weldments. The weldment is free from defects and verified through radiography techniques. The temperature in the weldment is high at the fusion and decreases moving away. The angular distortion increases when changes in the input process parameters.

Entropy generation analysis of free convection radiative MHD Eyring–Powell fluid flow between porous parallel plates with Soret and Dufour effects

K. Ramesh, Deepesh Patidar, Odelu Ojjela ✉

First published: 17 June 2021
https://doi.org/10.1002/htj.22210

Abstract

In this present study, we have investigated the entropy generation analysis and Dufour and Soret impacts on unsteady incompressible free convective radiative MHD Eyring–Powell fluid flow between parallel plates with periodic injection and suction. The governing PDEs are converted into nondimensional coupled nonlinear ordinary differential equations by using similarity variables then numerically solved by Runge–Kutta fourth-order scheme with shooting technique. The results are discussed in detail for different flow, mass, and heat transfer profiles corresponding to various active parameters and presented in tables and graphs. Also, it is noticed that the temperature profiles are enhanced with the fluid parameter, whereas the concentration profiles are decreased with the Prandtl number. The validations of present results with the existing outcomes for the viscous case of skin friction are included and have found to be in good agreement. The present numerical study is useful for the enhancement of heat transfer in various industrial and chemical processes.

Abstract

Fuzzy logic controller performance depends upon fuzzy rule base. The control strategy is represented by a set of rules which explain basic characteristics of the controller. The fuzzy logic controllers' inputs and outputs are characterized by its membership function. Most of the researchers use triangular MFs for implementation of control algorithms. The basic objective of the paper is to evaluate the performance of fuzzy logic switching controller with different membership functions. The comparative analysis of different types of membership functions is carried out in direct torque control of induction motor. In DTC, speed control is achieved by selection of optimal voltage vector of voltage source inverter using switching logic table. Major disadvantages of DTC are high ripples in torque and flux and variable switching frequency due to hysteresis controllers. Use of fuzzy logic controller replaces the conventional switching table, and hysteresis controller exhibits reduction in torque and flux ripples. In this paper, fuzzy logic controllers are developed using different membership functions in MATLAB/Simulink Environment. Performance of speed control is evaluated and summarized.

Book Description

This book describes various types of image patterns for image retrieval. All these patterns are texture dependent. Few image patterns such as Improved directional local extrema patterns, Local Quantized Extrema Patterns, Local Color Oppugnant Quantized Extrema Patterns and Local Mesh quantized extrema patterns are presented. Inter-relationships among the pixels of an image are used for feature extraction. In contrast to the existing patterns these patterns focus on local neighborhood of pixels to creates the feature vector. Evaluation metrics such as precision and recall are calculated after testing with standard databases i.e., Corel-1k, Corel-5k and MIT VisTex database. This book serves as a practical guide for students and researchers.

-The text introduces two models of Directional local extrema patterns viz.,

- Integration of color and directional local extrema patterns
- Integration of Gabor features and directional local extrema patterns.

-Provides a framework to extract the features using quantization method

-Discusses the local quantized extrema collected from two oppugnant color planes

-Illustrates the mesh structure with the pixels at alternate positions.

Thermal application of composites of iron and magnesium in thermosyphon solar water heating system

401

Akash Kumar Sahu, Gouri Sankhar Brahma, Rudrarapu Aravind, Trilochan Swain

First published: 10 August 2021
https://doi.org/10.1002/htj.22293

Abstract

A novel and low-cost mixture of iron and magnesium have been synthesized and used as selective coatings for flat plate absorber in solar water heating system. The commercial black paint is fabricated with the mixture of composition $Fe_3(PO_4)_2 \cdot 0.1Mg_2P_2O_7 \cdot 1.9 MgSO_4$(FPM3A). The composition of the coating mixture has been characterized by various analytical techniques. Thermal studies of these mixtures were accomplished using differential scanning calorimetry and thermo-gravimetric analysis. From the thermal analysis, it has been observed that the mixtures can be used as thermal heat storage materials. The FPM3A-modified black paint has been tested in a thermosyphon solar water heater prototype. The average water temperature and efficiency of the flat plate absorber with FPM3A-modified black paint have increased by an average of 7.5° and around 12%, respectively, in comparison with that with commercial unprocessed black paint.

Abstract

The Cobalt complex, (Co-DMET) has been synthesized from the reaction between cobalt chloride hexahydrate and dimethoxy ethane (DME) in a 1:1 molar ratio and characterized using various measurement techniques. The structural formula of this complex derived based on characterization is [Co(DMET)2(H2O)2]Cl2. 4H2O. Dimethoxy ethane is an O-donating ligand able to coordinate in a chelate mode to the central metal cobalt to form the complex. The bidentate ligand is used to make the complex more stable. This complex was further mixed with the catalytic amount of SnO_2 to obtain a

Abstract

In this article, the 3RRR planar parallel manipulator (PPM) is considered for modeling and performance analysis. As the revolute joints have better performance compared to prismatic joints because of frictional losses, in this paper, an attempt is made to calculate all possible performance indices. The 3RRR PPM is modeled, and performance indices like condition number, singularity, transmissibility, manipulability, stiffness and velocity indices are calculated. The three revolute joints (R) are considered, and the R indicates the actuated joint. Performance indices measurement is useful to the manipulator design, analysis, understanding and application of robotic manipulators to specific fields. Various different performance indices have been used to study the behavior of robotic manipulators from the inception of robots. This work is useful to have a clear understanding of 3RRR planar parallel manipulators.

Abstract

Gas metal arc welding process (GMAW) is one of arc welding processes commonly used in industries due to its wide range of applications and economic advantages. In GMAW process, the arc interacts with environment leading to weld defects that are realized in post weld non-destructive techniques (NDT). This leads to necessity of in-process monitoring and control of the process to ensure quality by defect free welds. The present work is a preliminary study intended to develop an in-process monitoring system that can identify and classify the defects in GMAW process. In this study, experiments are conducted on tube-to tube butt joints in flat position by varying the process variables such as current, voltage, travel speed and contact-tube-to-workpiece-distance (CTWD). It involves good weld as reference for three types of defects such as porosity, burn through and lack of penetration were considered. The instantaneous current and voltage signals were recorded using acquisition system that is later used in statistical features extraction. Based on statistical features such two classification techniques includes decision tree and support vector machine (SVM) were deployed to classify the defects with reference to good weld and their efficiencies are reported.

Synthesis, characterization of imidazole-based copper complex mixtures and study of their thermal behaviour

Rudrarapu Aravind ✉, Gouri Sankhar Brahma, Trilochan Swain, Akash Kumar Sahu

First published: 27 January 2021
https://doi.org/10.1002/er.6445
Citations: 1

Summary

Herein, the synthesis, characterization and thermal behaviour of imidazole-based two copper-phosphate mixtures, A = $Cu_2(PO_4)(OH)\cdot Cu(HPO_4)(H_2O)\cdot(C_3H_4N_2)_2.3.25\ H_2O$ and B = $Cu_3(PO_4)_2H_2O\cdot(C_3H_4N_2)_3\ (H_2O)\cdot 0.1(C_3H_4N_2).3.25\ H_2O$ are reported. The characterization was done by adopting various electro-analytical techniques such as elemental analysis, X-ray Powder Diffraction (XRD), Thermogravimetric Analysis (TGA) and Derivative Thermogravimetry (DTG), Fourier Transform Infrared (FT-IR) Spectrometry, Absorption Spectrophotometry and Ultraviolet-Visible and near Infrared (UV-Vis-NIR). Differential Scanning Calorimetry performed with the heating rate 10 K/min from 297.96 to 770.46 K in normal atmosphere for both mixtures. DSC data indicated that both mixtures A and B are exhibiting exothermic property by their net specific heat capacities (C_p) −11.11 and −2.83 J/g K, respectively. Therefore, these complex mixtures can be utilized as heat dissipation materials. Both mixtures A and B undergo phase change in terms of hydrated phase to dehydrated phase up to 356 and 392 K, respectively. The specific heat capacity of Mixture A during hydration, C_p = 2.54 J/g K, is higher than the tin, lead, stainless steel, glass and aluminium at their respective melting points. This mixture is also found better than the commercial product based on lithium ion battery in terms of specific heat capacity. From UV-Vis-NIR analysis, it is found that the mixtures A and B are showing semiconducting behaviour with band gaps 1.66 and 1.68 eV, respectively. The average crystallite sizes of these nano-complex mixtures are 35.29 and 30.94 nm and these were calculated using the Debye-Scherrer equation and Williamson-Hall method.

Abstract
In this article, we study machine repair problems (MRP) consisting of the finite number of operating machines with the provisioning of the finite number of warm standby machines under the care of a single unreliable server. For the machining system's uninterrupted functioning, an operating machine is immediately replaced with the available warm standby machine in negligible switchover time whenever it fails. The concept of threshold vacation policy: N-policy is also considered. Under this vacation policy, the server starts to serve the failed machines on the accumulation of a pre-specified number of failed machines in the system. The server continues until the system is empty from the failed machines; after that, the server goes for vacation. The notion of an organizational delay, server breakdown, and repair in multiple phases is also conceptualized to build the studied model more realistic. The recursive matrix method is used to find steady-state queue size distribution, and subsequently, various system performance measures are also developed to validate the studied model. The optimal analysis has been performed to identify the critical design parameters for the governing model. The state-of-the-art of the present study is its mathematical modeling of the multi-machine stochastic problem with varied limitations and strategies. The methodology to obtain queue size distribution, optimal design parameters, is beneficial for dealing with other complex and sophisticated real-time machining problems in the service

Abstract

An orbital fracture is a traumatic injury to the bone in the eye socket. These fractures modify the orbital bone dimensions and the functioning of the intraorbital contents. In this study, a surgical method that includes positioning, aligning and fixing implants to restore orbital fractures was adapted. Notably, it is difficult to achieve an original three-dimensional orbital shape through the process of forming and cutting implants; however, this problem was solved by creating customized implants using computed tomography (CT) images of the patient. The objective of this work is to reconstruct the damaged orbital floor defects by means of a 3D printed implant and restore the orbital floor to its original shape. A case study of an orbital fracture has been included in this study. CT images were used to create a computer-aided design (CAD) model of orbital floor implants, which were designed to maintain orbital floor symmetry from right to left and vice versa. Furthermore, the designed implants were manufactured through a material extrusion process with biocompatible material. The application of the material extrusion process with biocompatible material resulted in the fabrication of implants at a minimal cost. Therefore, the customized models used in the patient's intra-operation can minimize the operational time and maximize surgical safety.

Abstract: Environment protection and basic health improvement of all social communities is now considered as one of the key parameters for the development. It has become a responsibility for both industry and academia to optimize the usage of finite natural resources and preserve them. Efficient promotion and strategic marketing of Eco Friendly products can contribute to this development. It is important to consider any market as a heterogeneous mix, which requires well-organized and intelligent split or segmentation. A survey was conducted in Kolkata, metropolitan city in India, through a structured questionnaire to measure Perceived Environmental Knowledge, Perceived Environmental Attitude and Green Purchase Behavior associated to 18 product categories identified by Central Pollution Control Board for Eco Mark Scheme, 2002. Two hundred and twenty three data inputs from the respondents were analysed for this study. Here in this study a fuzzy rule based clustering technique was performed to segregate customers into two sections considering three parameters like Perceived Environmental Knowledge, Perceived Environmental Attitude and Green Purchase Behavior associated to Eco friendly product, which acts as an input variable. The rule base has linguistic variables like Significantly High, Little High, Medium, Little Low and Significantly Low and output as "Eco friendly" or "Non-ecofriendly" consumers. A set of 5×5×5= 125 rules were developed for output determination. They were designed manually and the method is applied for detection of a set of good rules. Thirteen such good rules were identified through Fuzzy Reasoning Tool, which can lead to better Decision Making and facilitate the marketers to develop strategy and take up effective marketing decisions.

ABSTRACT

Agriculture is a foremost field within the world, and it's the backbone in the Republic of India. Agriculture has been in poor condition. The impact of temperature variations and its uncertainty has engendered the bulk of the agricultural crops to be overripe in terms of their manufacturing. A correct forecast of crop expansion is a vital character in crop forecast management. Such forecasts will hold up the federated industries for accomplishing the provision of their occupation. ML is the method of finding new models from giant information sets. Numerous regressive ways like random forest, linear regression, decision tree regression, polynomial regression, and support vector regression will be used for the aim. Area and production are among the meteorological information that's made by necessary data. This paper figures out the yield recommendation of the crop by the accurate comparison of numerous machine learning ML regressions where the overall percentage improvement over several existing methods is 3.6%.

INTRODUCTION

Agriculture is the leading hold up and the paramount territory of the Indian wealth. The manufacturing of farming is very little. As the ultimatum for daily bread is heighten epidemically, the farmers, investigators, analysts, scientists, and government attempt to site further attempts and schemes to heighten the agricultural manufacturing to lodge the needs (Shastry et al., 2017). India is generally stubby despite being a huge sector and yields of crops per hectare. Correct productivity of crops hangs on numerous parameters such as properties of soil, irrigation, terrain, and climate.

Owing to several components such as change of climate, tumble levels of water, accidental rainfall, imprudent utilize of bio-pesticides, etc., the intensity of agricultural manufacturing is diminishing in India. The majority of farmers do not attain awaited crop yield for a variety of grounds (Kumar et al., 2018) To acknowledge manufacturing intensity, yield manufacturing is carried out which

Abstract

In Order To Increase The Performance Of The Organization, Timely And Reliable Information Is Required To Enable Internal And External Asset Utilization Corporate Decision-Making In The Global Market. Reinforcement Learning Is Widely Assumed To Transform The Mechanical Mechanization Market In Terms Of Increased Productivity, Lower Costs, Flexibility, And Increased Earnings. The High Level Of Capital Investment And Typically Low Degree Of Flexibility Needed To Spend More Than Manual Operation Machines With High Degrees Of Automation And Maintenance Are Two Disadvantages Of Automation Equipment. It Has More Intelligent Checking And Warning For Executives With Unshakable Poor Quality, Poor Accessibility, And Not Safe And Flexible To Disappointment. On Both Corrected And Uneven Informational Indexes, Offer The Cyber-Physical Production Systems Models (Cpps) Based Support Vector Regression (Svr) Method In Real-World Current Creation Scenarios. The Influence Of Increasing Industry Automation On The Manufacture Of Industrial Fabrics Is Substantial. As A Result, Employing The Manufacturing Sector Has The Effect Of Preserving Spare Parts Assets And Resources At All Times, As Well As Extending Production And Accuracy. Beyond The Rise Of Domestic Demand For Clothes, The Textiles Sector Will Be Able To Record Good Employment Growth And Compensate For The Labour Savings Of Technology With Particular Production Process Automation. The Svr Approach Is Used In The Cpps's Performance Analysis System. The Appearance And The Chosen Performance Measure Are Used To Compare The Outcomes Of Various Modeling Approaches.

Automated Classification and Detection of Brain Tumor using Wavelet Transform and Machine Learning

Dr. A. Chandrashekhar, Gangu Rama Naidu, Dr. Santosh Kumar, Dr. Sampada Gulavani, Dr. Manoj Sharma, Dr. Dhirendra Kumar Shukla

ABSTRACT

The abnormal development of tissues within the brain that affects its activity is referred to as a brain tumor. The accurate detection of brain tumors is an important diagnosis function. The proposed work can classify the given MRI image into the presence of a tumor or the absence of a tumor. Initially, the given MRI image undergoes to prepossessing to remove noise using various filters, then segmentation using OTSU method, the features of segmented MRI image extracted using Discrete Wavelet Transform. The effective features from a bunch of features obtained by using Principle Component Analysis. These features are used to train Support Vector Machine with Radial Basis Function as well as test. The results of the proposed tumor detection method are efficient over literature.

Abstract

Purpose

The COVID-19 pandemic has led to a huge loss of human life worldwide and presents an unprecedented challenge to public health, food systems and the world of work. Tens of millions of people are at risk of falling into extreme poverty due to loss of their carriers. Mainly, the people who work in public places are impacted due to this decease. The frontline warriors such as doctors, health workers, sweepers and policemen showed their effort to reduce the spreading of the virus. In this paper gives the detailed view of how the corona virus evaluated and how it spread from one person to another person and how we prevent this virus. The purpose of the paper, detailed about the diagnosis of the virus in the human body. There are some tests associated to know the presence of virus in our body; these are nose test, chest scan and CT scan of lungs.

Design/methodology/approach

Molecular analysis methods such as antibody or enzyme tests are used to assess whether the infection is present. The most common lancing techniques include using a cotton swab is in the back of the neck. Then hands over the sample to the doctor for examination. Polymerase chain reaction (PCR) is performed on the sample. This test screens for viral DNA. A CO19 PCR test can detect unique SARS-2 gene products. If one of these genes is ignored, it will return as an invalid result This test is useful only for patients who are already suffering from COVID-19. You cannot know if anyone has the infection, and they cannot say for sure whether they ever did. Serological tests are particularly useful for detecting cases of infection with mild or no symptom.

Findings

In this paper, the different tests provided to diagnosis the virus and the prevention measures to be taken to prevent the virus from spreading from one person to another are explained.

Study on Design and Analysis of Industrial Y Type Strainer

Mohammed Ather Patel[1] Shaik Himam Saheb[2]

[1,2] Department of Mechanical Engineering, Faculty of Science and Technology,
The ICFAI Foundation for Higher Education, Hyderabad
himam.mech@gmail.com

Abstract: Industrial Strainers are widely being used in Various Heavy Mechanical Industries such as Petro Chemical, Oil and Gas, Steel industry, Water Treatment and Process Industries. The Main purpose being Removal of unwanted Materials in pipelines is a never ending one. Whether the Flowing Material as Sea Water, Oil, Paint or variety of Food or Chemical products. The cause of damage might be dirt, foreign matter or even Clamps of the Product. The Main widely used Industrial Strainers are Basket, Magnetic, Duplex, Y-Type, Tee type and conical strainer. The material used in overall Manufacturing of the Different Strainers is MS (Mild Steel), SS (Stainless Steel). The most efficient of all the strainers Duplex Strainer, because of its large design ratio and larger Material Handling Capacity. The Main Purpose of this Research is to Study Design and Materials involved in the manufacturing of Y-Type are being mainly used in the fluid pipelines in order to Filter Out the impurities, Foreign Particles and protect the downstream.

Key Words: Industrial Strainers, Mechanical Industries, Basket, Magnetic, Duplex, Y-Type, Tee Type, Conical strainer, Fluid pipelines, Foreign Particles.

1. Introduction:

In the Oil and Gas Industry, a efficient filtration or separation system is basic to the dependability and execution of the actual resources that interaction oil based goods. Streamlining the dependability of these filtration frameworks is fundamental in amplifying your operational presentation. Y-Type Strainers are utilized in numerous mechanical applications to shield plant apparatus to harm from foreign substances like residue, scales, sand, strong particles and different prospects. It is utilized to eliminate solids from streaming gases or liquids utilizing stressing component.

Anurag Gupta et al.,[1] examined the common factors of new product planning, design & development of Y- type strainer. It additionally states about the process required for concept choice manufacturing & establishes criteria for new product achievement, the market research tools available for coordinating the Client/customer needs into the innovative process. Yashwanth et.al., [3][4] But they have not worked on the improvement of pressure drop valve of the strainer. If we consider the general length of process pipe which give process fluid to number of equipment and to ensure these equipment Y strainers are introduced before the same. Pavan et al.,[2][5] have concentrated deeply the internal chain of importance operations of concurrent engineering in the new product development process. The reason of this paper is to develop a dynamic planning strategy that is innovative, efficient and flexible for new product improvement by using the concurrent design idea.

Saeed Ovaysi et al.,[6] have studied a dynamic particle-based model for direct pore-level displaying of incompressible thick fluid flow in disordered media. The model is equipped of simulating flow directly in three-dimensional high resolution micro-CT pictures of rock tests. It is depend on moving particle semi-implicit (MPS) strategy. They modify this procedure to improve its stability for flow in porous media issues. Alexander Grahn et al.,[7] have studied Pressure Drop Model for the CFD Simulation of Clogged

Kinematic Analysis of 3RRR Planar Parallel Manipulator by Using Adaptive Neuro Fuzzy Inference System (ANFIS)

Shaik Himam Saheb, G. Satish Babu

Abstract

In this research paper the modeling and analysis of 3RRR parallel kinematic machine is considered, the parallel manipulator having fixed and moving platform, the moving platform is connected to fixed platform with the serial linkages the end effector is generally used as end effector, In this analysis the revolute joints are considered and from the researchers the prismatic joints have high frictional losses compared to revolute joints, for this reason the revolute is selected for analysis. Three serial revolute joints are connected between moving and stationary platform, after mathematical modeling Jacobian matrix is formulated, and then the equations are solved with computational software, with the results data and the epochs are generated and solved with ANFIS techniques and the results are compared.Performance indices measurement is useful to the manipulator design, analysis, understanding and application of robotic manipulators to specific fields. Different performance indices have been used to Study the behavior of robotic manipulators from the inception of robots. In this work five different performance indices are used. This work is useful to clear understanding of 3RRR Planar Parallel Manipulators.

Abstract

Parallel mechanisms are found as positioning platforms in several robot manipulator applications tool manufacturing applications. Today, various types of these mechanisms are classified based on the structure, type of joints, and degree of freedom. An important and basic planar mechanism providing three degrees of freedom at the end-effector (movable platform) is a 3-RRR linkage. The forward kinematics in parallel mechanisms is a multi-solution problem and involves cumbersome calculations compared to inverse kinematics. With forward kinematics, the input kinematic parameters for any manipulator are known, and the end effector coordinate must be determined. The kinematic equations are generated with mechanics principles, and Jacobian matrices are formulated, With the Jacobian m[redacted], the regular workspace and dexterous workspace analysis calculated. The main objective is to fabricate a model of this planar manipulation mechanism with calculated dimensions and observe the practical workspace and dexterous workspace available at the end effector. The practical workspace and calculated workspace is presented in this paper. This final output data is useful for manipulator designers to design manipulators for different applications. In addition to this, the stress analysis is performed with Ansys software's help to estimate the moving platform's failure zone.

Keywords 3RRR Parallel Planar Manipulator, Workspace analysis, Regular Dexterous Workspace, fabrication of 3RRR PPM Model, Performance analysis, Stress analysis, load-carrying capacity, precise and accurate position

Smart contract-based land registry system to reduce frauds and time delay

Sandeep Kumar Panda, Gouse Baig Mohammad, Sachi Nandan Mohanty ✉, Sipra Sahoo

First published: 15 June 2021
https://doi.org/10.1002/spy2.172

Abstract

In today's scenario, many news related to counterfeit land titles, fraud land registry, delay in ownership transfer, the involvement of government officers in fraudulent activities is frequently being heard. However, this depicts that the existing land registry system is not efficient to provide security and timely settlement of transactions between the seller and buyer. To solve this problem, we proposed a blockchain-based land registry system in this article. The specialty and popularity of blockchain technology is its transparency and security. Blockchain is being inculcated with the trait of persistence, immutability, decentralization. Its ascent to new opportunity of efficiency and cost saving. It can provide right framing for digital asset, online payment, and transfer of remittance. Additional to this it can check upon black money laundering. Enterprise that can use blockchain technology can gain faith of consumer. In this article, we proposed a decentralized application. In particular, for creating and deploying the smart contract, we used Ethereum network. The deployed contracts are interacted through frontend web pages. React is used for the development of web page. For server and routing purposes, Next.js is used. Finally, the results and analysis show that our proposed model is efficient and viable.

Abstract

In this article, we study machine repair problems (MRP) consisting of the finite number of operating machines with the provisioning of the finite number of warm standby machines under the care of a single unreliable server. For the machining system's uninterrupted functioning, an operating machine is immediately replaced with the available warm standby machine in negligible switchover time whenever it fails. The concept of threshold vacation policy: N-policy is also considered. Under this vacation policy, the server starts to serve the failed machines on the accumulation of a pre-specified number of failed machines in the system. The server continues until the system is empty from the failed machines; after that, the server goes for vacation. The notion of an organizational delay, server breakdown, and repair in multiple phases is also conceptualized to build the studied model more realistic. The recursive matrix method is used to find steady-state queue size distribution, and subsequently, various system performance measures are also developed to validate the studied model. The optimal analysis has been performed to identify the critical design parameters for the governing model. The state-of-the-art of the present study is its mathematical modeling of the multi-machine stochastic problem with varied limitations and strategies. The methodology to obtain queue size distribution, optimal design parameters, is beneficial for dealing with other complex and sophisticated real-time machining problems in the service system, computer and communication system, manufacturing and production system, etc. The present problem is limited to fewer machines, which can be extended to more machines with different topologies with high computational facilities.

Keywords- Warm standby, Threshold vacation policy, Unreliable server, Organizational delay, Repair in phases.

Description Now a day, Artificial intelligence is the most trending technology used in any platform. As the technology increases, the burden on the humans gets decreased rapidly. The tasks which need to be performed by the humans are being executed efficiently with the help of AI. Due to more dependence on the human load, the completion of the tasks leads to poor performance and less reliability. So, in order to improve the performance, reduce the execution time and delay in some of the crowded places like restaurant, this paper introduced a methodology named Smart Display Menu. This is used for visualizing the menu display clearly for all kinds of age groups. So, based on the AI enabled cameras, the age of the customer will be detected and based on the age group the Menu display change from static menu to dynamic menu or vice versa. The experimental outcomes of this research provide the ease in the visibility of …

Abstract: Numerous offices are currently utilizing AI calculations to settle on high-stake choices. Deciding the correct choice unequivocally depends on the accuracy of the info information. This reality gives enticing motivations to lawbreakers to attempt to mislead AI calculations by controlling the information that is encouraged to the calculations. Then, conventional AI calculations are not intended to be protected when going up against startling data sources. In this exposition, we address the issue of antagonistic AI; i.e., we will likely form safe AI calculations that are hearty within the sight of loud or adversarial controlled information. Ill-disposed AI will be additionally testing when the ideal yield has a mind boggling structure. In this paper, a sign cannot concentrate is on antagonistic AI for anticipating organized yields. To start with, we build up another calculation that dependably performs aggregate classification, which is an organized expectation issue. Our learning strategy is efficient and is defined as a raised quadratic program. This procedure verifies the expectation calculation in both the nearness and the nonappearance of an enemy. Next, we explore the issue of parameter learning for hearty, organized forecast models. This strategy builds regularization capacities dependent on the impediments of the foe.

In this exposition, we demonstrate that strength to antagonistic control of information is proportionate to some regularization for huge edge organized expectation, and the other way around. A customary enemy consistently either does not have enough computational capacity to structure a definitive ideal assault, or it doesn't have sufficient data about the student's model to do as such. In this manner, it frequently endeavors to apply numerous irregular changes to the contribution to an expectation of making a leap forward. This reality suggests that on the off chance that we limit the normal misfortune work under antagonistic clamor, we will acquire power against unremarkable enemies. Dropout preparing takes after such a commotion infusion situation. We [illegible] regularization technique for huge edge parameter learning dependent on the dropout system. We strewn out dropout regularization to non-straight parts in a few unique ways. Experimental assessments demonstrate that our procedures reliably beat the baselines on various datasets. This exploration work incorporates recently distributed and unpublished coauthored material.

Key Words: Embedding the reproduced foe, Robustness to learning assaults, Aggregate Classification, Discourse acknowledgment, Acquainted Markov Systems (AMNs)

Abstract:
Networks-on-Chips (NoCs) have found wide acceptance in many-core systems for on-chip communication due to their ease in addressing communication problems in integrated systems. Due to the incompetence of the 2D NoC structures, academia and industry have moved towards the 3D-NoC. The 3D-NoC can be manufactured with the help of Through Silicon Vias (TSV) as an interconnecting mechanism between the horizontal layers. These TSV links exhibit high vulnerability to the faults in the system. Significant research has been done to reduce this vulnerability by employing a few algorithms and schemes. This paper provides a survey of the different methods applied and their further advancements.

Title: Design of master controller test kit for the railway diesel locomotives

Authors: K. Kishore Kumar; Movva Pavani

Addresses: Department of Electronics and Communication Engineering (ECE), Faculty of Science and Technology, IFHE, Hyderabad, India ' Department of Electronics and Communication Engineering (ECE), Faculty of Science and Technology, IFHE, Hyderabad, India

Abstract: In the present paper, a master controller test kit for the diesel locomotives is designed, developed and the prototype is tested. Master controller test kit is used by the locomotive driver to drive the engine which is a human-machine interface which primarily performs three essential functions such as controlling the regression, progression, and locomotive braking. Stick type master controller is a modular based compact design which is crew friendly for smooth operation and comfort. In the proposed model, the operation of solenoids is indicated by LEDs, and dynamic braking is shown by digital voltmeter for measuring the drop across braking control pot (BKCP) coil. By using this test stand, a layman can also check the master controller in the section itself which saves staff-hours and most significantly loco downtime. The tested prototype is economical, and its performance is comparable with the existing microcontroller based master controllers.

Keywords: diesel locomotive; throttle handle; reverser handle; master controller testing kit; directional handle; dynamic brake handle.

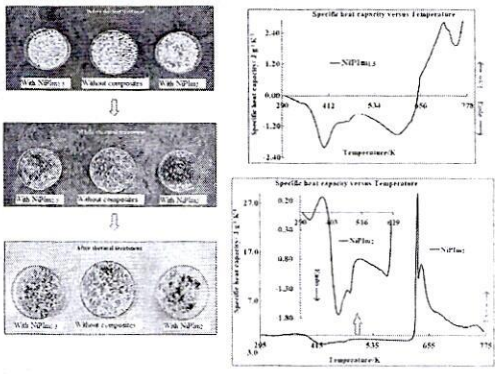
ACCESS | Metrics & More | Article Recommendations | Supporting Information

ABSTRACT: In this work, we report the synthesis of two nanoscale composites of nickel, $NiPIm_{1.5}$ and $NiPIm_2$ ($NiPIm_{1.5}$ = $[Ni(C_3H_4N_2)(H_2O)_5](HPO_4)\cdot(H_2O)\cdot 0.3(C_3H_4N_2)$ and $NiPIm_2$ = $[Ni(C_3H_4N_2)(H_2O)_5](HPO_4)(H_2O)\cdot 0.4\cdot(C_3H_4N_2)\cdot H_2O$), characterization by various instrumental methods and the investigation of the thermo-oxidative degradation of polyethylene (PE), poly(vinyl chloride) (PVC), and polystyrene (PS) in the presence of both nanocomposites. All of these polymers are subjected to thermal treatment with and without composites at 353 K for 120 min. The rate of degradation is maximum with $NiPIm_2$ for all three polymers, PE—13.1522%, PS—13.6152%, and PVC—8.04%, whereas with $NiPIm_{1.5}$, PE—7.3128%, PS—11.9837%, and PVC—4.9106%. The percentage of degradation in the presence of composites is much greater than the percentage of degradation without composites. The specific heat capacities of $NiPIm_{1.5}$ and $NiPIm_2$ are −148.42 and −348.64 J kg^{-1} K^{-1}, respectively. The degradation process takes place by free radical mechanism. Thermogravimetric and differential thermal analyses revealed that the temperatures corresponding to the formation of composite materials with $NiPIm_2$ are 338.76, 331.78, and 354.30 K for PE, PVC, and PS, respectively. The temperatures of formation of the above composites are found to be less than that of $NiPIm_{1.5}$. The degraded residues of polymers indicate that ester is formed in each case along with other byproducts containing imidazole. Infrared studies revealed the thermal oxidation of hydroperoxides and the formation of ketone.



1. INTRODUCTION

The use of nonbiodegradable materials containing polyethylene, poly(vinyl chloride), and polystyrene is increasing day by day due to their high degree of consumer adaptability and low price. Consequently, the global production and use of synthetic polymers and plastic materials are rapidly escalating.[1] Post use, these materials get accumulated as pollutants, posing a potential threat to the environment. These pollutants have drastically affected both fresh water and marine water ecosystems, though of late, their use has been restricted to a certain extent by some of the countries. Due to the enormous volume of plastic waste and environmental concerns, plastics recycling has become a central theme in the modern plastics sector. The design of environmentally acceptable, cost-effective methods to reduce plastic waste is challenging due to the extreme complexity inherent in polymer recycling.

Degradation of polymers can be achieved by many techniques such as thermal,[2] thermo-oxidative,[3] photo-oxidative,[4] or by chemical exposure of materials using hydrolysis,[5] ultrasonic,[6] and plasma treatment.[7] Some of these degradation techniques, their experimental details, and outcomes are tabulated in Tables S1−S3. Degradation is frequently due to changes in the chemical and/or physical structure of the polymer chain, resulting in a reduction in the polymer's molecular weight. These changes might be unwanted, such as modifications during usage, or desired, such as biodegradation or the intentional reduction of a polymer's molecular weight. The influence of these variables on the molecular structure of the polymer is largely responsible for these alterations. It relies on its structure and the susceptibility to degradation of a polymer. Aromatic epoxies and chains are particularly vulnerable to ultraviolet breakdown, whereas thermal-sensitive hydrocarbon-based polymers typically are not appropriate in high-temperature applications.[8]

Researchers and engineers around the globe are on quest toward metal-assisted thermal degradation of such materials. Jen-hou and Schwartz carried out some experiments to degrade the polyethylene using some bacteria.[9] Nisar et al.[10] studied the thermal decomposition of poly(vinyl chloride) (PVC) in the presence of catalysts of commercially available oxides in the temperature range of 473−923 K. Kaplan et al. studied the

Abstract

In the present work, nano-composite of $CoFe_2O_4$-MnO_2 has been successfully synthesized by a simple wet chemical route in three steps. Samples were sintered at 800 °C for a period of 5 hrs to get the desired phases. X-ray diffraction studies have confirmed the existence of both $CoFe_2O_4$ and MnO_2 phases. The average crystallite size was found to be 59.8 nm. Fourier Transform Infrared Spectroscopy analyses confirmed the occurrence of both phases by showing a characteristic band of ferrites at octahedral and tetrahedral sites as well as the vibrational mode of Mn-O. Scanning Electron Microscope analysis was carried out to study the morphology of the sample, which revealed the rod-like appearance of the composites in nano-scale. The thermal behaviour of $CoFe_2O_4$-MnO_2 was investigated by using the combined Thermogravimetry-Differential Scanning Calorimetry technique, which revealed the endothermic behaviour of the composite. Characterization of magnetic properties was accomplished by vibrating the sample magnetometer. Saturation magnetization, coercivity, retentivity, and squareness were calculated from the hysteresis loop (M–H Curve) obtained from vibrating sample magnetometer.

Investigation of the Static and Dynamic Path Planning of Mobile and Aerial Robots

Check for updates

428

A. Chandrashekhar, Shaik Himam Saheb, and M. L. Pavan Kishore

2021

Abstract Autonomous mobile robots are getting more important because they can make decisions on their own in the given environment. The robot path planning is an important function in the autonomous robot. In this review, several path planning techniques are investigated to analyze the performance. The path planning techniques are categorized as static and dynamic. A Q-learning method with flower pollination algorithm and the genetic algorithm has an effective performance on the path planning of mobile robot (MR) in a dynamic environment. The ant colony optimization (ACO) method shows considerable performance in the static environment. The aerial vehicle path planning method also reviewed and the method based on geometric random tree shows the effective performance in path planning. The comparison table shows the latest research in the MR path planning with the advantages, limitations, and performance analysis.

Keywords Autonomous mobile robots · Dynamic path planning · Q-learning robot path planning · Static path planning

1 Introduction

As mobile robots are deployed in different applications to make the process effective, it also increases the need for the robot movement plan, which has become significant research area over time [1]. Path planning is the basic challenge in mobile robots (MR) because the algorithm needs to convert the high-level specification from the human to the low-level specification robots to understand and perform related operations [2]. Path planning and controlling of MR is a very crucial task in the robotics [3].

Large scale air pollution monitoring using static multi-hop wireless sensor networks

by Movva Pavani; K. Kishore Kumar

International Journal of Computer Aided Engineering and Technology (IJCAET), Vol. 15, No. 2/3, 2021

Abstract: In the proposed paper, an effective system for a large-scale air pollution monitoring on a live basis is developed and tested. It is an Audrino based platform equipped with pre-calibrated sensors to sense gases like sulphur dioxide (SO_2), carbon monoxide (CO), ammonia (NH_3), and particulate matter (PM_{10}) in the air. Audrino board with the gas sensors, global system for mobile communications (GSM) and ZigBee module forms the wireless sensor motes used for the field deployment. Wireless sensor network built with ZigBee links can be scaled up using the GSM connectivity to interface with the external world. Air pollution monitoring is performed using a system of sensor nodes with the help of wireless communication via a ZigBee protocol. We proposed a static wireless sensor network to supervise air contamination level, and a multi-hop algorithm is implemented over ZigBee WSN. Designed low-cost WSN based prototype is tested under various atmospheric conditions which had provided stable and dependable data of air contaminants.

Single-Component/Single-Station-Based Machine Learning for Estimating Magnitude and Location of an Earthquake: A Support Vector Machine Approach

Show affiliations

Chanda, Sarit ; **Somala, Surendra Nadh**

Traditional approaches require a velocity model to compute travel times for estimating the location of earthquakes. Moreover, the velocity model typically assumed is layered in nature, ignoring the perturbations around the background velocity model. In this study, we propose a novel method that does not require any assumption on a velocity model. Also, triangulation estimates of location require three-station recordings. Even if the single station is used, three components of recordings are needed. In this work, we propose a machine learning method, based on support vector machines (SVM), that can predict earthquake location and magnitude with just one component (vertical) of a single station. Machine learning methods are typically used for either regression or classification. Literature shows that the SVM algorithm is promising for the classification of an arbitrary signal. This research demonstrates that, by using complementary input features from a seismic recording, a comparable performance can be obtained, with a substantial reduction in detection time. Furthermore, only the vertical component of a single recording station data is used to train the network. The SVM algorithm is applied on synthetic seismograms from 400 earthquakes of different focal mechanisms and magnitudes. This falls under supervised machine learning, as we give the input features and use them for training the model. Overfitting is avoided by tenfold cross-validation, i.e., the algorithm is repeated ten times, each time giving a different 10% as a testing portion. The classifier's performance is quite good, on the synthetic noise-free data, in predicting the magnitude, elevation angle, and hypocentral distance, but not the azimuthal angle. The trained model in the present work can be readily used where noise levels are quite low without sophisticated ray-tracing or Green's function computation. The performance of the algorithm is checked by adding additive noise to the data. The novelty of this work is that knowledge of the velocity model is not required, and the estimation of magnitude and the origin of the earthquake are done using the single-station/single-component earthquake records.

Abstract

Blockchain Technology is gaining lot of attention in recent days due to its distinct characteristics like decentralization, reliability, security and data integrity. Many companies are researching the possibility of adapting Blockchain Technology in their respective domains to utilize the potential of blockchain to the fullest. In spite of its rapid growth very little is known about the state of the art of blockchain in educational sector. The book keeping process of degrees and certificates can be one such potential area where blockchain can play a major role. This chapter presents the detailed analysis of Blockchain Technology and its application in education. Its emphases on (i) Blockchain Technology and its diversified application (ii) Digital Signatures and (iii) Blockchain based educational solutions. This chapter also highlights the challenges of blockchain in education based on an intensive research.

Part of the Internet of Things book series (ITTCC)

Abstract

Internet of Medical Things (IoMT) interlinks a collection of intelligent sensors on the patient's body to observe and interpret multimodal health data, including the patient's physiological and psychological signals. The large amount of data produced by IoMT devices in medical application is examined on cloud by replacing the restricted memory as well as processing resources of handheld tools. In this study, an IoMT-based healthcare diagnosis model is introduced by the use of intelligent techniques. This paper proposes a new IoMT-based disease diagnosis healthcare framework for heart disease prediction using the BBO-SVM model. The proposed model involves the parameter tuning of SVM using the BBO algorithm. The validation of the proposed model takes place using a Statlog Heart disease dataset. The detailed experimental analysis strongly pointed out that the proposed BBO-SVM model has shown excellent results by attaining a maximum precision of 88.33%, recall of 87.60%, accuracy of 89.26%, *F*-score of 87.96%, and kappa value of 78.27%.

Title: An intelligent COVID-19 classification model using optimal grey-level co-occurrence matrix features with extreme learning machine

Authors: Pavan Kumar Paruchuri; V. Gomathy; E. Anna Devi; Shweta Sankhwar; S.K. Lakshmanaprabu

Addresses: Department of Computer Science and Engineering, Faculty of Science and Technology, IFHE, Hyderabad, Telangana, India ' Department of Electrical and Electronics Engineering, Sri Krishna College of Engineering and Technology, Coimbatore, Tamil Nadu, India ' Department of Electronics and Communication Engineering, Sathyabama Institute of Science and Technology, Chennai, Tamil Nadu, India ' Department of Information Technology, Babasaheb Bhimrao Ambedkar University, Lucknow, Uttar Pradesh, India ' Department of Electronics and Instrumentation Engineering, B.S. Abdur Rahman Crescent Institute of Science and Technology, Chennai, Tamil Nadu, India

Abstract: In recent times, earlier diagnosis of 2019 novel coronavirus disease (COVID-19) is essential for disease cure and control. Since the chest computed tomography (CT) image diagnosis requires medical experts and more time, an automated intelligent model needs to be developed for effective COVID-19 diagnosis. This paper presents a new automated COVID-19 diagnosis model using optimal grey level co-occurrence matrix (GLCM) based feature extraction and Extreme Learning Machine (ELM) based classification. The input chest images undergo pre-processing to improve the image quality. Next, the optimal GLCM features are derived by the use of Elephant Herd Optimisation (EHO) algorithm. Then, the ELM model is applied to perform the classification task. The performance of the OGLCM-ELM model has been validated using the benchmark dataset and the experimental outcome ensured the superior performance of the proposed model over the compared methods. The proposed OGLCM-ELM model has achieved maximum sensitivity of 89.56%, specificity of 90.45%, F-score of 90.13% and accuracy of 90.69%.

Abstract

The latest advancements in highway research domain and increase inthe number of vehicles everyday led to wider exposure and attention tow development of efficient Intelligent Transportation System (ITS). One of the popular research areas i.e., Vehicle License Plate Recognition (VLPR) determining the characters that exist in the license plate of the vehicles. The VLPR process is a difficult one due to the differences in viewpoint, shape patterns, and non-uniform illumination at the time of capturing images. The current study develops a robust Deep Learning (DL)-based VLPR model using Search Algorithm (SSA)-based Convolutional Neural Network (CNN), called the SSA-CNN model. The presented technique has a total of four major p namely preprocessing, License Plate (LP) localization and detection, character segmentation, and recognition. Hough Transform (HT) is applied as extractor and SSA-CNN algorithm is applied for character recognition in LP. The SSA-CNN method effectively recognizes the characters that ex segmented image by optimal tuning of CNN parameters. The HT-SSA-CNN model was experimentally validated using the Stanford Car, FZU Car, and 2019 Challenge datasets. The experimentation outcome verified that the presented method was better under several aspects. The projected HT-SSA-CN implied the best performance with optimal overall accuracy of 0.983%.

An Investigation into Smart Contract Deployment on Ethereum Platform Using Web3.js and Solidity Using Blockchain

Sandeep Kumar Panda and Suresh Chandra Satapathy

Abstract Blockchain is a decentralized distributed platform, where multiple peers can exchange digital assets securely all over the globe without third party based on trustiness. In blockchain, blocks are connected by using hash that maintains the order of transaction. In this paper, we have proposed a novel approach of understanding proof of work and proof of stake which are considered as consensus algorithms that are used to manage and control blocks on distributed platform. Here, the paper also presents the Ethereum, a public blockchain platform which is used to implement decentralized application over the Internet using a contract (agreement) in digital form written by using solidity language that defines the way to exchange digital assets is called smart contact. Lastly, the paper concludes with implementation methodology for creation, deployment on Ethereum blockchain, and interaction of smart contract using Node.js, Web3 library, and Infura API.

Keywords Blockchain · Ethereum · Smart contracts

1 Introduction

A Blockchain [1] is a decentralized and distributed database system which comprises of various records bundled to form a block. All these blocks are chained together to from a blockchain. Here, the data structure linked list is used widely. One of the well-known applications of blockchain technology is the cryptocurrencies like bitcoin, ether, etc.

The blockchain is not controlled by single entity but it is controlled or managed by the group of people who are using that blockchain. For example, if a person wants to

Title: An efficient scheduling mechanism for IoT-based home automation system

Authors: Sirisha Potluri; Sachi Nandan Mohanty

Addresses: Department of Computer Science and Engineering, Faculty of Science and Technology, ICFAI Foundation for Higher Education, Hyderabad, Telangana – 501203, India ' Department of Computer Science and Engineering, Faculty of Science and Technology, ICFAI Foundation for Higher Education, Hyderabad, Telangana – 501203, India

Abstract: Using internet of things (IoT), we can connect and enable every object to send or receive data through the internet. When it comes to real life applications we can make use of this technology for easy communication through home automation. Smart homes, smart agriculture, smart automobiles, and smart electronic gadgets are the examples of IoT-based applications. When more number of objects is connected in distributed environment, controlling and managing the device is much difficult. Due to IoT enabled framework, the number of requests coming to the cloud computing environment is increasing exponentially. The scheduling algorithm which is used in such cases should be efficient to handle various requests coming from these connected devices. The objective of this paper is to develop efficient scheduling mechanism which controls home appliances remotely by using any android or smart phone. Since the devices are connected over cloud computing environment, the proposed method can efficiently schedule the tasks.

Keywords: internet of things; IoT; cloud computing; task scheduling; home automation.

Part of the Advances in Intelligent Systems and Computing book series (AISC, volume 1300)

Abstract

Due to enormous data generation at rapid rate, processing of large volumes of data becomes a challenging assignment. This leads to many issues in computing environment since it requires complex data analysis. Issues related to performance and cost may certainly arise due to heterogeneity of the systems which are connected in the distributed environment. Various consumers submit their request to the dynamic cloud environment depending on their demand and requirement. To manage these volatile workloads, an efficient workflow management system is proposed in this paper. In order to deal with these vital issues, a novel design of adaptive workflow management system is described to support on demand service management in the cloud. This mechanism includes workflow scheduler and iteration controller to optimize the data processing through iterative workflow task scheduling mechanism. Upgrade fit—is an optimization technique that dynamically and continuously reallocates multiple types of cloud resources to fulfill the performance and cost requirements of cloud resources. Using this algorithm, iterative workflow tasks can be executed repetitively for data processing and workload execution. The performance of the algorithm is evaluated by using weather forecast workflow. Since the performance of the algorithm is showing considerable efficiency levels, the same algorithm can be used in real time large volume data processing. The evaluation results indicate that the system can effectively handle multiple types of cloud resources and optimize the performance iteratively. The present paper has implemented the algorithm in cloud computing environment using CloudSim that has proved that the completion time is being minimized with maximization of resource allocation.

Abstract

Background: Conventional magnetic spectrometers used for conversion electron detection are cumbersome, require strong magnetic fields and the spectra have to be scanned point by point and have very low transmission. A magnetic filter using permanent magnets and an Si(Li) detector would facilitate multichannel analysis with high transmission. The mini-orange is a new type of spectrometer for conversion electrons combining a solid state Si(Li) detector with a filter of permanent magnets around a central absorber of lead.

Purpose: An indigenously developed magnetic spectrometer if optimized properly would be of great use in conversion electron spectroscopy for both online and offline experiments.

Methods: A Mini-Orange magnetic spectrometer made of small permanent magnets has been designed and developed indigenously and optimized for its best performance condition. The transmission curves

Vibration Analysis-Based Fault Diagnosis of a Dynamically Loaded Bearing with Distributed Defect

Govardhan Tingarikar[1] · Achintya Choudhury[2]

Received: 10 December 2020 / Accepted: 14 June 2021
© King Fahd University of Petroleum & Minerals 2021

Abstract

This research paper presents the analysis of vibration generated due to the race waviness of rolling element bearing which is under external dynamic load. The waviness on races is modeled either by sinusoidal function or superposition of sinusoidal functions of different orders. The mathematical model developed to analyze elastic deformations at race-rollers contacts and nonlinear contact forces for a defect free bearing under static external loading is modified and extended to take dynamic load into account. The radial waviness on races at these contacts is introduced in order to determine un-balanced excitations causing the bearing to vibrate. The set of equations that represent the dynamics of system have been obtained by inputting the excitations to linear vibratory model of bearing system. The vibration response of bearing has been obtained by numerical simulation of state space model representing dynamics of bearing system. The spectra of vibration response are analyzed for different amplitude contribution of dynamic component of external load. The numerical results have been obtained for NJ204 bearing with known values of order and amplitude of waviness. For harmonic loading, the additional spectral components have been observed for each order of waviness on both outer and inner race. The additional spectral components have also been observed for outer race waviness modeled as superposition of different order waviness models, whereas for inner race, there is some amplitude variation in spectral components. The vibration frequencies resulting from various orders of waviness on races have been validated with those of prior researchers.

Abstract

A huge amount of textual data is generated due to the boom of microblogging. Microblogging sites such as Facebook, Twitter and Google+ are used by millions of people to express their views and emotions on different subjects. In this paper, we discuss sentiment analysis on a Twitter dataset having various tweets from different users. Sentiment analysis is useful for gaining the opinion of people using large volumes of text data where texts are highly unstructured and heterogeneous. In this paper, different classification techniques like Support Vector Machine, Logistic Regression, Logistic Regression with Stochastic Gradient Descent optimizer, Decision Tree Classification, Naive Bayes, Bidirectional LSTM and Random Forest Classification have been applied to analyze the sentiment of people, i.e., whether their tweets are positive or negative. The corpus has been analyzed by plotting descriptive insights such as the word cloud and frequency of positive and negative tweets. The best classifier was selected by comparing the results of accuracy, recall, precision, F1 score, AUC score and ROC curve.

Keywords

Sentiment Analysis, Twitter, Natural Language Processing, Word2Vec, Support Vector Machine, Logistic Regression, Random Forest.

1. Introduction

With the universality of microblogging and social networking sites, Twitter, with 319 million monthly users has now become a valuable resource for several individuals and organizations for posting blogs and expressing their views and opinions on different subjects like politics, sports, movies, etc. [1]. Stimulated by the growth of social media, many companies and media organizations are trying to mine Twitter to observe people's views to understand what they feel and think about their products [2]. As a result, sentiment analysis on Twitter is an effective way of reckoning public opinion. Sentiment analysis provides the potential of observing numerous social networking sites in real-time.

Twitter has a limitation of 140 characters [3] in each tweet, which causes individuals to use phrases in their tweets. Sentiment Analysis automatically detects whether a text section contains emotions or opinioned content. It also determines the polarity of the text. Generally, the dataset consists of a group of tweets where each tweet is interpreted with a sentiment label. Commonly sentiments are labeled positive, negative or neutral. However, some datasets have mixed or irrelevant tags too, which ranges from -5 to 5 and depicting negative to positive polarity [4]. Twitter sentiment analysis is helpful to understand public temperament about different social or cultural events and forecasting the inconsistency within the stock exchange [5].

Abstract

The current researchers all over the world are striving to facilitate the answer to COVID-19 in a unique commitment of scientific collaborations, and with Cognitive technologies, highly flexible learning processes are needed to maintain the transmission of knowledge, prototype and code, by integrating application areas to specific culture and cross-border cooperation. Experts in artificial intelligence and machine learning technology were tracked and predicted with real-time data that was created worldwide by this pandemic situation and distributed COVID-19 patient information timely. Considered physiological features followed by clinical tests of patients with COVID-19 with very simple access to subsequent data transformation was relevant, but complicated. This paper works on in-depth Exploratory Data Analysis (EDA) prediction analysis over global database of COVID-19 medical data from around the world will be available benefiting future artificial predictive, analytical and biomedical research additional COVID-19 approaches including associated pandemics.

Keywords

Title: An efficient scheduling mechanism for IoT-based home automation system

Authors: Sirisha Potluri; Sachi Nandan Mohanty

Addresses: Department of Computer Science and Engineering, Faculty of Science and Technology, ICFAI Foundation for Higher Education, Hyderabad, Telangana – 501203, India ' Department of Computer Science and Engineering, Faculty of Science and Technology, ICFAI Foundation for Higher Education, Hyderabad, Telangana – 501203, India

Abstract: Using internet of things (IoT), we can connect and enable every object to send or receive data through the internet. When it comes to real life applications we can make use of this technology for easy communication through home automation. Smart homes, smart agriculture, smart automobiles, and smart electronic gadgets are the examples of IoT-based applications. When more number of objects is connected in distributed environment, controlling and managing the device is much difficult. Due to IoT enabled framework, the number of requests coming to the cloud computing environment is increasing exponentially. The scheduling algorithm which is used in such cases should be efficient to handle various requests coming from these connected devices. The objective of this paper is to develop efficient scheduling mechanism which controls home appliances remotely by using any android or smart phone. Since the devices are connected over cloud computing environment, the proposed method can efficiently schedule the tasks.

Keywords: internet of things; IoT; cloud computing; task scheduling; home automation.

Abstract

Due to enormous data generation at rapid rate, processing of large volumes of data becomes a challenging assignment. This leads to many issues in computing environment since it requires complex data analysis. Issues related to performance and cost may certainly arise due to heterogeneity of the systems which are connected in the distributed environment. Various consumers submit their request to the dynamic cloud environment depending on their demand and requirement. To manage these volatile workloads, an efficient workflow management system is proposed in this paper. In order to deal with these vital issues, a novel design of adaptive workflow management system is described to support on demand service management in the cloud. This mechanism includes workflow scheduler and iteration controller to optimize the data processing through iterative workflow task scheduling mechanism. Upgrade fit—is an optimization technique that dynamically and continuously reallocates multiple types of cloud resources to fulfill the performance and cost requirements of cloud resources. Using this algorithm, iterative workflow tasks can be executed repetitively for data processing and workload execution. The performance of the algorithm is evaluated by using weather forecast workflow. Since the performance of the algorithm is showing considerable efficiency levels, the same algorithm can be used in real time large volume data processing. The evaluation results indicate that the system can effectively handle multiple types of cloud resources and

Abstract

Blockchain is one of the leading technologies that have a huge number of implications in solving real time problems, especially in sectors like Healthcare, Banking, Aviation, Telecommunication, and so forth. Blockchain is known for its features like interoperability, improved information security, Data integrity, immutability, distributed database, Peer to Peer transaction Network, traceability, and transparency along with a trustworthy environment that makes it more secure and reliable. It is enormously known for decentralizing data, easy accessibility, and management of operations, which makes blockchain a better technology to work on. Currently, the big sectors like healthcare that have a huge number of implications in comparison to others, need to make their activities effective and efficient on a real time basis. Unlike other technologies that are presently available in the healthcare industry, Blockchain technology facilitates many things such as drug supply chain management by making it counterfeit-free, providing interoperability in patient health records, allowing data operations to be safe and precise, enhancing medical insurance security, assistance in disease predications, etc. Ensuring absolute encryption security by way of cryptographic algorithms with healthcare taking pleasure in the stack of benefits. Blockchain can solve numerous problems in healthcare and adapting it, will not only boost the working productivity but also enhances the

Effect of process parameters on sliding wear performance of red brick dust-filled glass–epoxy composites

Pravat Ranjan Pati, Mantra Prasad Satpathy

First Published April 21, 2021 Research Article
https://doi.org/10.1177/13506501211010553

Abstract

This research is focused on the study of the tribological properties of epoxy composites reinforced with red brick dust and glass fiber. Wear tests are conducted on a pin-on-disk apparatus. The wear rate and coefficient of friction are measured after tribological tests. The relative effect of process parameters such as sliding velocity, normal load, filler content on specific wear rate, and coefficient of friction is also examined using the Taguchi model and analysis of variance technique. Furthermore, an innovative optimization approach is adopted by combining grey relational analysis with the metaheuristic firefly algorithm to obtain the desired response values. A nonlinear regression model is generated to cater to the relationship between the grey relational grade and the process parameters. This model is further employed in the firefly algorithm to move the firefly to the neighboring brighter and attractive firefly. The most influencing factors for wear rate and friction coefficient are sliding velocity and normal load, respectively. This work not only opens up an opportunity for value-added utilization of waste material such as red brick dust but also the proposed metaheuristic approach can be customized and applied for any multi-response optimization problem.

Keywords

Red brick dust, sliding wear, Taguchi technique, grey relational analysis, firefly algorithm

ON INNER PRODUCT OVER A LATTICE VECTOR SPACE

DPRV Subba Rao and Rajesh Gudepu

ABSTRACT. This paper introduces the concept of lattice valued inner product space. A natural inner product structure for the space of n-tuples over Boolean algebras is generalised to n-tuples over a distributive lattice with 0 and 1. A dimension theorem for orthonormal basis of a Boolean vector space is generalised to a lattice vector space. Further, we prove that for any naturals m, n with $m < n$, any set of m orthogonal unit ortho vectors in a lattice vector space can be extended to an orthonormal basis (known in the Boolean algebra case).

1. Introduction

As lattice matrices become useful tools in various domains like the theory of switching circuits, graph theory, fuzzy systems, theoretical computer science, automata theory, optimizations etc, it is natural to study the lattice vector spaces in connection with lattice matrices. In this way the concept of a lattice vector space (or vector space over a distributive lattice) is introduced by G. Joy and K. V. Thomas in [**2**].

In comparison to usual linear algebra over fields, in this paper the notion of inner product space of a Boolean vector space [**4**] is extended to inner product space of a lattice vector space. As analogues to the Boolean-valued norm and orthogonality relations for Boolean vectors [**4**], the lattice valued norm and orthogonality relations for lattice vectors are introduced and studied.

2010 *Mathematics Subject Classification.* Primary 06D99; Secondary 15B99.
Key words and phrases. Distributive lattice, Lattice inner product, Lattice vector space, linear opearator, orthonormal basis, unit orthovector.

Abstract

Polymer composites are commonly used in industry and are used in various fields such as the aircraft industry, automobile industry, electronic industry and packaging industry, etc. due to their diverse versatility, low cost, light weight, and outstanding chemical consistency. For new technologies, especially in aerospace and aeronautics, thermal properties have become a significant parameter. A reference to a number of research studies is made in this paper and the role of fillers in polymers is studied. The main purpose of this analysis is to identify any possible patterns that control and dictate the thermal properties in polymeric composites.

Abstract

In this review, insight into the use of industrial waste as composite reinforcement has been discussed. Numerous papers have identified the reinforcing capacity of industrial wastes and their properties. Now, from many years of study, high-performance polymer composites are manufactured a day. Many applications are found in industrial waste-filled polymer composites, but large-scale commercial have not been found. Four commercial wastes such as Blast Furnace Slag, Red Mud, Fly Ash and Linz Donawitz Slag are discussed in this review article. In addition, the study takes into account innovations dealing with industrial waste and its composites. The industrial waste source, extraction, availability, type, composition, physical, mechanical, and wear properties are talked about. Finally, the paper provides a summary of the results of the composites generated from each industrial waste with suitable references for in-depth research.

Abstract

Indeed in spite of the fact that kind of metal and ceramic powders are recycled as coating fabric, the usage of fabricating squanders for this reason has not been enough found. Hence, the current study reports on the advancement and execution of plasma sprayed coatings using Linz-Donawitz (LD) slag as the leading material. LD slag coatings are kept on mild steel substrates in several weight proportions at input control levels of the plasma torch. The various mechanical properties such as thickness, hardness, strength, and porosity are discussed in this analysis. This type of coating is measured by computing deposition efficiency. The adhesion strength, efficiency, and coating thickness are affected by the control level of the plasma torch. This effort also exposes that LD slag is especially coated on mild steel substrate.

Abstract

The genesis of novel coronavirus (COVID-19) was from Wuhan city, China in December 2019. Its outbreak was later declared as a global pandemic in view of its exponential rise and spread around the world. Resultantly, the scientific and medical research communities around the globe geared up to curb its spread. In this manuscript, authors claim competence of AI-mediated methods to predict mortality rate. Efficient prediction model enables healthcare professionals to be well prepared to handle this unpredictable situation. The prime focus of the study is to investigate efficient prediction model. In order to determine the most effective prediction model, authors perform comparative analysis of numerous models. The performance of various prediction models is compared using various error metrics viz. Root mean square error, mean absolute error, mean square error and R^2. During

Abstract:
Over the few years civilian and military applications are maneuvering with multi-sensor Unmanned Aerial Vehicles (UAV). The aim of this paper is to improve autonomous UAV positioning by using Inertial measurement unit (IMU) and Global Navigation Satellite System (GNSS) is considered. The positional accuracy of UAV is limited to GNSS signal blockage. The advancements in micro electro mechanical systems (MEMS) helps to design low-cost IMU with meter-level accuracy in positioning. The estimation of attitude, position and velocity measurements are determined from a nine degree of freedom Arduino embedded IMU sensor. The Low-cost IMU sensor has been tested under static condition and then a dynamic movement of sensor is observed under moving base-line conditions on February 2 nd 2020 at Koneru Lakshmaiah Education Foundation (KLEF). In this paper, covariance filters are implemented to eliminate the gyro bias and accelerometer bias for improving attitude determination of IMU navigation system. The positioning from IMU sensor is

Abstract:
Most agricultural crops have been badly affected by the effect of global climate change in India. In terms of their output over the past 20 years. It will allow policy makers and farmers to take effective marketing and storage steps to predict crop yields earlier in their harvest. This project will allow farmers to capture the yield of their crops before cultivation in the field of agriculture and thus help them make the necessary decisions. Implementation of such a method with a web-based graphic software that is simple to use and the machine learning algorithm can then be distributed. The results obtained are granted access to the farmer. And yet there are various methods or protocols for such very data analytics in crop yield prediction, and we are able to predict agricultural productivity with guidance of all those algorithms. It utilizes a Random Forest Algorithm. By researching such problems and issues s... weather, temperature, humidity, rainfall, humidity, there are no adequ... solutions and inventions to resolve the situation we face. In countries like India even in the agricultural sector, as there are many types of increasing economic growth. In addition, the processing is useful for forecasting the produ... of crop yields.

Abstract:
Any crisis circumstance can be better dealt with by quickly announcing its event. Crisis times requests quick arrangements. Time is the parameter that makes all the difference. To have a moment and compelling arrangement we should have a successful framework close by. Our sole target in doing this task is to construct such powerful fire ready framework where the framework quickly perceives the littlest of disparities in the typical progression of things and cautions the concerned individuals of the separate association. It is considered that anything which emits smoke beyond a threshold temperature is a Fire accident. What makes this project an ever-exploring idea is the novelty in the scheme of explosions that are happening all-around. Characteristics of a system whose purpose is to alert the officials when the ammonium nitrate is emitted from the containers can be different from the system whose purpose is to detect a short out. It is an utmost necessity to build a system that finds its relevance in maximum of the situations. The proposed framework contains a circuit which will efficiently control the fire shock which are happening in running trains time and again.

Abstract

In this paper new continuous-time sigma delta modulator that supports complex band-pass (CBP) architectures with the re-configurable bandwidths of 5 and 10 MHz is presented. In this design a new CBP sigma delta ADC with less number of Gm cells and low power consumption has mentioned. A complex gm-C topology with positive feedback compensation, current reuse, feed forward techniques are used to reduce the power consumption. This work is done in CMOS 130 nm technology. The peak signal to noise plus distortion (SNDR) 67.3 dB is achieved both with 5 MHz and 10 MHz signal bandwidths with centre frequencies 4 MHz and 6 MHz respectively. This work is operated by 1.2 V supply voltage with 151.9 dB Figure of Merit (FOM) and with maximum dynamic range (DR) is 72.2 dB. The overall power consumption is 3.2 mW at 5 MHz and 4.5 mW at 10 MHz bandwidths.

Abstract

Estimating ground motion characteristics at various locations as a function of fault characteristics is useful for the proper damage assessment and risk mitigation strategies. This paper explores the application of machine learning approaches to predict peak ground acceleration (PGA) and peak ground velocity (PGV) using New Zealand's strong motion data. Five machine learning algorithms, namely linear regression, kNN, SVM, Random Forest, and XGBoost, are used in this study. Using the New Zealand flat-file database, the geometric mean of the peak ground motion parameters is used as predictor variables in training the machine learning algorithms. The performance of the chosen algorithms and how they work on PGV and PGA are discussed. The best prediction for PGA is obtained using random forest but for PGV XGboost worked best. The relative importance of various features in the flat file is also presented for the best-performing machine learning algorithm. Although the magnitude of an earthquake is found to be most influential for PGV, rupture distance showed the highest impact for PGA. Finally, the predictions are also explained using SHApley Additive exPlanations (SHAP) for the overall dataset as well as on a sample by sample basis, for a few samples. Pairwise dependency of some features with the highest feature importance is also presented using SHAP.

Abstract

Herein, the synthesis of the novel and inexpensive phosphate mixtures (calcined and non-calcined) of iron (Fe) and sodium (Na) and their application as reflective coating with building envelope materials is reported. The main objective of this work is to determine the effect of hydrated mixtures as a reflective coating. To obtain different hydrated mixtures, samples were synthesized as both calcined and non-calcined mixtures. Various measurement techniques were used to characterize and study the thermal behavior of mixtures. From the thermal behavior of the mixtures, it is noticed that the mixtures can be used as heat-dissipating materials. The average crystallite size was found 40.18 nm and 25.48 nm for the calcined and the non-calcined mixtures, respectively. The calculated band gap for the calcined

Synthesis, characterization of imidazole-based copper complex mixtures and study of their thermal behaviour

Rudrarapu Aravind ✉, Gouri Sankhar Brahma, Trilochan Swain, Akash Kumar Sahu

First published: 27 January 2021
https://doi.org/10.1002/er.6445
Citations: 1

Summary

Herein, the synthesis, characterization and thermal behaviour of imidazole-based two copper-phosphate mixtures, A = $Cu_2(PO_4)(OH)\cdot Cu(HPO_4)(H_2O)\cdot(C_3H_4N_2)_2.3.25\ H_2O$ and B = $Cu_3(PO_4)_2H_2O\cdot(C_3H_4N_2)_3\ (H_2O)\cdot 0.1(C_3H_4N_2).3.25\ H_2O$ are reported. The characterization was done by adopting various electro-analytical techniques such as elemental analysis, X-ray Powder Diffraction (XRD), Thermogravimetric Analysis (TGA) and Derivative Thermogravimetry (DTG), Fourier Transform Infrared (FT-IR) Spectrometry, Absorption Spectrophotometry and Ultraviolet-Visible and near Infrared (UV-Vis-NIR). Differential Scanning Calorimetry performed with the heating rate 10 K/min from 297.96 to 770.46 K in normal atmosphere for both mixtures. DSC data indicated that both mixtures A and B are exhibiting exothermic property by their net specific heat capacities (C_p) −11.11 and −2.83 J/g K, respectively. Therefore, these complex mixtures can be utilized as heat dissipation materials. Both mixtures A and B undergo phase change in terms of hydrated phase to dehydrated phase up to 356 and 392 K, respectively. The specific heat capacity of Mixture A during hydration, C_p = 2.54 J/g K, is higher than the tin, lead, stainless steel, glass and aluminium at their respective melting points. This mixture is also found better than the commercial product based on lithium ion battery in terms of specific heat capacity. From UV-Vis-NIR analysis, it is found that the mixtures A and B are showing semiconducting behaviour with band gaps 1.66 and 1.68 eV, respectively. The average crystallite sizes of these nano-complex mixtures are 35.29 and 30.94 nm and these were calculated using the Debye-Scherrer equation and Williamson-Hall method.

The influence of double diffusive gradient boundary condition on micropolar nano fluid flow through stretching surface with a higher order chemical reaction

Anjanna Matta and G. Nagaraju

Published Online: 16 Dec 2021

Abstract

The higher order chemical reaction of a magneto micropolar nanofluid flow through a stretching sheet under the effect of a Brownian motion and thermoporesis is investigated by applying the convective boundary condition on temperature and mixed boundary condition on concentration. The leading partial differential equations were transformed into ordinary equations using a similarity transformation and solved numerically using Matlab bvp4c solver. The presence of the nanoparticles has a most remarkable effect on the heat flow improvement of micropolar nanofluid. The results are depicted graphically for different flow governing material parameters.

ABSTRACT

We present the fabrication and characterization of a metal-ferroelectric-insulator-silicon field effect transistor (MFIS-FET) for high-speed and non-volatile memory applications. Ferroelectric $BiFeO_3$ and high-k dielectric HfO_2 films were deposited by the radio frequency sputtering and integrated on the silicon substrate to realize the FET structure. $BiFeO_3$ film of a constant thickness (200 nm) and HfO_2 film of varying thickness from 5 to 20 nm was selected for the different capacitor structure fabrication and parameter optimization. Structural characteristics of the $BiFeO_3$ film were obtained using x-ray diffraction (XRD) and scanning electron microscopy. Structural characteristics show the ferroelectric film of polycrystalline structure with the grain size of $\approx$ 26 nm at the annealing temperature of 500 °C. The ferroelectric film optimization was carried out at different annealing temperatures to obtain the crystalline structure. Effect of insulator layer thickness on the MFIS structure memory window (MW) and leakage current density was investigated to select an optimized buffer layer thickness for the FET fabrication. MFIS-FET with 10 nm buffer layer was fabricated from the optimized parameters that show a MW of 26.7 V and the drain current ON–OFF ratio higher than 10^6 for the voltage sweep of $\pm$ 30 V.

1 Introduction

In recent years, multiferroic materials have attracted much attention among the scientific community due to their intriguing properties and exciting application potential. Multiferroic bismuth ferrite ($BiFeO_3$) in pure form and doped with different atoms such as La, Mn, Zn, Pb, Ni, etc., have shown excellent coupling in their electric, magnetic, and structural order parameters that results in exceptional ferroelectricity, ferromagnetism, and ferroelasticity simultaneously [1–4]. Among the few discovered multiferroic materials, $BiFeO_3$ has shown the highest ferroelectric polarization with Curie temperature (T_c) of 1100

Abstract

We construct generalized coherent states for the rationally extended Scarf-I potential. Statistical and geometrical properties of these states are investigated. Special emphasis is given to the study of spatio-temporal properties of the coherent states via the quantum carpet structure and the auto-correlation function. Through this study, we aim to find the signature of the "rationalization" of the conventional potentials and the classical orthogonal polynomials.

Keywords: Exceptional orthogonal polynomials ▪ coherent states ▪ quantum carpets ▪ statistical and geometrical properties

ADVANTAGES OF VAASTU PRINCIPLES IMPLEMENTATION IN CONSTRUCTION –A CASE STUDY

Koora Sai Kumar, Shaik Himam Saheb, A. Chandrashekhar Faculty of Science and Technology, The ICFAI Foundation for Higher Education, Hyderabad.

Abstract: In Sanskrit language Vaastu Shastra Means "Science of Buildings" which is used in construction of buildings, villas and commercial complex. In the Sanskrit "VAASTU" means place of house, home and building and "SHASTRA" means science. The arrangement of shastra elements are Earth, Water, Air, and Sky in complete combination. Vaastu shastra maintains the good relationship between the man physical, mental and social well-being. The plan according to vaastu shastra is used for further design and architectural planning. The most important conceptual principles of vaastu with scientific reasons are examined with engineering concepts from olden days to current days buildings, structures and alternate affordable arrangements are proposed as per vaastu shastra. There are a greater number of connections between vaastu shastra in environment and modern architecture. By constructing the house according to vaastu shastra the area achieves life balance, as our lives are sub-ordinate to gods, nature and people. As constructing accordingly to vaastu will create peace, success, health, happiness and to avoid problems. This article is about vaastu survey in which we can know accordingly about people perspective towards vaastu.
Key words: Vaastu shastra, survey, Hyderabad

1.0 Introduction: Vaastu shastra was developed by our ancestors nearly about 4000 years ago and this has been followed over centuries and going generations. The fact is that, it has survived till now it has shown itself to a practical and that indicates it is a science and not superstition. Vaastu science gives the guidelines on the construction of buildings. It is mainly depending on the five natural resources like wind, sun, land, water and sky. Vaastu shastra is on principles of measurements, space arrangement and planning, layout, ground preparation, design, and spatial geometry. It includes the traditional of Hindu and some of the cases of Buddhist faith.

Vaastu is categorized into four types:

- BHOOMI : The Earth
- PRASADA : The Structures on the earth
- YAANA: The Movable objects on the earth
- SAYANA: Furniture

These categories are the principle of vaastu shastra which is expanded from the micro level to macro level – site selection, position of rooms, site planning and orientation and various proportional parts of building design details like furniture. Vaastu shastra gives great hopes for our better living tomorrow. Vaastu combination with modern planning is going a long way in decrease with the pressures of modern living.

1.2 Literature review:

Vaastu was developed in the ancient period. In that period of days, this science was purely passing out by the people called sathpathis. In olden days almost every separate house, public community halls, palace and temples were strictly constructed as per the vaastu Principles entitled as agama Shastra.

Vaibhav Chawadre (2015): Explained about the vaastu principles like fire, water, land, air and space. He mainly explained about the uses of principles. He has published the book in the name of "Indian Vaastu Shastra: Science of Construction & Architecture of Building".

Siddharth Borad and Dr. Jayshree Om (2020): Both authors had explained about the history of vaastu. They had published the book in the name of "Ancient science of vaastu".

Robert E. Svoboda (2020): Explained about the principle of space in vaastu shastra. He has published the book in the name of "VASTU: Breathing Life into Space".

Abstract: Social media platform permit users to have discussions, share data and create content. Social media has transformed people in many ways. As social media continue to ascend its demand, people continue to adapt them. In light of the ease of use of media, due to its user-friendliness of social media applications. People are engaging with mobile devices and interactive social media applications such as WhatsApp and Telegram and there is a new application in the Indian market called aapoon "Circles" which is a new age social media and messaging platform where communication has been made easy, organized and safe and also provides companies a new platform to interact with their customers and the impact for Business. This paper aims to provide a study about current status of social media applications. We discuss the specific domains in which the impacts of social media have been explained.
Key words: social media - correspondence - engaging - application – Business – aapoon.

I. Introduction

As day and squint at the mobile screen in the hands of a drowsy youthful grown-up. Looking through the pile of posts, tweets, pictures, and recordings to see what is happening in the existences of those they know. "Gracious, sweet! My post is at 75 likes!" "What? How might he move past 100 top choices for posting about his breakfast?!" "My sister is killing it for her work!" in the wake of encouraging 'like' the post that shows she got representative of the month. Social media has turned into a method for associating with individuals we know and offer our perspectives on news and occasions happening all throughout the planet. With the expansion of picture and video media, web-based media is an incredible method of taking a break like sitting in front of the TV. The absolute most famous social media applications incorporate Facebook, Twitter, Instagram, Reddit, Tinder, YouTube, Snapchat, and goes on.

Social media matters for organizations, and here are some details to prove it:

- As per 2019 social media insights, there are presently 3.4 billion users all throughout the planet. That is about 45% of our absolute present population.
- Study shows that an average user spends a normal of 2 hours and 22 minutes in his social media account each day, including informing.
- 73% of online advertisers concur that their endeavors in executing a web-based media showcasing methodology for their business have been viable.
- There are about one million new users joining social media daily or 10 new users joining for every 10 seconds.

1. Introduction and Preliminaries

It is well known that fixed point theory has applications in various fields of research. These fields include engineering, economics, natural sciences, game and graph theory, etc. The first known and perhaps most applicable result comes from Stefan Banach in 1922. It is known as the Banach contraction mapping principle. This principle claims that every contraction in a complete metric space has a unique fixed point. It is useful to say that this fixed point is also a unique fixed point for all iterations of the given contractive mapping.

After 1922, a large number of authors generalized Banach's famous result. Hundreds of papers have been written on the subject. The generalizations went in two important directions:

(1) New conditions were introduced in the given contractive relation using new relations (Kannan, Chatterje, Reich, Hardy-Rogers, Ćirić, ...).
(2) The axioms of metric space have been changed.

Thus, many classes of new spaces are obtained. For more details see papers [1–10].

One of the mentioned generalizations of Banach's result from 1922 was introduced by the Polish mathematician D. Wardowski. In 2012, he defined the $\mathbb{F}$-contraction as follows.

The mapping $\overline{T}$ of the metric space $(\overline{X}, d)$ into itself, is an $\mathbb{F}$ -contraction if there is a positive number τ such that for all $\overline{x}, \overline{y} \in X$

$$d(\overline{T}\overline{x}, \overline{T}\overline{y}) > 0 \text{ yields } \tau + \overline{\mathbb{F}}(d(\overline{T}\overline{x}, \overline{T}\overline{y})) \leq \overline{\mathbb{F}}(d(\overline{x}, \overline{y})), \tag{1}$$

where $\overline{\mathbb{F}}$ is a mapping of the interval $(0, +\infty)$ into the set $\overline{\mathbb{R}} = (-\infty, +\infty)$ of real numbers, which satisfies the following three properties:

Adaptive framework for detecting Accident black spots using IoT and Machine Learning

Dr. M. Lakshmiprasad, Dr. G. V. Shrichandran, A. Chandrashekhar, Dr. Revathi R., Venkata Harshavardhan Reddy Dornadula, Maddukuri Supriya

ABSTRACT

Human beings are currently involved in numerous accidents while travelling by car in the existing state of affairs. They lose both their lives and their property as a result of these catastrophes. Many accidents, deaths, and substantial vehicle damage have happened on India's rural and suburban roads as a result of fading lanes, uneven potholes, and inadequate and hidden road signs. The most difficult aspect of driving is seeing potential road hazards. The basic idea is to create a system that can detect obstructions in the cars' route and inform the driver. The Raspberry Pi Camera module is used in this project to recognise and capture photographs of items. In a rigorous research, the optimal method for determining picture boundaries is tested on a test image. Before segmentation, the framework performs preprocessing using the Mean Subtracted Difference Enhancement (MSDE) method. The categorization is carried out using the Advanced Classifier that has been suggested for item detection. The system can classify vehicles, animals, humans, and other objects. When an item is detected, the system sends a verbal message to the driver, telling them to slow down. A thorough investigation is used to consolidate the findings. As a result, the proposed method is more precise and efficient than the present one.

HYDERABAD

The manuscript presents a bragging-based ensemble forecasting model for predicting the number of incidences of a disease based on past occurrences. The objectives of this research work are to enhance accuracy, reduce overfitting, and handle overdrift; the proposed model has shown promising results in terms of error metrics. The collated dataset of the diseases is collected from the official government site of Hong Kong from the year 2010 to 2019. The preprocessing is done using log transformation and z score transformation. The proposed ensemble model is applied, and its applicability to a specific disease dataset is presented. The proposed ensemble model is compared against the ensemble models, namely dynamic ensemble for time series, arbitrated dynamic ensemble, and random forest using different error metrics. The proposed model shows the reduced value of MAE (mean average error) by 27.18%, 3.07%, 11.58%, 13.46% for tuberculosis, dengue, food poisoning, and chickenpox, respectively. The comparison drawn between the proposed model and the existing models shows that the proposed ensemble model gives better accuracy in the case of all the four-disease datasets.

373

Introduction

The rising prevalence of data acquisition applications leads to the collection of a vast amount of time-series data that enable forecasting for many medical applications. A multitude of end-use cases for time-series applications in the medical domain exists that aims to process thousands of time-series and millions

Abstract

To buy or not to buy green: the moderating role of price and availability of eco-friendly products on green purchase intention

Preshita Neha Tudu* and Vaibhav Mishra

ICFAI Business School (IBS Hyderabad),

Abstract: The purpose of the study is to empirically investigate the relationship between environmental concern and environmental knowledge on consumers' intention to buy green products in Indian context. Based on 220 samples, the study also tries to find out the moderating effect of price and availability of eco-friendly products on intention of consumers' to buy green. The result showed that the price of green products weakens the positive relationship between environmental concern, environmental knowledge and Indian consumers' intention to buy green products. Further, availably of the green products strengthen the positive relationship between environmental concern, environmental knowledge and Indian consumers' intention to buy green products. The results from this study help explain the attitude-behaviour gap in green consumption behaviour: why consumers may have an intention to behave in an environmentally friendly way but then do not engage in the actual behaviours. It gives insights to devise marketing strategies to encourage consumers' green buying behaviour.

Keywords: purchasing behaviour; behaviour intention; green products; eco-friendly; price; availability.

Empirical Investigation on the Effects of Culture on Knowledge Sharing and Organization Citizenship Behaviour: Study from UAE

Srinivasa Rao[a], Waheed Kareem Abdul[b] and Yehia Kamel[c]

[a]ICFAI Business School, Hyderabad, India; [b]Institute of Management Technology - Dubai, United Arab Emirates; [c]University of Dubai, UAE

ABSTRACT

Cross-cultural research studies with regard to organisation citizenship behaviour (OCB) focus primarily on testing various dimensions in different cultures. We have proposed in our study that culture is positively associated with knowledge sharing (KS) and OCB in the context of UAE and have further hypothesised this association is mediated by responsible leadership (RL). The data has been collected from employees and their respective supervisors of 46 mid-sized organisations from all the Emirates of UAE. The data regarding knowledge sharing and culture has been collected directly from 437 employees belonging to diverse industry sectors and cultures. The data regarding employees' OCB has been collected from 117 supervisors of those employees. The results depict that culture has positive relationship with KS and OCB. RL is found to partially mediate the relationship between culture and KS and culture and OCB. Further, the findings, implications on managerial practices, and future research directions are discussed.

KEYWORDS
Culture; knowledge sharing; responsible leadership; ocb; uae

1. Introduction

In light of the rapid changes in markets due to globalisation, competition has increased, which has resulted in changes in organisational functioning. This has prompted flexibility, enhanced responsiveness, and gave new direction to customer orientation and complexity of tasks. Transformational leadership motivates and inspires team members to obtain individual identification with the team for achievement of organisational goals (Bass, 1985). The study by Boerner et al. (2007) concluded that organisational citizenship behaviour (OCB) has no mediating role between transformational leadership and employee performance in the banking sector. Hence, there is wider scope of research on this aspect.

According to Podsakoff et al. (2000), OCB can influence performance of the subordinates. In the modern age, there is need for a responsible leadership (RL). The enhanced OCB can be seen as a positive impact of RL (Podsakoff et al., 2000). OCB is defined as engagement shown by an individual beyond one's role or what is expected from one's position; hence, responsible leaders will act as a role model.

Responsible leaders motivate and inspire employees for higher levels of productivity outcomes. Research studies need to investigate formal correlations and systematic procedure to relate behavioural aspects of RL with important outcomes expected by the organisation. Empirical research studies on leadership practices and styles engaging national and expatriate managers across many cultures are limited, especially for the MENA region. In our study, dimensions like trust, ethical behaviour, self-efficacy, inspirational motivation, individual support and psychological empowerment have been combined into single construct variable, i.e., RL, which is suitable for organisational and regional practices.

Knowledge is one of the most significant components for the organisations in today's work environment to achieve long term competitive advantage. Knowledge sharing (KS) is considered as one of the essential and important elements of knowledge management. Abu Naser et al. (2016) found that the most crucial factors influencing performance of employees are knowledge management, leadership, and people processes. Most of the people possessing knowledge will not be willing to share unless they get valuable returns. In any organisation, people exchange knowledge in return of rewards, promotions, or knowledge. They may not be willing to share due to apprehension of criticism. There are three components of KS, i.e. reputation, altruism, and reciprocity. Garrick and Chan (2017) observed that transfer of any tacit knowledge is critical for improving organisational

Evolving Corporate Governance in Indian Healthcare: An Ethical Perspective

Abstract

The ongoing trends in the Indian healthcare sector point to the need to evolve a strategic plan with concern towards 'quality care'. This demands a massive governance agenda from a management perspective. The evolution of Corporate Hospitals, on a mammoth scale, across the country heralded a new era in the realm of 'diagnosis' and 'treatment' unfolding many technologies. The so-called boom in the service sector, found to be responsible for elevating the living standards of the middle class, needs to be channelised for a productive cause. The growing awareness of health disorders and treatment-seeking attitude among the cross section of people put enormous pressure on corporate hospitals to prescribe an action plan for meeting customer needs spread in different forms. The entry of foreign capital into the fold of healthcare services has also resulted in a competition between equal players as seen in the case of heart ailments. The individual-centric and group-centric management patterns found in the corporate hospitals require a healthy debate on the pros and cons of the phenomenon. The growing thrust towards 'quality management' also enables us to focus upon 'clinical governance' that finds special place in the so-called corporate governance framework. Apart from this, technological implications and the resulting cost escalation are identified as potential elements that need attention in the effective management of corporate hospitals. The journey from 'commercialization' to 'corporatization' in varying forms has been analyzed. Above all, the classic models of management followed in Banking, Finance and IT sectors, which came to be known as 'Corporate Governance' is being thrust upon corporate hospitals for implementation in view of its positive outcome elsewhere. Eventually, the management architecture involves the application of an 'ethical code of conduct' not only for gaining the investor's trust but also for

Isabelle Kocher – can she lead a historic turnaround at ENGIE?

K.B.S. Kumar

ENGIE's mission is to detect, challenge and select the best possible technologies.
– Isabelle Kocher, CEO, ENGIE

K.B.S. Kumar is based at the Department of HR and Soft Skills, ICFAI Business School, Hyderabad, India.

In 2019, French multinational electric utility company, ENGIE SA (ENGIE) was on the verge of zero carbon transition. Under the leadership of Isabelle Kocher (Kocher) who became the CEO in 2016, ENGIE embarked on an arduous journey toward re-profiling itself toward renewable, low-carbon energies, such as solar, green gases and digital. Kocher said, "We want to focus our investments solely on generating low carbon energy and innovative integrated solutions for our customers. We've also made the decision to launch no further new coal projects. The future of our Group lies neither in oil, nor nuclear, nor shale gas. So we are redesigning our entire portfolio." (ENGIE, 2016a, 2016b, 2016c).

Kocher, inherited a company that recorded losses amounting to €4.6bn (ENGIE, 2016a, 2016b, 2016c), embarked on a transformational journey by disposing assets valued €15bn in non-renewable energy such as coal and oil. She planned to develop what was termed as "business lines for the future". These included renewables along with storage and digital technologies. As a part of her turnaround plan, she announced an investment of €22bn in of three years to develop the "business lines for the future" and to bring unprecedented changes in ENGIE.

At the heart of Kocher's strategy was selling oil fields and power plants that used non-renewable sources such as coal or gas and investing in renewable sources such as wind and solar power. She also planned to exit several countries.

By 2019, Kocher's turnaround plan was well underway. Though she delivered the plan, she was unable to deliver returns to the shareholders. ENGIE lagged behind competitors like Iberdrola SA, Enel SpA and Electricite de France SA. What Kocher was facing was a tradeoff between profits and clean energy. She needed to prove that clean power also means profits.

About ENGIE

Founding of ENGIE goes back to year 2008, when two organizations- Suez [1] (water supply and treatment, waste management and energy company) and Gaz de France [2] (Power company) were merged under the guidance and leadership of the French Prime minister Dominique de Villepin. The merger led to a liquefied natural Gas company GDF Suez (Reuters Staff, 2015).

Growth, diversification, and expansion had been at the center of GDF Suez. Its inorganic growth accelerated after the merger. In 2010, GDF Suez acquired 70% in International

Does Firm Performance Impact Top Executive Turnover ?

NASEEM AHAMED*
KAVITA WADHWA**

Abstract

Using data from 1618 companies listed on National Stock Exchange (India) from 2001 to 2016, this paper examines the impact of financial performance on top executive turnover. The threat of turnover serves as a disciplining tool for top executives because turnover of top executives is a way to rectify the misfit between executives and company. We found that there is an inverse relationship between firm performance and top executive turnover. Further, we also found that firms having more leverage have a higher propensity to terminate their top executives. Other factors such as independence of board, regulation year exhibit a positive relationship with the likelihood of top executive turnover. The long run stock performance of companies post turnover exhibits improvement validating the improved management hypothesis proposed by earlier researchers.

I. Introduction

DESPITE A SIZEABLE AMOUNT of literature on turnover of executives in the developed economies, the emerging economies have received relatively less than their due attention. Gibson, 2003 points out the lack of academic research in the corporate governance domain in emerging economies in his study on top executive turnovers in eight emerging economies. While a number of studies have emphasized the existence of an inverse relationship between firm performance and executive turnover, the intensity of the relationship and time lag differs from country to country (Suchard, Singh and Borr, 2001). An emerging country is characterized by features not

Non-Performing Assets and Revival of Banking Sector in India: An Empirical Study

Brahmaiah Bezawada

Finance and Accounting at IBS, IFHE, Hyderabad

Email: brahmaiahb@yahoo.com

Abstract: The paper examines the nature and causes of non-performing assets (NPAs) of Indian scheduled commercial banks (SCBs). It reviews the policies and practices of banks in terms of credit, credit risk management, NPAs management, NPA recovery measures and financial performance of the SCBs. The study uses the sample of 38 banks consisting of 18 public sector banks (PSBs) and 20 private sector banks (PVBs), accounting for 94 per cent of total banking business (assets and liabilities) of India. The paper studies the major causes of NPAs, such as internal and external factors, namely ownership structures of banks, credit policies, loan conditions and covenants, nature of loans, kinds of borrowers, bank management practices and business cycles. The study finds that not only macroeconomic factors but also other factors such as credit policies, nature of industry, size of loan, banks' management approach and degree of regulation by central bank determines the quantum of NPAs in the banking sector. The study finds that the public sector banks (PSBs) were aggressive in lending to the riskier sectors and borrowers. It is found that the performance stability indicators of banking industry show that the asset quality of banks has improved as a result of recapitalisation of PSBs, introduction of prompt corrective action (PCA) plan, and implementation of Insolvency and Bankruptcy Code (IBC). The operational and financial performance of PSBs has also improved during the last two years, and reported positive net profits in 2020 after a gap of three years. The net interest margin (NIM) and spread of banks improved during the last two years. Reserve Bank of India's regulation and supervision shall be extended equally to the PSBs as that of private sector banks (PVBs) and the regulation should be ownership neutral.

Keywords: Scheduled Commercial Banks, Non-Performing Assets, Revival of Indian Banking, Performance of Banks

JEL Classification Number: G 21, G 23, G 32

1. Introduction

The performance, profitability and efficiency of banking institutions depend upon the effective credit function of banks. Credit and credit risk managements are important ingredients of credit systems of the banks. The efficient and prudential credit function reduces the complexity of credit risk management of banks. If banks manage credit risk effectively, it reduces the quantum of non-performing assets (NPAs). The ratios of gross non-performing assets (GNPA) and net non-performing assets (NNPAs) determine the

The Empirics of Borrower Transaction Costs in Models of Financial Intermediation for the Poor

Vighneswara Swamy

Published: June 2021

This study explores the determinants of borrower transaction costs of the models of financial intermediation for the poor while they avail of finance from the institutional and informal sources in India. The loan size is an essential determinant of borrower transaction costs of the bank lending model. Though the loan size and age of the borrower are key determinants in the SHG lending model, the relationship is direct and not inverse as in the case of the bank lending model. The study shows that the distance from the borrower's household to the financial intermediary (spatial element) exerts a significant effect on the borrower transaction costs. This underscores the importance of the expansion of the networks of the financial institutions as well as imbibing modern information technology for reducing such distance between the borrower and the financial intermediary for lowering transaction costs. The borrowers with a higher level of education and being of an older age are found to experience reduced transaction costs. Though the age of the borrower is one of the determinants of the borrower transaction costs in the SHG lending model, the relationship is direct and not inverse as in the case of the bank lending model.

Abstract: The present study attempts to investigate the role of sacrifice and service quality in Indian restaurants. Responses were collected from 420 respondents using a convenience sampling approach and analysed with the help of confirmatory factor analysis and structural equation modelling. The data were collected using convenience study which was intended to point out the influence of service quality, sacrifice, service value, customer satisfaction, and behavioural intentions of 420 respondents of the metropolitan cities of India. Data analysis tools used in this research were EFA, CFA, and SEM the results disclosed that the service quality influenced sacrifice, service value, customer satisfaction, and behavioural intentions. for future study the research can focus on to identify antecedents of the sacrifice, service value and satisfaction relationship was not included in the model of the study in future research researchers can include this relationship in their model and sacrifice was not used as a mediator among service quality and service value in future research researchers can find out a mediating role of sacrifice.

Keywords: service quality; service value; customer satisfaction; sacrifice and behavioural intentions.

Abstract: Existing literature on mobile driven purchases is concentrated largely on developed countries and focuses predominantly on the intention to adopt. The present study investigates the mobile retailing usage behaviour of individuals by integrating theories of technology acceptance model (TAM) and technology-organisation-environment (TOE) in an emerging market context. A web-based survey data on the usage of mobile retailing was collected and analysed using structured equation modelling (SEM). The results show the direct influence of perceived usefulness and individual characteristics on actual usage, whereas perceived ease of use, environment characteristics and technology characteristics influenced adoption indirectly. The results of the study provide guidelines to the mobile retailers for promoting the usage of their products/services and to the policy makers for enhancing the usage of mobile technologies which can help advance the social and the financial inclusion.

Keywords: mobile retailing; adoption behaviour; usage behaviour; emerging economy.

Abstract: This study aims to investigate the differences in the path leading to young consumers' loyalty for premium and non-premium shoe brands in emerging economies like India. This study adopts a descriptive and cross-sectional research design which involves primary data collection from 526 respondents through the questionnaire survey method. Four sports shoe brands are considered – 'Nike' and 'Adidas' as premium and 'Bata' and 'Sparx' as non-premium brands. Data analysis involves application of structural equation modelling with the help of SPSS-AMOS software. Results indicated that a brand's emotional value and satisfaction are positively related and both act as significant predictors of brand loyalty for premium and non-premium shoe brands. No significant relation is observed while linking brand awareness with emotional value and perceived quality with satisfaction. The present study addresses this gap by investigating the path to loyalty for premium and non-premium shoe brands.

Abstract: Economic integration is an absolute necessity for sustainable economic growth and helps economies to focus on issues that encourage trade by reducing the incompetence and inability of the nation. The study aims to analyse economic performance, trade intensity, and trade specialisation of India in comparison with the rest of BRICS nations by using the 6-digit level of harmonised standard (HS) product clusters. The data was analysed using trade intensity index (TII) and Lafay Index (LFI). The analysis was carried under six distinctive industry levels as proposed by Basu and Das. Ex-post results of economic cooperation between India and BRICS nations reveal that, as far as trade is concerned BRICS nations specifically China has gained more export surplus than India.

NEXUS BETWEEN FOREIGN EXCHANGE RATES AND STOCK MARKET INDICES: EVIDENCE FROM INDIA

Joy Chakraborty*, Sambit Sen**

Abstract *The foreign exchange market and the stock markets in India are among the most important financial markets that are constantly being monitored by the investors, regulators, and the policy-makers. The present study makes an attempt to investigate whether any causal relationship exists between the foreign exchange market and the stock markets in India. The BSE and the NSE annual returns have been used as a substitute for the stock prices, while the currency rate of Indian Rupee against the US Dollar (INR/USD) has been considered as a substitute for the exchange rate exposure covering a time-period of 20 years, from 1 January 2000 to 31 December 2019. The applications of the unit root or Augmented Dickey-Fuller test, Johansen cointegration, and Granger causality tests, as employed in the present study, examined the relationship between the USD/INR exchange rates and Indian stock market indices (SENSEX and NIFTY-50). The Granger causality test indicated that both the BSE and NSE stock indices granger cause INR/USD exchange rates. However, the INR/USD rates do not granger cause the BSE and NSE stock returns. The study has portrayed a unidirectional relation between the stock indices and INR/USD rates, but a bi-directional relation between the BSE and NSE stock returns.*

Keywords: *BSE, NSE, Exchange Rate, Unit Root, Cointegration, Granger Causality*

JEL Classification: *D53, F31, O16*

INTRODUCTION

As an economy moves in a cycle, the stock market also obeys a similar kind of pattern. For the economy, there are growth and recession phases. Likewise, in the stock market, there is a bull and bear phase. For any stock market investor, it is crucial to determine the bull phase (rising prices) and the bear phase (falling prices) in the stock market. Similarly, the foreign exchange rates can be classified as strong and weak exchange rates, depending on the relative position of a country's national currency against its foreign currency per unit.

The exchange rate is volatile in nature and any fluctuations in the exchange rate can either strengthen or weaken the stock market indices of a country, yet there is still no consensus on the exact nature of relationship prevailing between the foreign exchange markets and the stock markets. The issue of an inter-temporal relation between stock returns and exchange rates has recently occupied the minds of economists, for theoretical and empirical reasons, since they both play important roles in influencing the development of a country's economy. In addition, the relationship between stock returns and foreign exchange rates has frequently been utilised in predicting the future trends of each other by investors (Agrawal et al., 2010). A higher exchange rate does have a positive effect on companies whose revenues are largely dependent on foreign exports. On the contrary, it has a negative effect on companies whose raw materials are mostly imported from abroad. As a result, a higher foreign exchange rate fetches more home currency from its exports, while paying out more of the home currency for importing goods and services. In contrast, when the exchange rate is low, it is good for imports, but impacts inversely on exports. Interactions between stock and foreign exchange market came to the forefront because these two markets are the most sensitive segments of the financial system and are considered as the barometers of economic growth through which the country's exposure towards the outer world is most readily felt (Gulati & Kakhani, 2012). Thus, understanding the relationship between the stock prices and the exchange rates remains a moot point for discussion and considerable research.

In light of this context, the present study makes an attempt to empirically examine the nature of relationship and inter-dependence between the INR/USD foreign exchange rates and the BSE and NSE (SENSEX and NIFTY-50) stock indices. The present study aims to benefit the prospective researchers, potential investors, stock-brokers, academicians, regulators, and the policymakers in making sound investment decisions and adopting remedial measures

The impact of information security initiatives on supply chain robustness and performance: an empirical study

Sindhuja P.N.
Operations and IT, ICFAI Business School Hyderabad, Hyderabad, India

Received 29 July 2020
Revised 12 September 2020
4 November 2020
Accepted 4 November 2020

Abstract

Purpose – Information security is an essential element in all business activities. The damage to businesses from information security breaches has become pervasive. The scope of information security has widened as information has become a critical supply chain asset, making it more important to protect the organization's data. Today's global supply chains rely upon the speedy and robust dissemination of information among supply chain partners. Hence, processing of accurate supply chain information is quintessential to ensure the robustness and performance of supply chains. An effective information security management (ISM) is deemed to ensure the robustness of supply chains. The purpose of the paper is to examine the impact of information security initiatives on supply chain robustness and performance.

Design/methodology/approach – Based on extant literature, a research model was developed and validated using a questionnaire survey instrument administered among information systems/information technology managers. Data collected were analyzed using exploratory and confirmatory factor analysis. Further, to test the hypotheses and to fit the theoretical model, Structural equation modeling techniques were used.

Findings – Results of this study indicated that information security initiatives are positively associated with supply chain robustness and performance. These initiatives are likely to enhance the robustness and performance of the supply chains.

Originality/value – With the advancements in internet technologies and capabilities as well as considering the dynamic environment of supply chains, this study is relevant in terms of the capability that an organization needs to acquire with regards to ISM. Benefiting from the resource dependency theory, information security initiatives could be considered as a critical resource having an influence on the internal and external environment of supply chains.

1. Introduction

The concept of information security has existed for centuries with the main objective of protection of confidentiality and integrity of the information in storage and in transit (Rusell and Gangemi, 1991). Organizations and businesses are depending on multiple platforms for creating, sharing and storing data. On one side, when it brings lots of business opportunities, on the other hand, all these platforms are replete with security loopholes. In today's platform economy environment, information systems security can no more be considered just from an information systems (IS)/information technology (IT) perspective, but it needs to be looked from an organizational perspective with a much broader focus and wider appeal (Brotby, 2009). With technological advancements, information security practices seem to have evolved from addressing trivial security violations at the information

Production network, technology choice, capacity investment and inventory sourcing decisions: operational hedging under demand uncertainty

J. Prince Vijai[1]

Accepted: 10 February 2021
© Operational Research Society of India 2021

Abstract

Our research is motivated by capacity investment and inventory sourcing decisions that firms make while investing in multi-plant production facilities to offer products and services to the markets. We study the strategic choice between investing alternative technologies in a production network and examine for conditions under which flexible technology to be chosen over dedicated technology and vice-versa. We model a firm's technology choice, capacity investment, and inventory sourcing decisions in face of demand uncertainty as a two-stage stochastic optimization problem for a production network. We conduct numerical studies to examine a situation under which flexible technology to be chosen over dedicated technology in a production network. We observe that optimal amount of capacity to be acquired in a production network with flexible technology is less compared to a network with dedicated technologies. However, optimal levels of inventories to be sourced in a production network with flexible technology is more compared to a network with dedicated technologies. We show that a production network with flexible technology can hedge against demand uncertainty using operational measures such as extra inventory and flexible capacity; in case products demand is either negatively or positively correlated then the value of investing in flexible technology in a production network diminishes.

Abstract— **Covid-19 has changed way of living. Airline operations were completely stopped and almost all airlines have grounded their fleets. After opening of aviation sector also, passengers are afraid of pandemic and avoid travelling. However, Modern, and innovative technologies have capability to disrupt operations and service offerings of airline industry also, like any other industry. This literature review-based study analyzes the impact of modern technology adoption by airlines for enhancing the safety features for passengers in post-covid-19 and its impact on passenger confidence, satisfaction and positive WOM (Word of Mouth). The literature-based study proposes that by adopting internet of things and artificial intelligence driven sustainable practices airlines can enhance passenger's confidence while travelling. The study also proposes that AI and IoT enabled systems has capability to turn old traditional processes at the airport and in flight to modern service capabilities which enhances passengers' trust as well as satisfaction as passenger received services of better quality. Although the study is based on previous research, it gives proposition and opens a door of opportunities for the future research. In future, the propositions can be converted into testable hypotheses and findings can be empirically validated using robust methodology.**

I. INTRODUCTION

In the recent era of industry 4.0, where all the work is carried out by robots, sensor driven machines connected remotely over the internet, internet of things, machine learning, neuro linguistic processing all the industries are behind the technological innovation to create the value in their products and/or services for retail as well as corporate customers. Airline industry is one of the prominent industries for business as well as leisure, using IoT and other technologies for providing better valued services for passengers.

Covid-19 has changed the way of living for everyone, it also disrupted the service offerings of almost every industry. Healthcare sector has started adopting state-of-the-art innovative digital technologies for providing services [1]. However, healthcare sector was one of the essential sector during the pandemic and it must adopt the technology to serve healthcare needs of patients. On the other side, airline sector was restricted only towards supply of goods and not for passengers, as during the flight journey also there are chances to get infected by covid-19.

Covid-19 lockdown was significant in determining travel and movement limits. The implications of these restrictions were that the transport sector has had a major impact, particularly in the aviation sector. According to the International Civil Aviation Organization's news report [2], the present scenario of the implementation of the biofuel is also quite difficult and cannot be entirely quantified instantly, which may contribute to a slower turnaround for the aviation sector and an upswing than a decline in the market, close to the aviation market during the 2008/2009 recession. Airline capacity is currently down 70 to 80 per cent in April 2020 compared to April 2019, and several major airlines have briefly
halted operations. Almost 60 percent of the global fleet was landed at the beginning of June of the year 2020 as stated by the McKinsey consultancy company [3].

As there are higher chances of getting infected with novel corona virus during flight, people are afraid to travel. There has been cases in India and abroad when people get infected with covid-19 during their flight journey [4]. Economy airlines have six seats in a row, and it is important for airline to achieve at least 80% occupancy to cover their operational costs. Airline companies must look for 100% occupancy and no seats left between two passengers will create fear in passengers mind [5]. On the other side, central air condition of flight may float the virus for longer time in to the aircraft [6], which creates fear on pandemic in to passengers.

The best solution for the above-mentioned issues is to properly disinfect the aircraft with high grade disinfection

Article | Info & Metrics | PDF

Abstract

In this article, the authors propose a novel option strategy that is better (in terms of success rate, profitability, risk, and return) than the short straddle option strategy on the Indian stock market index, Nifty. By using the trigonometric ratio tan θ, an angle is formed between the monthly points earned/lost by the short straddle option strategy and the monthly change in the price of the Nifty index. Further, the angle for the next month is forecast by using the technique of the 14-month moving average. After calculating the forecasted angle by the 14-month moving—average technique, the related angle (of forecasted angle) in different quadrants is calculated. The angles of quadrants one and two are considered because short straddle is profitable in quadrants one and two and hence the angles of quadrants three and four have been ignored. By using the total straddle premium of the forecasting month, the upside and downside levels of Nifty of that month were calculated where this forecast angle will form. After finding the upper level and lower level of Nifty, the authors propose a strategy (angled short straddle strategy) that involves the selling of a call and put option. They compare the proposed strategy against the short straddle option strategies based on the success rate, overall profitability, risk, and return in the Indian stock market. The result indicates that the proposed strategy has an 18.06% higher success rate than the short straddle strategy. In terms of overall profitability, the proposed option strategy is more profitable by 57.22% than the short straddle strategy. They

KEY FINDINGS

- Angled short straddle option Strategy is more successful and profitable strategy than the short straddle option strategy in the Indian Stock Index (Nifty).
- Nifty index has less bullish than bearish volatility behavior.
- Nifty index has range-bound properties.
- This is the first article where trading results are based on angle tan θ.

ABSTRAC

In this article, we promote a novel option strategy that is better (in terms of success rate, profitability,,risk, and return) than the short straddle option strategy on the Indian Stock market index, Nifty. By using the trigonometric ratio tan θ, an angle has formed between the monthly points earned/lost by the short straddle option strategy and the monthly change in the price of the Nifty index. Further, the angle for next month has been forecast by using the technique of 14-months moving average. After calculating the forecasted angle by the 14-month moving average technique, the related angle (of forecasted angle) in different quadrants has been calculated. The angles of quadrants one and two have been considered because short straddle is profitable in quadrants one and two and hence the angles of quadrants three and four have been ignored. By using the total straddle premium of the forecasting month, the upside and downside levels of Nifty of that month has calculated where this forecast angle will form. After finding the upper level and lower level of Nifty, we propose a strategy (angled short straddle strategy) that involves the selling of call and put option. We compared the proposed strategy against the short straddle option strategies based on the success rate, overall profitability, risk, and return in the Indian stock market. The result indicates that the proposed strategy has an 18.06% higher success rate than the short straddle strategy. In terms of overall profitability, the proposed option strategy is more profitable by 57.22% than the short straddle strategy. Further we have compared the risk and return of both strategies and our results shows that the proposed strategy has lower risk and higher return than the short straddle option strategy; these results were verified by the regression analysis. In the end, the results of the success rate have been verified by the time series plot of India VIX and realized volatility. Due to the higher success rate and better profitability, the proposed option strategy can be consistently applied by any trader on the Nifty for profit generation.

Abstract: The study attempts to examine the linkages between remittances, external assistance, trade-GDP ratio and real GDP growth for the period from 1980-81 to 2018-19 using unit root test and Autoregressive Distributed Lag (ARDL) technique in India. Results of the unit root test reveal that real GDP and trade-GDP ratio are integrated at level I (0) whereas growth in remittances (GR) and growth in external assistances (GEA) are integrated at I(1). Results of the ARDL technique indicate that remittances, external assistance and trade-GDP ratio have significantly contributed to economic growth in India. Results indicate that a raise in the value of remittances, external assistance, trade-GDP ratio have caused for a rise in the mean of the real GDP. This study predicts that the transaction cost on migrant remittances should be reduced from the present level of 5.8 per cent to less than 3 per cent as remittances are the major source of foreign exchange. To avoid reduction in remittances in future in view of COVID-19 pandemic, we stress the need for formulating a rational fiscal policy by the government by providing tax exemptions for remittances income and matching grants for migrant's association's projects to enhance the remittances inflows.

Keywords: Worker's Remittances, External Assistance, Trade-GDP Ratio, Real GDP, Autoregressive Distributed Lag

1. Introduction

In the last four decades, remittances have become an important source of external finance for Indian economy. In the era of liberalisation with the advent of Information technology migration of workers from India has increased gradually. The total private transfers consists of money sent for their family maintenance, NRI deposits withdrawals, Gold and Silver brought through passenger baggage and gifts and donations to charitable institutions etc. Private transfers comprising mainly Worker's remittances have emerged as the main source of invisible earnings. Global remittances have increased from 35.8 billion dollars in 1980 to 643 billion dollars in 2017 and further to 714 billion dollars in

Abstract

Purpose – The purpose of this study is to identify the factors affecting the quality of technical education in a developing nation, India.

Design/methodology/approach – Participants were 465 students and 310 faculty members who were randomly chosen from a total of 31 institutions/colleges/universities providing engineering education in Punjab state of India. The factor structures were obtained by applying factor analysis.

Findings – The result of this research reveals ten factors determining the quality of technical education, such as teaching practices, infrastructural facilities, industry–institute linkage, faculty's qualification, reputation of the institute, procedural simplification, administrative staff services, access and equity, financial burden of the course and work culture. Moreover, the research results also reveal eight factors affecting the quality of technical education, namely, institutional standards, institutional support, teaching environment, teaching practices, performance-linked promotion, work culture, academic freedom and administrative services in this order of preference are essential for the delivery of quality in technical education.

Originality/value – This study is the first attempt to examine the factor structure of technical education quality from both the perspectives of students and faculty. The implications of this study are expected to help the management of technical education institutes, regulatory agencies and the government in devising strategies to enhance the quality of technical education in India.

1. Introduction

The educational development has received greater attention in all the countries of the world because economic development is positively associated with educational development. As the economies are shifting toward knowledge-based economies, the needs the skills and the competencies have also increased significantly (Yadav and Bhatnagar, 2012; Sayed, 1993). Since independence, India's development strategy of attaining economic self-reliance had its moorings in building a technological workforce. It was clearly envisaged by the planners that to achieve economic self-reliance, technological self-reliance was indispensable. It was visualized that self-reliance would be unattainable unless based on domestically groomed workforce and skill (Chadha *et al.*, 2013). Accordingly, India's economic ills were sought to be overcome through a process of industrialization, which requires a well-developed system of technical education, making it a necessary preamble to the country's prosperity. A chain

Young working women's purchase intention towards organic cosmetic products

Tavishi Tewary, Ashish Gupta, Vaibhav Mishra and Jitender Kumar

Published Online: July 12, 2021 · pp 256-277

ABOUT

Abstract

This paper aims to assess the influence of awareness of the consumers regarding individual health and environmental health, price sensitivity, availability of the brands that are organic in nature on the consumers attitude towards purchasing organic cosmetic products. The sample was collected from 166 young working women. Furthermore, the conceptual model is tested through factor analysis, and the model is designed through path analysis in which PLS algorithm is used. The results of the study indicate a significant impact of environmental and health consciousness on the attitude of young working women consumers towards purchasing organic cosmetic products. The findings of this study could help businesses operating in the organic personal care or cosmetic industry by giving the psychology and attitude of the major cluster of target customers to grab the market. This research provides valuable recommendations for social media marketing activities. Theoretical and practical implications are discussed.

Real Earnings Management and Persistence of Firm Value: Evidence from India*

Srikanth POTHARLA[1], Kaushik BHATTACHARJEE[2], Durga Prasad SAMONTARAY[3]

Received: August 15, 2021 Revised: October 23, 2021 Accepted: November 15, 2021

Abstract

The present study aims to examine the impact of real earnings management on the future value of the firm and its persistence. The study also tests suspect firm effects on the relationship between real earnings management and the future value of the firm. The sample of the present study consists of all listed non-financial firms from the year 2011 to 2018. Real earnings management has been measured in three alternative ways viz., abnormal operating cash flows, abnormal discretionary spending, and abnormal production cost. Tobin's Q is used as a measure of firm value. The interaction term of real earnings management and Tobin's Q is used to test firm value persistence. The results of the analysis disclose that out of three measures of real earnings management, abnormal reduction in discretionary spending only has a significant negative impact on the persistence of firm value. Moreover, the suspect firm analysis reveals that when the underlying motive of real earnings management is to meet zero earnings, both abnormal increases in operating cash flows and abnormal reduction in discretionary spending have a significant negative impact on firm value persistence.

Keywords: Real Earnings Management, Suspect Firm Effect, Firm Value, Opportunistic Earnings Management, Signalling Earnings Management

JEL Classification Code: G32, G34, M41, M400

1. Introduction

The purpose of the present study is to examine the relationship between real earnings management (henceforth, REM) and the value of the firm. Managers adopt REM with an intention to inflate the current period earnings and which may not be sustainable in subsequent periods. Such inflated earnings will also have an impact on the value of the firm in the market. The nature of implications of REM depends on the motives behind adopting such REM. When the driving force for adopting REM is to meet the zero earnings or last year earnings, it will have negative implications on earnings quality and firm value which was supported by opportunistic earnings management theory (Bartov et al., 2002; Ewert & Wagenhofer, 2005; Graham et al., 2005; Roychowdhury, 2006; Bhojraj et al., 2009; Eldenburg et al., 2011; Li, 2019). The opportunistic earnings management makes the information content of the current earnings and firm value poor and makes them less persistent over a period of time.

On the other hand, when the REM is adopted to signal the private information about the future prospects of the firm, it will result in increased earnings persistence which was supported by the signaling theory of earnings management (Subramanyam, 1996; Bartov et al., 2002; Roychowdhury, 2006; Tan & Jamal, 2006; Koh et al., 2008; Gunny, 2010; Taylor & Xu, 2010; Zhao et al., 2012; Al-Shattarat et al., 2018). The signaling theory of earnings management argues that managers have access to private information relating

Application of GARCH Models for Volatility Modeling of Stock Market Returns: Evidence from Indian Stock Exchange

Neeti Mathur, Himanshu Mathur** and Satish Chandra Tiwari****

Stock markets significantly contribute to the economic development of any nation. They have a volatile character, which results in uncertainty of the returns; the variability causes volatility in speculative market prices and instability of business performance. Volatility plays a significant role in the investors, managers, policymakers and researchers' financial decisions as it can assess the risk exposures in their investments and the uncertainty in stock returns. The risk-averse investor avoids investment in a highly volatile market. The stock return forecasting leads to volatility forecasting. The paper analyzes the volatility concerning the Bombay Stock Exchange. The daily data of S&P Sensex 30 has been collected and used to calculate the volatility for the last 3 years (April 2016 to March 2019). The preliminary analysis is done based on descriptive statistics stationery test, normality test and serial correlation test. Volatility modeling is done by the ARCH and GARCH family models. The findings help investors make the right investment decisions in the Indian stock market in the presence of its volatile character.

Introduction

Indian stock market has a prominent position in the globe. In 2018, India's healthy economic growth had supported its stock market to become the world's seventh largest market by volume of transactions and market capitalization, which is $2.08 tn. India's economic growth propels higher market capitalization. India's ascent reflects the growing blow of emerging markets. The two major Indian stock exchanges are National Stock Exchange and the Bombay Stock Exchange (BSE); NIFTY and SENSEX are two essential indices of these stock exchanges.

Evolution of the housing market under the framework of adaptive market hypothesis and martingale difference hypothesis: a case of India

Received 12 November 2020
Revised 25 April 2021
Accepted 13 June 2021

Richa Pandey
Vignana Jyothi Institute of Management, Hyderabad, India, and
V. Mary Jessica
University of Hyderabad, Hyderabad, India

Abstract

Purpose – The purpose of this study to evaluate the evolving market efficiency of the housing market under the framework of adaptive market hypothesis and martingale difference hypothesis taking a case of India.

Design/methodology/approach – The study used a wild bootstrap version of the generalized spectral (GS) test in the rolling window framework to measure possible time-varying linear and non-linear dependence in the housing market.

Findings – The study finds that the Indian housing market, in general, is not efficient, and this efficiency is dynamic, which changes with time lending support to the adaptive market hypothesis. The study confirms that the evolutionary model of individuals adapting to a changing environment via behavioural biases affects the efficiency of the housing market, which leads to the evolving efficiency of the housing market prices.

Research limitations/implications – The study believes that the potential implications go beyond evolutionary forces and the adaptive market hypothesis , which, does not only depend on an individual's decision-making process but also on social psychology. Thus, a further attempt in this line, taking into account the social psychology and quantitative rigour towards drivers of evolving efficiency is suggested for future research.

Practical implications – The study suggests that there is a possibility of extra returns for market players, but not always. The Indian housing market has witnessed several landmark reforms in recent years, so it is believed that these reforms would decrease the inefficiency level of this market. Contrary to this, the study's findings reveal an increase in the inefficiency level in recent years. As the Indian housing market shows evolving efficiency, it is believed that the increased inefficiency is temporary. The increased inefficiency can be regarded as the settlement stage of the various policy and technical reforms.

Originality/value – Confirming the presence or absence of adaptive efficiency in the housing market under possible non-linear dependence will be a significant addition to the existing literature.

Keywords Adaptive market hypothesis, Behavioural finance, Efficient market hypothesis, Generalized spectral test, Martingale difference hypothesis, Social psychology

Paper type Research paper

1. Introduction

The study tries to check the martingale difference hypothesis to access the evolution of the housing market in India under the framework of the adaptive market hypothesis (hereafter AMH). The study contributes to the literature on the housing market in the following ways. First, it is hard to find out research confirming the presence or absence of adaptive efficiency in the housing market. Second, it will be insightful to examine the changing degree of housing market efficiency in an emerging market, like India. Emerging markets that witness thin trading, probably less-informed investors, the prevalence of substantial unreliable information and significant volatility make it more prone to deviate from traditionally established principles of efficiency (Antoniou *et al.*, 1997). Moreover, in the recent past, the

Personnel needs assessment in times of crisis: a focus on management of disasters

Yamini Meduri

Vignana Jyothi Institute of Management, Department of HR, Hyderabad, India and IBS – Hyderabad, The ICFAI Foundation for Higher Education, Hyderabad, India

Received 20 December 2019
Revised 18 June 2020
18 September 2020
Accepted 20 July 2021

Abstract

Purpose – This study aims to explain the importance of human resources and attempts to identify the competencies required by the personnel involved in disaster management operations.

Design/methodology/approach – The research uses a qualitative methodology to explore the competencies required by the relief workers using a content analysis approach to analyze the disaster literature and the job advertisements. The data for the content analysis was developed with the help of 23 independent coders, and exploratory inferences were drawn.

Findings – A detailed review of the literature highlighted the importance of competent personnel in disaster relief organizations. The analysis listed 34 mutually exclusive competencies and their relative importance, which were further divided into four competency clusters. The study also creates a competency dictionary that defines the competencies with the expected behaviors.

Practical implications – Deploying the right resources in the acute time frame during a disaster event can make a difference, and with lives at stake, such deployment acquires prime importance. In addition to contributing to humanitarian logistics literature, the competency model developed will also help forecast the future requirements and help the organization choose "the right person for the right job."

Originality/value – The inferences drawn in the study are based on disaster management areas, unlike earlier research which also considered business logistics research.

Keywords Competency models, Content analysis, Disaster management, Humanitarian logistics, Job analysis

Paper type Research paper

1. Introduction

With increasing competition globally, the business landscape is also operating in an entirely volatile, uncertain, complex and ambiguous environment to which a linear model of response might only have organizations turn a blind eye to reality. Surviving in such fierce competition and constant changes is a new crisis that organizations worldwide have to face today (Kutz & Wade, 2013) and it is not likely that any linear model of response could help them.

Accepted 18 September 2021

Abstract

Purpose – This study aims to examine the impact of workplace bullying on employees' burnout by investigating the mediating effect of affective well-being (AWB).

Design/methodology/approach – Data of 532 employees from diverse organizations in Portugal were collected. These data were collected using anonymously completed structured questionnaires available online.

Findings – The results support the research hypotheses proposed, confirming that workplace bullying is related to both AWB and burnout. Moreover, affective workplace bullying partially mediates the relationship between workplace bullying and burnout, indicating that the victims have their AWB reduced, and, consequently, increase their burnout levels.

Practical implications – The findings suggest that organizations can foster employees' AWB and reduce the level of burnout by encouraging organizations to develop preventive policies and practices to safeguard against bullying at work.

Originality/value – To this date, only a few studies have examined mediating and moderating variables (Nielsen and Einarsen, 2018) and none include AWB as a mediator of the relationship between workplace bullying and burnout. This study answers the call for further empirical research from those who have argued that more information is needed to understand the workplace bullying phenomenon and contributes to the growing debate on this topic and its effects on employees.

This work was supported by the Fundação para a Ciência e Tecnologia, Portugal, under the auspices of the Centre of Applied Research in Management and Economics - CARME (Grant UIDB/04928/2020).

Abstract

Purpose – This study aims to examine the impact of authentic leadership (AL) on employees' organizational citizenship behaviors (OCB) by investigating the mediating effect of affective commitment (AC).

Design/methodology/approach – Data were collected on 194 leader-follower dyads in diverse organizations, using individual surveys. Followers reported their perceptions of AL and their AC, and leaders assessed each follower's level of OCB.

Findings – The results support the research hypotheses proposed, confirming that employees' perceptions of AL are positively related to both their AC and OCB. Moreover, AC completely mediates the relationship between AL and OCB, indicating that authentic leaders increase employees' affective bonds to their organization, and therefore, strengthen workers' tendency to engage in OCB.

Research limitations/implications – Additional studies with larger samples are needed to clarify more fully not only AL's influence on OCB but also other psychosocial variables affecting this relationship.

Practical implications – The findings suggest that organizations can foster employees' AC and OCB by encouraging managers to adopt a more AL style. Authentic leaders are likely to focus on the collective as they care about their teams, the wider organization and even society's welfare and sustainability.

Social implications – Growing concerns about sustainability and business ethics and the crisis of trust in organizations can be addressed through further research on positive leadership forms such as AL. This study's findings suggest that AL fosters employees' affective bond to organizations and their willingness to engage in OCB, which are two indicators related to organizational sustainability.

The authors wish to thank the participating organizations and respondents for their assistance, without which this study would not have been possible. The authors also wish to thank the anonymous reviewers for their insightful suggestions and comments throughout the review process.

Funding: This work was partially supported by the Fundação para a Ciência e Tecnologia, Portugal through grant UID/GES/00315/2013 and contract DL57/2016/CP1359/CT0004.

Internal branding, employees' brand commitment and moderation role of transformational leadership: an empirical study in Indian telecommunication context

Received 27 April 2021
Revised 26 June 2021
8 August 2021
Accepted 10 August 2021

Asha Binu Raj
Department of Human Resource Management and Soft Skills, ICFAI Business School (IBS), ICFAI Foundation for Higher Education (IFHE) (Deemed to be University u/s 3 of the UGC Act 1956), Hyderabad, India

Abstract

Purpose – The purpose of this paper is to examine the relationship between internal branding (IB) and employees' brand commitment and analyze how transformational leadership (TFL) moderates this relationship.

Design/methodology/approach – Data were collected through structured questionnaires from 394 employees in Indian telecommunication sector. The hypotheses and conceptual model were tested by structural equation modeling (SEM), using Statistical Package for Social Sciences (SPSS) and Analysis of Moment Structures (AMOS).

Findings – The results suggest that employees' brand commitment is higher when organizations implement IB supported by transformational leaders. Results also indicate that impact of IB on affective commitment (AC) and normative commitment (NC) is greater than its impact on continuance commitment (CC).

Research limitations/implications – Consistent with the brand commitment dimensions, the findings present an empirically tested comprehensive and integrative model of IB moderated by TFL. This study provides scholars a deeper understanding of relationship among IB, employee's commitment and TFL. Though multicollinearity is addressed, presence of cross-sectional data is a limitation in the study.

Practical implications – The study would help practicing managers to gain a new perspective to manage their internal brand mechanisms through TFL style by stimulating change among employees and create emotionally committed brand advocates.

Originality/value – This paper suggests an empirically validated framework of IB tested for moderation effect by TFL. It adds value to literature by reinforcing the effect of IB employees' AC and NC, especially among customer contact employees who represent brand during customer service delivery in telecommunication sector.

Paper type Research paper

1. Introduction

Service firms today face tough competition due to complex and ambiguous work environments. This demands effective strategies and appropriate leadership style among managers to gain commitment of customer contact employees who represent the brand. Simultaneously, it is challenging to explore the ways of aligning the attitudes and behaviors of these employees with delivery of service. Hence, firms require a corporate philosophy to transform employees precisely into true brand ambassadors who interiorize the organization's brand values. It is observed that during service delivery, employees' behavior and attitude have long term effects on consumers (Vella *et al.*, 2009) because they are the direct touch-points for interaction between service organization and consumers. Thus, it is essential that these employees must internalize brand values and remain committed toward incorporating them during service delivery. Therefore, role of internal branding (IB) is critical among customer contact employees because it communicates the vision, mission and brand

Abstract

Purpose – In the present era of green consumerism, consumers are shifting towards sustainable consumption with the rising demand of green products. Despite consumers' demand of such products, their attitudes towards eco-friendly practices can neither be the same for different consumer groups nor can be treated as they all are equally green. The purpose of this study is to operationalize the green market segmentation based on demographic, psychographic and behavioural characterization in the Indian context of green consumerism.

Design/methodology/approach – The deductive approach of questionnaire survey method has been adapted to collect the responses from convenience sampling of Indian consumers using the measured constructs concerning to green consumer psychology. The data were analyzed by applying multivariate techniques of confirmatory factor analysis (CFA), cluster and discriminant analysis.

Findings – The results revealed that the three distinctive set of consumer groups are evolved as "keen greens", "moderate greens" and "reluctant greens" based on the eight cognitive variables used in this study, namely environmental concern (EC), perceived environmental knowledge (PEK), perceived consumer effectiveness (PCE), perception of eco-label, perception of eco-brand and environmental advertisements, green purchase intention (GPI) and green purchasing behaviour (GPB) in the Indian context.

Research limitations/implications – The research findings may lack its generalizability in the Indian context, as the survey strategy is confined with the most populated territory of India. To provide its robustness, the future studies need more heterogeneous sample across the country. The research findings could provide the key insights into policymakers and enterprises in the framing of marketing strategies to promote green consumerism in the setting of emerging economies.

Originality/value – There is dearth of literature concerning to green consumer segmentation based on the "attitude–intention–behaviour" approach in the Indian context. Therefore, the present study endeavours to manifest a holistic description of green consumer classification based on demographic, psychographic and behavioural characterization. At Prima facie, the study is the first that elucidates consumers' segments profile by incorporating environmental cognitive factors from both the perspectives; "consumers" inner stimuli' and "external green marketing cues", especially in the indigenous Indian setting.

Abstract

Purpose – The governing role of bank-appointed directors (BADs) on the boards of non-financial firms has a potential to reduce information asymmetry between the firm and non-bank lenders. This should increase the confidence of other creditors in firm activities, thus performing the certification role. Therefore, the purpose of this paper is to empirically examine the certification role of BADs.

Design/methodology/approach – The authors test their hypotheses by using a panel of Indian non-financial firms. Our approach involves examining whether there is a significant difference in the number of different debt sources, the dispersion of debt among different debt sources, and leverage for BAD and Non_BAD Firms. The authors use univariate analysis and multivariate regression models to test the difference.

Findings – The authors find that firms with BADs on their board have (1) access to a higher number of different debt sources, (2) debt distributed evenly among different sources and (3) a higher debt ratio. Overall, our study provides supporting evidence for the certification role that BADs play on the boards of non-financial firms.

Originality/value – The authors contribute to the literature in two aspects. First, to the best of our knowledge, this is the only study that examines the effect of the governing role of banks on the lending decisions of non-bank lenders. Second, our study is associated with the growing body of the governance literature in the emerging markets context by examining the interaction of financial policies and governance in an institutional framework, which is very different from that of the developed world.

Keywords India, Emerging countries, Bank affiliated directors, Debt diversification
Paper type Research paper

1. Introduction

Governance by creditors, particularly banks, is different from governance by shareholders. Shareholders' governance is intended to safeguard the interests of shareholders in the presence of agency cost of equity, whereas creditors' governance is intended to safeguard the interests of creditors in the presence of agency cost of debt. Both theoretical and empirical research in the finance literature has emphasized the role of debt contracts or covenants as a governing mechanism in safeguarding creditors' interests (Erkens *et al.*, 2014). However,

Investors and Indian Stock Indices Reaction to News Announcements during Covid-19

Dr. Rama Krishna Yelamanchili
Associate Professor, Finance
ICFAI Business School, IFHE-Hyderabad

Dr. Sager Reddy Adavelli*
Assistant Professor, Finance
ICFAI Business School, IFHE-Hyderabad

Abstract

Using Mahalanobis Distance process we identify 31 extreme values in daily return series of study variables span between February 2020 and June 2021. These extreme values represent 10 percent of total observations (N=304). We gather news announcements around those 31 trading days and quantified into four groups. We examine investors (Clients, FIIs, DIIs and Proprietary) and stock indices (BSE Sensex, and BSE S&P 500) reaction to these news announcements. In addition, using non-parametric statistical tests, we investigate randomness, equality of distribution and day of the week effect of study variables. Results are mixed. We find statistically significant difference between two groups of news announcements in stock indices. On the other side, there is no such difference in investor categories. We find the returns series of Sensex, BSE S&P 500, FIIs, DIIs to be random and Clients, Proprietary to be non-random. We also find that the daily returns of all variables are not statistically significant from their median return. Finally, we do not find any evidence of day of the week effect on investors' investment pattern. We conclude that impact of negative news surrounding Covid-19 is succumbing by Government of India (GoI) interventions. The stock market movements are random and there is no day of the week effect in net flow of investments. There is a visible trend in clients and proprietary investors net flow into the market.

Keywords: Investors' reaction, news announcement, non-parametric tests, random walk theory, stock market, day of the week effect.

I.INTRODUCTION

Investors and stock markets reactions to news announcements have received increasing attention in recent years. Few researchers (Broadstoc and Zhang, 2019, Shi and Ho, 2020) tried to explain whether there exists any relation between price movement in stock markets and news announcements with empirical and theoretical studies. Similarly, a proposition in behavioral finance posits that in addition to the basic value of stocks, emergencies will have an impact on investors' psychological and behavioral factors, which in turn will have an important impact on stock prices (Pinglin He et. al., 2020). Lee and Jiang (2002) provide an empirical evidence of this proposition and believe investor confidence reduces earnings volatility, while investor distrust increases earnings volatility. In the recent years there is growing interest in event studies, especially during Covid-19 pandemic period. Several studies analyze the impact of news on stock markets (Caruso, 2019; Lyocsa, Molnar, and Plihal, 2019). The consensus is that stock markets tend to adjust prices to news continuously. In the case of the Covid-19 pandemic, the price adjustment process was being hindered by the enormous amount of news. Even though investors agreed that the virus would lead to a decrease in current and future cash flows and earnings and, thus, to a drop in stock prices, the extent of the drop was unclear. A subgroup of studies has investigated the effect of macroeconomic announcements on stock markets (Jawadi et al., 2019; Ozatay et al., 2009). Another strand of the literature investigates the effect of non-fundamental news, such as natural disasters and terrorist attacks, on stock markets (Braun et al., 2019; Ammar, 2020). In this study, we aim to expand the literature related to the impact of different categories of news announcements on stock markets during Covid-19 pandemic period. During this pandemic period, along with Covid related news, news related to other categories like federal government interventions, economic activities, and foreign markets are on headlines of media. We test whether these four news categories have any impact on stock market returns and investors' investment patterns.

In a different context there is a long debate on market anomalies with regard to day of the week effect. These anomalies are in contrast to efficient market hypothesis. Day-of-the-Week Effect refers to the observations that mean stock returns are differently distributed among different week days. The First day of the week is usually considered as a week day because the market remains bearish, while on the last day of the week the market is found buoyant. We posit that in present information age, information is disseminated in fraction of minute and

ADR on Dispute Between a Client and Trading Member at the Leading Stock Exchange in India: A Case Study

Dr B Brahmaiah[1]

Abstract

This case is an appeal matter with the Leading Stock Exchange of India Ltd (LSE) with regard to a dispute between a client and trading member of the LSE.The Appellantcontended that the award passed by the arbitrator had not taken into account of the evidences, documents and rules of stock exchange properly while determining the case matter and passed award.Appellant challenged the Award on the grounds that theaward was beyond the scope of submissions to the arbitration, non-application of mind, and ignorance of established judicial principles. The Appellate Member has to determine whether there had been any lapses on the part of the arbitrationin applying the trading rules and procedures of the Exchange while analyzing the matter, determining the case and passing the award.Based on that, the Appellant Arbitral Tribunal had to decide whether to set aside the award passed by solearbitrator, modify the award or uphold it. The findings and conclusions provide inputs for the development of appropriate regulatory framework for the Futures Market. However, the results may be generalized only in the emerging markets environment. Hence, researchers are suggested to study margin guidelines of futures market, appreciate the dynamics of futures market and apply the same in their future research in India and abroad.

Key words: Arbitration., Stock exchange, Trading member and Client.

Abstract

Algorithmic Trading (AT) has been despised by retail traders and market regulators for its speed. AT has taken the hit for creating un-intended volatility and hampering the market quality due to skepticism of quote-stuffing and front-running, however in reality the evidence pertaining to ill impacts of AT are yet to be found. This study takes a step in the direction to decriminalize algorithmic trading and give AT it's due towards improvement in market quality. This study uses direct identification of AT from Indian Stock Market (National Stock Exchange, NSE) and uses *Order-to-Trade Ratio* (OTR) as a measure of AT efficiency and paves the way for regulators and traders to come forward and appreciate the positive impact of AT on market quality.

'From technology adoption to consumption': Effect of pre-adoption expectations from fitness applications on usage satisfaction, continual usage, and health satisfaction

ARTICLE INFO

Keywords:
UTAUT
ECM
Fitness applications
Perceived privacy
User-interface quality
Technology self-efficacy
Health satisfaction

ABSTRACT

Despite the increasing usage of fitness applications, there is a dearth of research examining how expectations from fitness applications impact people's post-adoption consumption and health satisfaction. A novel research framework, spanning across pre- and post-adoption phases and involving a two-stage data collection, is proposed with additional contextual variables like technology self-efficacy, user-interface quality and perceived privacy, playing an important role in determining the continual usage for fitness applications and subsequent health satisfaction, shaped through pre-adoption expectations. Results of this work, conducted in India, not only enable an extension of the traditional adoption and post-adoption theories into the realm of fitness applications but also provide practitioners with guidance for developing fitness applications that enhance post-adoption engagement.

1. Introduction

Engaging oneself in health-enhancing activities, like exercising, not only provides daily satisfaction but also serves as a source of psychological vitality (Harvard Health, 2019). Technology aids, like fitness applications, are enabling people to engage in the pursuit of health (Sokolova and Perez, 2021). Such applications provide users with health advice and help track/manage daily routines (Kim and Park, 2019). This concept, called m-Health, has emerged globally and many applications exist for smartphone users to maintain a healthy lifestyle (Beldad and Hegner, 2018). The innovative m-Health solutions, through fitness applications, also connect users to medical assistance for providing timely hospital care (Kishore, 2018). Apart from native applications, third-party applications help a user achieve various outcomes; for example, knowing total calories expended, total workouts done, body mass index, exact distance covered while walking/running, and medication reminders. The global m-Health application market is currently valued at US$28.32 billion and is expected to increase to US$102.35 billion by 2023 (Accenture, 2018 [1]).

Smartphone and communication technology have made available a platform where users can track/monitor their health and take preventive healthcare measures, thus, contributing to their overall subjective well-being (Cho et al., 2014). Subjective well-being is a central driver of human happiness, an outcome of physical health (Daig et al., 2009). It signals the indicators of positive psychological adjustments, like positive emotions, general happiness and high self-esteem (Houben et al., 2015). Health satisfaction, a determinant of subjective well-being, represents the cognitive judgment of individuals about the quality of their overall mental and physical fitness (Kesavayuth et al., 2015). Higher levels of perceived health, as an outcome of regular exercising, is a source of enjoyment-capability and subjective well-being.

The extant research suggests that fitness applications are primarily used by young individuals with higher levels of education; and are used for benefits such as accessibility, instant and customized real-time accurate feedback, as well as the opportunity to share information on social networking sites (e.g., Sokolova and Perez, 2021). Despite indicated relationship of fitness with physical and mental health, no works explore the role of post-adoption consumption of fitness applications, shaped through pre-adoption expectations, in creating health satisfaction (Cho et al., 2014; Li et al., 2018). The related research in this domain focuses on narrower issues like initial adoption (e.g., Zhou, 2013; Lin and Ning, 2012; Canhoto and Arp, 2017), usage pattern of health applications

Abstract

Based on the theory of co-creation and resource-based theory, this study examines the differential impact of varying levels of customer participation in service recovery (firm, customer, and joint) on recovery satisfaction, customer-brand engagement (CBE), and electronic-word of mouth (e-WoM). Besides, using social exchange theory, this study examines the mediating role of consumers' recovery satisfaction in the relationship between the types of service recovery and electronic word of mouth (e-WoM). The data to accomplish the research objectives was collected from 495 customers of interactive food delivery apps in India. The experimental design was used to collect the data. The multivariate analysis of variance (MANOVA) and PROCESS macro techniques were used to test the hypotheses. The findings suggest that joint recovery results in better recovery evaluations such as CBE, recovery satisfaction, and e-WoM. Also, recovery satisfaction mediated the relationship between CBE and e-WoM. These findings provide empirical evidence for the linkages among the theory of co-creation, resource-based theory, and social exchange theory. The marketers of interactive food delivery apps may use these findings to ascertain which recovery type they should emphasize to improve recovery satisfaction. Moreover, they are encouraged to take steps for improving recovery satisfaction as CBE affects e-WoM through recovery satisfaction.

Keywords: service recovery, satisfaction, customer-brand engagement, e-word of mouth, interactive food delivery apps.

1 Introduction

Technology-based interactive apps, especially mobile apps, are widely used for service delivery by individuals, businesses, and communities (Verkijika & Wet, 2019). According to a market research study, mobile app downloads across the globe are expected to cross 258 billion by 2022 (Statista, 2019). However, the competition is intense (Lim et al., 2015) in the app market and service failure is one of the major reasons that may lead to customer defection thereby hampering an app's market share (Hsu et al., 2019). The customer retention rate, according to Statista 2019 study, decreases significantly over time in the case of mobile apps. Thus, it is

Understanding the Pandenomics: Indian Aviation Industry and Its Uncertainty Absorption

Abstract

This study seeks to identify the role of pandemics upon the Indian aviation industry. The main objectives of this study are threefold: First, to measure the impact of hotel sector upon the aviation market outcome of India post 2005: Second, to measure the impact of human fatality from the communicable diseases upon the Indian aviation market: Third, is to test the impact of economic uncertainty and pandemic uncertainty upon the Indian aviation market. This study has adopted the linear regression model in which total aviation market outcome is estimated as the function of movements of people in airlines, hotel industry cost and uncertainties. We utilise the quantile regression model to see the effects of various factors upon the aviation market at different quantiles. In order to study the cointegrating relation, we utilise Johansen Cointegration test. Further, we employ robustness techniques through FMOLS and DOLS to confirm our earlier findings. Results suggest that fatalities from communicable diseases have exerted negative impacts upon the Indian aviation market. Furthermore, we notice that increasing hotel cost volatility and rising uncertainty in hotel sector have impacted positively and negatively the aviation market, respectively. We also discover that economic uncertainty has impacted the aviation market more than pandemic uncertainty.

Received 6 February 2021
Revised 9 June 2021
Accepted 20 July 2021

Abstract

Purpose – In the realm of energy behaviour studies, very little research has been done to understand industrial energy behaviour (IEB) that influences the willingness to adopt (WTA) energy-efficient measures. Most of the studies on energy behaviour were focused on the residential and commercial sectors where the behaviour under investigation was under volitional control, that is, where people believe that they can execute the behaviour whenever they are willing to do so. The purpose of this paper is to examine the factors influencing the industry's intentions and behaviour that leads to enhanced adoption of energy efficiency measures recommended through energy audits. In particular, this paper aims to extend the existing behaviour intention models using the total interpretive structural modelling (TISM) method and expert feedback to develop an IEB model

Design/methodology/approach – TISM technique was used to determine the relationship between different elements of the behaviour. Responses were collected from experts in the field of energy efficiency to understand the relationship between identified factors, their driving power and dependency.

Findings – The results show that values, socialisation and leadership of individuals are the key driving factors in deciding the individual energy behaviour. WTA energy-saving measures recommended by an energy auditor are found to be highly dependent on the organisational policies such as energy policy, delegation of power to energy manager and life cycle cost evaluation in purchase policy.

Research limitations/implications – This study has a few limitations that warrant consideration in future research. First, the data came from a small sample of energy experts based on a convenience sample of Indian experts. This limits the generalizability of the results. Individual and organizational behaviour analysed in this study looked into a few select characteristics, derived from the literature review and expert feedback, which may pose questions about the standard for behaviours in different industries.

Practical implications – Reasons for non-adoption of energy audit recommendations are rarely shared by the industries and the analysis of individual and organisational behaviour through structured questionnaire and surveys have serious limitations. Under this circumstance, collecting expert feedback and using the TISM method to build an IEB model can help to build strategies to enhance the adoption of energy-efficient measures.

Abstract: This study aims at verifying the long run relationship between public expenditure and revenue and to assess the impact of the fiscal deficits on economic growth of Ethiopia. To this end an asymmetric cointegration test based on NARDL and an endogenous growth model have been used for the period starting from 1974 to 2016. Toda-Yamamoto test has been employed to verify the causality among the variables. The findings suggest long run cointegration between expenditure and revenue; and causality test confirming fiscal synchronization hypothesis for Ethiopia. The evidence supports long run and short run asymmetric relationship between real total government expenditure and real total revenue. The endogenous growth model estimates reveal that, a positive shock in fiscal deficit leads to positive change in GDP and when there is a negative shock, it reduces GDP. There is bi-directional causality running between GDP, human Capital and labour force. However, there is a unidirectional causality running from fiscal deficits to economic growth. In view of these findings the policy measures such as improving tax revenues and minimizing fiscal deficits have been suggested.

Keywords: Public expenditure, Revenue, Fiscal deficits, Economic growth, Asymmetric cointegration

Abstract:
The world has been going through an unprecedented surreal phase since the beginning of 2000 due to the outbreak of Covid-19. Due to the deadly effects of this disease hundreds of thousands of people across the world have died and several million people are infected. To restrict the spread of this disease countries across the world declared complete or partial lockdown. Due to the lock down, suspension of public transportations, closure of business houses and other institutions the world economy has experienced a severe blow. Economics of all the major developed and developing countries are in shambles. Due to these depressing scenarios people across the world are also suffering from mental issues. Several socio-economic issues have also been surfaced in developed and developing countries. Amid all these gloomy surroundings the only positive outcome is healing of nature. The quality of all the elements of nature have been improved worldwide drastically. In this paper we are going to discuss how the lockdown or reduction of economic activities have improved the air quality and how the regulatory bodies can take cues to develop a long-lasting carbon policy. Here we have introduced a seminal concept of "Carbon lockdown" policy and proposed some other practices, which can reduce emissions considerably.

Keywords: COVID-19, Greenhouse gases, Carbon polices, Carbon-lockdown, Environment

Introduction:

Officially, the outbreak of coronavirus was first recorded in Wuhan, China in the month of December of 2019. On February 11, 2020 World Health Organization (WHO) termed it as COVID-19. In March 2020 WHO announced that the outbreak of recent coronavirus is a pandemic (New Scientist, 2020). Millions of people have fallen prey of this virus. This virus spreads with a deadly pace through person to person contact and respiratory droplets from infected persons. According to many scientists getting vaccine is the only solution of this pandemic (Callaway, 2020). To avoid rapid spread of this disease several governments across the world have announced large-scale quarantines, travel restrictions, complete or partial lockdowns, but that leads to a disastrous economic crisis. As per the United Nations this pandemic disrupted global supply chains and international trade. Since, many countries closed their borders during this phase the movements of people and tourism flows came to a halt. Global economy shrank by 4.3 % in the year of 2020 due to outbreak of this pandemic (United Nations, 2021). In many countries the issues related to alleged ethnical discrimination or perils of migrant labors have worsen the scenario. The geo-political environment has hit the nadir. People across the globe have been suffering from acute stress and psychological distress. In the middle of all the miseries and sufferings the only silver lining is recovering of environment. The quality of water, air has

Optimisation of a production-inventory model under two different carbon policies and proposal of a hybrid carbon policy under random demand

Arindam Ghosh

Department of Operations and IT, ICFAI Business School (IBS), the ICFAI Foundation for Higher Education (IFHE) (Deemed to Be University), Hyderabad, India

ABSTRACT

In last Table 6couple of decades organisations are looking for solutions to reduce carbon emissions across their supply chains primarily due to stringent carbon policies. The two most familiar carbon policies are (i) Carbon tax/cost policy and (ii) Carbon cap-and-trade policy. In this paper a two-echelon supply chain have been optimised under these two policies under random demand. Comparisons of these two policies have been discussed, and a possible hybridisation of these two policies has also been presented. It has been assumed that the demand is random in nature. Two different Mixed Integer Non Linear Programming (MINLP) models have been developed and solved under the consideration of two different carbon policies. These models will help organisations to determine optimal order quantity, reorder point and number of shipments under most widely known carbon policies, severally. Sensitivity analyses have revealed that organisations can reduce total expected emissions and total expected cost by operational adjustments under both the carbon policies. It has been shown here that while optimising the total supply chain cost under the two different policies the decision variables and total emissions remain same. The advantages and disadvantages of both the policies have been discussed here and the potential benefits of a hybrid policy have also been presented.

1. Introduction

Global warming due to emissions of anthropogenic greenhouse gases especially CO_2 is a threat to environment and the existence of human civilisation. Regulatory bodies across the world have implemented several carbon policies to restrict emissions. The existing policies can be categorised under the following basic categories: Carbon tax/cost policy, Carbon cap-and-trade policy and Strict carbon cap policy (Ghosh, Jha, and Sarmah 2017). In case of Carbon tax policy every unit of emissions of CO_2 is chargeable. Organisations can emit CO_2 as per their requirements, but they are bound to pay tax for each unit of emissions. According to this policy carbon emissions are treated as additional sources of economic cost (Arslan and Turkay 2013). In case of Carbon cap-and-trade policy companies get a threshold level for carbon emission, known as carbon cap. If companies emit less than the specified limit they can sell unutilised carbon to other companies, on the other hand if any company want to emit more carbon than the threshold level then they can buy the extra amount of carbon from other organisations. In case of strict carbon cap policy organisations get an upper limit (cap) for carbon emissions, if organisations emit more than the given limit, the penalty for exceeding the cap is infinitely large (Chen, Benjaafar, and Elomri 2013).

Optimization of a two-echelon supply chain with random demand and random defect rate under strict carbon cap policy

Arindam Ghosh
Department of Operations and IT, ICFAI Business School (IBS), Hyderabad, IFHE (Deemed to be University), Hyderabad, India

Received 14 October 2020
Revised 19 May 2021
Accepted 23 May 2021

Abstract

Purpose – The yield of defective items and emissions of greenhouse gases in supply chains are areas of concern. Organizations try to reduce the yield defective items and emissions. In this paper, a constrained optimization model is developed with consideration of the yield of defective items and strict carbon cap policy simultaneously and then optimized. Further, sensitivity analyses have been carried out to draw different managerial insights. Precisely, we have tried to address the following research questions: (1) how to optimize the cost for a two-echelon supply chain considering yield of defective items and strict carbon cap policy, (2) how the total expected cost and total expected emissions act with changing parameters.

Design/methodology/approach – The mathematical modeling approach has been adopted to develop a model and further optimized it with optimization software. Costs and emissions from different areas of a supply chain have been derived and then the total cost and total emissions have been formulated mathematically. One constrained mixed-integer nonlinear programming (MINLP) problem has been formulated and solved considering emissions-related, velocity and production related-constraints. Further, different sensitivity analyses have been derived to draw some managerial insights.

Findings – In this paper, many decision variables have been calculated with a set of basic values of other parameters. It has been found that both cost and emissions can be controlled by controlling different parameters. It has been also found that some parameters have very little or no influence either on cost or emissions. In most cases, originations may exhaust the given limit of carbon cap to optimize their costs.

Originality/value – In spite of my sincere efforts, no paper has been found that has considered the yield of defective items and strict carbon cap policy simultaneously. In this paper, it is assumed that both demand and defect rates are random in nature. The model, presented in this paper may give insights to develop different supply chain models with consideration of both defective items and strict carbon cap policy. Sensitivity analyses, drawn in this paper may give deep insights to managers and carbon regulatory bodies.

Keywords Supply chain, Defective items, Strict carbon cap policy, Mixed-integer non-linear programming

Paper type Research paper

1. Introduction

The emission of greenhouse gasses is the main cause of global warming and pollution (Du *et al.*, 2015). In the year of 2015, most of the countries participated in United Nations Climate Change Conference in Paris and conceptualized Paris Agreement. The crux of this agreement is to reduce the threat of climate change by keeping a global temperature rise below 2°C above pre-industrial levels (UNCC, 2018). Due to persuasion from governments and other different socio-economic causes the concept of green supply chain management (GSCM) has been an emerging area in the domain of supply chain management for decades. In recent days, several organizations take steps to make their operations environmentally friendly across the supply chains with the help of emerging tools and techniques. The concept of green supply chain management is gaining momentum mainly due to carbon policies, imposed by different regulatory bodies. The existing carbon policies can be classified under three main categories – carbon tax policy, carbon cap-and-trade policy and strict carbon-cap policy. Under the carbon tax policy organizations pay a financial penalty for every unit of emissions

FACTORS AFFECTING TELEMEDICINE HEALTHCARE SERVICES ADOPTION DURING COVID-19 PANDEMIC: A STUDY IN INDIAN CONTEXT

Nishit Kumar Srivastava, ICFAI Business School, IFHE Deemed to be University, Hyderabad
Utkal Khandelwal, Institute of Business Management, GLA University
Trilok Pratap Singh, Madhav Institute of Technology and Science, Gwalior
Anurika Vaish, Indian Institute of Information Technology Allahabad

ABSTRACT

The current study attempts to understand the antecedents to intention to adopt telemedicine healthcare services. In the year 2020 India experienced a tremendous rise in telemedicine service adoption, around a 500 percent increase in teleconsultation was observed. Lockdowns and Covid-19 restrictions acted as a catalyst in telemedicine service adoption. However, the huge population still remains untouched by the benefits of telemedicine healthcare services. In order to understand the drivers of intention to adopt telemedicine healthcare services, a pilot survey is conducted and a research framework is proposed. The following factors are considered for the study: expectation, knowledge, telemedicine experience, prior satisfaction, fear of covid-19 (FC-19), and subjective norms. The proposed framework is then tested using SEM and adequate model fit was observed. The results can be used by policymakers and marketers to enhance the popularity of telemedicine healthcare services among the masses to promote convenience, reach, and healthy living.

Keywords: Telemedicine Healthcare Services, SEM, Telemedicine Experience, Satisfaction, Fear of Covid-19, Adoption Intention, and Subjective Norms.

INTRODUCTION

Continuously increasing Covid-19 infections has overloaded healthcare infrastructure around the globe, limiting access to hospitals. National and/or localised lockdowns have further reduced the mobility of people to hospitals for consultations and medications. Moreover, fear of Covid-19 has led to psychological challenges among the masses leading to panic and discrimination (Pappas et al., 2009; Ahorsu et al., 2020). However, this fear has led people to look for alternative channels of healthcare services and has mobilised telemedicine healthcare services (THS) adoption which was in nascent stage in most of the countries including India. Fear of Covid-19 has acted as a catalyst in impacting behavioural intention of people towards THS adoption. Telemedicine can be seen as a canopy incorporating any medical activity with an element of distance (Wootton, 2001). Telemedicine services use communication technologies in providing healthcare to the participants/patients separated by distance (Donner et al., 2018; Zobair et al., 2018). Almost two third of Indian population resides in rural areas and telemedicine can act as a boon for them providing access to quality healthcare.

According to a report published in Indian express in June 2020, India observed a 500 per cent rise in healthcare teleconsultations where, 80 per cent of the users were first time

Shriram Transport Finance Corporation Ltd: Do Proxy Advisors Really Protect Non-promoters' Interests?

Abhishek Sinha [1] and Suresh Kerani[2]

Abstract

This case study demonstrates how agency cost type 2 may lead to a conflict of interest between the promoters and the financial institutions. Proxy advisory firms further the cause of shareholder activism by addressing the dissonance so caused. They advise shareholders on the stance to be taken at the time of voting on important resolutions to be discussed in the General Body Meeting. This research case study explores how proxy advisory firms are playing an important role in promoting the cause of shareholder activism in the Indian context. It examines the role of a few Indian proxy advisory firms in foiling the attempt of Shriram Transport Finance Company (STFC) to re-appoint an independent director. Shareholder activism is relatively a less explored topic in academic research, especially in India. The authors, through this case study, wish to address this gap. The phenomenon studied in the case pertains to increased attention now being paid to reports of proxy advisory firms. Citing low attendance track record of a director in previous meeting, two Indian proxy advisory firms appealed to financial institutions to oppose the resolution to re-appoint him. Questioning his commitment and ability to devote time to the company affairs, they succeeded in thwarting the attempt of STFC to re-nominate Puneet Bhatia as director. The dilemma addressed in the case pertains to whether attendance in meeting can be a sole criterion for removing an independent director from the board. Secondary research among leading business publications unearthed major developments that have been captured in the case study. The case contributes to increasing the awareness of growing role of proxy advisory firms in India through a real example.

A Critical Analysis of Indian Mutual Funds: Equity and Debt Schemes

Joy Chakraborty, Ishani Roy** and Arkaprabha Das****

The present paper examines the performances of equity and debt-oriented mutual fund schemes covering the period from 2015 to 2019, concurrent to the implementation of demonetization and GST in India. A total of eight schemes, with four each from the equity and debt funds, of SBI and HDFC Asset Management Companies (AMCs), have been considered in the present study. Based on the risk-adjusted performance analyses, particularly the Treynor ratio, the selected debt schemes of HDFC Mutual Fund have outperformed the debt schemes of SBI Mutual Fund.

Introduction

While investing in mutual funds, investors may buy units of varied mutual fund schemes that align with their personal goals, objectives, and strategies. There are various types of mutual fund schemes for investors, out of which the most popular and widely-accepted schemes are the equity and debt schemes. If the investors demand a steady amount of return with minimal risk, then the debt schemes give them the suitable option for investment. Again, if the investors demand a higher return with substantial risks, they can either select stand-alone equity schemes or a mix of equity and debt schemes for investment.

According to the data furnished by the Association of Mutual Funds of India (AMFI) for the period ended December 2019, the 44 Asset Management Companies (AMCs) presently operating in India collectively held assets under management worth ₹27.86 tn. It has been found that the top two companies, namely, HDFC AMC and SBI AMC, with total assets under management of ₹3.82 tn and ₹3.53 tn, respectively, collectively held close to 30% market share of the Indian mutual fund industry. In equity assets, SBI Mutual Fund held the leading position with ₹1.94 tn closely followed by HDFC Mutual Fund with ₹1.54 tn worth of assets. In debt assets, SBI Mutual Fund was found to be trailing behind HDFC Mutual

COVID-19 IS DEADLY! LONG LIVE THE KING, CORPORATE CASH HOLDINGS!

Akanksha Saxena[1], R. Ranajee[1*], Ms Saumita Roy[1]

1. ICFAI Business School, Hyderabad, India

* Corresponding Author: Ranajee Ranajee, Associate Professor, ICFAI Business School, Hyderabad, India, ✉ Email: ranajee@ibsindia.org

Abstract

COVID-19 has adversely affected the human race. With the human race confined to their houses, the level of consumption has gone down and it has a significant negative impact on the cash flows of the existing businesses. In this study, using different scenarios and stress levels, we try to predict the impact of COVID-19 on a business's cash flows and establish the role of corporate cash holdings in avoiding the illiquidity of businesses.

Keywords: COVID-19, Illiquidity, Cash crunch, Stress test, Debt structure

1. Introduction

Corporate cash holding is a tradeoff between liquidity and investment. Cash is the basis of the sustenance of a business. Excess cash provides liquidity in times of external externalities. It also eliminates the underinvestment problem. The lower level of cash leads to costly external financing for the investment (Habib and Hasan, 2017; Al-dhamari et al., 2015). Holding cash is connected to efficiency gains where businesses with valuable investment ventures and businesses with greater cash flow risks are expected to hold more cash. Holding cash offers liquidity with the flexibility to the businesses (Keynes, 1934), however, it is also regarded as pervasive in nature (Kalcheva and Lins, 2007; Pinkowitz et al., 2012). Researchers have empirically tested and validated the commonly held intentions of firm cash holdings (Baumol, 1952; Mulligan, 1997; Opler et al., 1999; Harford, 1999), its diverse determinants (Ferriera and Vilela, 2004; Chen and Chuang, 2009; Duchin, 2010; Al-Najjar, 2013), and reported an increasing trend in corporate cash holdings.

Irrelevance theory (Keynes, 1934), asserts that investment and financing are distinct decisions and are not affected by each other. So, in a perfect market situation, corporate cash holding should not matter. On the contrary, pecking order theory (Myers and Majluf, 1984) postulates sequencing in the financing of the projects. The internally generated cash is followed by debt and finally equity. Financing in pecking order theory follows the cost of financing from lowest to highest. Investments by the company and its growth are limited by internal sources of funding during the credit crunch. Small companies have more information asymmetry about their growth assets, and they are financially inadequate. The role of corporate cash holdings becomes important during the time of credit crunch or to such companies (Denis and Sibilkov, 2009). Bates et al., 2009 report the significance of cash holdings during the economic crisis. External capital market or bank funding becomes challenging during the financial crisis due to the deficit of confidence. Usable cash holding becomes a defence against external instability in the macroeconomic climate.

Abstract

The Human Resources Shared Services (HRSS) model helps organizations combat internal resource competition by reducing redundant activities thereby improving cost efficiencies. The COVID-19 pandemic has impacted seemingly all global entities, most of them in a negative way. In the middle of businesses failing and halting worldwide operations due to the pandemic, HRSS plans are thriving. This paper examines the reasons behind progress of HRSS model despite unpromising conditions and derives learnings for business operations in the new normal work setup. It further elaborates on the contemporary shared services trends along with outsourcing and changing business climate bringing forth a new normal. We add the COVID-19 perspective and provide a comprehensive practitioner 2X2 framework connecting two inevitable dimensions of 'technology advancement' and 'customer need fulfillment via virtual means' for future HR dominions. The paper provides practical insights to HR practitioners and leaders about outsourcing HR services in the new expected normal business setup. Further, it envisions the future trajectory for HRSS in midst of novel global effects and disruptive technologies of artificial intelligence and cloud computing.

Keywords: HR shared services, Outsourcing, COVID-19, Customer Service, Technology.

1. Introduction

Increasing demand for organizational effectiveness along with the need for cost reduction had made Human Resource Shared Services (HRSS) a popular choice worldwide in the pre-COVID world. The impact of the virus after early 2020 disrupted supply chains and manufacturing plants across the world, haltering many businesses. It was naturally expected that shared HR support function will also take a hit.

Online reviews
Natural language processing

ABSTRACT

The paper presents a text analytics framework that analyses online reviews to explore how consumer-perceived negativity corresponding to the supply chain propagates over time and how it affects car sales. In particular, the framework integrates aspect-level sentiment analysis using SentiWordNet, time-series decomposition, and bias-corrected least square dummy variable (LSDVc) – a panel data estimator. The framework facilitates the business community by providing a list of consumers' contemporary interests in the form of frequently discussed product attributes; quantifying consumer-perceived performance of supply chain (SC) partners and comparing the competitors; and a model assessing various firms' sales performance. The proposed framework demonstrated to the automobile supply chain using a review dataset received from a renowned car-portal in India. Our findings suggest that consumer-voiced negativity is maximum for dealers and minimum for manufacturing and assembly related features. *Firm age*, *GDP*, and *review volume* significantly influence car sales whereas the sentiments corresponding to SC partners do not. The proposed research framework can help the manufacturers in inspecting their SC partners; realising consumer-cited critical car sales influencers; and accurately predicting the sales, which in turn can help them in better production planning, supply chain management, marketing, and consumer relationships.

1. Introduction

With the emergence of Web 2.0, online text has become a primary source of consumers' product assessment and purchase decisions (Yang, Jun and Peterson, 2004; Chevalier and Mayzlin, 2006; Li et al., 2019a; 2019b; 2019c). Companies such as Yelp, Amazon.com, and CarWale.com provides online platform where existing consumers rate and share their feedback about the product and the service they use, in the form of star ratings and textual comments (Nakayama and Wan, 2019; Luo, et al., 2020). It helps them in attracting millions of potential consumers and generating revenue (Wu et al., 2015).

Online reviews are considered explicit and implicit indicators of the product repute (Lee, Jeong and Lee, 2017). A survey by AC Nielsen suggests that online consumer reviews are second to word of mouth (WOM) from friends, which consumers trust the most (Wu et al., 2015). A survey by eMarketer (2014) reflects that 79 per cent of consumers go beyond the star rating and refer the review text before final purchase. Many organisations use the review text to mine consumers' contemporary interests and concerns while devising their marketing strategies (Cui, Lui and Guo, 2012; King, Racherla and Bush, 2014). The literature suggests that consumer reviews can be used as a proxy for overall WOM, which significantly influence firms' sales performance (King, Racherla and Bush, 2014).

The association between product sales and the review volume, average review length, review rating, and consumer sentiments has been under examination by extant researchers (Nikolay, Anindya and Panagiotis, 2011; Li et al., 2019a; 2019c; Zhang et al., 2020). Researchers observe that negative opinions are relatively rare and contain more distinctive, sensible, and worthwhile information (Fiske, 1980; Lee, Jeong and Lee, 2017); therefore, negative texts are found to be more influential than positive ones (Cui, Lui and Guo, 2012). Negative tweets about the retailers result in 11 per cent decline in revenue (Sonnier, Mcalister and Rutz, 2011). SC glitches discussed in tweets have been reflected in significant loss in firms' stock market performance (Sonnier,

Sports celebrity personality and purchase intention: the role of endorser-brand congruence, brand credibility and brand image transfer

Abstract

Purpose – This study aims to examine the influence of five sports celebrity personality (SCP) attributes – attractiveness, expertise level, credibility, trustworthiness and character – on consumers' purchase intentions (CPI). It identifies celebrity brand congruence (CBC), endorsed brand celebrity (EBC) and transfer of brand image (TBI) as antecedents of CPI.

Design/methodology/approach – The purposive sampling technique was used to collect the data from 838 respondents. This study developed a multidimensional construct for SCP. The covariance-based structural equation modeling (SEM) technique was used to examine the relationship between SCP and the endorsed brand. The study used CBC as a mediator and EBC and TBI as partial mediators. The direct and indirect effect of SCP on CPI was investigated using CBC, EBC and TBI as mediators.

Findings – This study supports the importance of three antecedents (i.e. CBC, EBC and TBI) on CPI. It finds congruence across SCP and CBC variables, and a positive impact of SCP on EBC and TBI variables. Also, it exhibits a significant direct effect of CBC on EBC and TBI, whereas the direct effect of CBC on CPI is not substantial. The indirect effect of CBC through mediating variables EBC and TBI found to be significant.

Research limitations/implications – This study concludes that sports celebrity endorsement is essential to transfer the positive celebrity image to the endorsed brand image. However, it is not merely sufficient to influence the buyers' purchase conduct; the brand credibility additionally assumes to take a role in changing their behavioral intentions.

Originality/value – This study contributes to the sports marketing literature by its novelty in analyzing the sports celebrity personality at a multidimensional level. It uses SCP's different attributes as one construct and studies its impact on CPI by taking CBC, EBC and TBI as mediators. The results of this study equip sports management professionals with the knowledge to build better long-term relationships with consumers.

dennisjoseph@ibsindia.org

ABSTRACT

The Indian smart phone applications market is really flourishing with India ranked as number one in terms of the downloads made via Android and Google play store. However the smart phone application penetration is still low in rural India as compared to its urban part. This study is first of its kind which tries to explore two things, one the reasons, why rural Indian market is not growing in terms of smart phone application downloads/usage and second some antecedents that can affect the behavioral intention of rural customers for increased smart phone application usage. For this study authors resorted to ethnographic in-depth interview during pre-test stage followed by collecting of responses through administrated questionnaires in the second part. Around 346 responses were collected from ten villages in Rangareddy district in Telangana state, in India. SEM was used as the statistical tool to run the hypothesis. In terms of smart phone application development, this study is unique one which tries to throw light immensely on how the marketers/developers can increase the sustainability of smart application usage among rural consumers which happens to be an untouched profitable segment till this point of time.

Keywords

Introduction

Today smart phones and the applications (in-built and downloadable) in it has become a technology of substantial interest in every people lives at a global level. The multi tasking capability, ease of use, user friendly interface and ability to deliver almost all the necessary functions that was previously performed by the users via desktops has lead to higher user engagement among consumers (Varnali & Toker 2010). Today smart phone performs almost all kinds of functions starting from reading newspaper, healthy diet selections, doing exercise, booking cabs, making hotel reservations, listening music and many more. For its ubiquitous nature it is being more and more popular among users. Seeing this increased customer acceptance of smart phone apps among consumers, marketers all over the world are working really hard to develop various kinds of smart phone applications to cater to the demand of this huge profitable market.

According to App Annie index the worldwide mobile application market is expected to grow at 270 percent — from $70 billion in 2015 to $189 billion by 2020 (venturebeat.com, 2016). The worldwide smart phone application market represented $108,440 million out of 2016, and is required to develop at a CAGR of 19.2% to reach $311,249 million by 2023. Constant increment in the smart phone users and the development of special endorser base in the telecom business is driving the market development for the worldwide smart phone application market amid the estimate time frame (statista.com, 2018).

The smart phone applications industry in India is deafening only lately. However, in this shorter time span India has outpaced countries like US, UK by displaying highest growth in the mobile application market in the year 2016 in terms of Google Play downloads (economictimes.indiatimes.com, 2017). Indian users downloaded over 6 billion apps in 2016, up from 3.5 billion in 2015 which was 15% higher than the overall download of the apps worldwide (ivemint.com, 2017). Currently India is ranked 29th globally by revenue on iOS and Google Play store in 2018 (thehindubusinessline.com, 2018). Application store revenue and downloads in India grew to 140 % and 250 % in 2018 over 2016 by making Indian market ranked 1 globally by combined downloads in iOS and Google Play store (economictimes.indiatimes.com, 2017).

Furthermore the average smart phone user in the nation has 17 applications and the number is near the worldwide average of 25 applications

Is oil price risk systemic to sectoral equity markets of an oil importing country? Evidence from a dependence-switching copula delta CoVaR approach

Aviral Kumar Tiwari[1] · Sangram Keshari Jena[2] · Satish Kumar[3] · Erik Hille[4]

Abstract
In this paper, a dependence-switching copula model is used for the first time to analyse the dependence structure between sectoral equity markets and crude oil prices for India, one of the largest oil importing countries. Specifically, we investigate the dependence and tail dependence for four distinctive states of the market, i.e. rising oil prices—rising equity markets, declining oil prices—declining equity markets, rising oil prices—declining equity markets, and declining oil prices—rising equity markets. Our results reveal that the tail dependence is symmetric (asymmetric) in positive (negative) correlation regimes. Based on the copula results, we estimate the systemic crude oil price risk to different sectors using CoVaR and delta CoVaR. A fleeting positive sectoral CoVaR and delta CoVaR across all sectors implies a time-varying oil price systemic risk. Yet, little difference between CoVaR and VaR across the sectors reveals that a bearish oil market does not add additional systemic risk to a bearish sectoral equity market. The carbon sector is found to be the safe haven investment when both the equity and the oil markets are in a downward phase.

The impact of brand familiarity, customer brand engagement and self-identification on word-of-mouth

Anitha Acharya
Department of Marketing and Strategy, IBS Hyderabad, a Constituent of IFHE, Deemed to be University, Hyderabad, India

Received 18 July 2019
Revised 5 December 2019
6 March 2020
10 April 2020
Accepted 21 April 2020

Abstract

Purpose – The purpose of this paper is to check for the effects of brand familiarity, customer brand engagement and self-identification on word-of-mouth (WOM) communication.

Design/methodology/approach – A systematic review of the literature regarding brand familiarity and customer brand engagement CBE) was conducted and data were analyzed using structural equation modeling.

Findings – The results revealed that brand familiarity had a positive impact on CBE; self-identification also had a positive impact on WOM communication.

Research limitations/implications – The model was tested in the context of service sector; future research may investigate in different context.

Practical implications – The framework advances insight into customer engagement and service dominant logic, which, despite having been recognized for their significant theoretical fit, have remained largely disparate in the literature.

Originality/value – This study is among the first few attempts to examine the impact of brand familiarity on different dimensions, namely, cognitive, affective and activation dimensions of CBE. This study contributes to a more detailed description of the brand familiarity construct and improves understanding of WOM communication. The study provides implications for practitioners and marketers.

Keywords Word-of-mouth, Customer brand engagement, Brand familiarity, Self-identification

Paper type Research paper

Introduction

The importance of information which consumers acquire from interpersonal sources in influencing consumer decision-making has been well recognized in consumer behavior and marketing literature (Goldsmith and Clark, 2008). Word-of-mouth (WOM) is a form of written or oral communication between existing and potential consumers (Cheung and Lee, 2012; Sijoria *et al.*, 2019). Increasing number of consumers trust these communications compared to traditional forms of communication (Bickart and Schindler, 2001; Steffes and Burgee, 2009; Liang *et al.*, 2018). In addition, information received through interpersonal sources is considered to be more credible compared to traditional sources (Feick and Price, 1987), and consumers often rely on informal WOM when they look for information before purchasing the product (Goldsmith and Clark, 2008; Shen and Sengupta, 2018). For instance, prior studies revealed that WOM influences the momentum and velocity of innovation diffusion (Rogers, 1995) and is essential to the information flow for helping consumers to adopt the product (Frenzen and Nakamoto, 1993). As a result, generating positive WOM in consumers' social networks has become an essential practice for marketers to build trust and maintain strong brand relationships with highly engaged consumers (Chu and Kim, 2011; Gelper *et al.*, 2018; Meire *et al.*, 2019).

The results of the study conducted by Whyte (1954) on air conditioners revealed that the buying pattern could be explained only by the existence of an influential network consisting of neighbors exchanging product information whenever there was a social gathering.

Time-varying dependence structure between oil and agricultural commodity markets: A dependence-switching CoVaR copula approach

Agricultural commodities
Oil
CoVaR
Dependence-switching copula
Tail dependence

ABSTRACT

We examine the energy-food nexus using the dependence-switching copula model. Specifically, we look at the dependence for four distinct market states, such as, increasing oil–increasing commodity, declining oil–declining commodity, increasing oil–declining commodity, as well as declining oil–increasing commodity markets. Our results support the argument that the crash of oil markets and agricultural commodities happen at the same time, especially during crisis period. However, the same is not true during times of normal economic conditions, implying that investors cannot make excess profits in both agricultural and oil markets at once. Furthermore, our analysis suggests that the return chasing effect dominates for all commodities on maximum occasions. The CoVaR and ΔCoVaR results indicate important risk spillover from oil to agricultural markets, especially around the financial crisis.

1. Introduction

Recently, the linkages among oil and agricultural markets have increased either due to the replacement of fossil fuels with bio-fuels or hedging strategies used to combat oil price driven inflation (Jebabli et al., 2014; Ahmadi et al., 2016). Moreover, the financialization of commodities has resulted in higher level of association among oil and agricultural markets (Tang and Xiong, 2012). In order to effectively manage the risks in the portfolio, it is crucial for investors to measure dependence and tail dependence. Based upon the direction of dependence between oil and agricultural markets, one could plausibly argue for a positive correlation regime (return chasing effect) or a negative correlation regime (portfolio rebalancing effect) (Wang et al., 2013). On the one hand, return chasing effect occurs when booming oil prices attract investors in the commodity markets, resulting in the rise of commodity prices. Hence booming oil prices coexist with high commodity prices, generating a positive correlation between them. On the other hand, a portfolio rebalancing effect is observed when crash in oil prices encourages investors to shift to agricultural commodity markets, resulting in higher commodity prices. In this case, lower oil market prices are associated with higher agricultural commodity prices, resulting in a negative correlation regime.

A number of studies have examined the dependence between various commodity markets. The first attempt to examine dependence structure among markets used the traditional Pearson coefficient of correlation (Poon et al., 2003). This approach has been criticized because it may underestimate the risk in case of joint severe outcomes (Tastan, 2006). To address this issue, various other models have been used such as, multivariate GARCH (M-GARCH) models (Abdelradi and Serra, 2015; Kang et al., 2017), EGARCH models (Dahl et al., 2020), mixture of multivariate normal distributions (Han et al., 2015), fractionally integrated VAR model (Yip et al., 2020) etc. Another technique adopted to address this issue is the extreme-value approach (e.g., see, Poon et al., 2003). A major shortcoming of the studies above is their inability to capture the asymmetric tail dependence among markets because they believe that returns are symmetrically distributed. Theoretically, it is expected that markets react heterogeneously to changes in the price level of goods and services (Salisu et al., 2019). As such, markets' reaction to positive changes would be different from negative changes (Yahya e al., 2019; Meng et al., 2020; Albulescu et al., 2020; Sun et al.,

Abstract: The study aims to understand the factors contributing to an organizational climate in hospitals in the Covid-19 pandemic period. The paper used the analytical Hierarchical Process (AHP) approach to analyze the factors of significance, and hence identify the critical factors that contribute to the organizational climate in hospitals in India. The AHP method is adopted to examine the key factors influencing organizational climate in hospitals in India by collecting the primary data through pre-validated structured questionnaires. The outcome of the research indicates that human relations at the workplace are the most important organizational climate factor followed by the internal process, open system approach, and rational goals. Managers may consider autonomy as the most important criteria in human relations, formalization in internal processes, innovation and flexibility in an open system, and clarity of organizational goals in the rational goal approach contributing to effective organizational climate, as they have emerged as the significant indicators of key success factors of organizational climate in the hospitals.

Understanding the luxury purchase intentions of young consumers: a qualitative analysis

Purva Sharma, Sudeepta Pradhan and Ankur Srivastava
ICFAI Business School, Hyderabad, India

Received 14 January 2021
Revised 7 April 2021
9 May 2021
Accepted 14 May 2021

Abstract

Purpose – The study intends to investigate the key purchase drivers of luxury brands in India. Given that a major segment of this target audience is the young consumers, the study focuses on determining these antecedents of luxury purchase from a young Indian consumer lens.

Design/methodology/approach – The study uses an interpretive research position, employing qualitative techniques in the form of in-depth interviews. In total, 62 respondents were interviewed, and later the transcribed interviews were analyzed using content analysis.

Findings – The study identifies the three main value dimensions that contribute to the final purchase decision: functional, social and emotional. The study also highlights the importance of Internet and web for luxury brands and how young Indian consumer consumes luxury online.

Originality/value – Research on luxury brands is still at a nascent stage. Though variables such as economic value, brand origin, social identity, prestige, self-congruity and so on have been examined in the context of luxury brands in prior studies. However, these studies are restricted because either they were product-specific or actual users of luxury brands were not approached as the sample. Most importantly none of these studies reflect the purchase behavior of young consumers in an emerging market, especially India. Given the growth of luxury brands in India, it would be worthwhile to investigate the factors influencing the customer purchase intention of luxury brands in emerging markets.

Keywords Luxury products, Young consumers, Purchase intention, Consumption values, Content analysis, Luxury marketing, Consumer behavior, Self-concept theory

Paper type Research paper

1. Introduction

The global luxury market is growing at 5% every year and currently stands at $1.3 trillion (Hundekari, 2019). India is one of the fastest-growing luxury markets in the world, and it is expected to grow from US $30bn in 2019 to more than $200bn by 2030 (Jain, 2019). According to an Assocham report, by 2020 the Indian luxury market is poised to cross US$ 50bn (Jain, 2018). Some of the pertinent factors that are responsible for driving this growth in India are the increasing number of millionaires, rapid urbanization, higher disposable incomes of the Indian middle class, favorable trade policies, increase in the number of millennials and widespread social media proliferation (Jain, 2018). In recent years, research on luxury brand consumption has burgeoned, with branding experts and academicians keen to investigate various phenomena of luxury brands (Hung *et al.*, 2011). Previous research indicates that people's behavior varies across cultures with regard to the consumption of luxury goods (Jain and Mishra, 2019). The determinants to purchase luxury goods of customers residing in eastern nations are contrary to those people in western nations (Jain and Mishra, 2020); hence this study focuses on the various dimensions of luxury purchase intentions in the context of emerging markets.

One of the reasons that has augmented the growth of the current luxury market is a generational shift (D'Arpizio *et al.*, 2017). Young Indian consumers have a huge stake in the current luxury market, and they are expected to redefine the determinants of the luxury market segment (Gupta, 2020). In 2018, 47% of luxury consumers were categorized as young consumers, and they accounted for 33% of luxury purchases (D'Arpizio *et al.*, 2019). It is

Keywords:
Expectation–confirmation model
Perceived enjoyment
C2c interactions
Perceived content quality
User satisfaction
Continuance intentions

ABSTRACT

Using data from India and the USA, this research expands the expectation–confirmation model (ECM) to include constructs like neutral confirmation, customer-to-customer (C2C) interactions and perceived content quality as antecedents to perceived enjoyment, perceived usefulness, user satisfaction, continuance, and recommendation intentions. Across both countries, except for the influence of C2C interactions on perceived enjoyment and of perceived usefulness on recommendation intentions, the remaining hypotheses are supported. There are cross-country differences in the magnitude of the paths from neutral confirmation and C2C interactions to perceived usefulness, and of paths from perceived enjoyment and satisfaction to continuance intentions.

1. Introduction

The term over-the-top (OTT) is used to refer to the "programming content that is streamed through the internet to a device where it can be viewed, such as a television, mobile phone, or tablet" ([104], p. 343). In recent years, there has been a dramatic shift from linear broadcasting and cable/satellite to OTT content [77]. This shift is often attributed to the fact that OTT platforms offer consumers anytime/anywhere digital media services, combined with convenience, accessibility, high quality, and affordability [67]. Enabled through the latest embedded technologies, online streaming content provided by Netflix, Amazon, and Hulu is consumed more extensively compared with programs shown through most traditional television broadcasters [26, 91]. Revenues from streaming services are expected to reach $252 billion by 2025 from $123 billion in 2019[1]; the three largest OTT markets, the USA, China, and India, are expected to command two-thirds of global OTT revenues, with $68 billion, $19 billion, and $6 billion, respectively [18].

The shifts in the evolution of OTT platforms have recently led to a proliferation of studies examining its implications for both firms and consumers ([26]; Kim, [47, 48, 77, 91]). A few studies have also evaluated the use of OTT platforms to predict adoption or consumers' willingness to pay (e.g. [48]). However, none of these focuses on the post-consumption dynamics for this technology, whereby consumers not only continue using the service, but also recommend the platform to others.

Understanding the post-adoption behaviour for OTT platforms is relevant to researchers and practitioners [17, 53]. The OTT platforms, with the integration of digital technologies and traditional media, are rapidly disrupting the entertainment business [43, 74]. Such emerging platforms have a strong influence on consumer lives, have evolved the approach of entertainment, and have created a transition in the consumer adoption and consumption journeys [75, 86]. The traditional televisions are being gradually replaced by a variety of smart devices, with the content creation going beyond a few creators [34]. Faster and cheaper data access has fuelled the demand for OTT platforms, which are constantly leveraging technology to embed the content in an ecosystem of technologies and devices for wider access [17].

The rise of OTT platforms has also caused consumer retention to emerge as a serious challenge for its managers, given there are no major switching costs and consumers have greater control over the content/platform they want to watch [87]. Beyond quality content, OTT platforms need to provide user-friendly interface features, across-devices accessibility, and on-the-go consumption abilities to promote consumer loyalty [43]. Additionally, the growth of OTT platforms across

Foreign Institutional Investors: Fair-Weather Friends or Smart Traders?

Hari Venkatesh[1] · Jyoti Kumari[2] · Gourishankar S. Hiremath[1] · Hiranmoy Roy[3]

Accepted: 22 February 2021 / Published online: 3 April 2021

Abstract

We examine a theoretically robust but previously undocumented issue of what drives foreign portfolio investments into emerging markets. Foreign institutional investors (FIIs) are often blamed as fair-weather friends who pull out their investment at the first sign of trouble. Using a bottom-up approach, we explore this possibility. We demonstrate the influence of the firm-specific factors such as size, book to market ratio, the riskiness of the stocks, stock prices, dividend yield, liquidity, leverage, and earnings on the FII ownership. We find no evidence to show foreign investors as fair-weather friends. Instead, they are smart traders who follow a diligent investment strategy. We suggest reforms in corporate governance and improvement in financial fundamentals of the companies to attract FII ownership.

Keywords FII · Equity research · Corporate governance · Financials · Portfolio investment

JEL Classification F21 · G10 · G11 · G32

Introduction

Foreign direct investment (FDI) and foreign portfolio investment (FPI) are the most important channels of capital flows into emerging and developing economies (EDEs). The higher returns and international portfolio diversification are primary drivers of FPI in the emerging stock markets (ESMs) (Solnik 1974). The remarkable increase in the FPI in ESMs and the consequences of integration of these economies

Identifying dimensions of job search strategy: A validation of measurement scale

Chetna Priyadarshini[1] · Pratyush Banerjee[2] · Prerna Chhetri[1]

Published online: 6 September 2018
© Springer Science+Business Media, LLC, part of Springer Nature 2018

Abstract
This paper validates the scale on job search strategy by Crossley and Highhouse in the Indian context. Exploratory factor analysis followed by a confirmatory factor analysis was conducted on the responses elicited from a sample of 504 graduating students in a large business school in India. Reliability and validity scores were also calculated to ensure the psychometric stability of the scale.14items out of the original 16 items were retained for the study. Three distinct factors, namely; Focused Search Strategy (FSS), Exploratory Search Strategy (ESS), and Haphazard Search Strategy (HSS) emerged from the study, which is in sync with the extant factors reported by Crossley and Highhouse. This study highlights the importance of focused job search strategy for university students entering the job market in India. This should help final year higher education students to be better oriented towards their job search process in order to get a job in their preferred professions. This is the first study to focus on the psychometric stability of the measures for job search strategy when applied to the job seekers in emerging economies, like India. This research provides evidence that, with a few exceptions, the job search strategy scale is a valid and reliable measure amongst entry-level job seekers in India. Given the evidence, universities and career counselors in India can focus on guiding the students and job-seekers to use a focused or exploratory strategy when searching for a job.

Keywords Job search behavior · Job search strategy · Scale validation · Exploratory factor analysis · Confirmatory factor analysis

Introduction

Job search is one of the critical processes one gets involved in for finding (re)employment. However, with the rapid change in the job market scenario and development of economies across the globe, individuals are facing the wrath of unemployment, layoffs, and retrenchment due to lack of employability and/or mismatch between skills and requirements of jobs across different industries. A report by the Asia Business Council Forum (2014) highlighted that in recent times, the Asian job market has been boosted by the 'demographic dividend' factor. The two major economic powerhouses- India and China are producing young graduates in huge numbers every year. The majority of developing nations including Japan are faced with the ageing population conundrum; this has opened up new avenues of labor supply. However, strangely, Asian countries are yet to leverage on this opportunity thereby leading to a wide-spread skill gap observed in some of the most populous Asian nations such as India, China, Pakistan and Bangladesh (S4YE 2015; Kilimani 2017). Population projection reports predict sustained increase in youth population across most Asian countries, including sub-Saharan Africa (Cleland and Machiyama 2016). In stark contrast, the number of jobs created to employ this huge employable youth workforce is lagging far behind. As a result, there is huge underutilization of labor resources and gross unemployment in some of the major developed and developing economies of Asia such as India, China, Vietnam, Philippines and Indonesia (Asia Business Forum Report 2014). In a Mckinsey Global Survey (Gratton 2011), it was prominent that there is a difference between what educational institutions are teaching to the students and what the industry demands of fresh graduates. Asian nations have started some process to address this skill gap deficit problem and a few programs such as the Kosen schools in Japan and the National Skill Development Center (NSDC) of India aims at

Abstract

Purpose – This study investigates the role of consumer cosmopolitanism on consumer attitudes and purchase intentions (PIs) towards foreign and local brands.

Design/methodology/approach – The responses were collected on a structured questionnaire through a consumer survey. The data were then analysed through structural equation modelling (SEM).

Findings – The results depict the positive influence of consumer cosmopolitanism on consumer attitudes towards foreign brands, which positively influences PIs towards foreign brands and negatively influences the PIs of local brands. Further, the mediating role of perceived quality was observed in explaining the consumer preference towards foreign and domestic brands.

Practical implications – Finally, the study concludes by providing implications for marketing scholars and managers of global and local brands.

Originality/value – The paper examines the underlying mechanisms related to consumer cosmopolitanism and its role in influencing the foreign and local brand purchase.

Keywords Foreign brand, Local brand, Consumer cosmopolitanism, Purchase intention

Paper type Research paper

1. Introduction

The growing pace of globalization has led to increasing choices among consumers towards foreign and domestic brands in various product categories (Batra *et al.*, 2000; Özsomer, 2012; Mandler *et al.*, 2020). International marketing researchers have investigated various factors such as brand attributes, consumer values, personality traits and situational variables to explicate the consumer choice between foreign and domestic brands (Liu *et al.*, 2021; Steenkamp, 2019). From the socio-psychological aspect, it is found that consumers hold various dispositions towards various countries and brands (Bartsch *et al.*, 2016; Khare and Kautish, 2021). While international marketing has accumulated a rich body of knowledge in explicating the bias towards local products, the research on factors explaining the preference for foreign brands is scant (Riefler and Diamantopoulos, 2009; Bartikowski *et al.*, 2021). We address this gap in the literature by investigating the role of consumer cosmopolitanism in influencing the preference towards foreign brands in an emerging market context. In addition to this, we also examine the underlying process through which consumer cosmopolitanism exerts its influence on global purchase and its cross-effects on local brand purchase intentions (PIs). Specifically, in this study, we investigate the role of consumer cosmopolitanism in explicating the consumer purchase intention towards foreign brands and its cross-effects on consumer preference for local brands.

Abstract: The present study analyzes and assesses the robustness of monitoring effectiveness of institutional investment against the information asymmetry prevailing in the market, especially the asymmetric monitoring effectiveness of Domestic Institutional Investment (DII) vis-à-vis Foreign Institutional Investment (FII). Drawing from a sample of listed non-financial firms with institutional investment of 20% or more, this study tests the relationship between earnings management and institutional ownership controlling for known firm-specific variables. The results reveal that institutional investment in aggregate as well as DII and FII have significant negative impact on earnings management supporting the active monitoring hypothesis. The results also support hometown advantage hypothesis for the sub-group of companies with higher Price to Book Value (PBV) and global investor hypothesis for the sub-group of companies with lower PBV ratio. Various implications applicable in the Indian markets contexts are discussed. Domestic institutional investors should improve their cost-effective technology to acquire and process the price-sensitive information which can enhance their competitive advantage over their foreign counterparts. This is one among the first few studies that tests the

His research interests are in the area of Earnings Management, Corporate Governance, Derivatives and Volatility Modelling. He is an Assistant Professor at IBS Hyderabad, IFHE

Kaushik Bhattacharjee is a Bank Manager turned academic and is an Associate Professor in the area of Finance. His PhD was in the Cross Listing and Asset Pricing and his research interests include financial engineering, portfolio performance evaluation and valuation. He is an Associate Professor at IBS Hyderabad, IFHE

Vishwanathan Iyer is a full Professor in the area of Accounting and Finance and currently the Dean (Academics) at T A Pai Management Institute. His research interests are Portfolio Optimization, Earnings Management, Information content of text-based narrative in Annual reports and the role of inspirational potency in communication to stock market participants.

PUBLIC INTEREST STATEMENT

Emerging markets such as India are characterized by high agency conflicts, weak governance controls, more information asymmetry. All these factors incentivize the management of the firms to manipulate the reported earnings to meet or beat the earnings targets. In such situations, given the size and clout of institutional investors, policymakers and market participants expect them to play a constructive role in ensuring the quality of corporate governance.

Diversified characteristics of domestic and foreign institutional investments (FIIs) yield varying results in constraining the earnings management in the investee firms. The empirical results reveal that where the markets are characterized by significant information asymmetry, foreign institutional investors play significant role in constraining earnings management, which may be attributed to their arm's length relationship with the investee firm, resilience from local political pressures; having state-of-art technology in acquisition and processing of information. So, the findings of our study suggest promoting FII in order to improve the quality of financial reporting by the firms in India.

'From technology adoption to consumption': Effect of pre-adoption expectations from fitness applications on usage satisfaction, continual usage, and health satisfaction

Keywords:
UTAUT
ECM
Fitness applications
Perceived privacy
User-interface quality
Technology self-efficacy
Health satisfaction

ABSTRACT

Despite the increasing usage of fitness applications, there is a dearth of research examining how expectations from fitness applications impact people's post-adoption consumption and health satisfaction. A novel research framework, spanning across pre- and post-adoption phases and involving a two-stage data collection, is proposed with additional contextual variables like technology self-efficacy, user-interface quality and perceived privacy, playing an important role in determining the continual usage for fitness applications and subsequent health satisfaction, shaped through pre-adoption expectations. Results of this work, conducted in India, not only enable an extension of the traditional adoption and post-adoption theories into the realm of fitness applications but also provide practitioners with guidance for developing fitness applications that enhance post-adoption engagement.

1. Introduction

Engaging oneself in health-enhancing activities, like exercising, not only provides daily satisfaction but also serves as a source of psychological vitality (Harvard Health, 2019). Technology aids, like fitness applications, are enabling people to engage in the pursuit of health (Sokolova and Perez, 2021). Such applications provide users with health advice and help track/manage daily routines (Kim and Park, 2019). This concept, called m-Health, has emerged globally and many applications exist for smartphone users to maintain a healthy lifestyle (Beldad and Hegner, 2018). The innovative m-Health solutions, through fitness applications, also connect users to medical assistance for providing timely hospital care (Kishore, 2018). Apart from native applications, third-party applications help a user achieve various outcomes; for example, knowing total calories expended, total workouts done, body mass index, exact distance covered while walking/running, and medication reminders. The global m-Health application market is currently valued at US$ 38.31 billion and is expected to increase to US$102.35 billion by 2028 (Accenture, 2018 [1]).

Smartphone and communication technology have made available a platform where users can track/monitor their health and take preventive healthcare measures, thus, contributing to their overall subjective well-being (Cho et al., 2014). Subjective well-being is a central driver of human happiness, an outcome of physical health (Daig et al., 2009). It signals the indicators of positive psychological adjustments, like positive emotions, general happiness and high self-esteem (Houben et al., 2015). Health satisfaction, a determinant of subjective well-being, represents the cognitive judgment of individuals about the quality of their overall mental and physical fitness (Kesavayuth et al., 2015). Higher levels of perceived health, as an outcome of regular exercising, is a source of enjoyment-capability and subjective well-being.

The extant research suggests that fitness applications are primarily used by young individuals with higher levels of education; and are used for benefits such as accessibility, instant and customized real-time accurate feedback, as well as the opportunity to share information on social networking sites (e.g., Sokolova and Perez, 2021). Despite indicated relationship of fitness with physical and mental health, no works explore the role of post-adoption consumption of fitness applications, shaped through pre-adoption expectations, in creating health satisfaction (Cho et al., 2014; Li et al., 2018). The related research in this domain focuses on narrower issues like initial adoption (e.g., Zhou, 2013; [illegible] 2012; Canhoto and Arp, 2017), usage pattern of health applications

MARKETING AND TECHNOLOGY – AN EMERGING FIELD OF EXCELLENCE

Sashikala Parimi, ICFAI Business School

ABSTRACT

Marketing has become a technology-powered discipline, and it's leading to the rise of new kinds of marketing professionals. Marketing Technology refers to software used by marketers to perform marketing activities. Marketing and Technology (MarTech) applications help marketers plan and execute marketing campaigns, collect and analyse the results of those campaigns, measure & track marketing performance, and apply the insights to future campaigns.

MARKETING AND TECHNOLOGY

The marketing technologist builds on technological, marketing, analytical and strategical qualities leading to analyse new business opportunities and building technological solutions for marketing purposes. A marketing technologist is a technically skilled person who designs and operates technology solutions in the service of marketing.

They're passionate about reimagining what marketing can do in a digital world which helps nontechnical marketers to plan better campaigns, programs, and customer experiences that efficiently influence software and data. They help manage the new kinds of technical interfaces that marketing has with agencies and service providers layer between them. The most distinctive characteristic of the current marketing technologist is bridging paradoxical worlds (for example IT and marketing).

Covid-19 is an economic, social, and health care crisis that continues to take a heavy toll on businesses. It has also served as a catalyst for change on an unprecedented scale and is forcing CEOs to make tough decisions for their businesses. Enterprises across industries are at an inflection point, where they risk being left behind unless they change their digital strategies to adapt to and thrive in the new normal. Businesses need to move beyond their comfort zones and boldly adopt new technologies to transform business and operating models while accelerating changes to their organizational culture.

It has become well established that people are using an increasing range of tools and technologies—from social media to smartphones—to help make more informed purchasing decisions. They help manage the new kinds of technical interfaces that marketing has with agencies and service providers—the API1 layer between them.

Most common tools and technologies in the MarTech include:

Digital Asset Management solution is widely used for managing and grouping the content, which is the driving force behind marketing, having a single, centralized resource for managing a large volume of digital assets for marketing efficiency and effectiveness Indrajeet (2019).

Since the organizations rely more on the analytic solutions which provide a quantifiable means of measuring the effectiveness of marketing messaging, campaigns, channels, and more.

Lead Management tools help marketers engage, nurture, and qualify potential leads to determine sales-readiness.

Customer Relationship Management help companies keep track of their customer base, providing a central resource for sales and customer relationship team members who need to interact with customers and prospects. Email marketing may be a built-in technology, or procured as a separate service.

ABSTRACT

The current study attempts to measure the entrepreneurial level deploying a developed instrument, that is, Carland Entrepreneurship Index, which is driven by psychological variables among micro-entrepreneurs in the selected states of India. An empirical study is conducted on a sample of 437 Indian Entrepreneurs. A questionnaire survey has been administered to obtain information regarding their demographics, organizational variables, psychological characteristics and entrepreneurial level. The statistical, i.e., T-test, correlation analysis and regression model analysis are performed. The results validate the applicability of Carland Entrepreneurship Index (CEI) in the Indian context. It is also determined that psychological variables are important determinant to predict entrepreneurial level. In this context, it is seen that innovativeness is a less exhibited characteristic among Indian entrepreneurs. The result advocates the need for policy reframing to inculcate the component of innovation in Indian scenario. Moreover, the universality of Carland Entrepreneurship Index (CEI) is strengthened by this study.

Keywords: Entrepreneurship, Psychological Variables, Entrepreneurial level, Carland Entrepreneurship Index.

INTRODUCTION

Past research on entrepreneurship show that no consensus description exists to define the process of entrepreneurship (Carland et al. 2001). Many studies have come up with the fact that entrepreneurs possess certain psychological traits that differentiates them from common man (Lachman, 1980; Cooper & Dunkelberg, 1987). In order to understand who an "*entrepreneur*" is,

Abstract

Purpose – The purpose of this paper is to examine the mediating role of immediate performance outcomes on the relationship between dimensions of supply chain integration (SCI) and financial performance.

Design/methodology/approach – This study tests the proposed model linking dimensions of SCI, immediate performance outcomes and financial performance using structural equation modeling on a sample of Indian manufacturing companies.

Findings – The findings suggest that the relationship between dimensions of SCI and firm performance is fully mediated through the immediate performance outcomes.

Originality/value – This study deals with the potential benefits of SCI, especially in developing countries like India, where a little research has been done in this area. Also, this study provides support to practitioners that SCI is an effective way of improving both supply chain performance and financial performance.

Keywords Supply chain integration, Supplier integration, Customer integration, Internal integration, Immediate performance outcomes, Financial performance

Paper type Research paper

1. Introduction

Research in the past two decades has shown growing consensus regarding the strategic importance of supply chain integration (SCI) (Frohlich and Westbrook, 2001; Childerhouse *et al.*, 2011; Afshan *et al.*, 2018; Munir *et al.*, 2020, Nartey *et al.*, 2020). Increased globalization, rapidly changing technology, shorter product life cycles, focus on efficiency and increasing customer expectations are some of the main factors that have pushed for SCI (Soosay and Hyland, 2015; Yu *et al.*, 2017; Shukor *et al.*, 2020). SCI toward a "seamless" supply activity has become the priority for firms (Feyissa *et al.*, 2019) since efficient integration combines essential resources of all partners and connects all functional processes for effective resource utilization (Zhang *et al.*, 2019). As a result, the adopters of SCI strategies have performed better than the non-adopters in the areas of quality, delivery, flexibility and efficiency (Ataseven and Nair, 2017).

The authors are most grateful to the anonymous reviewers for their detailed and constructive comments, which helped to improve the presentation of the paper considerably.

Microcredit-Backed Securitization (MBS): A Win-Win Scenario for MFIs and Investors

C Anitha, S Galab** and Raghunatha Reddy****

Securitization is an off-balance sheet tool that facilitates capital relief. However, in India, securitization originated three decades ago, yet, the market is still in its development stage. In this backdrop, this paper examines an innovative existing structured finance model—securitization as an emerging alternative for sourcing funds to tide over the liquidity and funding constraints in MFI sector. Currently, MFIs rely on lumpy cash flows from banks during Q3 or Q4, when banks are trying to fulfil their CAR needs. However, the structured instruments facilitate MFIs to access the capital markets to match their funding and liquidity requirements. The paper outlines the concept of structured finance and emergence of new asset classes, application of structured instruments in the area of microfinance, securitization models—Direct Assignment (DA) and Pass Through Certificate (PTC)—in MFI sector with insights from industry experts. It also examines the advantages to both originators and investors and suggests the prerequisites for MFIs contemplating approaching these markets.

Introduction

In India, Microfinance (MF) plays a crucial role in delivering credit to poor at the bottom of the pyramid. Microfinance Institutions (MFIs) have been lending for asset building/ purchases, income generation and consumption smoothening activities to low income households in small amounts. Besides lending, many pioneering MFIs across the globe have catered financial services offering savings, remittances, insurances and other financial products to economically backward low income households, which otherwise would not have access to these products or services. Thus, MFIs play a critical role in financial inclusion (Ananth and Sahasranaman, 2011).

Abstract

Purpose – This study aims to examine the significance of the non-linear relationship of board size and board independence on the financial performance of listed non-financial firms in India.

Design/methodology/approach – The study draws the sample of the listed non-financial firm in the Indian market from the year 2011–2018 and applied panel least squares regression with and without industry fixed effects on the model with quadratic equation. Quantile regression is also used to test the robustness of the results. The financial performance is measured through one accounting measure (i.e. return on assets [ROA]) and one market-based measure (i.e. Tobin's Q). The empirical model also controls firm-specific variables which are expected to have an impact on financial performance.

Findings – The study found that the relationship of board size and board independence with the financial performance of a firm is in a non-linear inverted U-shape. The results are qualitatively similar for both ROA and Tobin's Q after controlling industry fixed effects.

Originality/value – This is the first study in India which tests the non-linear relationship of board size and board independence with the financial performance of the firm. The study contributes to the limited literature on the implications of board characteristics on the performance of the firms in India.

Keywords Financial performance, Stewardship theory, Board size, Corporate governance, Board independence, Resource dependence theory

Paper type Research paper

1. Introduction

The present study aims to examine the relationship of board size and board independence with firm performance against the backdrop of resource dependence theory and stewardship theory. One stream of research which supports agency theory (Meckling and Jensen, 1976) argues that board size and board independence are positively associated with firm performance. Larger boards having more number of independent directors will minimize the agency problem and effectively aligns the interests of the managers with the interest of shareholders in maximizing the value of the firm (Zahra and Pearce, 1989; Johnson *et al.*, 1996; Dalton *et al.*, 2007). Though the agency theory is a widely used framework to examine the implications of board characteristics on firm performance, Resource Dependence Theory (herein after referred to as resource dependency theory [RDT]) (Pfeffer and Salancik, 1978) provides more useful insights in understanding the

ABSTRACT
Cloud computing has become one of the most emerging field in the technology park. Schemes such as attribute-based encryption technique are used for the access control of the third-party data. For protecting the data from hacker various secured data transaction are used. In the proposed work Cipher texts are encrypted to one particular user as well as to multiple users due to its hierarchical structure. It controls the access of complex structured data in a flexible and secured manner. The cipher-text policy enhances the flexible performance for the third-party data

Keywords
Access control, cloud computing, Distributed Environment, Cryptography, Encryption, Decryption.
Article Received: 18 October 2020, Revised: 3 November 2020, Accepted: 24 December 2020

Introduction

Due to its various benefits, cloud computing has become the most beneficial pattern in the IT industry. Cloud computing reduces costs and capital expenditures, increases operational efficiencies, scalability, flexibility and immediate market growth. Commercial cloud computing has been built such as Google App Engine, Sales' Customer Relation Management.

One of the vital security concerns are privacy preserving and data security in cloud computing. In this techniques used cloud platform to perform and store their data sets. But increasing the demand of storage and vast usage of internet storing the data in cloud platform is not so safe. So the confidential data are not to be disclosed to the business organization otherwise enterprise users will face serious outcomes. Henceforth the data security is at the prioriesrequirement. Fine-grained access control and flexible access is desired in the service-oriented architecture. For instance, the health-care system requires restricted access of medical records whichshould be displayed only to the eligible data sets, similarly, other application in cloud allows only the authorized user or authorized senior people in the respective company can only access those data sets. Such sensitive records either required by the legislation or by company regulations.

In this paper, first the hierarchical attribute set based encryption method is shown in extension with the algorithm with a hierarchical architecture to show flexible and scalable access of data. Next this scheme enhances user grant, file creation, user revocation, file access and file deletion based on Hierarchical attributed set based encryption. Thirdly it analyzes its performance by enhancing CP-ABE technique. Lastly, hierarchical attributed set based encryption technique is implemented to experiment performance evaluation.

Problem Definition

Existing System

In the existing technique any information are stored in the cloud storage information are converted into unreadable format then it is stored in the cloud platform. The techniques or the procedure used for converting the information into unreadable format are kept secretly. Only the authorized users who involved the transaction only can view the secrete clue. But this technique creates a lot of complexity whenever the number of users get increased. It is very difficult to store all user's information in a single location. Second there is separate mechanism is required to manage this clue process it creates the additional burden to the user's community. Third problem after generating the clue if the user forgot the clue it is very difficult to complete the transaction. Suppose the legal user want to extract information even the user forgot the key then there is a separate procedure need to develop for find the clue for accessing the original data sets. **Disadvantage**

- Cipher texts are encrypted to multiple user.
- No administrator is there to maintain security.
- Complex to store data since ABE scheme is not flexible.
- User revocation is difficult in CP-ABE scheme.

Sustainability
Island countries
Panel data model

ABSTRACT

This study examines the determinants of blue economy activities, namely tourism and fisheries, in 19 Asia-Pacific Island countries for the period 1996 to 2016. Using a panel data model, we find that the size of the blue economy positively depends on gross fixed capital formation and access to electricity. We also find that the size of the blue economy responds positively to sustainable ocean management policies. Hence, our findings support the need for, and the effectiveness of, sustainable ocean governance policies in the Asia-Pacific Island countries to further strengthen the growth of these countries.

1. Introduction

The importance of promoting the 'blue economy' has been recognized since the Rio+20 conference of 2012, brought about mainly by coastal countries. As defined by the World Bank, the blue economy implies 'sustainable use of ocean resources for economic growth, improved livelihoods, and jobs while preserving the health of the ocean ecosystem' (World Bank, 2017). The components of the blue economy, as identified by the World Bank (2017), include fisheries, tourism, maritime transport, aquaculture, off-shore renewable energy, seabed extractive activities, marine biotechnology and bioprospecting.

The concept of the blue economy is also recognized by the United Nations Sustainable Development Goals in SDG 14, which sets a target that by 2030 economic benefits will increase for small island developing states (SIDS) and least developed countries (LDCs) from sustainable use of marine resources, including through sustainable management of fisheries, aquaculture, and tourism (Spalding, 2016). Numerous studies (Attri, 2016; Keen et al., 2018; Smith-Godfrey, 2016; World Bank, 2017) identify a working definition and framework to understand the blue economy. Smith-Godfrey (2016) identify five activities, extraction of living resources, extraction of non-living resources, new resource generation, trade in resources including tourism and recreation and ocean health as the components of the blue economy. A similar classification is extended in a World Bank report on understanding the potential of the blue economy (World Bank, 2017). While Keen et al. (2018) consider ecosystem resilience, economic sustainability, community engagement, institutional integration, and technical capacity as important dimensions to conceptualize the blue economy, other studies, for example Attri (2016) and Techera (2018), recognize the importance of good governance, legal resource management, monitoring and regulatory reforms as the main pillars supporting national blue economies. Ehlers (2016) and Barbesgaard (2018) identify several strategies to enhance ocean governance mechanisms to improve growth in the blue economy, including establishment of a financing system for conservation and sustainable use of the seas. Apart from conceptualization of the blue economy, several attempts have already been made to measure the size of the blue economy. But the scope of such studies is limited and confined mainly to developed countries and a few Asian countries (e.g. Carvalho et al., 2018; Mohanty et al., 2014; Mohanty, 2018). Blue economy activities are also identified as a major employment generator (Pauli, 2010; Pranathi and Gonchkar, 2019). Hence, several studies support expansion of blue economy activities but simultaneously

Abstract

The present study was an attempt to identify the most prevailing means of digital devices and its impact as digital pollution on family and social interactions. Despite the obvious benefits of digital devices, in recent years researchers have taken more concern about its potential negative effect on human attitude and behavior, which in turn affects our society. A total of 613 usable responses were collected from Bangalore, India of excessive users of digital devices, such as a smartphone, computer/laptop, and television. All statistical analyses were performed using SPSS 23.0, AMOS 23.0, and SmartPLS 3.0. The results indicated that as the use of smartphone and computer/laptop increases, levels of digital pollution also increase, which in turn significantly triggers unfavorable impact on family and social interactions. The study indicated that digital pollution appears as an important predictor which significantly affects social interaction unfavorably. The present study explored the various critical dimensions within this domain and delineated gaps in our knowledge of digital pollution. It was found that smartphones are more responsible for digital pollution among all the identified digital devices, followed by computer/laptop.

Does geopolitical risk improve the directional predictability from oil to stock returns? Evidence from oil-exporting and oil-importing countries

Satish Kumar [a], Rabeh Khalfaoui [b,*], Aviral Kumar Tiwari [c]

[a] IBS Hyderabad (ICFAI Foundation for Higher Education), Hyderabad, India

Keywords:
Geopolitical risk
WTI
Brent
Stock markets
Cross quantilogram

ABSTRACT

We examine the nonlinear dependence structure between oil (WTI, Brent, Gas oil, Heating oil) and the stock market returns for 14 emerging market indices in oil-exporting and oil-importing countries before and after conditioning upon geopolitical risk using a novel developed quantile dependence approach – cross-quantilogram. When the dependence structure of oil prices with the stock markets of major oil-exporting and oil-importing countries is analyzed without controlling for the geopolitical risk, we do not find any significant dependence. However, after conditioning for geopolitical risk factors, we find the evidence of significant positive (negative) quantile dependence when both oil and stock returns are in the same (either in lower and middle) quantiles of the distribution. Further, the response of oil-exporting equity markets to oil shocks is significantly higher and more persistent than that of oil-importing countries. Results are crucial for diversification benefits and strategy decision making. Since serious geopolitical risk leads to high directional predictability spillover from oil to the stock markets of oil-exporting and oil-importing stock markets, investors and portfolio managers should be cautious when formulating their portfolios and making good hedging strategies. In terms of diversification, it is more suitable for international investors to construct a portfolio of stocks in net oil-importing instead of net oil-exporting countries under geopolitical risk control.

1. Introduction

During the last two decades, oil has been considered as an engine of the world's economy. Notably, its instability of prices has yielded a novel stimulus to the research on oil prices and its alternative energy sources. Since the seminal work of Hamilton (1983), economists have examined the oil price shocks and its effects on the economy. In particular, researchers have paid more attention to oil-exporting and importing countries since oil price shocks and its influences differ across these two sets of countries. The increase in oil prices may positively affect the oil-exporting economies since higher oil prices may produce more income for them (Bjørnland, 2009; Jung and Park, 2011). Albeit, increases in oil prices may convey higher industry costs and inflation rates, as well as a decrease of non-oil goods expenditure (Barsky and Kilian, 2004) in oil-importing countries. Since oil price troubles are the aftermath of the large changes in oil supply and demand, the share of supply is related to exporting part and the share of demand is connected to importing part and they are considered as the key forces that have driven the oil prices the most (Ashfaq et al., 2019). In view of this heterogeneity across oil-exporting and oil-importing economies, the reaction of stock market returns and its directional predictability to/from oil prices may be ascertained by the relative significance of positive and negative causal effects on these countries.

The nexus between oil price and the stock markets of oil-exporting and oil-importing countries is a renewable phenomenon and still generates a substantial debate for researchers, policymakers, and financial investors globally. Though, a few studies[1] have examined oil-exporting and/or oil-importing countries, however, most of these studies either examine the bidirectional nexus between oil market returns and oil-exporting/oil-importing stock market returns, or investigate the cross-spillovers causal effects between oil-stock market pairs, or measure the extent of asymmetries between oil price and stock market returns.

Does managing customer accounts receivable impact customer relationships, and sales performance? An empirical investigation

Ramendra Pratap Singh [a,*], Ramendra Singh [b], Prashant Mishra [b]

[a] IBS Hyderabad, a Constituent of IFHE, Deemed to be University, Hyderabad, 501203, India

Keywords:
Account receivables
Customer orientation
Relationship orientation
Customer performance
Salesperson

ABSTRACT

The impact of accounts receivables on the performance of salespersons is largely ignored in sales literature. However, in many sales contexts, managing customers' accounts receivables is directly managed by the sales people, and therefore substantially impacts their sales performance. Towards such sales contexts, in this empirical study, we study the effect of customer account receivables and salespersons' customer orientation on their relationship orientation and customer-related performance. We further analyse the direct impact of relationship orientation on customer-related performance. Using survey-based data from 224 salespersons based out of India, we empirically test the proposed model using partial least squares structural equation modelling. Our findings suggest that accounts receivables from customers and salespersons 'customer orientation strongly impact relationship building and also improves customer-related performance. The salespersons' relationship orientation also partially mediates the relationship between customer account receivables and customer-related performance. Therefore, this study provides much-required evidence to establish the salience of salesforce appropriately managing customers' account receivables so that its impact on their sales performance customer relationships are not adversely affected.

1. Introduction

"The receivables asset is often called the company's garbage bin. This is because the asset receivables reflect the quality of the entire operation in the revenue cycle. If a mistake is made in placing an order, delivering it, invoicing it, taking payment by the customer or if the customer is dissatisfied with the product or service, it may show itself as past due or short payment in the accounts receivable ledger"- (Salek, 2005).

There is a popular belief in sales management that a sale is not a sale until the payment is received; it is a gift, until then. In the world of sales, products and services are regularly sold and delivered to customers under an explicit understanding that payments would be rendered in compliance with the negotiated conditions of the sale. The critical challenge in managing the credit risk from a firm's perspective is to balance the necessity for credit sales and the benefits generated from the sales against the potential risk of offering credit to customers. Most often, when firms decide on credit policies for their customers, the credit limits are estimated based on the cumulative liability that the firm can undertake for a specific client, often referred to as a 'line in the sand', above which, risks cannot be accepted (Salek, 2005). If customer accounts receivables are not managed well, the customer payments may reduce or dry up, which may adversely influence the cash flows of the supplier firm. The salespersons thus need to develop the 'collection skills' required to handle such situations, which may include the knowledge of company accounting policies, account monitoring and management, exemption and modification handling, record collection, and, most importantly, the ability to establish a productive working relationship with clients. For most firms, it's salesperson has the closest relationship with the customer, which makes them the appropriate individual to manage credit on the firm's behalf. From the customer's perspective also, it makes it more difficult for customers to defer payments, as most often, they tend to have a 'personal connect' with the firm's salesperson (Schauffer, 2002).

The role of credit sales, that generates account receivables (AR), has been studied in sales literature, albeit under different facets. The literature shows that facets such as the credit rating/score (Abdou and Pointon, 2011; Kiesel and Spohnholtz, 2017; Sustersic et al., 2009); credit risk assessment (Crook et al., 2007; Papouskova and Hajek, 2019); and/or credit policy (Ng, C. K., Smith and Smith, 1999; Petersen, ... Rajan, 1997; Sarkar et al., 2015) are well studied. Although some studies

In this paper, we investigate the impact of promoters and institutional investors' equity ownership on the firm performance in the Indian context. Using a sample of 1583 firms during 2010–2019, our results suggest a positive relation between promoter ownership and firm performance, supporting the alignment effect, where the interests of promoters and managers align in the same direction. On the one hand, our results support the global advantage hypothesis in that the foreign institutional investors (FIIs) positively impact the firm performance, implying that the FIIs are vigilant shareholders, and actively monitor the firm performance. On the other hand, we reject the hometown advantage hypothesis since the domestic institutional investors (DIIs) like banks and other financial institutions are found to have negative relation with firm performance. Overall, we conclude that shareholding pattern does affect the firm performance. Our results are insensitive to various robustness tests.

KEYWORDS
agency problem, alignment, entrenchment, firm performance, institutional investors, ownership structure, promoters

1 | INTRODUCTION

Determinants of firm performance have been a widely researched area in empirical finance. Apart from financial determinants of the firm performance, the pattern of shareholding has been found to play a significant role in influencing the firm performance. However, majority of these studies have been conducted in developed countries such as the US and the UK where the corporations are characterized by lower ownership concentration. In emerging countries like India, the firms are usually characterized by high promoter ownership concentration. Investors with greater ownership have more incentives to maximize the firm value, and have ability to collect information and control over managers (Claessens et al., 2002). However, the divergence of interests between large and minority shareholder might begin to appear instead, since in such firms, the large shareholders may represent their own interests, which may not be in the interests of the minority shareholders (Shleifer & Vishny, 1997; La Porta et al., 2000; Young et al., 2008; Bozec and Laurin, 2008; Andres et al., 2013). Various studies provide evidence favoring the notion that the controlling shareholders have incentive to extract private benefits from the firm at the expense of small shareholders (Demsetz, 1983; Demsetz and Villalonga, 2001; La Porta et al., 2000; Shleifer & Vishny, 1997; Arosa et al., 2010).

Therefore, literature suggests that increasing promoter ownership can either improve or deteriorate the performance of the firm, though some argue that there is no relation between the two (Kumar and Singh, 2013; Himmelberg et al., 1999). In this paper, we test the alignment and the entrenchment hypothesis to examine if concentrated ownership in India leads to either convergence of interest between the majority and minority shareholders, supporting alignment hypothesis or increases opportunism and expropriation of outside investors, favoring entrenchment hypothesis (Demsetz, 1983; Fama and Jensen, 1983). Margaritis and Psillaki (2010) test the alignment and entrenchment effect hypothesis of ownership concentration across different industries, and suggest that more dispersed firms face higher agency costs in computers and R&D industries, whereas the reverse holds true for chemicals industry; and that family firms perform better than non-family firms. Kapopoulos and Lazaretou (2007) find a linear positive relationship between the firm's profitability and ownership

ENHANCING SERVICE ENGAGEMENT AND COLLABORATIVE DECISION MAKING THROUGH WEARABLE DEVICE ADOPTION

Vaidik Bhatt, IBS Hyderabad, IFHE University
Samyadip Chakraborty, IBS Hyderabad, IFHE University

ABSTRACT

With the aid of IoT (Internet of Things) powered wearable sensors, it is possible to measure the pulse, blood pressure, and other body functions by the physicians in real-time. The study highlighted that use of wearable tracker eventually leads to improved health for patients through improved medical service engagement. Survey-based approach was implemented to collect primary data from 131 respondents using wearable devices. The statistics were evaluated using partial least squares-structural equation modeling (PLS-SEM) approach with smartPLS 3.0 software. The results revealed that information pervasiveness has no major effect on collaborative decision making, However, Patient-Provider interaction are found to be positively impacting collaborative decision-making. Key outcome came out to be an important finding as collaborative decisions did not exert significant impact on service engagement.

Keywords: Healthcare; Service Engagement; patient-Provider Interaction; Collaborative Decision making; Internet of Things; Information Pervasiveness; Wearable Health Devices; PLS-SEM.

INTRODUCTION

Unlike any other industry, healthcare as a promising sector is also using the technological progressions to generate competitive advantage. Healthcare transformed itself by adopting Electronic Health Record (EHR) for a patient's record-keeping and Enterprise resource planning (ERP) for enhancing efficiency in internal operations (Chakravorty et al., 2019). Now, in the era of industry 4.0, where all devices are connected seamlessly and integrated. Healthcare sector uses such tools for enhanced flexibility and agility. Sensor empowered IoT enabled wearable health device (WHD) have the enormous potentiality to disrupt healthcare services with data integration and transmission power and opens up a new era of service delivery, which is more flexible, affordable and efficient (Chakraborty & Bhatt, 2019). Wearable devices transmit the physiological data to the provider by cloud services (Rahmani et al., 2015). With integrated and real-time monitoring system provider and other medical professionals can have early intervention and reduces unnecessary patients' visit to the emergency room (*Internet Of Healthcare Things In India: Changing The Landscape*, n.d.; *Riding Technology: The Role of IoT in Healthcare Surveillance - The Economic Times*, n.d.; Thompson et al., 2020).

Most of the literature is focused based on the antecedent to the adoption of WHD. The research includes the study of the adoption models like UTAUT 2 (Talukder et al., 2020), TAM (Papa et al., 2020), TRA and TBP (Mital et al., 2018) which measures the antecedents to adopt WHD. However, mainstream literature focuses on efficiency and effectiveness of WHD for health monitoring for chronic as well as acute disease (Godinho et al., 2016; Kekade et al.,

Exploring the connection between socially responsible HRM and citizenship behavior of employees in Indian context

Received 19 January 2018
Revised 12 September 2018
Accepted 13 September 2018

Neha Gahlawat
Department of Human Resources, ICFAI Business School (IBS), The ICFAI Foundation of Higher Education (IFHE), Hyderabad, India, and

Subhash C. Kundu
Haryana School of Business, Guru Jambheshwar University of Science & Technology, Hisar, India

Abstract

Purpose – The purpose of this paper is to establish the effectiveness of socially responsible HRM (SRHRM) on organizational citizenship behavior (OCB) while examining the mediating role of work motivation and job satisfaction.

Design/methodology/approach – Primary data based on 565 respondents belonging to various organizations operating in India were collected and analyzed. Statistical tools like confirmatory factor analysis and bootstrap procedure were used to determine the hypothesized relationships between SRHRM and employee attitudes and behavior.

Findings – Drawing upon social identity perspective, the results have revealed that the employees' perceptions of SRHRM including legal compliance HRM, employee-oriented HRM, general corporate social responsibility (CSR) facilitation HRM and general CSR conduct are related to higher engagement in extra-role behavior among employees in Indian context. The findings further reveal that this SRHRM–OCB relationship is serially mediated by work motivation and job satisfaction.

Practical implications – The study gives strong indications that managers at both global and local level need to pay high attention to the designing and implementation of the CSR-focused HRM systems in their organizations, as these do not only lead to positive organizational image but also generate positive employee outcomes.

Originality/value – By establishing a multi-step partial mediation model, this study brings new insights in the underlying mechanism existing in the SRHRM–OCB relationship.

Introduction

Rising importance of corporate social responsibility

In the past few years, the concept of sustainability and corporate social responsibility (CSR) has made great progress in business world. A report by KPMG (2013) has revealed that 93 per cent of the world's largest renowned organizations are formally engaged in CSR activities, and it is not just restricted to Western economies. Grant Thornton (2013) survey has reported that 69 per cent of organizations in India are heavily engaged in CSR, 64 per cent in Vietnam, 60 per cent in Philippines and 52 per cent in Mexico. According to Indian Institute of Corporate Affairs, the number of organizations in India who take up the CSR

FACTORS INFLUENCING YOUNG CONSUMERS ON E-RETAILING- AN EMPIRICAL STUDY TO ANALYZE E-SATISFACTION LEADING TO E-LOYALTY IN THE INDIAN CONTEXT

Sashikala P, ICFAI Business School
Vijayudu G, ICFAI Business School

ABSTRACT

In 21st century, the evolution of e-retailing in India is growing phenomenally. The role of young consumers' participation especially the age group of 18 to 25 years is highly appreciable in the e-retailing growth in India. This has triggered the researchers to study and find more relevant factors behind the youth involvement in e-retailing sector especially towards fashionable items.

The purpose of this research paper is to provide an empirical framework for determining factors effecting young consumers' online re-purchasing. This paper is testing whether the young consumer satisfaction is leading to young consumers' repeat purchase behaviour or not? Hence, we proposed a model 'young consumers' e-loyalty over e-satisfaction'. Towards this, twenty variables (items) were taken from previous literature and framed the hypotheses. The primary data was collected from young consumers by following simple random sampling technique.

The primary data was analysed by using factor, regression and logistic regression analysis. The results were found that the Product-specific factors, website design, price & payment methods and product delivery are the most determining factors influencing young consumers' online satisfaction in e-retailing industry. The proposed model was proved through logistic regression that there is high significance between e-satisfaction and e-loyalty.

Keywords: Young Consumer, E-Satisfaction, E-loyalty, Q-sort, Logistic Regression.

INTRODUCTION

Michael Aldrich (1979) was the man behind the invention of online shopping (e-retailing). Since then, the e-retailing business across the world is in high progress. E-retailing is a web-enabled interface between a retailer and its target consumers for selling products and services on the web (Chen, Ayanso, & Lertwachara, 2018). In recent times, India has seen an amazing growth in online retail shopping. Customers are individual buyers especially from metros, tier one and tier two cities. There was a huge expectation by a joint study of ASSOCHAM and Resurgent that the annual growth rate is all about 115 percent for the year 2018-19 (ASSOCHAM, 2018). The report was also noted that for the year 2017-18 as many as 108 million consumers did online shopping. The most preferred categories by Indian consumers were apparels & accessories which is about 54 percent, beauty and personal care is about 43 percent (ASSOCHAM, 2018; Sagar Malviya, 2020). In all purchases, the quality is the predominant at any price that led to online customers' satisfaction (Gehrt, 2012). Consumers also feel very convenient to shop online since they find themselves free from personally visiting the stores (Williams, et. al. 2006). It has given a new market space for the

FEATURE SELECTION USING CLUSTERING ALGORITHMS

Sashikala Parimi, ICFAI Business School
Padmanabha Aital, Narsee Monjee Institute of Management Studies

Feature selection is one of the important aspects of Data mining which is most useful in pattern recognition. Once the data which is in millions and trillions of tuples obtained from the user, the feature selection stage comes. It is used in the removal of redundant data from the highly dimensional data sets leading to reducing the dimensions of the complex data.. In this the features are extracted based upon the various attributes which are selected for the object or class of objects based upon the classifier generated from the trial data (Jianyu et al, 2016). There are two types of algorithms which are used such as supervised and unsupervised feature selection algorithms.

Supervised approach needs the labelled instances to train the classifier. Decision tree, Support Vector Machine, Naïve Bayes etc. are supervised algorithms. Supervised approach has limitations such as labelled instances are rare and difficult to obtain and it forces mapping of instances to one of the known class without detecting new ones.

Unsupervised learning is one of the Machine learning paradigms which is learnt using experience. The main task of this is to recognize the similar patterns in a data set and group them together to form clusters. This task is involved in extracting features from a data sets and classify them according to the similarity of the feature sets. In this the features of the data set cannot be decided in the beginning as the data considered is raw. It is a class where unlabeled instances are used and based on the inner similarity between instances, clusters are formed. K-Means, DBSCAN, Birch etc. are unsupervised algorithms. The clusters formed are homogeneous within the same group and are as much as possible heterogeneous outside the group (Jennifer et al, 2004).

Unsupervised feature selection algorithms can be divided as Filter approaches and wrapper approaches. Filter approaches discover relevant and important features by analyzing the correlation and dependence among features without any clustering algorithms. Wrapper approaches aim to identify a feature subset where the clustering algorithm trained on this feature subset can achieve the optimal value of the predefined.

Due to the outgrowth of the genetic algorithms, the evolutionary algorithms (EA) are developed called the Estimation of Distribution Algorithms (EDAs). This algorithm is used by replacing the crossover and mutation operators with the learning and sampling technique. In this the probability distribution of each of the criterion is determined and the best criterion is selected among the population of data sets at each iteration.

In EDAs, the correlations between different variables are explicitly expressed through the joint probability distribution associated with the individuals selected at each iteration. Hence EDAs are promising methods for capturing the structure of variable interactions, identifying and manipulating crucial building blocks. Since it has certain limitations on non-availability of theory to ensure that the solution is optimum, another technique based incremental learning was developed called Population-Based Incremental Learning (PBIL).

It assumes that all variables considered are independent of each other. It proved to be very successful in solving a variety of real-world problems. It's combined with the mechanisms of a generational genetic algorithm which is far simpler than a GA, and out-performs a GA on large set of optimization problems in terms of both speed and accuracy (Liu & Qu (2003).

BLOCK CHAIN ANALYTICS

Sashikala Parimi, ICFAI Business School
Anita C Raman, ICFAI Business School

INTRODUCTION

Block chain is going to lead majority of data storage and information sharing for upcoming IT industry. Block chain is a chain of blocks that talk about digital information (the "*block*") stored in a public database (the "*chain*").

Blocks store information about transactions like the date, time, and dollar amount of most recent purchases. They store information about participants in transactions. They store information that distinguishes them from other blocks. Even though the details of new transaction would look identical to earlier purchase, the blocks are apart because of their unique codes.

When one pays another for goods using bitcoin, computers on the Bitcoin network race to verify the transaction. In order to do so, users run a program on their computers and try to solve a complex mathematical problem, called a "*hash.*" When a computer solves the problem by "*hashing*" a block, its algorithmic work will verify the block's transactions, referred to as "*mining.*" (Jimi, 2018).

Although transactions are publicly recorded on the blockchain, user data is not—or, at least not in full. In order to conduct transactions on the Bitcoin network, participants run a program called "*wallet.*" Each wallet consists of two unique and distinct cryptographic keys: a public and a private key. The public key is the location where transactions are deposited to and withdrawn from. It also appears on the blockchain ledger as the user's digital signature.

Even if a user receives a payment in bitcoins to their public key, they will not be able to withdraw them with the private counterpart. A user's public key is a shortened version of their private key, created through a complicated mathematical algorithm. This technology is confidential due to the complexity and is impossible to reverse the process and generate a private key from a public key Lim (2021).

Applications of Blockchain

Health Care

Blockchain can provide safe opportunities for sharing patient data between insurers, providers and multiple doctors. It promises to improve information accuracy and sharing and helps in preventing fraud in health care.

Supply Chain

Complex supply chains can be tracked consistently and securely for all interested parties, including purchasers and regulators. Grocery supply chains have been early adopters of blockchain to improve food safety (Ming,2021)

Banking

Banks can share parts of a blockchain with each other to keep track of suspicious activity and track the flow of transactions. Permissioned blockchains can be used to re-engineer business processes, like moving transactions from front to middle to back office while

Blow whistle, should I or shouldn't I: a study on moderating effect of perceived organizational support on intention to blow the whistle among Indian Government employees

Preshita Neha Tudu
Department of HR, ICFAI Business School, IFHE University, Hyderabad, India

Abstract

Purpose – This paper aims to understand an employee's intention toward whistleblowing by analyzing Ajzen's (1991) theory of planned behavior (TPB) and Graham's principled organizational dissent (POD). It also seeks to find the moderating effect of perceived organizational support (POS) on whistleblowing intention (BI).

Design/methodology/approach – A total of 220 usable responses, collected from government employees of India, were analyzed using structural equation modeling. For developing a questionnaire, items were adopted from the literature and were measured on a five-point Likert-type rating scale.

Findings – Results revealed that attitude, perceived behavioral control (PBC), subjective norm (SN) and perceived responsibility of reporting (PRR) positively influence BI whereas the perceived cost of reporting (PCR) negatively influenced BI. It was further found that POS negated the effect of attitude, PBC, PCR and PRR on BI and strengthens the effect of SN.

Research limitations/implications – The present study adds to the list of academic literature on topics such as corporate governance and whistleblowing and provides new avenues to academicians and researchers for research. It provides a comprehensive understanding of whistleblowing concept, factors that influence BI and reasons to promote whistleblowing culture in organizations.

Practical implications – The findings may help government institutions to understand the factors that hinder whistleblowing practices and to devise strategies to foster a culture of whistleblowing. It may also offer insights to managers to mold human resource practices so that it includes policies of moral behavior.

Originality/value – This study is one of the initial studies in the Indian context to explore the moderating role of perceived organization support on employee's intention to blow the whistle.

Abstract

Purpose – This research paper aims to explore the relationship of financial performance and capital structure of Indian pharma firms of BSE 500, the impact of research and development (R&D) expenditure on financial performance and also explore the moderating role of competitive intensity between the existing relationship of capital structure and firm performance.

Design/methodology/approach – The balanced panel data of listed pharma firms of BSE 500 are used for the research study, and the present study adopts both the panel and ordinary least square (OLS) estimation techniques to draw the results.

Findings – The results exhibit that the high debt ratio is harmful for the accounting performance of the selected sample of pharma firms of BSE 500. Besides, market competition negatively moderates the relationship between capital structure and firm performance.

Research limitations/implications – The research findings provide evidence for the policymakers/regulators that the sample firms should discourage the high debt financing in the presence of competitive intensity in the product marketplace.

Originality/value – The core contribution of the current research is to examine impact of R&D expenditure on financial performance and the moderating role of market competition on the relationship of capital structure and firm performance to the best of the authors' knowledge, and no single study has previously explored this relationship in the context of BSE 500 pharma firms.

Keywords Capital structure, Firm performance, Competitive intensity, BSE 500 firms

1. Introduction

In the 21st century, the Indian pharmaceutical industry has experienced massive growth. India holds a significant position among the worldwide pharmaceutical sector, which is the largest global provider of generic drugs. Indian pharmaceutical industries fulfill more than 50% of the global demand for various vaccines. Furthermore, India also provides supplies of about 40% of the generic market in the United States, and 25% of all medicine in the UK. India's pharmaceutical exports amounted to US$ 17.27 bn in FY18, which reached US$ 19.14 bn in FY19 (www.ibef.org). So, the outstanding performance of the Indian pharmaceutical sector has motivated us to study this sector and to find some empirical facts and figures related to the significant determinants of capital structure in the pharmaceutical sector of India. The current study finds the relationship between capital structure and financial performance as well as explores the moderating role of competitive intensity in the relationship. This research study examines the impact of capital structure on the financial performance of pharmaceutical firms considering the moderating role of competitive intensity.

The theory of capital structure and relationship with firm value:

Abstract

The major purpose of place branding is to attract tourists and investors by enhancing the value proposition of a place through its unique regional identity. We undertake two studies to test the impact of regional identity on destination brand loyalty, and thereby on investment attractiveness. Study 1 involves identifying the dimensions of customer-based place brand equity (CBPBE) from a regional identity perspective. Data were collected from the state of West Bengal in India. Results of exploratory factor analysis show a four-dimensional structure of CBPBE consisting of brand salience, brand meaning, perceived quality, and brand attachment. Based on 290 responses collected from Thailand, we use these CBPBE dimensions in study 2 to develop and validate the psychometrically robust CBPBE-RI instrument. Finally, we test for the impact of CBPBE-RI dimensions on destination brand loyalty and investment attractiveness. The results have managerial and theoretical implications.

Introduction

In recent years, the branding of regions and nations has gained popularity among practitioners and academics to attract domestic and international audiences (Anholt 2010). Geographies compete for trade, students, exports, tourists (both domestic and international), and investments, among other things. Such rivalry among regional entities has resulted in the growth of place branding (Castañeda-García et al. 2020; Dinnie 2004). Place branding extends the corporate branding theory to generate opportunities for trade, tourism, inward investments, and economic development of a place (Cleave, Arku, and Chatwin 2019). It is argued that place can act as a brand to its customers akin to that of a product brand, and place brand is subject to its own form of brand image and equity (Rainisto 2003). One of the prominent aims of place branding is to attract target audience (trade, tourist, investors, immigrants, and students) by enhancing the value proposition of the place through its unique identity. This identity is a set of unique associations rooted to the people of that place and is comparable to the concept of brand identity (Paasi 2013). These unique associations are aspirational and enduring to the target customers that the place marketer tries to leverage (Aaker 1996).

The emphasis of existing place branding is primarily on creating an offering that enhances the image of the place to the target audience (Foroudi et al. 2016; Hafeez et al. 2016), and harvesting the place brand equity (Florek 2015; Bose et al. 2020). Likewise, place image is primarily sourced from the place attachment (Prayag and Ryan 2012; Stylos et al. 2017) and place reputation (Foroudi et al. 2016; Braun et al. 2018) theories, particularly in the tourism context (Chen and Dwyer 2018; Patwardhan et al. 2020; Nelson 2015). Place brand equity literature is influenced heavily by customer-based brand equity (CBBE) (Aaker 1996; Keller 1993).

Place attachment is deeply embedded in the concept of regional identity. Paasi (2013) explained regional identity as uniqueness of regions and/or identification of people with them (p. 1206). Attachment of locals toward a place and their way of life creates a unique identity for that place. This unique regional identity creates positive brand equity,

CUSTOMERS' PERCEPTIONS OF ONLINE RETAILING SERVICE QUALITY AND THEIR LOYALTY

Vikas Gautam, Department of Marketing & Business Strategy, ICFAI Business School, Hyderabad
Vikram Sharma, Department of Marketing, ICFAI Business School, Gurgaon

ABSTRACT

Computer-assisted services have developed in abundance and contributing substantially towards swift progression of Internet espousal. The main objective of the current study was to examine the effects of E-Service Quality (website design, reliability, privacy/security, and customer service), Customer Perceived Value, Corporate Image, Customer Satisfaction, Trust, and Commitment, on customer Loyalty. After theoretical considerations, a research model was developed and empirically tested. 243 eligible responses were collected via an offline questionnaire survey. Higher order Structural Equation Modeling results confirmed significant effects of customer satisfaction, corporate image, and commitment on customer loyalty by explaining 79.70 % of variance. Whereas, trust proved to be insignificant predictor of customer loyalty. Commitment was not found having significant mediating effect in the relationship between customer satisfaction and loyalty. On the other hand, corporate image has an indirect positive effect on customer loyalty through customer satisfaction. Moreover, electronic service quality has a direct and indirect positive effect on customer satisfaction through customer perceived value. Drawing from the results, this research provides empirical support that customer loyalty can be influenced by e-service quality, customer perceived value, customer satisfaction, commitment, and corporate image in online retail context.

Keywords: E-Service Quality, Customer Perceived Value, Customer Satisfaction, Commitment, Corporate Image, Trust, Customer Loyalty.

INTRODUCTION

Past few decades have witnessed a rapid growth in Electronic-commerce market. This growth has resulted in drawing attention of social science researchers across the globe towards electronic marketing activities. Every organization dreamt of having large loyal customer base, thus all global e-commerce companies are developing strategies to achieve customer loyalty. According to Parasuraman & Grewal (2000), inducing loyalty among customers demand ingredients like; superior quality products, superior value and flawless after-sales service. As well, customer delight is as indispensable key to achieve customer loyalty (Oliver, 1999). The service quality provides significant information and feeling to prospects and customers in virtual shopping context, as it does in case of brick and mortar retail store. Several management scholars have confirmed tangible and intangible benefits for the companies resulting from customer's loyal behavior. Reichheld (1996) identified positive word of mouth and product recommendations as intangible benefits, whereas repeat purchases as tangible benefits. In addition, loyal customer saves money for the company and maintains long term relationships. Customer satisfaction is very important to ensure loyalty (Anderson & Srinivasan, 2003; Oliver,

A Sequential Bayesian Change-Point Analysis of BRICS Currency Returns

Aviral Kumar Tiwari[1] · Cleiton Guollo Taufemback[2] · Satish Kumar[3]

Accepted: 16 December 2020
© The Indian Econometric Society 2021

Abstract
We examine the occurrence of structural breaks in the mean return and volatility of the BRICS currency returns. We propose a novel methodology to identify regimes with same statistical variance based on sequential Bayesian change point model. We find frequent occurrence of structural breaks in the mean returns and volatility of BRICS currencies. The segments with same statistical properties are merged into regimes. We sorted the regimes from low to high regarding their volatility. We show that the last regime exhibits the highest returns and incorporates the shortest periods across all currencies with exception to the Chinese and Brazilian currency. This is an indication that periods of high volatility are few and offers high returns compared to periods of low volatility.

Keywords BRICS · Bayesian change-point model · Return · Volatility · Regimes

Introduction

Recently the five major emerging economies including Brazil, Russia, India, China and South Africa (BRICS) have received considerable attention from academicians and practitioners alike since they have witnessed significant development in the last two decades (Cheng et al. 2007; O'Neill 2011; Samargandi and Kutan 2016). As per the latest Bank for International Settlements (BIS) 2019 report, the Chinese

ADVERTISING PUFFERY IN THE INDIAN EDUCATION SECTOR: A COMPARATIVE ANALYSIS OF ELECTRONIC AND PRINT MEDIA PUFFERY AND RECOMMENDATIONS

Nandan Kumar Dey

Research Scholar, Dept. of Marketing and Strategy, IBS Hyderabad, Telangana, India

ABSTRACT

In this highly competitive Indian educational product market, marketers are continuously searching for innovative ideas to sell their products. As a consequence, advertising puffery has been extensively used a tool to acquire a new customer. This article aimed to explore the various types of media used in advertising puffery in the Indian education sector. With this regard, a list of consumer complaints was collected from the Advertising Standards Council of India's (ASCI) official website and analyzed. The results revealed that traditional print media is predominantly used for puffery in advertisements in the Indian education sector. As far as advertising puffery through electronic media is concerned, digital media is considered as the most notorious media followed by Television & YouTube, Facebook & Instagram, and Website. Comparing the results of both the traditional print media and various electronic media in promoting the Indian education sector, it was evident that digital media was extremely responsible for spreading advertising puffery. Based on the literature review and consumer complaint data analysis, the author has given few recommendations which may be useful for future research.

Keyword: *Puffery, Advertising, Print Media, Electronic Media, Digital Media, Education, India.*

1. INTRODUCTION

The sellers and marketers are continuously searching for new and better ways to increase their sales volume for any product or service. Business entities use puffery as a key marketing tool allowing them to advertise their product/brand as "The Best", "No. 1", "The Better Choice" or even "The World's Most Effective", etc. Advertising puffery is also seen as one of the most common practices to promote the Indian education sector nowadays. According to the annual report 2019 – 20 by ASCI (The Advertising Standards Council of India), the Indian education sector has the maximum no. of advertising puffery (i.e., 2000 no. of misleading advertisements), followed by the healthcare sector (787), Personal Care (202), Food & Beverages (175), and so on. Despite this, advertising puffery has remained as one of the under-researched areas [1]. Therefore, this article aimed to explore the ASCI Complaint Analysis Report – Q3 FY (2020-2021). From the analysis, it has been observed that both electronic and print media are extensively used to promote the education sector in India. A comparative analysis of electronic and print media advertising puffery has been done.

2. THEORETICAL BACKGROUND AND LITERATURE REVIEW

Advertising puffery is defined as "advertising or other sales representations which praise the item to be sold with subjective opinions, superlatives, or exaggerations, vaguely and generally, stating no specific facts" [2]. It is the language used by marketers to describe their brands in advertising and sales presentations. Similarly in India, as per ASCI, the advertisements must be truthful and justifiable. The decision on whether an advertisement is justifiable or untruthful is objective whereas, deception or untruthfulness is subjective that resides in the mind of the

An investigation of antecedents and consequences of supplier integration: a study in Indian context

Nikhat Afshan and Jaideep Motwani

Nikhat Afshan is based at the Department of Operations and IT, ICFAI Business School Hyderabad (A constituent of ICFAI Foundation for Higher Education), Hyderabad, India. Jaideep Motwani is based at the Seidman College of Business, Grand Rapids, Michigan, USA.

Abstract

Purpose – *The purpose of this study is to investigate the antecedents and outcomes of supplier integration. Based on an extensive literature review, the study has proposed a research model, which includes both the antecedents and consequences of supplier integration. The study has included contextual factors, namely, trust, relationship commitment to supplier and information technology (IT) for supplier as antecedents to supplier integration. The supplier-related performance outcome and financial performance of manufacturing firm has been modeled as outcome variables.*

Design/methodology/approach – *The proposed research model was tested on a sample of 166 manufacturing firms from India using structural equation modeling.*

Findings – *The results suggested that trust, relationship commitment to supplier and IT for supplier have a positive impact on supplier integration. The results further confirmed the positive impact of supplier integration on supplier-related performance outcome and supplier-related performance outcome on financial performance of the firm.*

Originality/value – *The study argues that the contextual factors (trust, relationship commitment to supplier and IT for supplier will facilitate the integration between manufacturing firms and their suppliers). Further, the study argues that the supplier integration would lead to specific performance outcome resulting from a high level of integration between manufacturer and their key suppliers and labeled it as supplier-related performance outcome (SRPO). The study conceptualizes and develops scale to measure SRPO and investigates the impact of SRPO on the financial performance of the manufacturing firm.*

Keywords *Trust, Firm performance, Supplier integration, Relationship commitment, Supplier-related, Performance outcome, Financial performance*

Paper type *Research paper*

Introduction

Suppliers have been identified as a critical component of supply chain by the supply chain management theory. To deliver customized products quickly to the customers, the companies need to communicate quickly and efficiently with their suppliers. This often involves a significant attitudinal shift for firms where they view the supplier not as a competitor but rather as a collaborator (Stock *et al.*, 2010). Supplier integration stresses such a relationship between firms and their key supplier which involves information sharing and collaboration in planning and joint production development in dealing with inter-organizational boundaries. It enable organizations to work more effectively with a few important suppliers who are willing to share responsibility for the success of the products. Supplier integration synchronizes the core competencies and capabilities of buyers and suppliers to jointly achieve improved service capabilities at lower supply chain cost (Gallear *et al.*, 2012).

Supplier integration are increasingly viewed in both scholarly and practitioner literatures as key drivers of sustainable competitive advantage (Stock *et al.*, 2010; Roden and Lawson, 2014;

ANN model for users' perception on IOT based smart healthcare monitoring devices and its impact with the effect of COVID 19

Kashmira Ganji and Sashikala Parimi
Department of Operations and IT, ICFAI Business School, Hyderabad, India

Received 1 September 2020
Revised 27 November 2020
Accepted 26 January 2021

Abstract

Purpose – COVID-19 was indeed a global epidemic that revolutionized the way of life, especially health-care services. The way health care will be delivered will undergo a dramatic change in the future. The aim is to analyse the increasing usage of health care systems along with digital technology and IoT especially during pandemic.

Design Methodology Approach – This research paper deals with users' perception and their recommendation status of IoT-based smart health-care monitoring devices based on their perception, experience and level of importance to enhance the quality of life. An effective artificial neural networking (ANN)-based predictive model is designed to classify the user's perception of usage of IoT-based smart health-care monitoring wearables based on their experience and knowledge.

Findings – The model developed has 96.7% accuracy. Among the various predictors chosen as inputs for the model, the findings indicate that self-comfort and trusted data from the device are of high priority. The present study focused only on some common factors derived from previous studies.

Research Limitations Implications – Although the performance of the proposed system was noticed to be good, the size of the sample is also limited to a few responses. Implications for future research and practices are discussed.

Originality Value – This is a novel study that aims to develop an ANN model on analyzing the user's perception of IoT-based smart health-care wearables with the effect of COVID-19 pandemic. This paper elaborates on the ongoing efforts to restart the health-care services for survivability in the new normal situations.

Keywords ANN, IoT, Smart health-care devices, COVID-19

Paper type Research paper

1. Introduction

The combination of health care and technology witnessed several advancements in creating new opportunities in customized health-care services. Especially in current times, there is a growing demand for a system with connected devices, tracking technology and continuous monitoring. The wearable technologies are majorly important in the field of health care (Aliverti, 2017). The emergence of wearable technologies in combination with the Internet of things (IoT) has growing importance in this era. With the effect of COVID-19, there is an increased amount of health crises in various countries. The COVID-19 outbreak which was previously known as 2019-*n* CoV, is spreading rapidly which led to the closure of cities. The rate at which the spread of the virus to various countries across the globe led the World Health Organization (WHO) on January 30, 2020 to declare coronavirus outbreak a "Global Public Health Emergency". On March 11, 2020, the WHO has marked the outbreak of novel coronavirus disease (nCoV or COVID-19 or SARS-CoV-2) a pandemic (Who, 2020b) and as of

Abstract

The quest for a healthy lifestyle has increased the popularity of wearable activity devices (WAD) among the masses. However, despite the numerous benefits of WAD, most people (50 percent) stop using it within two weeks of their usage. This presents a concern that needs to be addressed to promote WAD usage for healthy living. This current study attempts to understand the factors affecting the continued usage intention of WAD among users. So, to understand the drivers of continued usage, a sample population with continuous usage of WAD for more than six months is considered for the study. The proposed framework includes the factors: self-quantification, gamification, feedback, and commitment. Structural equation modeling is conducted to establish the model validity and predictability. Results indicate that the model satisfies all the model fit-indices and is adequate to predict the continued usage intention of WAD users.

Keywords

Wearable Activity Devices, Self-Quantification, Gamification, Feedback, Commitment.

Introduction

Healthy lifestyle has become a priority in the current pandemic situation and building immunity is being considered as an effective tool to fight the Covid 19 pandemic (Lotfi et al., 2021; Yazdanpanah et al., 2020). It is suggested that apart from having balanced diet, exercise and activities are crucial for building immunity. Wearable activity devicess (WAD) have proved to be handy in improving activities and in countering sedentary lifestyle. Recent years have seen a surge in wearable activity devices adoption around the globe. 68.9 billion US Dollars were spent in 2020 on wearable activity devicess (Rimol, 2021). This industry is expected to become an 81.5 billion US Dollar by the end of the year 2021(Rimol, 2021). Wearable activity devices has amassed a considerable attention of the masses as these devices are not only convenient to wear but are also very effective tool in monitoring one's own activities (Lunney et al., 2016). The data provided by WAD can be further analysed by an individual to assess the present health condition and set their own goals to achieve the required level of activities.

WAD comes with several features such as step counting, heart beat tracking, sleep pattern analysis, calories spent, etc. (Lunney et al., 2016; Stragier et al., 2016) which not only provides vital information to quantify health but also acts as a motivation to do better in terms of health.

Despite the numerous benefits of WAD almost 50 per cent of the users stop using these devices withing two weeks of their usage (Endeavour Partners (2014) report). This presents a concern that needs to be addressed to promote continuous usage of WAD in order to promote health. The current study is an attempt to address the above issue by considering the sample of users who have an experience of using WAD for six or more than six months. In this study based on the experience of users, only those factors are considered which are identified to play a role in promoting the continued usage of WAD. The proposed framework considers the factors: gamification, self-quantification, feedback and commitment and their impact on intention to continued usage of WAD.

Hypotheses Development and Research Model

Self-quantification (SQ)

Self-quantification can be described as the process of self-regulation by an individual to regulate their own behaviour by monitoring their own activities (Bai 1991; Michie et al., 2011; Stragier et al., 2016). It includes setting goals and standards, planning and scheduling activities to reach the targeted behaviour (Ba 1991; Stragier et al., 2016). Self-quantification is observed to posit a positive impact on behavioural intention (Stragier et al., 2016).

Gamification (GM)

Gamification refers to creating a gaming like experience where an individual feels motivated and target seems achievable imparting a sense of achievement and mastery (Ryan, et al., 2006). Gamification uses positive reinforcement among individual to instigate action towards achieving better results (Palfai & Macdonald, 2007; Nelson et al., 2016). WAD even provides badges or levels or both for physical activities which can further be shared on social groups creating a sense of competition and improving motivation (Nelson et al., 2016). Gamification is observed to have a positive impact on behavioural intention of users (Palfai & Macdonald, 2007).

Feedback (FB)

WAD is equipped with biosensors, collects data of one's activities which is then feed-back to the users providing essential data regarding present condition of the user (Chittaro and Sioni, 2014). Feedback further acts as a catalyst to enhance empowerment among individual's improving their determination towards their goals (Nelson et al., 2016). With the help of feedback mechanism an individual feels confident in setting and achieving their goals (Nelson et al., 2016). In some advanced WAD analytical tools provide further health analysis and helps an individual to have better understanding and control over their activities. Feedback is observed to posit a positive impact on behavioural intention of users (Nelson et al., 2016).

Autonomous/controlled travel motivations and their effect on travel intentions of Indian Millennials: a mixed method approach

Anish Yousaf[a], Abhishek Mishra [b] and Insha Amin[a]

[a]Department of Marketing and Strategy IBS Hyderabad, Telangana; [b]Department of Marketing Indian Institute of Management Indore, M.P. (India)

ABSTRACT

With the self-determination theory (SDT) as grounding, the current study uses qualitative investigation with twenty-five respondents and a two-stage quantitative validation with 782 respondents, to propose seven travel motivations for Indian millennials. These motivations are knowledge-seeking, escape, sense of accomplishment, experience stimulation, social relationships, destination rewards, and social media compulsion. These motivations are mapped to specific regulations in the SDT and organized into autonomous and controlled motivations. Both autonomous and controlled motivations have a significant impact on travel intentions. A judgemental sample of Indian millennials is drawn from the eligible client-list of a prominent tourism agency used as the sampling frame. The study guides destination managers to position their destinations aligned with the motivations that drive Indian millennials to travel.

ARTICLE HISTORY

KEYWORDS
Indian millennials; travel motivation; self-determination theory; autonomous motivation; controlled motivation; travel intention

Introduction

Pew Research defines millennials as those who are between ages 22 and 38 years as of 2019 (Dimock, 2019). Recent trends indicate that global tourism increased by 6% to 1.4 billion in 2018 and rose by another 3–4% in 2019; however, is expected to fall 80% in 2020 due to the COVID-19 pandemic (UNWTO, 2018, 2020). Millennials comprise around 23% of all global and domestic travel, contributing USD 286 billion in 2016, USD 308 billion in 2017, and USD 400 billion (estimated) in 2020,[1] making them an attractive traveller segment (UNWTO, 2016; WTTC, 2019). Travel is the top priority for millennials who travel more than any other generation (Cavagnaro et al., 2018).

India is an emerging economy where tourism accounts for 9.2% of GDP and 8.1% of employment worth 42.7 million employees, including both international and domestic travel (FICCI, 2019; WTTC, 2019). Its emergence as a vibrant economy has stimulated the country's outbound travel. From 16.6 million in 2013, the international departures have risen to 26.3 million, a year-on-year growth of 9.6% (ETC, 2020), making Indians a preferred group for tourism destinations. In terms of value, the outbound tourism expenditure rose by 22% from 2017 to touch USD 21.3 billion in 2018, with Europe accounting for a 17% revenue-share (HBL, 2020). As a cohort, Indian millennials are the biggest travel group who seek novel experiences and travel for longer durations averaging 35 days a year, with their travel demand growing by 50% in 2019 (Mint, 2020). Indian millennials' travel motivations are much different from other groups since they represent a sizeable generation with substantial purchasing power and shared pro-environmental concerns (Muralidharan & Xue, 2016). They focus on their image, ethos, use of social media, and are also powerful influencers (McCormick, 2016). Given the vastness of the country and its rich heritage, many Indian millennials also prefer to travel domestic (HBL, 2020). Post COVID-19, Indian millennials are expected to be leading the recovery of the Indian travel industry, with 71% eager to travel domestic (BT, 2020).

Recent studies on millennials are primarily focused on psychographic segmentation of this age-group and their travel styles, without providing a holistic typology of motivations that shape such behaviours (e.g. Giachino et al., 2020; Han & Hyun, 2018; Richards, 2015; Rita et al., 2019; Smith et al., 2018). Motivation is the primary reason for people depicting a specific intention/behaviour (Dann, 1981; Han & Hyun, 2018; Nikjoo & Ketabi, 2015), and tourism studies use motivations as part of psychological frameworks for examining the factors behind travel (e.g. Chen et al., 2019; Giachino et al., 2020). However, none of these presents a robust

Abstract— **With the modern technological innovations every industry is transforming itself to produce better goods and services for client satisfaction. Healthcare is also such an industry which is using modern technology for transforming the pattern of patient care and treatment. In the technological era, the aim of the healthcare ecosystem is not only disease management but an overall well being of patients. Sensor enabled IoT based smart healthcare systems along with integration of artificial intelligence creates orchestration of healthcare services and enables healthcare professionals to monitor the routine activities of patients in real-time enabling on time response for patients' healthcare needs. The study discusses how artificial intelligence and sensor enabled smart devices creates smart systems for continuous monitoring of patient's health and creates orchestrated services for the benefits of the patients. Study also creates the literature-based propositions which can be empirically validated in the future.**

Keywords—Artificial Intelligence, Internet of Things(IoT), Smart Healthcare Systems, Wearable Devices, Patient health monitoring.

I. INTRODUCTION

The world is moving towards the smart things. Like cities are not just cities, but now they are smart cities. Smart cities invest in novel ICT (Internet and Communication Technologies including IoT (Internet of Things), AI (Artificial Intelligence), cloud computing, mobile internet based services etc. for providing better governance and better services to the residents [1]. Providing better healthcare is equally important as providing better governance with smart gadgets and smart technology as with the aging population, chronic illness has become part of daily life [2]. Although with the slow adoption of smart devices, healthcare is slowly transforming itself towards digitization of services by slowly adopting the smart technologies [3].

People have started to adopt modern healthcare technological innovations not just for activity tracking but also for healthcare purposes [4]. People have started to use mHealth platforms for an online consultation with their physician in chronic as well as acute disease [5], and sensor enabled IoT based wearable devices for the purpose of exercise and fitness tracking as well as for continuous monitoring of vital physiological signs [6]. On the other end, healthcare service providers also adopted the smart devices and technology to create orchestrated services for enabling their flexibility and agility [7], [8].

With the increase in use of smart health gadgets like IoT, it is not only possible to monitor the health remotely, but also possible to run healthcare analytics for individual patients, as data can be obtained in real-time. With the integration of artificial intelligence and smart gadgets, it is possible to find the undesirable outcome and alert the patient at the correct time [9], enabling the right-time treatment for the patients. The study describes applications of AI when it is integrated and embedded with smart health systems and gadgets like IoT or IoMT (Internet of Medical Things) enabled devices responsible for real-time remote monitoring for individuals. The study also describes the opportunities and advantages of using such technologies into healthcare scenarios and gives a framework for orchestrated futuristic healthcare enabling the better service outputs.

The remaining floe of the study is presented as follows, section 2 represents the objective of the study and section 3. represents theoretical framework and literature review. Section 4 and 5 represent methodology and results respectively, whereas section 6 represents a hypothetical case study and section 7 represents the proposition development, where the proposed theoretical model has been established. At the end section 8 represents conclusion along with research limitations and future scope.

II. OBJECTIVE OF THE STUDY

The literature-based study aims to investigate the futuristic healthcare service scenario from the lenses of healthcare service orchestration where the network of healthcare professionals is seamlessly integrated and creates orchestrated services to serve healthcare needs of patients.

- To understand how artificial intelligence, when integrated with sensor enabled IoT based devices can create the smart systems.
- To analyze how smart systems enable remote-patient monitoring and create service orchestration by involving the network of healthcare professionals.

Accepted 31 March 2021

Abstract

Purpose – This study aims at identifying critical success factors of a sustainable mobile banking application using text mining approach.

Design/methodology/approach – A total of 6,073 consumer reviews relating to a mobile banking application were collected and analyzed to meet the study objective. Latent Semantic Analysis (LSA) was done to identify the critical success factors of a sustainable mobile banking application.

Findings – The results indicated that privacy and security, navigation, customer support, convenience and efficiency are the key factors.

Research limitations/implications – The study findings enrich the mobile banking and sustainable service delivery channel literature.

Practical implications – The results are expected to benefit the bankers in delivering effective banking services through a mobile banking application.

Originality/value – Studies in the sustainability are few yet promising particularly the ones that use rigorous statistics suitable on thousands of data points to accomplish the study objectives.

Keywords Mobile banking application, Text mining, Latent semantic analysis, Sustainability

Paper type Research paper

Introduction

The financial sector offers a wide range of delivery methods and is known for its early adoption of self-service technologies (Laukkanen, 2007; Martins *et al.*, 2014; Shankar *et al.*, 2020a, b). The banking industry is particularly popular in taking such initiatives within this sector. Automated Teller Machines (ATMs), telephone banking, online banking and, more recently, mobile banking, are a few of the major technology-oriented delivery methods adopted by banks (Hoehle *et al.*, 2012; Mullan *et al.*, 2017). Among these service delivery routes, mobile banking (m-banking) enables banks to provide convenient and customized banking services to customers without time and geographical constraints (Laukkanen, 2016; Tam and Oliveira, 2016).

The information communication-related technological advancements and the proliferation of mobile phones has encouraged banks to deliver banking services using m-banking applications (Gupta and Arora, 2017; Foroughi *et al.*, 2019; Hassan and Wood, 2020; Shankar *et al.*, 2020a, b). A m-banking application is beneficial for both banks and consumers (Chaouali and El-Hedhli, 2019), because it can provide cost-effective and efficient banking services to consumers (Jun and Palacios, 2016). Moreover, consumers can use

Abstract

Purpose

While prior studies have highlighted the brighter side of technology adoption in improving human resource (HR) functions, the dark side pertaining to the adoption of technology in people management within organizations has gone relatively unnoticed. The current study tries to demystify the dark side of electronic human resource management (e-HRM) by examining banking institutions in India which are believed to have undergone several transformations in recent years.

Design/methodology/approach

This study adopts an inductive qualitative approach to examine the research problem. In total, 53 semi-structured interviews were conducted with the employees of eight public sector banks in India. The interviews were transcribed. The analysis of the data was

How Does Online Engagement Drive Consumers' Webrooming Intention?

A Moderated-Mediation Approach

Amit Shankar, Indian Institute of Management, Visakhapatnam, India
Rambalak Yadav, Institute of Management Technology, Hyderabad, India
Manish Gupta, ICFAI Business School, Hyderabad, India

ABSTRACT

Based on the cognitive-motivational-relational (CMR) theory, this study empirically investigates the mechanisms through which consumers' online engagement impacts their channel switching intention. The present study examines the mediating effects of perceived value and the ways in which these mediating effects are moderated by online risk perception. Data were collected from 428 online Indian consumers using systematic random sampling. The results of the structural and process macro analyses indicated that consumer online engagement has a significant impact on consumer online search benefits which in turn leads to webrooming intention. Also, perceived value mediated the effects of online search benefits and offline purchase benefits on webrooming intention. The results advance the theory of CMR by explaining consumer channel switching behaviour and are expected to help multi-channel retailers to identify the key drivers that help engage consumers online.

KEYWORDS

Multi-Channel Retailing, Online Engagement, Online Risk Perception, Perceived Value, Webrooming Intention

1. INTRODUCTION

Due to widespread access to the internet, increasing mobile phone penetration, and developed information systems, channel switching behaviour has become a common phenomenon (Arora & Sahney, 2018; Verhoef et al., 2007). Webrooming has emerged as a frequent consumer behaviour relating to channel selection where consumers search information over online platforms before making a final purchase from offline stores (Frasquet et al., 2015; Flavián et al., 2016; Fernández et al., 2018; Wong et al., 2018; Aw, 2019; Flavián et al., 2020; Shankar & Jain, 2020). According to a Price waterhouse Coopers' (PwC) recent report, a large number of consumers visit a company's website to collect information before purchasing a product or availing of services from the company's offline store (PwC, 2015). According to the Deloitte (2017) report, more than 69% of consumers search for products and services online before purchasing them offline. Further, more than 72% of The United States of America (USA) consumers search for product information over online platforms before purchasing from physical stores (D'Avanzo & Pilato, 2015). The majority of the purchases at

Abstract

The purpose of the study is to examine the influence of onboarding on employee creativity and test if psychological empowerment moderates the relationship between onboarding and perceived employee creativity of knowledge workers. Data required for the survey was collected from 550 knowledge workers of three firms in service sector in India. The model was analysed using ANOVA, Chi-square test and regression analysis and was used to establish the conditional indirect effects of the moderator. Descriptive analysis was used to calculate mean, standard deviation and correlation coefficient. The results of the study supported the impact of onboarding levels on employee creativity. This study proved higher level of creativity for employees who experienced four levels of onboarding. The results indicated onboarding to strongly influence employee creativity. Onboarding also proved to moderate the effect of psychological empowerment on employee creativity. The crucial theoretical implication is to study the effect of onboarding on new employee perception, production and productivity. The study aims to provide insights to improve new employee creativity on successful onboarding and role of psychological empowerment on it. Much scope of future research on onboarding exists as research in this direction is on surge in the recent days.

Abstract

Purpose – The present study is an attempt to extend the Model of Goal-directed Behavior (MGB) to consider health consciousness and perceived privacy protection as two critical factors to predict desire and intention by individuals to adopt and use wearable health devices (WHDs).

Design/methodology/approach – Based on the literature review hypotheses were framed and tested using data collected through a questionnaire survey. A total of 418 self-reported complete responses were considered to analyze the hypotheses proposed in the study. Structural equation modeling, effects analysis and model comparison (MGB and extended MGB) were performed to understand the predictability of the suggested model.

Findings – The results of the study corroborate that along with MGB, health consciousness and perceived privacy protection also induces the intention of users toward using WHDs. Health-consciousness is found to have a positive and significant direct and indirect impact on intention to use WHDs. Further, the model comparison exhibits that the proposed extended MGB is a better predictor of intention to use WHDs.

Abstract

In a typical influenza epidemic, a majority of the victims are young children and the elderly, giving the age profile of mortality a distinct 'U' shape. But the 1918 epidemic was unique in that a disproportionate number of its victims were men and women aged 15 to 44, giving the age profile of mortality a distinct 'W' shape, rather than the customary 'U' shape, leading to extremely high death rates in the prime working ages. The greatest disadvantage of studying the economic effects of the 1918 influenza is the lack of economic data. Given the general lack of economic data, however, a remaining source for information on (some) economic effects of the 1918 pandemic has been the print media.

Description

As the Covid-19 pandemic unfolded, many features common with the 1918 influenza pandemic were identified. Both pandemics involve the spread of a novel, highly contagious virus that induces respiratory distress, could be contracted from casual close contact of an infected individual and spreads across many countries within months. In both the pandemics, non-pharmaceutical interventions like social distancing were the prime modes used to control their spread (Beach et al., 2020).

The mortality rates for both the pandemics are higher than a typical seasonal influenza, killing tens of millions worldwide. There were substantial variations in the intensity of the pandemic with population density, air pollution and non-pharmaceutical interventions playing an important role in determining the pandemic severity (Beach et al., 2020). The analysis focuses on the impact of a country's flu death rate on its economic outcomes, and not on reverse effects of economic conditions on the death rate (Barro et al., 2020b).

Client Category Turnover, Stringency Index and Indian Stock Market Movement during COVID-19

Rama Krishna Yelamanchili*and Sager Reddy Adavelli**

ICFAI Business School, IFHE-Hyderabad, India

Abstract: Indian stock market is one of the global stock markets which swiftly moved from its trough to peak in an unprecedented short time horizon. In this paper, we try to understand this sudden surge from the perspective of client category turnover. We also try to assess the causal relationship between stringency index and stock market movements. The Indian stock market investors are majorly classified into four categories, i.e., Clients, Domestic Institutional Investors (DIIs), Foreign Institutional Investors (FIIs) and Proprietary investors. Our data contain 305 daily observations of all the study variables. We use Hierarchical Linear Model (HLM) to assess the impact of client category wise turnover on stock index movements. We find statistically significant negative relation between stringency index and stock market indexes; clients, DIIs, and stock market indexes. On the other side, we find statistically significant positive relation between FIIs, Proprietary investors and stock market movement. In all, these five variables explain 63% of variance of the stock market. We noticed that in HLM model 3, proprietary net is the only variable with positive beta and explained 25 percent of R^2change. We observed divergent investment strategies adopted by each investor category, clients followed momentum trading, DIIs followed market timing, FIIs responded to global cues, and finally proprietary investors were bullish.

Keywords: DIIs, FIIs, HLM, Proprietary Investors, Stock Market, Stringency Index

JEL Classification Number: E44, G1

1. Introduction

COVID-19 pandemic created chaos in all economies across the globe. However, the impact was sequential rather than contemporaneous. Initially, Chinese economy was hit badly followed by Europe, USA, and then emerging economies like India. In Indian market, the downtrend started by the end of February 2020 and reached deepest by the end of March 2020. During this one month, the Indian broad market index tanked by 60%. Beginning April 2020, even after a nationwide lockdown imposed by the federal government, the Sensex soared towards north and gained more than hundred per cent in next 15 months. No other stock market in the world witnessed such a phenomenal surge. However, there is a heated debate among market participants about whether and when the Indian stock market will crash. On one side, the Reserve Bank of India (RBI) in its annual

Examining the Relationship between Consumer Brand Relationships and Brand Evangelism

Australian Journal of Business and Management Research ▫

10.52283/nswrca.ajbmr.20210601a07 ▫ 2021 ▫
Vol 6 (1) ▫ pp. 84-95

Author(s): Mukesh Kumar Mishra ▫ Ankit Kesharwani ▫ Vikas Gautam

Keyword(s): Purchase Intentions ▫ Model Fit ▫ Causal Relationships ▫ Brand Trust ▫ Brand Identification ▫ Brand Relationships ▫ Equation Modelling ▫ Sample Data ▫ Brand Affect ▫ Brand Evangelism

It is a well-known fact now that consumers falsify profound and meaningful relationships with particular brands and that such consumer brand relationships are expected to impact brand-related behavior of consumers. The study investigates the influence of three consumer-brand relational constructs - brand trust, brand affect and brand identification – and their effects on brand evangelism behavior, which was operationalized in the form of two supportive behaviors namely; purchase intentions and positive referrals. After assessing common method bias as well as reliability and validity estimates, structural equation modelling was employed with 458 sample data to test the study model fit and hypothesized relationships. The findings reveal that the consumer-brand relationship influences brand evangelism. All consumer-brand relational constructs (i.e., brand trust, brand affect and brand identification) influence brand evangelism positively in terms of purchase intention and brand referral. The study highlights the importance of brand evangelism in the marketing literature by establishing its causal relationships with the key brand attributes of brand affect, brand trust and brand evangelism. Implications of the results are deliberated with future scope for research.

Marketing of Life Insurance to the Indian BOP Segment: A Literature Review Using the 4A Framework

Rohit Joshi, Vikas Chauhan** and Vipin Choudhary****

The design and implementation of strategies to enter into the base of the economic pyramid requires a thorough understanding of market potential, opportunities and challenges. Life insurance market is a less explored territory in low-income emerging countries. This paper investigates life insurance services using the 4As framework for the bottom of pyramid (BOP) market. The study conducted a systematic literature review in the BOP context, life insurance, and other related services. Literature that fulfilled certain inclusion criteria was subjected to a quality evaluation before being considered for review. The study presents a very good discussion on various key attributes, opportunities, and challenges for life insurance in the BOP market in terms of acceptability, affordability, accessibility, and awareness. Furthermore, it provides suggestions and implications for marketing life insurance in the BOP market.

Introduction

Life happens, be prepared! A phrase that makes us ponder over beauty and uncertainty of life at the same time. As per Kocchar (2015), today, 70% people globally live on less than $10 per day, having insufficient financial provisions to tackle unfortunate events such as demise of the income earner and managing unplanned health expenses. As per Ple and Angot (2015), most of the poor population is still not an active part of the financial inclusion activities. A strong and sustainable financial sector needs to be designed for coping with this graphic reality. Insuring the poor can be a fairly good approach to reduce their vulnerability. BOP concept, as per Simanis and Hart (2011), focuses on developing value for both corporations and low-income customers.

According to a recent World Bank (2021) report, climate change and Covid-19 pandemic stress has caused extreme poverty to rise after two decades in the year 2020.

The Effects of Context Congruence On Ad Persuasiveness in e-Magazines

It Serves My Motive, And I Distinguish the Advertisement

Achyut Telang, Debajani Sahoo, S. Sreejesh, Justin Paul

DOI: 10.2501/JAR-2021-002 Published 1 September 2021

Article | Figures & Data | Info | PDF

ABSTRACT

Despite substantial interest in advertisement-context congruence as a determinant of advertisement effectiveness and advertisement memory in digital platforms, especially in the electronic magazine (e-magazine) context, less attention has been devoted to identifying how it influences advertisement persuasion. This issue is explored through three between-subjects experimental studies: in Study 1, the causal role of advertisement-context congruence on advertisement persuasion and the conditional role of consumer motive as a chronic characteristic; in Study 2, consumer motive as a situational aspect and the mediating role of felt

involvement; and in Study 3, generalizability, using a diverse sample. The insights generated enrich the understanding of the various conditions and mechanisms that create advertisement persuasion in e-magazines to create better advertisement effectiveness.

Abstract

We study the interactions between innovation and economic growth in G20 countries over 1961–2019. We establish whether there is a temporal causality between these two variables. Employing the autoregressive distributive lag framework, our results expose a grid of short-run and long-run causal relationships between innovation and growth, including long-run unidirectional causality from innovation to economic growth. Overall, our findings shed light on the real effects of innovation on economic growth.

Reforms 2.0 viz-a-viz Political Consensus

Vinay K. Srivastava[1]

The indirect tax regime of GST has completed two years on July 1, 2019. It has replaced multi-layered, complex indirect tax structure with a simple tax regime. It took a long time to come into existence. It got delayed because of a number of hurdles. One of the major hurdles was political consensus. There is no correlation between politics and reforms. It is a big challenge to create political consensus among the political parties. Political parties are

Status of Migration Among Tribal Workers After Economic Reform: A Case Study of West Champaran District of Bihar State in India

Dharmnath Uraon[1]

After the completion of 28 years of economic reform the principal goal of holistic development with equality is unattended. The horizontal and vertical inequalities are not cracked till the date especially in laborer class. The massive out migration of tribal labours for their livelihoods from rural to urban areas or one state to another state has increased at an enormous rate after reform period in India especially in the Bihar and Uttar Pradesh state of the country. This indicates that most of the developed regions of India are utilizing labour force of backward areas. A detailed investigation of labour out-migration was done in the states of Uttar Pradesh and Bihar to study its determinants of migration and their impacts on farm economy. This study is trying to reveal ground root reality of the socio-economic factors of migration of tribal labours and its nature regarding frequencies with different places of the country of surplus unskilled, semi skilled and skilled labour after the new economic reform era in the study area. They have faced lots of difficulties in choosing the places and work. The determinants analysis shows that number of members in the family and their education status had a positive impact on migration. This paper is based on primary data sources, which are supplemented by the secondary sources and other relevant sources. The paper has been divided in five sections, first one is introduction and relevant studies, second part is objective of the study and methodology, then third is data analysis, fourth part is based on findings with conclusion and last section comprises suggestions for betterment of the respondents of the study area

Key Words: Socio-Economic, ground root tribal communities, out-migration, surplus of unskilled labour, Betterment.

Estimating Technical Efficiency and its Determinants – A Study of Saffron Cultivation in District Budgam of Jammu and Kashmir

Imtiyaz Ul Haq [1]

Saffron cultivation in the state of Jammu and Kashmir is an ancient agricultural activity placing India as the second largest producer of saffron in the world. During the year 2009-10 National Saffron Mission was launched to boost this vital sector of the economy in view of its deteriorating trends in area, production and productivity. Because of its socioeconomic and cultural significance, it was also declared as heritage site by the Food and Agricultural Organization. This study pertains to district Budgam, the second largest producer of saffron in the state, in which an attempt has been made to examine the performance of saffron growing farmers by introducing the concept of technical efficiency. It, particularly,

investigates the extent to which the saffron growers have been able to realize the potential of new technology brought under the National Saffron Mission. Technical efficiency analysis has been carried out with the help of FRONTIER 4.1 computer programme by specifying Cobb-Douglas stochastic frontier production function on a cross-section data generated from a sample of 90 saffron cultivating farmers selected randomly from 6 villages of the two only saffron producing blocks of the district. The results suggest that on an average saffron farming in the district is only 46 per cent technically efficient ranging between a low of and a high of 9 per cent and 89 per cent respectively. Whole-time specialist farmers and the households with higher number of farm workers are technically less inefficient in contrast to their counterparts. Inefficiency tends to increase with the increase in percentage of saffron land, degree of fragmentation, distance of farms and household income levels.

Key Words: Kashmir Valley, Saffron, Cobb-Douglas Production Function, Stochastic Frontier Analysis, Technical Efficiency.

Does Health Expenditure Predict Economic Growth in Nigeria?

Osobase, A. O. [1]
Bakare-Aremu, T. A. [2]

Health is an unique item that can promote economic growth if there is an increasing number of healthy human resource among the active population. It is argued that a society with more healthy economic active population will be more productive than a nation with unhealthy productive individuals. Based on this assertion, this study investigates the impact of health expenditure on economic growth in Nigeria using secondary data from 1981-2018. The data include; Real Gross Domestic Product (RGDP), Gross Fixed Capital Formation (GFCF), Aggregate Health Expenditure (AHE), Secondary School Enrolment (SSE) and economic active population (PPT; Ages 15-60). The empirical techniques includes descriptive statistics, Unit root tests, ECM, Granger causality test, Inverse Root of Autoregressive (AR), Q-statistics and Breusch-Godfrey serial correlation tests. The findings from the ECM outcome revealed that at lagged three, only lagged value of RGDP(-2), AHE and SSE significantly predicted RGDP in Nigeria. In addition, the ECM t-statistics result was statistically significant which prompt the estimation of the Granger causality test. The causal result reveals that there is a one-way causal relationship that runs from RGDP to AHE, GCF, SSE without a feedback effect. Furthermore, the Inverse Root of Autoregressive (AR) result depicted that all the polynomial roots, except one, lies outside the unit circle, and this implies that both the IRF and the variance decomposition tests are relatively stable and can be utilize as a basis for temporary policy analysis. Lastly, the Q-statistics and Breusch-Godfrey serial correlation tests indicated that the model is free from serial correlation. Based on the outcomes of the study, it is re-stated that the Nigeria government needs to increase the budgetary allocation to the health subsector for better services delivery likewise, there is the need for better welfare package and remuneration for health care workers to discourage the incessant brain drain issues.

Key Words: Health Expenditure, Economic Growth, ECM, Granger Causality Test.

Extent of Deprivation of Tea Garden Labourer in Plantations of Different Classification: A Study of Dibrugarh District of Assam

Pradyut Guha [1]

Through a carefully designed primary survey present study made an attempt to examine the extent of deprivation of tea garden labourer in plantations of different classification in Dibrugarh district of Assam. Beside using Sen's index the Engels ratio was estimated separately for food and non food items of consumption for understanding the level of deprivation among labourer in different classification of tea plantations. There seems to be the moderately high incidence of poverty among the tea garden labourers across the classified tea plantations of the study area with larger share of budget being spent on nourishment. The deprivation level among the labourer seemed to be directly linked to the size of the garden they were engaged in. Low literacy level of labourer constrained the occupational mobility and engagement for supplementary earning of adult dependents. Beside beneficiary of agricultural land as a supplementary earning source the labourer in small size gardens artificially escaped poverty through borrowing of loans which was avoided by the labourers in large size gardens thereby remained under the poverty line in the study area. In addition extent of deprivation among the families to some extent seems to be correlated with inequality in consumption expenditure. Since management of a particular classified pattern of tea plantation provides no assurance offering low lying unutilised land for agriculture or animal husbandry activities of labour household. Hence, public initiatives on training and skill development program through vocational and technical education, awareness on entrepreneurship may help the adult dependents of the labour households in finding engagement outside tea plantation supplementary earning activities thereby influencing their consumption pattern in the study area.

Impact of Economic Indicators on Passenger and Commercial Vehicle Stocks Returns

Rama Krishna Yelamanchili [1]

In this paper, we aim to study the influence of economic indicators on automobile stocks returns. We chose four passenger and commercial vehicle manufacturers stocks listed in BSE SENSEX and collect monthly stock prices data from April 2012 to June 2019. On the other side, we collect monthly data for four economic indicators of which two are coincident indicators and two are leading indicators. We split sample period into growth years (2012-2017) and decline years (2018-19) and perform data analysis. Results reveal that automobile stocks returns are positive and phenomenal till 2017 and since then negative. We find that during first sample period automotive stocks are very aggressive and outperform both the leading indicators. We also find that there is no relationship between automobile stocks returns and coincident indicators. For second sample period we find that automobile stocks have negative relationship with manufacture of motor vehicles, trailers and semi-trailers Index (MMVI). Results of causality tests indicate that AUTO index Granger cause SENSEX with three period lag, and manufacture of motor vehicles, trailers and semi-trailers Index Granger cause AUTO index with one and two lag periods during 2012-17. During second sample period, we observe that SENSEX Granger cause MMVI with two lags. Results also indicate that during 2012-17 Indian automobile manufacturers drive Indian stock markets and since 2018 even though the BSE SENSEX grow, AUTO index and auto stocks returns decline. We observe that decline in automobile stocks returns gradually affect MMVI and cause slowdown in industrial production and economic development.

Keywords: Auto sector, Economic Development, IIP, economic indicators, Government Policy.

Dynamics of Phillips Curve in Indian Economy: An Empirical Analysis

Narendra K. Bishnoi[1]
Manoj Kumar[2]

Keeping inflation down to pull down the growth rate of the economy, and therefore, recent slowdown may be the result of control on inflation. This issue is critical, therefore, this analysis regarding to examine the existence of Phillips Curve in Indian economy. For the modelled equations of Phillips curve, quarterly data of GDP from Central Statistical Office for the period 1996-2019 for India has been used. The sources for the data on unemployment do not provide comprehensive, regular and uniform defined data on the rate of unemployment. Therefore, Okun's Law has been used to estimate the relevant values unemployment indirectly. Augmented Dickey-Fuller and Phillips-Parron tests have been applied to avoid spurious regression. Granger Causality test has been also employed to confirm the functional causal relationship. All the significant coefficient of OLS of different time periods proves the existence of shortrun Phillips Curve. It means that the inflation and expected inflation helps to reduce the gap between actual output growth and trend-growth of output in India, which reduces the cyclical voluntary unemployment. The results of the study may tempt one to draw the inference that by relaxing the inflation target, India can improve its growth performance by enhancing the productive capacity of the economy.

Social Capital and Life Satisfaction: A Panel Data Analysis of the Moderation Effects of Trust and Sociability on Income and Relative Comparison in the Relationship between Money and Happiness in India.

T. Lakshmanasamy[1]
K. Maya[2]

This paper empirically examines the role of social capital in terms of trust and sociability in explaining the incomehappiness relationship in India using the World Value Survey data for the period 1990-2014. The estimated cross-section and panel data results show that the direct effect of social capital on life satisfaction is insignificant relative to the effect of relative income and rank income in India. At the individual level, the estimated indirect effect of social capital, operating through the interaction of social capital with both absolute and relative incomes, reveals that social capital moderates the negative impact of reference income on life satisfaction. At the aggregate state level, social capital incompletely moderates the importance of material well-being on subjective well-being. In developing and less developed states, social capital has no direct effect but has some indirect effect on life satisfaction. In developed states, there is no moderating effect of social capital on life satisfaction is absent. Although the moderation effect of social capital on happiness is not complete, still material wellbeing significantly influences life satisfaction in India, irrespective of the time frame and alternative measures of subjective well-being. The scarcity

Abstract

In this paper, using a panel causality approach, we examine endogenous connections between financial development, innovation, and economic growth in OECD countries for the period 1961â€"2018. The empirical results of our study show that financial development and innovation support long-run economic growth and that the short-run dynamics facet the multifarious interconnections between financial development, innovation, and economic growth. The strategic insight drawn from this research is that to ensure sustainable economic growth, policy-makers in the OECD countries must pay attention to establishing an integrated structure that looks into co-improvement policies concerning the activities that enhance financial development, innovation, and economic growth.

Turn-of-the-month effect in three major emerging countries

Geeta Singh, Kaushik Bhattacharjee and Satish Kumar
IBS Hyderabad (ICFAI Foundation for Higher Education), Hyderabad, India

Received 14 January 2020
Revised 28 January 2020
Accepted 28 January 2020

Abstract

Purpose – The purpose if this paper is to examine the turn-of-the-month effect in the equity market of three major emerging countries – Brazil, India and China – from January 2000 to December 2017.

Design/methodology/approach – Ordinary least square regression analysis is used to examine the presence of the turn-of-the-month effect and to test the efficiency of the emerging stock markets. The characteristics of the returns during the turn-of-the-month days are compared with that of the non-turn-of-the-month trading days.

Findings – The average returns during turn-of-the-month days for all the considered emerging market indices are significantly higher than the non-turn-of-the-month days for the full sample. For the subsample analysis, the average returns for Brazil and India for pre-GFC period are higher on the turn-of-the-month days than on the non-turn-of-the-month days. However, the effect disappears in China during the GFC period. During the crisis period, the results show that the turn-of-the-month effect disappears in Brazil and India, whereas for China, the effect is significant. For the post-GFC period, the-turn-of-the-month effect reappears for all the countries.

Practical implications – The results have important implications for both traders and investors. The authors' results indicate that the market participants can time the stock markets of these countries by taking long positions especially during the times when the turn-of-the-month effect is highly significant.

Originality/value – To the best of the authors' knowledge, this paper is the first to study the turn-of-the-month effect, in the key emerging countries such as Brazil, China and India. Second, the authors divide the sample into three subperiods based on the 2008 GFC such as pre-GFC, GFC and post-GFC to understand the dynamic behavior of turn-of-the-month effect over time. Most importantly, the authors control for the day-of-the-week effect while examining the turn-of-the-month effect.

Keywords Turn-of-the-month effect, Adaptive market hypothesis, Market efficiency

Paper type Research paper

1. Introduction

Market efficiency has been a long studied area in finance. It has become a fundamental that calendar anomalies help us know about the market efficiency, especially in capital markets. Calendar anomalies are changes in security prices in stock market following certain patterns that occur at a regular interval or at a specific time in a calendar year. Thus, these seasonal anomalies may open a window for market participants to beat the market by examining these patterns. Various studies have been done in countries across the world for different time periods to study calendar anomalies to derive some conclusion about their markets' efficiency. For instance, Jacobs and Levy (1988) study various calendar anomalies, associated with abnormal equity returns on the turn of the year, week, month and preholiday and even time of the day. Cadsby and Ratner (1992) examine the preholiday and turn-of-the-month (TOM) effect for five countries including Canada and the United Kingdom. Kunkel *et al.* (2003) show the evidence of significantly higher returns during TOM days compared to non-TOM days in the stock markets of 16 countries across Europe, Far East, North America and Latin America. Kumar (2016) examines the day-of-the-week (DOW) effect, January effect and TOM effect across a set of developed, advanced and emerging currencies and concludes that these calendar anomalies are more significant across emerging currencies compared to advanced and developed currencies.

Students' Blended Learning Course Experience Scale (BLCES): development and validation

Kaushal Kumar Bhagat [a], Chia-Hui Cheng[b], Indira Koneru[c], Fong Soon Fook[d] and Chun-Yen Chang [b]

[a]Centre for Educational Technology, Indian Institute of Technology Kharagpur, Kharagpur, India; [b]Graduate Institute of Science Education, National Taiwan Normal University, Taipei, Taiwan; [c]e-Learning Department, ICFAI Business School, Hyderabad, India; [d]Centre for E-Learning, Universiti Malaysia Sabah, Kota Kinabalu, Malaysia

ABSTRACT

The aim of this study was to develop a scale to measure students' blended learning course experience. A total of 792 undergraduate students from Malaysia participated in this study. Exploratory factor analysis (EFA) was employed to evaluate the factor structure of the scale. As a result of EFA, three factors with 19 items that explained 68.06% of the total variance were obtained. The three factors are: *course design, learning experience*, and *personal factors*. Confirmatory factor analysis (CFA) was used to establish the structural validity of the scale, and item discrimination was conducted to validate the scale. The Cronbach's coefficients (α) for the factors ranged from .71 to .95. The overall Cronbach's coefficient (α) of the scale was .92, demonstrating a satisfactory level of reliability. The results showed that the developed scale is reliable and valid. Future implications for course designers and instructors are discussed.

Introduction

In recent years, many researchers and educators have paid much attention to the development and implementation of blended learning (BL) (Drysdale et al., 2013). Garrison and Vaughan (2008) advocated that BL could bring a significant transformation in higher education if it is well developed and implemented. BL has been applied in different disciplines like business management (Lin et al., 2020), engineering (Singh et al., 2019; Zampirolli et al., 2018), biology (Riffell & Sibley, 2005), chemistry (Bernard et al., 2017; Williams et al., 2008), language learning (Xu et al., 2020), and medical sciences (Luo et al., 2017).

In the early stages of BL development, time, and cost are significant challenges (Míguez-Álvarez et al., 2020). However, many researchers have found the potential advantages of BL in improving students learning performance (Deschacht & Goeman, 2015), motivation (Álvarez et al., 2013), learning engagement (Manwaring et al., 2017), course satisfaction (Williams et al., 2008), and self-efficacy (Moon & Hyun, 2019).

While there are many studies conducted on the implementation and evaluation of BL in different disciplines across different education levels, less is known about students' perceptions and views about BL. Although there have been efforts to develop instruments (e.g. Han & Ellis, 2019) to measure students' perceptions towards BL, it is still limited. A study by Manwaring et al. (2017) showed that students' perceptions had a significant influence on students' engagement in the BL environment. Therefore, to better understand how to achieve effective BL, it is important to identify

MOBILE BANKING USAGE, UTILITY, AND PREFERENCE OF GEN Z

Prof. Rama Krishna Yelamanchili, Associate Professor, Department of Finance,
ICFAI Business School, IFHE-Hyderabad.
Dr. Sager Reddy Adavelli, Assistant Professor, Department of Finance,
ICFAI Business School, IFHE-Hyderabad

ABSTRACT

This paper aims to measure, assess, and understand Gen Zs usage, utility, and preference of mobile banking. A structured questionnaire with 17 scale items and four demographic variables is designed exclusively for this study. A two-stage sampling method is adopted to collect data from participants using Google form. In all there are 377 usage responses. A series of one sample and two sample non-parametric statistical tests are performed to test the hypotheses. Results of the study specify that 100% of the participants have high ability to use smartphone and internet. They are very often availing mobile banking services to perform various financial and banking transactions. The results also stipulate that mobile banking offers a wide range of benefits to Gen Zs in terms of cost saving, time saving, physical security, and convenience of 24/7 access. However, the study reports that Gen Zs are very familiar with services offered at ATM, their transactions are not uniformly distributed throughout the days in a month, and the average amount spent per month is about INR. 15,000. This is a very good amount, considering the demographic nature of the participants, all the participants are currently doing their master's degree. Once they enter the earnings club, then the amount spent per month would be high.

Key words: Gen Z, Mobile Banking, Digital Payments, Financial Transactions, Spending

1. INTRODUCTION

Mobile banking is a convenient way to manage money on the go and continues to grow in popularity. Digital Banking Attitudes Study by Chase Bank found that 99% of Gen Z and 98% of millennials use a mobile banking for a wide range of tasks, including viewing account balances, making payments, online purchasing etc. Gen Z overwhelmingly complete numerous tasks with mobile banking. According to Morgan Stanley, up to 80% of smartphone-carrying Gen Z members are already using mobile banking. Studies show that Gen Z has a deep desire to better understand money: Data from Experian (via The Financial Brand) found that of recent high school graduates who had never taken a personal finance class, "43% said they want to learn to save, 38% want to learn to manage their expenses, and 36% want a class that teaches them how to file their taxes."

Gen Zs are true digital natives, having grown up with easy access to the internet, smartphones and convenient, intuitive digital experiences. Such experiences have entailed a degree of instant gratification. They are able to make orders from Amazon with a single click, their favorite songs are instantly available to stream on Spotify, and they can eat dinner from their favorite restaurant without having to step foot outside their home – and today's Gen Z digital banking consumer won't settle for anything less.

Household Consumption and Income Inequality

Vighneswara Swamy (/Authors/Vighneswara%20Swamy.author?AID=1253)

Published: September 2021

This article seeks to explore the extent to which household consumption causes income inequality and addresses the questions: (i) is there a linear relationship between household consumption expenditure and income inequality? (ii) what is the causal relationship between household consumption and income inequality? and (iii) does household consumption impact differently on rural and urban income inequalities? The results provide evidence of rising consumption inequality causing rise in income inequality. The causality tests show the presence of a unidirectional causality flowing from household consumption to income inequality. The findings provide insights that macroeconomic policymakers can use to manoeuvre household consumption expenditure using appropriate policy instruments.

Celebrity credibility;
Brand credibility;
Brand equity;
Relationship continuity expectation

Abstract This study examines the role of celebrity credibility in building brand equity and relationship continuity using brand credibility as a mediator. The experience of smartphone use is considered a moderator. This study included a survey of 376 select participants. The model is tested using structural equation modelling. Brand credibility partially mediates the positive influence of celebrity credibility on brand equity and expectation of relationship continuity. A significant difference is found for new users in terms of relationship continuity expectations. This study examines the hitherto unexplored role of celebrity credibility in the case of the smartphone. Relationship continuity, an important construct in services, is tested for a tangible product.

Introduction

> "There isn't any significant difference between the various brands of whisky, or cigarettes or beer. They are all about the same. And so are the cake mixes and the detergents, and the margarine... The manufacturer who dedicates his advertising to building the most sharply defined personality for his brand will get the largest share of the market at the highest profit."
>
> - David Ogilvy, Confessions of an Advertising Man (page 26)

This statement also holds true for a technological product in today's technology-obsessed culture. Smartphone is considered an important innovation among all technological inventions in the 21st century, owing to its greater social impact through revolutionised connectivity and, thus, empowered consumers (ITV, 2016). The products are rapidly and regularly upgraded with better variants, more sophisticated features, and innovative technology to target various customer segments with varying needs and to achieve long-term firm profitability (Schilling & Hill, 1998). Under conditions of intense market competition, every brand is trying to build a strong customer base. Most often, a consumer can barely differentiate brands based on attributes from its rival products (Walsh & Mitchell, 2010). Therefore, in order to differentiate, most brands use celebrity endorsements for better recall and persuasion (Misra & Beatty, 1990).

Abstract

With increased digitisation, more and more customers are moving to their smartphones for health advice or for tracking and managing their health. This has resulted into fast adoption of smartphone in the global healthcare industry, thus, creating a vast and untapped opportunity for mobile health apps (Holmes, 2013). This concept, called as mHealth, has emerged globally and many health apps, a key component of mHealth, are designed for smartphone users across the world for maintaining healthy behaviour and monitoring data. Despite the popularity and usage of fitness apps, the research in this domain is still growing and focus on issues like the initial adoption, intentions to use fitness apps (Kratzke & Cox, 2012; Lim et al., 2011), usage of heath apps (Cho, Qunlan, Park, & Noh, 2014; Cummiskey, 2011), educational use and effectiveness of specific health apps (Sherry & Ratzan, 2012) and many others focusing on motivations or usage pattern of fitness app users. There is however a dearth of researchers in this area studying the micro and fundamental issues determining the continuance post adoption behaviour of fitness app(s) and linking it with other outcome variables (Cho, Qunlan, Park, & Noh, 2014). To examine the important determinants for post adoption usage of fitness apps in our study, a research framework is proposed along with additional variables including self-efficacy, user interface and perceived security and privacy. Of these, perceived security and privacy and user interface are proposed to affect user satisfaction and self-efficacy to influence continuous intentions to use fitness apps which, in turn, is proposed to impact the life satisfaction of users. On the basis of extensive and related literature review the following hypotheses are proposed as summarized in Figure 1 which also illustrates the hypothesized relationships between the select research constructs. A survey instrument was developed based on the existing information system literature. The scale items for ECM constructs i.e., confirmation (3 items), perceived usefulness (3 items), user satisfaction (3 items) and continued intentions (4 items) were adopted from Bhattacherjee (2001), Cho (2016), Davis et al. (1989), Lin and Bhattacherjee (2008), Mouakket (2015), Thong et al. (2006). Items for perceived security and privacy (3 items) and user interface (5 items) were chosen from Chung (2016), Flavián et al. (2006) and Oghuma (2016). For self-efficacy (3 items), the measurement scales were taken from Bhattacherjee, Perols & Sanford (2008), Susanto, Chang & Ha (2015). Life satisfaction was measured by three items from the SWLS (Diener et al., 1985) in a way similar to Inoue, James, Filo, & Funk (2017). The responses of the survey participants to each of the items were measured on a five-point Likert scale, ranging from 1 ("strongly disagree") to 5 ("strongly agree"). The target population for this study was limited to individuals having a gym membership and use fitness app(s) on their smartphone. A non-probability purposive sampling was used to

Production-inventory models considering different carbon policies: a review

Abstract: Mitigating carbon emissions in supply chains has become an important issue in the recent era. Recently, companies are looking for solutions to lessen carbon emissions associated with their supply chains mainly due to carbon policies imposed by different regulatory bodies. Apart from regulations, competitive advantage, ISO certification, customer satisfaction also influence organisations to adopt green practices in their supply chains. Production and inventory are two important aspects of supply chains, and they contribute to a significant amount of cost and emissions. Organisations try to optimise their production and inventory related activities with operational adjustments while operating under different carbon policies. Over the last couple of years, authors have incorporated different carbon policies while optimising supply chains, especially production-inventory policies. This paper presents a review of quantitative models on green production-inventory problems considering different carbon policies and ends with suggestions for future research.

Keywords: carbon policies; production-inventory policies; green supply chain; quantitative models; emissions.

Diversity climate perceptions and its impact on multicultural team innovation and performance

Raavee Kadam, Srinivasa A. Rao, Waheed Kareem Abdul and Shazi Shah Jabeen

Abstract

Purpose – *This study aims to examine the influence of diversity climate perceptions (DCPs) on team member's contribution to team innovation and team performance in a multicultural team (MCT). The authors also investigate the moderating effect of cultural intelligence on these relationships.*

Design/methodology/approach – *The authors draw upon the interactional model for cultural diversity to build their hypotheses. Data was gathered from 43 teams consisting of 217 members using a structured questionnaire. Ratings were obtained from both team members and supervisors. The data collected was analyzed using structural equation modeling.*

Findings – *Results indicated that when team members have positive DCPs, it had a positive impact on their innovation and performance in the team. Cultural intelligence was also found to have a direct impact on team member innovation but not on team member performance. Furthermore, cultural intelligence was found to positively moderate the DCPs – team member performance relationship but not the DCPs – team member innovation relationship.*

Practical implications – *Managing diversity is a key concern for organizations worldwide given the exponentially rising cultural diversity within the workforce. This study would enable practitioners to understand that developing positive DCPs and cultural intelligence of team members are critical to the success of MCTs.*

Originality/value – *Literature has documented mixed results pertaining to team diversity and its effect on performance, resulting in scholars urging the need to explore how the negative effects of team diversity can be mitigated. This research establishes that positive DCPs and cultural intelligence as two key factors contributing to the performance of MCTs.*

Keywords *Diversity climate, Cultural intelligence, Team innovation, Team performance, Multicultural teams*

Paper type *Research paper*

Introduction

The advent of globalization, immigration and technological advancements has resulted in the workforce becoming increasingly diverse. Salas *et al.* (2008, p. 903) remark how "organizations now face increased competition and this mandates collaboration across organizational, geographic, and temporal boundaries and a need to engage a demographically heterogeneous workforce." Furthermore, to meet the demands of globalization:

> [...] a classical, functional organization can no longer create the variation necessary for solving complex problems which leads to the installation of project teams, matrix structure, cross-functional teams and other new forms (Janssens and Steyaert, 2002, p. 1).

Given the increasing diversity in the workforce, multicultural teams (MCTs) have become prominent structures within organizations today. It is established in literature that cultural

ABSTRACT

The present research attempts to develop a theoretical framework for the assessment of shopping mall customer experience dimensions. It further classifies the variables associated with retail experiences that may attract customers in Tier-II and Tier- III cities towards the malls. Exhaustive literature review and expert opinion approaches have been used to explore the evaluation criteria for the assessment of the mall experience. ISM is used to develop a structural model that represents relationships among variables at different levels along with driving and dependence relationships in the structural model. The result highlights that factors like customer value orientation, tenant mix, employees, facilities management are the most significant benchmarking criteria for customers' assessment of their mall experience in the present study. To achieve profitable operations in these cities, retailer's need to acquaint themselves with the expectations of customers in order to attract their attention. This indicates that it is imperative for mall managers to identify how consumers benchmark different parameters while evaluating a mall experience. Understanding the importance of such parameters will allow malls to be built according to some standard specifications that can meet a consumer's threshold for appeal and attractiveness. The study adds to the existing literature of assessing shopping experience in Tier-II and Tier-III cities' malls through a structural model. The most and the least dominant factors found in this study will help mall managers to develop strategies to enhance the customer shopping experience in malls.

INTRODUCTION

Customer experience has gained significant attention due to its potential for creating engaging as well as effectively managed retail spaces and environments (Dalmoro, Isabella, Almeida and dos Santos Fleck, 2019; Sadachar and Fiore, 2018). This concept has become ubiquitous in context of malls wherein customers can potentially derive benefits from the variety of outlets that are present within a mall's premises. Prior research has indicated that customers may derive such benefits from physical triggers

ABSTRACT

We examine the connectedness among the series of four exchange rates with respect to the Indian Rupee. The results of Diebold and Yilmaz method which measures time-domain connectedness, show that the overall connectedness of the system is 30.15%. The results of Baruník and Křehlík approach which measures frequency-domain connectedness, exhibit that in the total connectedness the maximum contribution is from highest frequency (14.27%) and the lowest contribution is made by the second-lowest frequency (2.03%). Finally, the dynamic connectedness is also examined with rolling window methods. These results are very critical in understanding the connectedness among various exchange rate markets.

Introduction

One of the important landmarks in the field of economic sciences is the integration and liberalization of the international financial markets witnessed in most of the emerging developing economies (EDEs). The expedition of the foreign exchange activities is conjointly an outcome of the introduction of a floating exchange rate regime and speedy economic liberalization, which have smoothened the cross-border trade and capital flows. Such unprecedented developments might sometimes lead to higher exchange rate exposure risk and volatility in international financial markets as evident from the crises in the past.

The dramatic episodes of global financial crisis have reversed the direction of capital flows toward the EDEs, making these economies susceptible to financial volatility. These events in turn multiply occurrences of foreign exchange rate volatility transmission and spillovers across the foreign exchange markets and among various country's trading partners. India, the

Does financial inclusion promote tourism development in advanced and emerging economies?

Yongfen Shi[a], Vighneswara Swamy[b] and Sudharshan Reddy Paramati[c]

[a]School of Business, Hong Kong Baptist University, Kowloon, Hong Kong; [b]IBS-Hyderabad, ICFAI Foundation for Higher Education, Hyderabad, India; [c]School of Business, University of Dundee, Dundee, UK

ABSTRACT

This research article is the first of its kind to consider the financial inclusion, which is constructed using the depth, access and efficiency of the financial institutions and markets, and various aspects of tourism development such as business tourism spending, direct tourism contribution, domestic tourism spending, total internal tourism expenses, leisure tourism spending and total tourism contribution. Given the growing importance of financial inclusion in the recent time, this article is designed to investigate the role of financial inclusion on various dimensions of tourism development across the panels of 24 advanced and 21 emerging economies around the world, using yearly data from 1995 to 2016. Given the presence of cross-sectional dependence in the data series, we employ Augmented Mean Group (AMG) estimator as it is a robust technique to handle this issue in the estimation. The evidences show that financial inclusion has a significant positive impact on various aspects of tourism development across the panels. The results also suggest that the impact is more in emerging economies than that of advanced economies. Hence, this article offers numerous policy and practical suggestions for sustainable tourism management.

I. Introduction

Tourism has emerged, of late, as a driver of economic growth for many economies as it generates 10.04% (i.e. 8 USD.8 trillion) of global GDP in 2018, besides supporting 1 out of 10 jobs (i.e., around 319 million jobs) worldwide (WTTC, 2019a[1]). In 2018, global tourism has reached export earnings of 1 USD.7 trillion (i.e. generally 5 billion USD per day). Global travel and tourism account for almost 29% of the global services exports and, about 7% of the global exports of goods and services. Through the ages, tourism which was encouraged mostly as a practice of religious pilgrimage has evolved as an economic activity generating jobs, improving income distribution and contributing to economic growth.[2] Tourism[3] is employment-intensive and has diverse linkages with other sectors of the economy.

Sustainable tourism is firmly positioned in the 2030 Agenda, and it has been included as targets in Sustainable Development Goals (UNWTO, 2019). The tourism sector has a fair gender dimension as well. Across the G20 countries, the female share in tourism jobs is about 46.4% compared to the 43.3% of total employment in the economy; suggesting that a growing tourism sector promotes female employment. Growing female employment is crucial in reducing poverty, sustaining economic growth and enhancing women empowerment and independence (WTTC, 2019b). As Swamy (2014) shows that financial inclusion with a gender dimension has a significant positive effect on the poor households, tourism industry with a gender dimension greatly contributes to economic upliftment of poor households around the tourist destinations. For sustainable tourism development, financial inclusion has a greater role to play. However, the extant empirical literature does not provide any study that focuses on the dynamics of financial inclusion and tourism development.

CONTACT Sudharshan Reddy Paramati srparamati@yahoo.com School of Business, University of Dundee, Dundee DD1 4HN, UK

[1]WTTC 2019 https://www.wttc.org/https://www.wttc.org/economic-impact/. In 2018, tourism sector achieved a 3.9% growth compared to the global GDP growth of 3.2%. In the last five years, one out of five new jobs in the world is generated by tourism sector.

[2]Several empirical studies (e.g., Paramati, Alam, and Chen 2017; Alam and Paramati 2016) document that the tourism sector plays an important role in promoting economic growth and improving income distribution.

[3]Tourism is defined as a social, cultural and economic phenomenon which entails the movement of people to countries or places outside their usual environment for personal or business/professional purposes. These people are called visitors (which may be either tourists or excursionists; residents or non-residents) and tourism has to do with their activities, some of which imply tourism expenditure (UNWTO, 2008).

Abstract

Purpose – The purpose of the study is to investigate the role of service convenience in the relationship between organizational characteristics (such as brand equity, store ambiance, store layout, customer information and employee responsiveness) on customer engagement behaviors (CEBs), including service improvement, customer cooperation, positive word-of-mouth and customer helping customers. It examines two research models, with service convenience as a separate antecedent of CEBs (model A) and as a mediating variable between organizational characteristics and CEBs (model B).

Design/methodology/approach – Using a positivist paradigm, data were collected from 384 respondents representing the existing customers of grocery retailers based in India via a survey instrument. Data were analyzed using partial least squares (PLS) path modeling.

Findings – Results demonstrate service convenience as a motivational driver of CEBs. Results also show that the organizational characteristics significantly influence service convenience which in turn impacts CEBs.

Practical implications – The findings have important implications for store managers in effective management of customers' time and effort in terms of saving customers' time and effort as well as motivating customers to elicit their engagement behaviors.

Originality/value – The originality of this paper lies in identifying the impact of organizational characteristics in helping customers to save time and effort in their shopping activities and thereby elicit various types of CEBs. The paper also adds to knowledge by examining the role of service convenience in the nexus between organizational characteristics and CEB types.

Paper type Research paper

1. Introduction

The dynamics of the service provider–customer relationship have evolved over time, especially since the advent of the networked society (Hollebeek and Andreassen, 2018). Today, customers are aware of competitive offerings and actively interact with service firms as well as other stakeholders (Larivière *et al.*, 2017). Consequently, service firms have also strategically introduced practices to engage customers, beyond revisits and positive word-of-mouth, to develop a meaningful and profitable relationship with them (Pansari and Kumar, 2017). For example, the Lego IDEAS website invites Lego supporters to submit designs for new playsets. If a design receives more than 10,000 votes, it moves into the review phase wherein Lego designers and a marketing team decide on the feasibility of the project for production. Customers also exhibit engagement behaviors on various social

Use of Artificial Neural Network for Inquiry Follow Up System in Sales Operations for Two-Wheeler Automotive Dealership.

Vaidik Bhatt, P Sashikala

Abstract: *Artificial neural network can be the good classifier based on its capabilities of supervised learning and back propagation of the error. We have used this capability of ANN for distinguishing buyers and non-buyers in the automotive industry sales to save the time of the sales consultant in order to provide the better services to the potential buyer and convert the inquiry into the sales. Based on the six parameters with the ANN consisting of one hidden layer and 4 hidden units we have checked the results which is satisfying.*

Keywords: *Based on the six parameters with the ANN consisting of one hidden layer and 4 hidden units we have checked the results which is satisfying.*

I. INTRODUCTION

Indian automobile industry is one of the big industries in India with the sales of around 2,50,000 units of car and 16,45,791 units of two wheelers which includes bikes and scooters per month (AutoPunditz). The sales of vehicle depends upon the many factors on the product side, service delivery side and the customer side. (Kotler and Keller, 2006). On the other end the conversion ratio (the ratio of the total sales on total inquiry for the vehicle) in the industry is less compared to other industry. And all the sales responsibility comes to the authorized dealership owner with very less profit margin. There are numbers of inquiry comes every day and there are very few sales consultants there in the showroom to serve the customer and help them with their choice of car. In this case it is impossible for sales consultant to take the good and timely follow ups of the customer and sell the vehicle to them. Because of the sales consultant cannot take the timely and quality follow ups of the customer for the generated inquiry, the customer moves away and there are chances that, customer will buy a competitive vehicle, or buy the same vehicle from the competitor dealership and ultimately dealers loose their business. So, to avoid the lost sales and increase the number of unit sales and profitability and in order to achieve the monthly, quarterly and yearly target, it is very important to take the timely follow ups of the customers. But due to the less sales consultant it is not practically possible.

However, sales consultant can prioritize the customer based on their interaction and differentiates the customer with the high probability to buying the vehicle from them than those who has a low probability of buying.

Sales consultant does this bifurcation based on the past experience and behaviour of the customer during the interaction over the phone call, in the show room ar during the test drive. As this method is only the perception of the sales consultant, it is not useful and chances of making the error in the predictions are very high. The strong scientific support and the statistical evidence required to take the decision, otherwise method based on the perceptions can have a dared consequence for the dealership business in automotive field.

II. ARTIFICIAL NEURAL NETWORK

It is very important to classify and distinguish the potential buyers and non-buyers. In this situation, where there are number of parameters has to be considered, Artificial Neural Network (ANN) classifier is s popular classifier with its broad application areas as it focuses on the cost sensitive binary classifications and learning (Zakaryazad and Duman, 2015). Here, in this process of automobile sales, misclassification of buyers and non-buyers can have a dared consequences for the dealership, as the sales consultant spends time and energy to the non-buyers and don't have a time to attend and respond to the queries of potential buyers.

Moreover, there is a profit for the true classification. For example, if the system has classified buyer in the category of buyer than sales consultant can put the effort to pitch the product and take the routine and timely follow ups from which the potential buyer can turn in to the buyer of the vehicle. On the other end, if the system has classified non buyer as a non buyer than sales consultant will not put the effort rather the inquiry will be passed to the sales CRE (customer relationship executive) team for the further follow ups.

III. OBJECTIVE

This paper aims towards the using the supervised learning of the Artificial neural network using the descriptive statistics and prioritize the customer on their probability of purchasing the vehicle.

Use of Technology in Distance Education – A Bibliographic Study

Dr. Jaipal Dhobale

Assistant Professor, IBS, IFHE Campus Hyderabad

Abstract

Current research paper speaks about the utilization of technology in distance education is the bibliographic study of Scopus indexed database. Various parameters like year wise publications, country wise publications, subject wise publications, based on sources, based on type of document, publications by Authors and publications by different funding agencies worldwide are considered for bibliographic analysis. Simple excel based charts are used as analysis tools.

Keywords

Distance education, Universities, technology, Learning, bibliography study.

Introductions

Advancement into the technology and widening of the scope of education sector has given new dimension to the distance education. As per Wikipedia Distance education is nothing but distance learning. This is the education process in which student may not always physically present in school or colleges. Traditionally these types of courses were known as correspondence courses as student were corresponded with school/colleges through Postal Communication. A distance learning course can be completely distance learning or it incorporates traditional classroom learning also (Wikipedia, 2020). Now day's students are accessing course details using web enabled or application based technologies.

Flexible and choice based variety type of courses from worldwide renowned universities / institutes makes distance education more popular. It offers wide range of courses which incorporates certification courses to master level courses (Dhobale & Rath, 2012). Technology support to share course material using audio visual aids makes it more impactful. These technologies have great potential to promote distance learning environment. More personalized courses became reality (Technology enabled learning) because of these advancements.

Motivation

This study may give new insights to the various stakeholders associated with

Workforce Management Decisions in the Construction Industry in the UAE

by

Mohammed Abdul Nayeem
IBS Business School Hyderabad, India

This study is guided by the need to develop a framework for workforce management decisions in the context of the construction industry in the UAE. A full contextual framework involving all the factors that can possibly play a role in the success of workforce management decisions has been delineated. The factors considered are related to hiring, selection, and quality of workers. The literature has focused not only on the overarching strategies and tactics but also on how day-to-day decision-making occurs while using human resource management for productivity growth of an organization. The data was collected from three construction companies in the UAE. The findings of the study are in line with the findings of previous works.

1. Introduction

Workforce management decisions like hiring, training, and staffing are crucial to any organization since these decisions impact directly on organizational performance (Buller & McEvoy, 2012; Pera, 2019). The direct and potent implications of workforce planning on organizational performance have been documented by several studies (Jiang et al, 2012). Direct linkages exist between organizations' strategies regarding workforce management and performance outcomes, or the ability to create competitive advantage. However, most research has been directed toward the HRM policies that have a direct impact on leadership attitudes, employee motivation, and commitment and performance. But HRM decisions related to workforce hiring, training, and staffing are also important and require equal consideration and merit research (Buller & McEvoy, 2012; Feeney, & Camarena, 2018).

However, there is still a substantial lack of literature and research on understanding the factors that play a role in making workforce management decisions successful. The costs associated with workforce management decisions need to be justified with the resulting quality of output and organizational efficiencies (Scott & Davis, 2015). In today's organizations much of these tasks are carried out with the help of mathematical programming models, which enable arriving at an understanding of optimum organizational needs and skills requirements. However, since most of these mathematical models are deterministic in nature and rely on pre-decided and already known traditional parameters like supply and demand characteristics, they do not capture the contribution and role of new or unknown factors (Abaker, Al-Titi, & Al-Nasr, 2019). It can be said that mathematical models largely fail to take into account uncertainty related to the involvement of many more unaccounted for factors – and thus cannot give optimal or relevant solutions (Van den Bergh et al., 2013). Most models work on oversimplified assumptions that explicitly endeavour to minimize complexity in order to arrive at solutions, but in effect end up being inaccurate simply because they fail to capture the complexity of the real situation.

This lack of accuracy and relevance of mathematical models to predict needs and solutions is a source of concern for organizations. Models may imbibe state-of-the-art user interfaces or provide well-analyzed solutions, but they may still fail because they do not take into account the whole gamut of variables that may be impacting upon the situation that they are dealing with (Sencer & Ozel, 2013). Strategic decisions are based on such inadequate models for the duration of the project, and the fallacy is exemplified when the project employs a transient workforce. Moreover, decision-making tools need to be

Published 5 November 2020

This paper provides insight on how banking officials communicate with customers and how effective their techniques and tools are for development of banks. With the help of structured questionnaire technique, 373 customers having accounts in commercial banks in Nepal were interviewed in the month of April–September, 2019. Dummy based awareness index and Ordered Logit Regression Model were performed to understand customers' perception on banking communication in Nepal. The Awareness Index shows that banking customers are moderately aware about banking communication while the Ordered Logit reveals that providing time to address customers' problem and DEMAT facility were found to have significant relationship with banking communication awareness level. This study therefore indicates providing time to address customer's problem and using DEMAT facilities experiences increases awareness in banking communication. This study contributes to the banking sector communication by transforming communication barriers for customers' satisfaction.

Keywords: Banking communication; customers' perception; loyalty; trust; banking communication awareness index; ordered logistic model.

Abstract

This study explores the finance and economic growth nexus in G-7 economies as these countries experience significantly higher levels of financial development. Using a balanced panel of 31 years from 1983 to 2013, we provide new evidence on the finance–growth relationship. We show the presence of nonlinearity as there is an inverted U-shaped relationship between finance and growth in the long run. Estimating the thresholds in the finance–growth nexus, we notice that there exists a threshold effect of finance at 109% of Gross Domestic Product (GDP). We observe that exceeding the threshold would hinder the countries instead of furthering economic growth as too much finance is harmful. Based on the panel Granger causality test results, we claim that financial development should be associated with optimal growth performance. Our findings for the G-7 economies offer some useful policy inferences to the emerging and developing economies in designing their financial development strategies.

Uber's bumpy ride in China

Geeta Singh, Rishi Dwesar and Satish Kumar

Introduction

> The battle in China had become global. We had the sovereign wealth of China being invested in our competition globally. We had American tech companies that were being compelled to invest in our competitor in China. And so China battle had become a global battle [. . .]. At some point, we realized that we can't do everything ourselves. So we partnered in China so that we can focus on other interesting things we are doing worldwide like Ubereats, what is going on in India, driverless cars. There are the whole bunch of things that we needed to focus on. We could not do everything ourselves. We did put our heart and soul in that effort (China operations).[1] -Travis Kalanick, CEO, Uber, 2016.

> I am amazed at how far Uber got. When I saw them come into the market in 2013, my friends and I predicted they would exit quickly. I wouldn't consider it a complete failure they made a merger with Didi happen! That is a big event, as competitors normally fight to the death. Uber China has a presence and is still operating to this day (Bailey, 2016). Mike Michelini, a US social media and e-commerce specialist based in China, 2016.

Geeta Singh, Rishi Dwesar and Satish Kumar are all based at IBS Hyderabad (ICFAI Foundation for Higher Education), Hyderabad, India.

On one morning of August 2016, 24-year-old Chu He of Jiangbei District, Chongqing, in southwestern China, opened her ridesharing app (Uber) to book a cab but she immediately decided to take the bus instead. Usually, it cost her around 14 yuan (about $2.11) to get to work but today the fare for the 20-min ride to her office had suddenly soared (Miao, 2016). It had doubled with the estimated price of 28 yuan. She was not the only one, many Chinese riders in multiple cities were complaining about the non-availability of cheap rides. This was the result of a merger between the Chinese subsidiary of the US-based ride-hailing service provider, Uber and its biggest rival in China, Didi Kuaidi (Didi).

In August 2016, Uber, after struggling for more than two years to generate sustainable profits, surrendered to Didi. Consequently, Uber too joined the list of big companies such as Yahoo, eBay, Microsoft, Qualcomm and Apple, which had been facing problems in the world's second-largest economy, China, to set up their businesses and gain market share.

After its official launch in China in 2014, Uber's aggressive business model helped it expand in the country initially. It established a separate regional entity, adapted many of its strategies and modified its products and services to match the demands and needs of Chinese customers. In all, Uber made efforts to win Chinese customers but all went in vain against the market leader, Didi. Finally, to escape further losses, Uber sold its business to Didi.

Analysts and industry experts from across the world believed that China was a very different market with fierce local competition and tough regulatory systems. The country was well-known for being home to the world's most sophisticated ride-hailing scammers (Hook, 2016a), and Uber could not escape from fraud and scams in China. Despite all barriers, Uber was optimistic about its expansion in the country until early 2016; however, soon after the Chinese government announced new regulations governing the taxi-sharing markets, Uber gave up and merged with its biggest rival in China. While many believed that Uber's

UNDERSTANDING WORK MOTIVATION FOR EMPLOYEES WORKING IN INFORMATION TECHNOLOGY INDUSTRY FROM HERZBERG'S PERSPECTIVE

Dr. Niraj Kishore Chimote
Associate Professor-HRM and OB
ICFAI Business School (IBS) Hyderabad, Telangana, India

Ashima Malhotra
Student of MBA: 2019-21 Batch, IBS Hyderabad, Telangana, India

ABSTRACT

In the changing times, the source of employee motivation has become more and more dynamic. The HRs around the world are trying to tap the right causes for motivation to sustain employee engagement and enhance job satisfaction. This paper examines the various factors of job satisfaction and job dissatisfaction among IT sector employees using Herzberg's theory of motivation as underlying factors of motivation. This research is empirical in nature as it involves the administration of a questionnaire to the responses on the basis of their current job role in IT sector. The results indicated that the factors causing job satisfaction and job dissatisfaction differ in nature as explained by Herzberg. However, some factors like advancement, company policies and interpersonal relations showed mixed results towards their contribution to either job satisfaction or dissatisfaction.

Key words: Information Technology, job satisfaction, Motivation

1. INTRODUCTION

1.1. Customer Satisfaction and Experience

Customer satisfaction is a critical concept for customer success professionals to understand and live by, and it's actually about more than a money-back guarantee. In this post, we'll start discussing customer satisfaction: what it is, and why your business needs to start measuring.

Philip Kotler defines customer satisfaction as a '*person's feeling of pleasure or disappointment, which resulted from comparing a product's perceived performance (or outcome) against his/her expectations*'. Although Kotler uses abstract terms like pleasure and disappointment, the definition is by no means ambiguous.

SURVIVABILITY AND RESILIENCE OF SUPPLY CHAIN SYSTEM POST-PANDEMIC IN INDIA

Ramanjaneyulu Mogili, National Institute of Technology Tiruchirappalli
Kashmira Ganji, ICFAI Business School (IBS), IFHE
G.V.R.K Acharyulu, University of Hyderabad

ABSTRACT

Purpose: *The Supply Chain (SC) in India will undergo a dramatic change in the future due to COVID 19 pandemic. Supply chains in collaboration with digital technologies have the potential survivability opportunities in the new normal environment. The paper provides a conceptual foundation on how India will cope with the current pandemic in the economic crisis.*

Design/methodology/approach: *It is a conceptual paper, addressing the application of SC technology and concludes the proposed model with constructs and concepts that are useful for the renovation of the resilient post-COVID SC. The propositions are made to explore the impact of the Supply Chain (SC) on implementation of Resilience and survivability of the post-pandemic environment.*

Findings: *The study shows the importance of technology adoption in building a resilient supply chain with outcomes like recovery, survivability, and improved performance of SC. The article discusses challenges and potential opportunities with the effect of COVID 19, to enable supply chain professionals for effective planning of operations in future.*

Research limitations/implications: *The study is limited to a conceptual framework, wherein future there is scope of converting the propositions into a testable hypothesis. The proposed model can be applied to manufacturing and service industries with a global focus.*

Originality/Value: *This is a novel study that aims to develop a conceptual model on building supply chain resilience with the effect of COVID 19 pandemic. This article elaborates on ongoing efforts to restart supply chains for survivability in the new normal situation.*

Keywords: COVID-19, Technology Adoption, Supply Chain Resilience.

INTRODUCTION

In the contemporary market environment, the competition is not just limited to firms or brands or stores but it is with supply chains (SC) (Guan et al., 2020). As the global competition growing, the organizations are compelled to incorporate integration and have strong ties among SC partners. (Mentzer et al., 2001), defined supply chain as a

"Set of three or more entities (organizations or individuals) directly involved in the upstream and downstream flows of products, services, finances, and/or information from a source to a customer".

The strength of supply chains is handling risks, and building collaborative resilience (Aggarwal et al., 2020). However managing crises such as natural disasters, technological instability, economic crisis, or unprecedented acts of violence may either lead to disruptions or can offer opportunities for collaboration, consensus building, and accelerating social change (Ozawa et al., 2011). Since the last decade, we have seen the industries had a significant lift, where the technology started to have a much bigger role, specifically with supply chain implementation of technological solutions. At that time methodologies like Lean, just in time management was more than sufficient for supply chain professionals. The

THE GENERAL GOVERNMENT CAPITAL SPENDING AND ITS EFFECT ON GDP: EVIDENCE FROM INDIA

Dr Tamma Koti Reddy

Professor & Head, Department of Economics, IBS Hyderabad(A constituent of ICFAI Foundation for Higher Education (IFHE),A Deemed to-be University u/s 3 of The UGC Act 1956)

Email: tammamuralimanohar@gmail.com

Received: May 2020 Revised and Accepted: August 2020

ABSTRACT: The study attempts to examine the effect t of General government capital spending on Real GDP growth for the period 1990-91 to 2018-19 using Multiple Regression model. GDP at Factor cost is the dependent variable while General government capital expenditure, Gross fixed capital formation, Inflation and Combined tax revenue are the independent variables. The result indicates that the General government's capital spending has a positive and insignificant impact on economic growth of India for the period under study. The author points out that a limited size of low quality capital expenditure than that of huge current expenditure has failed to show a significant impact on economic growth. The other independent variables also have shown a positive and insignificant impact on economic growth due to low Tax-GDP Ratio, higher Incremental Capital-Output ratio and lack proper inflationary targeting mechanism. The study highlights that government should allocate more resources for productive sectors of the economy like Infrastructure, agriculture and industry to accelerate the economic growth. There is a need to achieve fiscal consolidation by reducing the revenue expenditure, effective implementation of FRBM Act, fiscal deficit, rationalizing the subsidies and enhancing the Tax-GDP ratio etc. To avoid economic slowdown in the context of USA-China trade war and COVID-19 pandemic, reforms relating to composition and management of public expenditure is essential.

KEYWORDS: Capital expenditure, Economic Growth, Tax revenue, Inflation, Gross Fixed Capital formation, Multiple regression model.

I. INTRODUCTION

Economic development in any developing economy like India to a greater extent depends on public spending as it assist the economy to grow. There is a direct relationship between public expenditure and socio-economic development of the country. The annual financial statement of the government consist of both revenue budget and Capital budget. Revenue budget comprises Revenue receipts and Revenue expenditure while Capital budget comprises of Capital receipts and Capital expenditure. Revenue budget contains all such financial transactions which do not create any assets or liabilities for the government while transactions in Capital budget do create assets or liabilities for the government. The general government public expenditure has increased significantly from Rs.900 crores in 1950-51 to Rs.155142 in 1990-91 and then to Rs.4861640 crore in 2017-18 **(Public Finance Statistics 2017-18).** The combined expenditure of center and states together was amounted to Rs.57,60,758 crore in 2018-19(BE).The General government capital expenditure grew from Rs.30202 crore in 1990-91 to Rs.837441 crore in 2018-19.The proportion of General government capital expenditure in the combined expenditure was in the range of 15-16 per cent on an average during the entire Post-reform period. It clearly reflects growing revenue expenditure of the General government.

The public expenditure of the general government can be classified as both Development and Non-development expenditure. The General government Revenue development expenditure consist of expenditure made on social & Community services. General economic services, Agriculture & allied, Industry & Minerals, Fertilizer subsidy, Power, irrigation & Flood control, transport & Communication and public works. Revenue non-development expenditure is expenditure made on Interest payments, Defence services, Fiscal services, Administrative services, pensions & other retirement benefits, Food subsidy and Social security & welfare.

The General government Capital development expenditure consist of expenditure made on Railways, Posts & Telecommunications, Social & Community services, general Economic services, Agriculture & allied, Industry

Received 25 December 2018
Revised 6 June 2019
Accepted 8 September 2019

Abstract

Purpose – Prior literature demonstrates that the effectiveness of bank monitoring decreases when multiple banks are involved, due to a free rider problem, leading to lower firm value. The purpose of this paper is to investigate whether this free rider problem exists in an emerging market context, and whether the relationship between multiple banking relationships and firm value is conditioned on bankers' incentives to monitor.

Design/methodology/approach – The authors use multivariate panel regression to examine the hypotheses. The conditioning effect of the incentive to govern (the amount of average bank lending) is modeled using an interaction variable. Based on the result of the Hausman test, the authors employ two-way fixed effects estimator to estimate the coefficients.

Findings – First, the negative relationship between multiple banking relationships and firm value holds true among Indian firms. Second, the authors show that this negative relationship is lessened for firms with high average bank debt or higher free cash flows. The analyses suggest that these moderating effects are related to a reduction in the free rider problem rather than a decrease in financial constraints. However, these results are only significant among larger firms.

Originality/value – Prior literature has not considered the conditioning impact of the "incentives to govern" when examining the free rider problem, inherent in situations where multiple actors are involved. The authors show in this study that the free rider problem disappears when the incentives to govern are considered in the overall research framework.

Keywords Emerging markets, Firm value, Free rider problem, Multiple banking

Paper type Research paper

1. Introduction

Bank debt can play an important role in aligning the interests of managers and shareholders, leading to increased firm value (James, 1987). Debt's positive spillover effect on valuation occurs when lenders effectively monitor the firm's activities, reducing agency costs (Diamond, 1984, 1991; Fama, 1985; Agarwal and Elston, 2001). However, realization of this benefit of borrowing may be impeded when firms have multiple banking relationships

Passenger Demand Forecasting in the Ridesharing Context: A Comparison of Statistical and Deep Learning Approaches

*Sanjay Fuloria**

Forecasting of passenger demand in the short term could be beneficial to the on-demand ride services platforms. This would help the platforms to incentivize drivers by moving them from areas of low demand to high demand. This, in turn, would help the platform companies to maximize their profits too. Using Uber dataset for New York City, the present study compares three different methods—exponential smoothing, multiple regression and Long Short-Term Memory (LSTM)—to forecast passenger demand in the short term. While traditional statistical methods like exponential smoothing and multiple regression are more explainable, deep learning methods like LSTM, with their complex methodologies, are more accurate in some situations. Additionally, temperature dataset for the city of New York is also used for forecasting. The study concludes that LSTM models perform better in forecasting both for training and validation datasets. The research could be further enhanced by using a bigger and geographically diverse dataset.

Introduction

Ridesharing services like Uber, Ola, and Lyft use technology to create a platform where cab drivers and customers meet for mutual benefit. In this setup, private car owners provide rides to customers for a fee (Chen *et al.*, 2017). Ridesharing services are accessed through a smartphone application. The platform plays the matchmaker by matching supply and demand. The registered drivers constitute the supply side and the customers looking for rides constitute the demand side in this case. There are a lot of factors that influence both the drivers' and customers' behaviors and preferences. These behaviors and preferences impact the demand and supply. This in turn affects the profitability of the platforms and the economic wellbeing of the drivers. In such a situation, it is imperative to understand the short-term passenger demand across a city for an operator. This would help the operator to incentivize the cab drivers by reallocating them from an area of low demand to high demand.

Likelihood of Surviving Children using a Probability Model

*Shubhagata Roy**

ICFAI Business School, IFHE University, Hyderabad, India.

Received: 19 Mar. 2019, Revised: 20 Oct. 2019, Accepted: 11 Nov. 2019.
Published online: 1 Nov. 2020.

Abstract:
Child birth is a natural phenomenon which is required to develop a society. Controlled population growth is a boon for any developing country and taking care of it is the prime responsibility of the concerned government. Unfortunately, in India, child mortality had been a real curse for decades and there were no concrete models which could estimate the number of surviving children in a given time period. In the recent times, lots of initiatives have been taken by the government and other agencies for controlling the fast growing population and at the same time to reduce child mortality. Few of probability models are available to study the variation in the number of births to a female under varying sets of assumptions, but a very little work has been done to find out the distribution of number of surviving children out of the births in a given period of time. Hence, it is necessary to develop a probability model which could explain the distribution of number of surviving children apart from deriving the distribution of number of births. This paper attempts to develop a probability model for number of surviving children, using discrete probability distributions.

Keywords: Population, mortality, survival, probability model, probability distribution.

1. Introduction

Most of the developing countries have experienced a decrease in the mortality and fertility levels and a notable increase in the educational attainment of its citizens. These three major changes have put almost all the developing countries on an economic growth path which was awaited since decades. A decrease in fertility level is an indicator of financial stability, better medical assistance and lesser youth mortality, which in turn increases the investment in education [15]. The decision on the number of children is taken within the household decision making framework [17] and governed by the number of surviving children rather than the number of total children ever born. Hence, it is important to have the distribution of number of surviving children with the help of a concrete probability model. Although, a number of probability models are available to study the variation in the number of births to a female under varying sets of assumptions, but a very little work has been done to find out the distribution of number of surviving children out of the births in a given period of time. Another finite horizon stochastic model was proposed with respect to life cycle fertility within an environment where infant survival is uncertain [21]. It is thus, desirable to develop a probability model which could explain the distribution of number of surviving children apart from deriving the distribution of number of births.

Yadava and Singh (1985) attempted to develop a probability model, but they could only exclude the infant deaths out of the number of births in a given period. A probability model was proposed to study the effect of sex of their previous children on their subsequent fertility at each parity and explained the exclusion of infant deaths [5]. Another probability model was proposed to estimate current fertility including the component of infant and early childhood mortality [6]. Similarly, Yadava and Srivastava (1993) discussed the pattern of births over time in equilibrium birth process. Yadava and Tiwari (2006) derived a probability distribution of number of surviving children out of the births in a given time period in an equilibrium birth process for a defined duration.

The objective of this study is to develop a probability model for number of surviving children, utilizing the properties of Binomial and Poisson distribution. Efforts have been made to have the model assuming survival of a child as success and death as failure. It is also assumed that the probability of survival remains same for all parity. Then, the process of birth

Assessment of Stakeholders Perception on Marketing Techniques adopted by Universities in Tripura State

Biplab Halder[1], P.Venkateswarlu[2], Muddu Vinay[3]
[1,2,3] ICFAI University Dehradun, Dehradun, India

ABSTRACT

This study was conceived as an attempt to assess the stakeholder's perception on the marketing techniques adopted by the universities in Tripura, India. A total of 247 respondents inclusive of students and parents as stakeholders were interviewed. The perceptions on the marketing techniques were different from students and parents. While students preferred personal counselling, social media, web site, parents have considered personal counselling, TV talks and presentations to be important for deciding about the institution.

Article Received: 10 August 2020, Revised: 25 October 2020, Accepted: 18 November 2020

Introduction

Marketing is considered as an art of generating demand and the process of convincing the existing as well as new customers. Competition in all the business sectors is growing rapidly and education sector is no exception to it. With the emergence of the universities both public and private, universities are facing ever increasing competition and difficulties to attract students. Growing number of choices in the tertiary education level are increasing and with the advent of private universities, the prospective students have plenty of options to choose from. In order to be successful, the universities should realize the factors which actually influence the choice, and accordingly devise marketing procedures to give complete factual information to the potential students to make their university as their school of choice.

Professional Education in Tripura

Tripura is the third smallest state in India, predominantly a hilly region with Agartala as the capital. It has wide ethnic groups and is known as 'Daughter of Mother Nature'. Tripura has lush green landscapes and rich in human resources. It has cultural diversity in the population basically are tribals and non-tribals. The state is divided into eight districts where most of the population live in these districts are scheduled castes and scheduled tribes. Tripura has 95% literacy rate which is the highest compared to other states.

The importance of higher education has been growing constantly and several knowledge based industries are being set up in the state. Since last one decade, significant growth was seen in the technical institutions and had also witnessed significant increase in enrollments both in schools and professional education because of the decline in dropout rates over the years. For the last few decades, the decentralization of higher education delivery was the main focus and also on creation and development of infrastructure has been the mainstay at Tripura.

To cater to the population of Tripura State, it has one Central University (Tripura University) and one Private university (ICFAI University Tripura) in addition to universities run by state government. All facets of education are available in the state such as technical, medical, agricultural, legal, teacher and para medical. The available information on educational statistics from various census reports revealed that the overall literacy rate in India has increased from 61 percent in 1987 in males to 82 percent in 2018 and in females it was 32 percent in 1987 to 65 percent in 2018. The state has shown significant improvements in literacy levels both among boy and girls. The gap from 28.8 in 1987-88 has narrowed down to 16.9 in the year 2017-18 (Table 1).

Table 1. Literacy rates in Tripura State

Literacy	1987-88	1993-94	1999-00	2007-08	2014	2017-18
Male Literacy Rate	60.5	65.5	69.2	76.6	80.3	81.5
Female Literacy Rate	31.7	37.9	43.8	54.9	61.8	64.6
Gap	28.8	27.6	25.4	21.7	18.5	16.9

Stakeholders of Higher Education: Stakeholders are the ones who are associated with the institution for its welfare and the success of their students. It may be a collective entity such as community, local businesses, organizations, and committees etc. However, Students are the most important and one of the stakeholders of the higher education institution. Students are the primary customers to the institution because they are the ones who pay the fee and secondly the parents who sponsor their wards for education. Hence, universities must recognize the importance of the

Comparison of Stress Distribution and Deformation of Four Prosthetic Materials in Full-mouth Rehabilitation with Implants: A Three-dimensional Finite Element Study

Yemineni Bhavan Chand[1], Jaideep Mahendra[2], Nasina Jigeesh[3], Little Mahendra[4], Lakshmi Shivasubramanian[5], Shareen Babu Perika[6]

Abstract

Aim: This study aimed to compare the von Mises stress distribution and deformation on the implant, abutment, and abutment screw using metal-ceramic, zirconia, polyether ether ketone (PEEK), and Trinia as prosthetic materials for full-mouth cement-retained implant prosthesis using finite element analysis.

Materials and methods: Four, 3-dimensional mandibular models were designed using Solidworks software. Six conical implants of 4.5 × 11.5 mm, with an internal hexagonal abutment, were fabricated and placed. The physical properties of the implant components, bone, and crowns were simulated to mesh the three-dimensional finite element models. The bite was recorded, and various contact points were marked, on which 50 N loads were applied. The von Mises stress distribution and resultant deformation were analyzed using the finite element method.

Results: Higher stress distribution was recorded on the implants, abutments, and abutment screws when zirconia and PEEK prosthesis were used in comparison to metal-ceramic and Trinia. In consideration of deformation, zirconia and Trinia resulted in higher deformation of the implant assembly, abutment, and abutment screw when compared to metal-ceramic and PEEK prosthesis. Anterior implants showed a higher deformation and stress distribution when compared to posterior implants for all four prosthetic materials.

Conclusion: Within the limitations of the study, metal-ceramic and Trinia showed less stress distribution, while metal-ceramic and PEEK exhibited less deformation on implant and its components. Hence in future, Trinia and PEEK along with metal-ceramic can be promising prosthetic materials of choice in full-mouth rehabilitation with implants.

Clinical significance: Considering the deformation and stress distribution on the implant and its components, the selection of prosthetic material in full-mouth rehabilitation has always been a challenge. Findings of the abovementioned cross-sectional observational study could give an overall insight into materials such as metal-ceramic and Trinia as materials of choice, which can provide a basis for future clinical trials.

Keywords: Deformation, Finite element analysis, Implant prosthesis, PEEK, Trinia.

The Journal of Contemporary Dental Practice (2020): 10.5005/jp-journals-10024-2959

Introduction

In the modern era, dental implants provide edentulous patients with an enhanced functional and confident life. Fixed dental and implant prosthesis has been accepted as an integral part of prosthetic dentistry for edentulous patients ever since the late 1950s. The success rate of implants is usually high, which may be due to the inherent contributed factors such as effectiveness, convenience, and affordability.[1] However, treatment planning in the rehabilitation of a completely edentulous arch using implant-supported prosthesis has been quite challenging. The crowns restored over the implants need to be mechanically strong and esthetically satisfactory. Critical parameters such as stability and distribution of stress on the bone along with clinical health of gingiva play a pivotal role for long-term implant survival. Different types of materials have been used in the past as prosthetic considerations for rehabilitation on implants.

Off late, the most commonly used materials for full-mouth rehabilitation are metal-ceramic and zirconia along with other advanced biomaterials. The metal in the metal-ceramic crown offers strength, while the ceramic layer enhances aesthetics.[2,3] Despite many clinical trials that have shown positive results, there are contrary studies and possibilities that have demonstrated significant mechanical failures.[4,5] Hence, there is a need for the development of metal-free prosthesis, which is esthetically satisfying and biocompatible.[6,7] Eventually, the development of

Regulatory capital requirements: can the banks mitigate the risk through lending rates?

Vighneswara Swamy
Department of Economics, IBS Hyderabad, ICFAI Foundation for Higher Education, Hyderbad, India

Received 21 June 2020
Revised 14 September 2020
Accepted 30 September 2020

Abstract

Purpose – The purpose of this study is to investigate the impact of the new capital requirements under the Basel III framework on bank lending rates.

Design/methodology/approach – By constructing a stylized representative bank's financial statements, the authors show that the higher cost associated with a 1-percentage increase in the capital ratio can be recovered by increasing the bank lending rate.

Findings – The results indicate that in the case of scheduled commercial banks, a 1-percentage-point increase in the capital ratio can be recovered by a commensurate increase in the bank lending rate by 16 basis points and would go up to an extent of 94 basis points for a 6-percentage point increase assuming that the risk-weighted assets are unchanged.

Practical implications – The results assume significance as the estimations for the scenarios of changes in risk-weighted assets change in return on equity and the cost of debt. Given the enormous significance of the impact of Basel III on banks, this research outcome benefits the practitioners in the industry and researchers.

Originality/value – This study contributes to the literature on bank regulation and risk management with a newer and topical approach for quantification of the impacts of new regulatory standards. Another contribution of this study is that it considers three different groupings of banks: (1) scheduled commercial banks; (2) public sector banks and (3) private banks in Indian banking. This is the first of its kind in the context of studying Indian banking.

Keywords Banks, Regulation, Basel III, Capital, Liquidity, Lending rates

Paper type Research paper

1. Introduction

The lessons from the analysis of the global financial crisis underscore the role of bank regulation as vital because of its severe potential impact on economies. In the context of the implementation of Basel III proposals proposed by BCBS (2010), on the one hand, there are logical points of view that higher capital requirements lead to (1) a healthier financial system through a reduced risk of bank failure, (2) lower systemic risk and (3) lower social costs as a result of the elimination of the moral hazard. On the other hand, the counter-arguments highlight that higher capital requirements will escalate the costs of financing for banks as equity financing is more expensive than debt financing, leading to (1) a slowdown in credit growth and the potential detrimental effects on the economies concerned and (2) a decrease in profitability, preventing the future accumulation of capital via retained earnings and ruling out future expansion of banks' operations (Cosimano and Hakura, 2011). However, the overall objective of Basel III is to strengthen the global capital, liquidity, and risk assessment rules and enhance the resilience of the banking sector.

The higher capital requirements cause an increase in the weighted average cost of capital by raising the marginal cost of funding and consequently banks would have to pass on the increase in the cost of capital to the borrowers as higher lending rates [1]. *Per se*, the

Abstract

Aim

The present study evaluated maximum principal stress, von Mises stress, and deformation on the mandible and surrounding structures during the insertion of an implant in various anatomical positions.

Materials and Methods

Finite element models of straight two-piece implants of 4.5 mm × 11.5 mm were modeled using Ansys software, v. 16.0 (Ansys, Inc., Houston, TX, USA). The mandibular model was derived through cone-beam computed tomography of a cadaveric mandible using Mimics software (Materialise NV, Leuven, Belgium). An osteotomy was performed at the first molar region, second premolar region, lateral incisor region, central incisor region, canine region, and second molar region that had varying bone densities. Implant insertion was simulated with a variable load of 1 - 180 Newton, which was applied axially downward with a rotational velocity of 30 - 120 rpm. Maximum principal stresses, von Mises stress distribution at the implant insertion site, and maximum deformation on the entire mandible were recorded during the insertion of the implants.

Results

Maximum principal stress was highest in the crestal area of the right first molar region and least in the middle third of the central incisor region during implant insertion. Von Mises stress in the mandible was highest in the right first molar region and the least in the lateral incisor region during implant insertion. The extent deformation was recorded on the x-axis, y-axis, and z-axis of the mandible. Deformation on the x-axis was highest at the crestal region of the canine and least for the lateral incisor. On the y-axis, deformation was highest at the symphysis region during implant insertion at the first molar region and the least at the condylar area during implant placement in the canine area. On the z-axis, the deformation was highest at the condylar region during implant insertion at the first molar region, and the least was observed in the symphysis region during implant placement in the second molar region.

Conclusion

When overall stress was considered, there is a direct correlation between stress and quality of bone. The highest maximum principal stress and von Mises stress were recorded during the placement of implants in posterior regions of the mandible, which suggests that the presence of dense cortical bone results in higher stress values. The maximum deformation was observed at different regions of the mandible, away from the site of implant insertion. The resultant stress and deformation exerted on the bone during placement of implants at different sites in the mandible varies, which could be detrimental factors in the longevity of the implant.

About

Abstract

A normal demand curve shows a definite inverse relationship between the market price of a product and the quantity demanded of that product, other factors held constant. But there have been situations in the crude oil market in which there was a positive relationship between the market price and the quantity consumed. Moreover, the responsiveness of change in the quantity demanded of oil in the market was not uniform with the change in price. The demand for oil is mostly derived from other factors such as increased incomes and the availability of cost effective substitutes.

Canada Goose – Building a Global Luxury Apparel Brand

K B S Kumar and Indu Perepu***

This case is about Canada-based luxury apparel brand Canada Goose Holdings Inc. (Canada Goose) a manufacturer of parkas. It traces the journey of the company and the way it had built a global luxury apparel brand. The parkas were made in Canada at the company's facilities using a 13-step production process. As the company's popularity grew and the demand from countries in Europe and China grew, Daniel Reiss the CEO was in a dilemma. While producing in Canada helped Reiss maintain the quality that Canada Goose was known for, increasing its global footprint and popularity in China meant he needed to decide whether he could move the production to another location closer to the markets where it was getting popular. Will producing from a different location impact the popularity of the brand and its ethos?

Consumers come to us because we are a real brand with real products that have an inherent and authentic story; our heritage, craftsmanship and product quality resonate.[1]

– Dani Reiss

Introduction

Canada-based performance luxury apparel brand Canada Goose Holdings Inc. (Canada Goose) emerged as a global player after Dani Reiss (Reiss) became the third generation President and CEO of the company in 2001. Canada Goose, founded in 1957 by Reiss' grandfather, sold highly expensive down-filled[a] parkas[b] priced between $600 and $1500[c]. The functional down jacket used in harsh winters soon became popular among urbanites and the brand became associated with warmth provided by superior materials like down filler, highly technical fabric, real fur, etc.

Abstract: Computation of complex mathematical problems are always a challenge of resource constrained clients. A client can outsource the computations to resource abundant cloud server for execution. But this arrangement brings many security and privacy challenges. In this paper, we have presented a secure and efficient algorithm for general computation and scientific problem i.e. matrix multiplication. The proposed algorithm is inspired by the existing algorithm, but we believe that it is imperative to improve the algorithm to enable secure outsourcing of computation. The previous state-of-the art algorithm for matrix multiplication is vulnerable to the Cipher-Text Only Attack (COA) along with Chosen Cipher-Text Attack (CCA) and Known Plain-Text Attack (KPA) and reveal information about the client's data. Hence fails the security requirements of the outsourcing algorithm. The proposed work retains the efficiency benefit of state-of-the-art algorithm, additionally defended the client data against (COA) along with (CCA) and Known Plain-Text Attack (KPA).

Green–agile practices as drivers for patient satisfaction – An empirical study

Samyadip Chakraborty, P. Sashikala and Shubhagata Roy

IBS Hyderabad, IFHE University, Hyderabad, India

ABSTRACT

Healthcare sector is emerging as a very dynamic and competitive sector where the service providers are in constant pursuit to differentiate and distinguish themselves from each other. Green and agile practices have been gaining importance over the years as an important aspect in the service sector. Although majority of the sectors were forerunners in green–agile implementation, the healthcare sector has been fast catching up, where agility and green practices show promises and lots of scope. There is a general absence of research focus involving the impact of green practices and agile practices in patient care delivery in the healthcare sector, let alone in Indian healthcare context. This paper aims at empirically investigating the antecedent consequence relationships between green and agile practices on patient satisfaction and aims at empirically validating the proposed linkages. The contribution of this paper lies in understanding whether green practices and agile practices' implementation in Indian hospitals has any implication on patient perception and their understanding of satisfaction.

ARTICLE HISTORY

KEYWORDS
Green practices; agile practices; health care; care delivery; patient satisfaction

Introduction

In the recent years, Indian healthcare sector has become highly competitive and health issues of patients are being treated or reassured by providing quality service which is an economical form of service with minimum side effects. It is, therefore, quite an easy task to evaluate the satisfaction of patients in terms of service rather than evaluation based on the quality of medical services [1]. In this context, a study on patient satisfaction would be an essential instrument to improve the quality of services. The customer satisfaction is considered to be the most important factor in majority of the sectors [2]. In the recent past also, healthcare was the only sector that neglected customer satisfaction and feedback of the patients as customers were ignored. In other words, the customer's desires were immaterial and not significant [3].

In recent times, healthcare customers have become more refined and increasingly demand the precise and effective proof on the quality of health plan. In order to measure the effectiveness of healthcare delivery, the main focus has become patient centric. The satisfaction of patients with respect to quality of care and services has gained prominence along with many clinical health measures. In view of this, the healthcare organizations are focusing on patient satisfaction to gain and maintain the market share [4]. In order to meet the rapidly increasing demands of customers in a variety of products and services, the organizations need to be agile especially in situations where the demand is complex and unpredictable [5].

In today's scenario, the approach is open systems which help in describing and analyzing organizations [6], thereby necessitating the importance of including the impact of environmental factors on organizational structures and processes. The system needs to interact with environment continuously and adapt to changes in the environment; demanding the strategic management levels needing to focus on scanning, interpreting and acting on environmental changes, as well as coordinating external changes with internal activities [7]. One of the practices of healthcare industry is to maintain environmental sustainability which not only improves the environment pollution but also helps in saving the operating cost. Green and agile practices have been gaining importance over the years as an important aspect in the service sector, let alone the healthcare sector, where agility and green practices have lots of scope. However, over the past few decades as evident from the extant literature, not much of investigations have been done along these lines. Although separate instances of agile practices and green practices' implementation in the service sector have drawn attention, highly focused niche investigation, involving the impact of green practices in the healthcare sector and agile practices in patient care delivery in the healthcare sector, is evident, but the Indian healthcare sector has largely been overlooked.

Does globalization affect export performance in India? An empirical insight

Aruna Kumar Dash

Email: akdash@ibsindia.org

The present paper examines the effect of economic globalization on India's aggregate export performance during the period from 1995:M1 to 2016:M12. We use various macroeconomic variables such as export, relative price, nominal effective exchange rate (NEER), GDP per capita, and economic globalization. We employ Auto Regressive Distributed Lag (ARDL) model to find out the long-run equilibrium relationship among the variables considered. The empirical results indicate that there exists a long-run equilibrium relationship between export, relative price, NEER, GDP per capita and economic globalization. Further, in the long run, we find that India's export performance is influenced by economic globalization, GDP per capita and relative price. However, in the short run, export performance is influenced by economic globalization, relative price, NEER and GDP per capita. In the short run, 1% increase in economic globalization will lead to increase in the volume of export by 0.77%; whereas, in the long run, it is 3.40%. Hence, sustainability of export in the long run is a matter of concern for policy makers.

1 | INTRODUCTION

Before World War II, there was rapid integration of the economies in terms of flow of goods and services and movement of capital. The inter-war period witnessed the erection of various barriers to restrict free movement of goods and services. After World War II, most of the countries across the globe were fragmented and divided into a number of poorly integrated economies. In order to protect their economy, quantitative restrictions and other barriers to commerce such as high tariffs, strict quotas, controls on capitals and currency movements, etc. were enforced. However, during the last two decades, this fragmentation of the globe into several different economies has tended to be reversed; and now most of the countries in the world have become economically and financially integrated. As a result, tariffs were substantially lowered in a series of negotiated stages. International trade was revived, and, indeed, the volume of world trade has increased more rapidly. In the financial sphere, exchange controls were largely removed, which permitted funds to flow rapidly from one country to another; this encouraged the integration of the financial markets.

In the current climate of globalization, the exchange rate has become an extremely important macro-economic variable, with potential influence on the whole economy. It is one variable through which global influences from other countries get transmitted across the borders, with a potential to affect two major macro-economic variables, namely output and inflation. After the introduction of economic reforms in the 1990s, India chose greater integration with the world economy as part of its development strategy. Even though integration deepened, the rate of growth of per capita income and investment level did not change much. However, in the first decade of the 21st century, the integration was very strong and also saw a sharp increase in volume of export, per capita income, capital inflows, savings and investment, etc. In the last three decades, world trade relative to GDP has seen substantial increase. The rapid development of the capital market has been one of the important features of the current process of globalization.

Globalization means integration of economies and societies through cross-country flow of information, ideas, technologies, goods, services, capital, finance and people (Rangarajan, 2003). However, the term "globalization" is used here in the limited sense of economic integration which can happen through the three channels of (a) trade in goods and services, (b) movement of capital and (c) flow of finance. Dreher (2006) developed an index of globalization covering its three

A B S T R A C T

We develop empirical models using difference-in-difference method to find out how COVID-19 testing and infection rates impact the BRICS economy. Our results show that strict government measures, areas of poor people and people with heart diseases have resulted in high COVID-19 testing due to the increasing infections. However, economic development and population density are not found to be rather insignificant towards the COVID-19 testing rates. Hence, both from policy and pandemic perspectives, it is inferred that these developing economies need to divert more resources and infuse more investment in the healthcare sector in the coming days.

- Governments must give due stress to the health sector along with development irrespective of nature of the economy.
- Our results show that strict government measures, areas of poor people and people with heart diseases have resulted in high COVID-19 testing due to the increasing infections.
- Both from policy and pandemic perspectives, it is inferred that these BRICS economies need to divert more resources and infuse more investment in the healthcare sector.

Turn-of-the-month effect in three major emerging countries

Geeta Singh, Kaushik Bhattacharjee and Satish Kumar
IBS Hyderabad (ICFAI Foundation for Higher Education), Hyderabad, India

Received 14 January 2020
Revised 28 January 2020
Accepted 28 January 2020

Abstract

Purpose – The purpose if this paper is to examine the turn-of-the-month effect in the equity market of three major emerging countries – Brazil, India and China – from January 2000 to December 2017.

Design/methodology/approach – Ordinary least square regression analysis is used to examine the presence of the turn-of-the-month effect and to test the efficiency of the emerging stock markets. The characteristics of the returns during the turn-of-the-month days are compared with that of the non-turn-of-the-month trading days.

Findings – The average returns during turn-of-the-month days for all the considered emerging market indices are significantly higher than the non-turn-of-the-month days for the full sample. For the subsample analysis, the average returns for Brazil and India for pre-GFC period are higher on the turn-of-the-month days than on the non-turn-of-the-month days. However, the effect disappears in China during the GFC period. During the crisis period, the results show that the turn-of-the-month effect disappears in Brazil and India, whereas for China, the effect is significant. For the post-GFC period, the-turn-of-the-month effect reappears for all the countries.

Practical implications – The results have important implications for both traders and investors. The authors' results indicate that the market participants can time the stock markets of these countries by taking long positions especially during the times when the turn-of-the-month effect is highly significant.

Originality/value – To the best of the authors' knowledge, this paper is the first to study the turn-of-the-month effect, in the key emerging countries such as Brazil, China and India. Second, the authors divide the sample into three subperiods based on the 2008 GFC such as pre-GFC, GFC and post-GFC to understand the dynamic behavior of turn-of-the-month effect over time. Most importantly, the authors control for the day-of-the-week effect while examining the turn-of-the-month effect.

Keywords Turn-of-the-month effect, Adaptive market hypothesis, Market efficiency

Paper type Research paper

1. Introduction

Market efficiency has been a long studied area in finance. It has become a fundamental that calendar anomalies help us know about the market efficiency, especially in capital markets. Calendar anomalies are changes in security prices in stock market following certain patterns that occur at a regular interval or at a specific time in a calendar year. Thus, these seasonal anomalies may open a window for market participants to beat the market by examining these patterns. Various studies have been done in countries across the world for different time periods to study calendar anomalies to derive some conclusion about their markets' efficiency. For instance, Jacobs and Levy (1988) study various calendar anomalies, associated with abnormal equity returns on the turn of the year, week, month and preholiday and even time of the day. Cadsby and Ratner (1992) examine the preholiday and turn-of-the-month (TOM) effect for five countries including Canada and the United Kingdom. Kunkel *et al.* (2003) show the evidence of significantly higher returns during TOM days compared to non-TOM days in the stock markets of 16 countries across Europe, Far East, North America and Latin America. Kumar (2016) examines the day-of-the-week (DOW) effect, January effect and TOM effect across a set of developed, advanced and emerging currencies and concludes that these calendar anomalies are more significant across emerging currencies compared to advanced and developed currencies.

This study examines the road accident rates from 29 Indian states and 6 Union Territories during 2006–2015. In this paper, we have employed several empirical techniques such as regression, generalized method of moments (GMM), and threshold regression models to examine how education and attitude of the drivers impact the road accident rates. In our empirical analysis, we demonstrate that lawless driving is found to be positive and statistically significant while incorporating both state and year effects. We also find some interesting result in the context of education and road accidents. We notice positive relationship between higher education and road accident rates across Indian states, which tells us highly educated people are more prone to road accidents as compared with less educated people. In the threshold analysis, the study discovers the positive relationship between road injury and accidents caused by people with higher education, in cases of considering road injury rate from drunken driving as the threshold variable. There appears to be a large number of behavioral issues emanating from higher education, which contributes significantly to the road accident rates in the Indian states. Hence, there is a need for policy intervention.

1 | INTRODUCTION

Globally 1.3 million people die on the road every year and 50 million suffer injuries (OECD, 2017). Around 90% of road traffic deaths occur in the low- and middle-income countries, although these countries have only 54% of the world's vehicles (United Nations Conference on Trade and Development [UNCTAD, 2017]). Out of 10 lives lost in traffic, nine are lost from low-and middle-income countries. The World Health Organization (WHO) report (2015) shows that 68 countries have witnessed a rise in the number of road traffic fatalities since 2010, of which 84% are from low- and middle-income countries. The majority of victims are between 15 and 29 years in low-income countries. The African region faces highest road traffic injury death rates in the world followed by the Eastern Mediterranean region. Among the high-income countries, the lowest rates are in the European Region. The United Kingdom has been successful in reducing road fatalities, and has the second lowest road fatality rate worldwide with only 2.9 deaths per 100,000 populations recorded by the WHO in 2015. Even within high-income countries, people from lower socioeconomic backgrounds are more likely to be involved in road traffic crashes and living with long-term adverse health consequences. According to WHO, this is largely due to the fact that the development of infrastructure, policies, and enforcement measures has not kept pace with the increase in vehicle use. If we will compare between urban and rural areas, around 40–50% of traffic fatalities occur in urban areas globally (Global Mobility Report, 2017). According to WHO, road traffic accidents cause a loss of 3% of GDP in many developed countries and 5% of GDP for low- and middle-income countries. Road collisions incur huge economic costs at a national level, which includes a burden on the health, insurance, and legal systems.

The causes of road accidents are multidimensional such as human/driver behavior (includes negligence, over speeding, overtaking, traffic violation, alcohol and drugs intake, and pedestrians on the street), vehicle-related factors (like faulty brakes and tires), quality of

A Proposed Architecture for Finding Missing Threads in Internet

D. Saravanan
Faculty of Operations & ITICFAI Business School (IBS), Hyderabad,The ICFAI Foundation for Higher Education (IFHE)(Deemed to be university u/s 3 of the UGC Act 1956)Hyderabad-India

ABSTRACT

As increasing the usage of internet grows very rapidly present days. It creates challenge for my researchers how the connectivity links works such a heterogeneity network. Particularly on individual domain how the procedure works to transfer data or communication among the network. Identifying the structure at the individual level still one of the most demanded research activity. Here most of the researchers don't know where the missing procedure or how the missing procedure change our network structure. Identify the missing procedure it is necessary to find the network architecture completely. In this paper a new architecture helps to find the missing thread on the internet.

KEY WORDS: NETWORK ARCHITECTURE, MISSING CONNECTION, NETWORK PROCEDURE, INDEPENDENT SYSTEM, ROUTING PROCEDURE, PERFORMANCE EVALUATION.

INTRODUCTION

It is highly necessary for finding the network structure whenever user find difficult in mission connection. This work highly complicated in individual network structure (Floyd & Paxson 2001; Chang et al. 2004). For that it is necessary user need to build correct and absolute structure for network operations. There are various methods are currently existing for finding missing connection. One important observations identified most of this missing connection take place in peer-top-peer type of network structure only (Colitti et al. 2007; Cohen & Raz 2006). This take place especially at network exchange point or network exchange node. But constructing the accurate and obsolete network design is one of challenging factor for many researchers. In most of the existing systems collects the network steering information's that are all recorded in a table (Saravanan 2016). This table entry are updates at regular interval or whenever any transaction take place on the network structure. Additionally, network steering registries helps the user find the missing connection (Xu et al. 2004). Using this resources user identify the missing connection. There is no guarantee that each of this resources are providing complete details to the user, sometime providing information may be incorrect or inaccurate also. So user first need to find the gene unity of the available datasets. In most of research works network swapping points are not yet consider or this points are not included in network architecture (Lakhina 2003). This points normally consider least significant points. For that most of the research work devoted first find the missing connection, find the importance of the missing connection. Based on this information user need to find the missing connections.

DOES EXCHANGE RATE VOLATILITY AFFECT TOURIST ARRIVAL IN INDIA: A QUANTILE REGRESSION APPROACH

Sangram Keshari JENA[1]
Aruna Kumar DASH[2]

Abstract. In this study, we examine the degree and structure of the impact of exchange rate change and volatility on tourist arrival in India by using Quantile Regression Analysis (QRA) during January 1990 to March 2015. The study made the use of inbound tourist arrival as the dependent variable and world GDP per capita, nominal Indian Rupee/US Dollar exchange rate and exchange rate volatility as the independent variable. We have studied the impact of exchange rate on tourist arrival in the world and top 10 counties context. As far as impact of exchange rate change is concerned, the results are contrasted with both the measures of tourist arrival. In the case of total tourist arrival in India, the impact is positive which means deprecation (appreciation) of domestic currency has a positive (negative) in normal to bad phases of tourist arrivals. But in case of top ten countries, deprecation (appreciation) of domestic currency, the impacts tourist arrival at extreme good and bad phases negatively (positively). However, for these top ten countries, the per capita income of the respective countries is much more important as it has a strong positive impact on all conditions of tourist arrival. Similar impact is observed for exchange rate volatility too. Further, the impact of exchange rate both change and volatility is found asymmetric at different condition of tourist arrival from top ten countries. So, the same tourism policy may not work in all the situations. Thus, the policy makers should come out with suitable tourism policy appropriate for different conditions of tourist arrival.

JEL Classifications: C32, L83, O40, F41
Key Words: Tourist arrivals, exchange rate volatility,Quantile regression analysis,India

I. Introduction

In a globalized world, the exchange rate has become an extremely important macroeconomic variable holding potential to influence the whole economic activity of a country. It is one of the variables through which global shocks get transmitted across the borders with a potential to affect the other macroeconomic variables of the economy. Since the collapse of the Bretton-woods system in 1973, most of the countries in the world moved from fixed to floating exchange rate system. Economic uncertainty created by floating exchange rates has surprised and disappointed many economists, businessmen and policy makers which is beyond their expectations. The Central Banks take measures to ensure that exchange rate volatility remains under control as a highly volatile currency has a negative effect on the economy. Therefore, it is not only a concern for financial market participants, but also for policy makers to discern the impact of exchange rate volatility on different sectors of the economy.

Corporate governance
Group-affiliated firms

ABSTRACT

Corporate debt diversification (firms simultaneously utilizing multiple distinct debt sources) is a global phenomenon. However, how such financing affects firm value has not yet been examined. Using Indian firms, we investigate debt diversification's impact on monitoring effectiveness, agency costs, and financial constraints – which can all affect market value. Results reveal a negative impact of debt diversification on firm value, particularly among group-affiliated firms. This negative impact is attributed to free riding among lenders: evidence suggests that increased agency costs resulting from inferior monitoring contributes to worse firm accounting performance. Further, debt diversification does not appear to reduce financial constraints.

1. Introduction

Debt diversification is a common phenomenon among corporations across the globe. About 79% of firms in the U.S. use more than one source of debt financing (Johnson, 1997). Although it is an emerging market, about 78% of firms in India report a debt component on the balance sheet that utilizes more than one source of borrowing.[1] In spite of its international prevalence, the implications and impacts of the debt diversification phenomenon have yet to be fully examined. Prior research has concentrated on two aspects of diversification: the determinants of debt diversification (Colla, Ippolito, & Li, 2013; Rauh & Sufi, 2010) and the impact of debt diversification on certain firm-specific characteristics (Diamond, 1991; Huang & Ramirez, 2010; Rajan, 1992). However, the literature has not yet examined the impact of debt diversification on the value of firms. Thus, intriguing questions in this context are: (i) *Does* debt diversification affect firm value? and, if so, (ii) *why* does debt diversification impact value?

We examine Indian firms to investigate these questions because of the access to reliable and detailed information about the sources of debt for Indian corporations.[2] Additionally, the frequent affiliation of Indian firms into business groups – a phenomenon which is generally not observed in western economies – provides a unique setting to examine relationships between debt diversification and firm value.

Does Corporate Governance Influence Capital Structure in Indian Firms?

T. Sita Ramaiah[1], Satish Chandra Tiwari[2]
Neeraj Kumar[3] and Radha Mohan Chebolu[4]

ICFAI Business School, Hyderabad, India

Abstract: The corporate governance ensures transparency, accountability, responsibility, and fairness of the firms. If the company demonstrates a high level of corporate governance, then the stakeholders of the company trust it. Corporate governance is essential for organizational growth and success. Corporate governance influences capital structure up to some extent. The effects of corporate governance on capital structure alternatives have been well recognized. This paper explores the significance of corporate governance practices and their impact on the capital structure of S&P BSE-100 companies. It squeezes that four characteristics of corporate governance, including Board independence, Board remuneration, CEO duality, and Ownership structure, have a positive correlation with debt-equity whereas Board independence, CEO duality, and ownership structure have a positive correlation with debt ratio. It concludes that Board Independence, Board Remuneration, CEO duality, and Ownership structure have been showing a positive impact on capital structure.

Keywords: Corporate governance, Capital structure, BSE

1. Introduction

Capital structure (CS) elaborates the firm's financing pattern or the mixture of the various kinds of finance. Shapiro and Balbirer (2000) explained capital structure as the capital mix with debt and equity and used by the company to finance its operations. Funding may be in the form of debt securities, loans from financial institutions, retained earnings of the company, and equity shares issued by the company. Many theories discuss capital structure in different ways. It refers to how the finance manager mixes debt and equity to finance capital. The trading-off can explain the optimal capital structure between the gains from debt and related costs such as bankruptcy, financial distress, and agency cost (Scott, 1976). Modigliani and Miller (1958) started the theory of capital structure reveals that in a perfect world (no taxes, complete and credible disclosure of the information and no transactions and agency costs), the level of debt in a firm's capital structure would have no impact on the value of the firm.

Effective decisions of financial management in the field of capital structure, maintaining liquidity and solvency, the balance of short-term and long-term capital are views as a

DEVELOPING HIERARCHICAL RELATIONSHIP OF ICTM BARRIERS-AN EFFORT FOR ECONOMIC EVOLUTION OF INDIAN HIGHER EDUCATION SECTOR

SUMANT KUMAR TEWARI

Abstract: *Sustainability of educational system warrants modernization which is not possible without ICT. The paper tries to associate with existing set of challenges in the Indian educational set up, particularly the ones closer to large masses of the society. Once the challenges are established paper tries to identify the capabilities of ICT as well as barriers of ICTM. In order to understand the cause and effect relationship between the ICTM barriers and their driving and dependence power, ISM and MICMAC analysis technique is used. The opinions from a group of experts from academia and industry were used in developing the relationship matrix which is later used in the development of ISM model.The paper concludes while establishing relationship between ICTM enablers helping conventional educational systems to increase the reachability and provide quality education in an interactive way.*

Keywords: *Economic Evolution, ICT, ICTM, MICMAC, Education Sector, ICTM barriers*

INTRODUCTION

Globalisation and liberalization has strengthened the concept of 'One World'. In current global economic environment many leading organisations have blurred the geographical boundaries by making their strong presence and significant contribution in the economy of other countries. This scenario has created theintense competitive environment for developing countries like India where it has created new job opportunities but for that more precise and updated knowledge, skill, attitude and habits (KASH) are desired(MHRD, 2019; UNESCO, 2018).Manufacturing and service sectors are facing the challenges on the front of quality, volume, variety, variability, velocity and innovation.

India is a diverse country where people have various religions, cultures, believes, languages, socioeconomic status. Geographic diversity is also a big challenge. India is expecting to have 34.33% share of youth in total population by

Demographic Determinants of Access to Bank Credit

Laila Memdani, Kalaa Chenji, Sode Raghavendra

Abstract: *The main objective of the paper is to study the determinants of access to bank credit, an important dimension of Financial Inclusion in India. For this purpose we studied if access to bank credit depends on district, gender, education and literacy. The data was collected from Jogulamba with lower literacy rate and Ranga Reddy a semi urban district in the Telangana. A semi structured questionnaire was prepared for the data collection. Regression analysis has been used to analyze the data for the study. Results show that access to credit for districts is significant which is contrary to general belief that in rural areas the credit from banking sector is less. Education is also significant and positive which implies that educated people prefer credit from banks compared to uneducated. This has important implication for policy makers to focus more on education and Financial Inclusion will follow.*

Key words: *Financial Inclusion, Access to credit, Gender, Education, District JEL: G20, G21. O12, O16*

I. INTRODUCTION

Banking sector reforms in India marked a beginning for unprecedented economic development in the country. Development of banking sector positioning the country in a prominent place. India still faces the challenges such as illiteracy, poverty, growing inequalities between rich and poor, disparities in development in rural and urban areas. The poor and weaker sections of the population are yet to taste the fruits of economic development. Planning in India, brought about structural changes required for the economies' development. With an aim to reach the backward sections of the economy and the term inclusive growth was coined to cater to the needs of economically backward population. The 11th five year plan aimed at eradicating poverty with the help of financial inclusion and focused on guaranteeing gender parity in order to address the issues faced by the economy. The concept of inclusive growth intended to reduce the gap between the urban and the rural, rich and poor, men and women and amongst different sections of the economy. The objective of financial inclusion is to provide access to financial services among the most underprivilegedsections of the society.

According to Kofi Annan (2003), the present days reality is that a large majority of people do not have access to financial services like savings, credit, and insurance, which are must these days.

DOI: 10.35940/ijrte.D5115.018520

Clessens (2006) explains financial inclusion as the availability of a supply of reasonable quality financial services to all at a very low cost or minimum cost. The Chairman of committee on Financial Inclusion, Rangarajan (2008)defined financial inclusion as a process of providing access to financial services and adequate credit to the poorer sections of the society.

II. REVIEW OF LITERATURE

Inclusive finance and its accessibility has been studied by many authors, Banerjee and Newman (1993) opined that access to finance facilitates the poor to exit poverty and helps in enhancing productivity. Binswanger and Kandker (1995) studied the progress of Indian Rural expansion program and found a significant change in rural poverty scenario and increase in non-agricultural employment.

The financial inclusion committee formed under the chairmanship of Rangarajan, 2008, formed by the Government of India testified that the access to formal sources of credit in farmer households in India is less than 73 percent. It is found that around 560 million people in India are excluded from formal source of finance. Around 41.6 percent of the population still lives below the poverty line earning less than US $ 1.25/ day (NCR White paper on Financial Inclusion, 2009). Financial Inclusion is now recognized as a policy priority in many countries and identified to be a powerful tool to not only alleviate poverty but also to accelerate economic development of the nation. Chakraborty (2010) in his study explained that as the benefits of economic growth have not been equitably shared, the concept of inclusive growth has received paramount attention as a strategy for economic development.

Elaborate research on financial inclusion reveals the multifaceted quality of the factors congregating and influencing it. The excluded sections of the society suffer severely from inequalities and poverty. Factors that help in including the poor and deprived sections of the society include availability and mobilization of deposits that result in improved savings and accessibility of insurance to efficiently deal with risk and uncertainty. Review of literature emphasizes that ceremonial economic services are negatively related to poverty and inequalities in the sections of the society (Beck T. D.-K., 2007) (Clarke, 2006) (Galor, 1993) (Honohan, 2004) (Jeanneney, 2011). A well-developed financial system supporting the poor and needy has a huge impact on savings and investment rates as well as on technological innovation and long term growth rates while cutting the costs on information and transactions.

Financial development and economic growth are found to be positively related as found in the research in the field of inclusive growth (Yang, 2008) (Beck T. &., 2006). Financial inclusion is said to curb the

Corporate Governance, Board Characteristics and Performance of Indian Banks: An Empirical Study

Brahmaiah Bezawada, Sager Reddy Adavelli*

Department of Finance, ICFAI Business School (IBS), IFHE, Hyderabad, India. *Email: sager@ibsindia.org

Received: 04 February 2020 **Accepted:** 14 April 2020 **DOI:** https://doi.org/10.32479/ijefi.9536

ABSTRACT

The paper examines the corporate governance, board characteristics, performance and asset quality of Indian banks and investigates the impact of a set of board characteristics on performance and asset quality of banks. We use a sample of 34 scheduled commercial banks, for ten years from 2009 to 2018, accounting for about 90% of the total banking assets and banking business India. We measure bank performance by return on assets (ROA) and asset quality of banks by ratio of net non-performing assets (NNPA) and document evidence on the role of the board characteristics on performance and asset quality of banks. The study finds that the board size and percentage of independent directors have significantly positive impact on ROA. The percentage of executive directors is having significantly negative relationship with the ROA. The board size and percentage of independent directors have significantly negative relationship with banks' NNPAs. The research suggests that the board of directors play a significant role in bank governance in India. The paper contributes to the literature on the corporate governance of banks in India, which is one of the emerging economies of the world. The research results provide some insights of corporate governance to the RBI for considering appropriate policy guidelines on corporate governance to banking industry in India.

1. INTRODUCTION

The global financial crisis of 2008 attracted more attention on the corporate governance of banks. The Basel Committee on Banking Supervision on corporate governance reported that effective and sound corporate governance practices are critical to the efficient functioning of the banking sector in particular and the economy as a whole in general. The primary objective of corporate governance is to safeguarding stakeholders' interest in conformity with public interest on a sustained basis (BCBS, 2015). India has the largest number of banks in the world after the US. Presently there are 84 scheduled commercial banks (SCBs) in India consisting of 19 public sector banks (PSBs), 18 private sector banks (PVBs) and 47 foreign banks (FB).[1] These banks account for about 90% of the total banking assets and business in India. In the post reforms era, the Indian banking experienced tremendous growth in deposits mobilization, sanctions of loans and overall banking business. Corporate governance deals with the organizational structure through which the objectives of the banks are achieved. An effective board has become increasingly important for Indian banks. However, the market for corporate control is still underdeveloped. Hence, the board of directors might be a key mechanism to monitor and advise bank management. Risk management and corporate governance in banking firms have become an important issue since the global financial crisis. Banking institutions operate on a higher leverage. Non-banking institutions operate with a low leverage (debt to equity ratio) of 3 to 4, whereas banks and financial institutions operate at a leverage of about 18 times (RBI, 2018).

The Securities and Exchange Board of India (SEBI) has introduced a sound corporate governance system not only to improve the

1 In addition, there are regional rural banks, small finance banks and payment banks, local area banks and cooperative banks operating India. All these banks account for less than five percent of total banking business in India

Corporate Governance Practices and Bank Performance: Evidence from Indian Banks

Brahmaiah Bezawada *PhD*
Professor of Finance and Accounting
ICFAI Business School (IBS), IFHE, Hyderabad, India
E-mail: brahmaiahb@ibsindia.org

Abstract
The study examines the corporate governance practices and analyzes the role of the board characteristics (size of the board, the composition of the board, and functioning of the board) on the performance and asset quality of banks. We use a sample of 34 commercial banks consisting of 19 public sector banks and 15 private sector banks from 2009 to 2018 accounting for 93 percent of the total banking industry in India. The study finds that busy directors and the number of meetings have a positive significance on bank performance. The percentage of independent directors and the percentage of busy directors influence a significant negative relationship on the net non-performing assets ratio. The board size and number of meetings are associated negatively with Tobin's Q significantly and the percentage of busy directors is a significantly positive impact on Tobin's Q. The board size has a significantly negative impact on bank performance. The research findings provide some insights into corporate governance to the RBI for considering appropriate policy guidelines on corporate governance in the banking industry in India. The paper adds to the existing literature on corporate governance mechanisms and banking industry performance.

Keywords: Corporate Governance, Board Characteristics, Performance of Banks, Indian Banking.

I. Introduction

The role and importance of the board of directors in the corporate governance of financial and banking institutions have become more important during the post-global financial crisis of 2008. The Basel Committee on Banking Supervision (BCBS, 2015) emphasizes the importance of corporate governance. The primary objective of corporate governance would be safeguarding stakeholders' interest in conformity with public interest on a sustained basis. Good corporate governance practices in banking institutions are essential conditions for achieving and maintaining public trust and confidence in the banking, financial and economic systems of the country. Corporate governance deals with the organizational structure through which the objectives of the firms are achieved. Good corporate governance will enable better financial performance and provide fair return and treatment to all stakeholders and incentives for management to pursue objectives that are in the best interests of the institution and its shareholders.

The Indian banking sector is the largest and most complex among emerging economies of the world. The banking industry supported commerce, industries, trade, and personal segments of the economy by providing different types of banking products. The nature of the banking business enhances the information asymmetry and reduces stakeholders' ability to monitor bank managers' decisions. Banks do business with other people's savings and money and trust of depositors' forms the cornerstone of their existence. Therefore, the banking industry is subject to more intense regulation than other industries, as they are responsible for safeguarding and protecting the depositors' rights, guaranteeing the stability of the financial system, and reducing systemic risk. Regulation may be considered as an additional measure of corporate governance mechanism and occasionally it diminishes the effectiveness of other mechanisms in the corporate governance of banks. The Reserve Bank of India (RBI) widened highly and deepened banking reforms and strengthened structurally the banking industry. Most of the banks from the public and private sectors are listed on the stock exchanges and are actively trading at the stock exchanges. The Securities and Exchange Board of India (SEBI) introduced a sound corporate governance system to improve the functioning of the banking system. Corporate governance in banks plays an important role due to the complexity and uniqueness of banking institutions. Boards are expected to take proper control and fair decisions on various strategies and policy choices.

Regulators may discourage competition and discipline banks by imposing restrictions on ownership structures and business operations. The size, composition, and functioning of boards might show directors' motivation and their ability to adequately supervise and advise managers' decisions. SEBI introduced a sound corporate governance system not only to improve the functioning of the banking system but also to ensure full and fair disclosures by the banking industry. The boards of directors of Indian banks are responsible and accountable for the operations and performance of the banks and to monitor and advise top management and operational management of banks. SEBI lays more importance on the board through a comprehensive and effective regulatory framework for corporate governance of banks. The RBI introduced "fit and proper" criteria for the constitution of the bank board and selection of the board of directors. The SEBI issued

Carbon cap-and-trade

ABSTRACT

Manufacturers face challenges while collecting used products in their reverse supply chain from several scattered geographic regions. These regions are different in terms of quality of used products returned, quantity returned, the timing of the returns, and regions' distance from the central remanufacturing facility. The paper proposes a mixed-integer linear programming model for such manufacturer to decide on an optimal combination of channels for collecting used products from these regions in a finite multi-period situation. In each region the manufacturer has two potential sources of collection activity for the manufacturer are −1) through a regional independent collection firm, and 2) direct collection from regional customers. The decision problem is considered under constrains of the quantity and quality of returned products, carbon emission cap-and-trade regulation. A numerical analysis using parameter value estimated using field studies in India for steel drums is presented. The results of the analysis suggest that manufacturers and carbon policymakers should consider the quantity of returned product over the product life cycle. Further, the target for long term carbon emission reduction has implication to a manufacturer's channels selection for collection activity from multiple regions. Results of analysis also indicate the effect of timing for carbon-cap-and-trade policy implementation on the selection of channels for collection activity in a multi-region problem.

1. Introduction

The activity of collection in a reverse supply chain (RSC) involves acquiring the products from the customers/consumers, an inspection of these products for residual value, and transporting these collected products to a remanufacturing facility. Products that have completed its service life served the utility to customers, and are worn-out beyond economical maintenance for customers are suitable input material for RSC that extracts residual value from returned products by remanufacturing.

Globally, manufacturers are selecting third party firms as a channel for the collection of such used products. The Volvo uses services of a network of scrap car recycling centers in Britain.[2] Microsoft authorizes multiple regional partners for collection-recovery-remanufacturing of used Microsoft computers from international locations.[3] Few manufacturers use in-house RSC for the collection of used products. Cummins in India deliver remanufactured engine components from a central facility as a replacement to the customers and they return engine components that are worn-out to the facility.[4] A similar practice is seen at Fuji Films (Wu and Zhou, 2017). These firms are using a single type of collection channel to receive used products from multiple geographic regions. These regions often has different characteristics such as the consumers' habit of product usage and duration of the usage, residual service life of the returned products, proximity of the location from remanufacturing facility, the timing of customers returning the products, quantity of used products available for collection at respective localities, and associated cost components (Srivastava and Srivastava, 2006; Shi et al., 2011; Lu et al., 2014; Yu et al., 2016; Feng et al., 2017; Ding et al., 2018). Studies and industry

Causal Effect of Economic Indicators on Indian Automobile Sector

Rama Krishna Yelamanchili*

Department of Finance and Accounting, ICFAI Business School, IFHE-Hyderabad, Hyderabad, Telangana, India.
Email: yrk@ibsindia.org

Received: 05 December 2019 **Accepted:** 06 February 2020 **DOI:** https://doi.org/10.32479/ijefi.9175

ABSTRACT

In this paper we examine the co-movement and casual relationship between economic indicators and automobile index. We postulate that leading and coincident economic indicators will help explain, cause, and predict movements in automobile index. To test our hypotheses we source data for four coincident indicators, namely index of industrial production (IIP); index of manufacture of motor vehicles, trailers and semi-trailers (MVI); index of manufacture of other transport equipment (TEI); and west texas intermediate (WTI) crude oil price, for leading indicator we use bombay stock exchange (BSE) sensitive index (SENSEX). We consider BSE's AUTO index as proxy for Indian Automobile Industry. We collect monthly data of our study variables from April 2012 to June 2019. We break our full sample into two sub-samples based on break point in AUTO index and run separate analysis for each sample period. We find significant contemporaneous co-movements between SENSEX and AUTO index. In contrast to our hypothesis AUTO index cause SENSEX in all the three sample periods. Granger test confirms this result with different lags. In addition, we also find evidence for causation from AUTO index to MVI and TEI with five and three lags respectively in our second sub-sample period. Our results indicate that automobile industry influence Indian stock markets and automobile industrial production. Our results suggest that policy makers and regulators should be vigilant in making policies pertaining to automobile industry and should consider the repercussions of their decisions, because wrong policy decisions about auto industry may hurt the Indian economy.

Keywords: Indian Economy, Indian Stock Markets, Automobile Industry Performance, Policy Implications, Regulatory Norms

1. INTRODUCTION

The Indian automobile industry is recognized as a "sunrise industry" as it has emerged as one of the fastest growing sectors over the last few years. The automobile sales in India have grown at a compounded annual growth rate of six percent over the period of FY11-FY17. This growth can be attributed to significant support the automobile industry received from Government of India (GOI) in the form of fully de-licensing, tax incentives for exports, and allowing 100% foreign direct investment (FDI) are few to mention. With such a kind of support the industry attracted FDI's worth USD 20.85 billion during the period April 2000 to December 2018. Along with these initiatives, the industry also received support in the form of decrease in global fuel prices, easy access to loans from banks and non-banking financial institutions to customers, lower interest rates on loans, growing employment rate, income, and the economic wealth of Indian citizens. In Indian automobile industry major share belongs to two wheelers segment (80%), followed by passenger vehicles (14%), commercial vehicles (3%) and three-wheelers (3%). The Indian automobile industry contributes more than seven percent to the total GDP and provides employment to about 32 million people directly and indirectly. As per the GOI automotive mission plan (AMP) 2016-26, automobile industry's contribution to GDP is projected to increase to 12% from 7%. It is also expected that India will emerge as the world's third largest passenger vehicle market by 2021 and create approximately 65 million jobs.

Accepted 6 May 2020

Abstract

Purpose – This study aims to investigate the interrelationships among the Lean manufacturing (LM) adoption barriers in Indian SMEs. This issue has its own importance as LM has become the inescapable requirement for small- and medium-scale enterprises (SMEs) because of the increased concerns about quality, cost, delivery time and rapidly growing competition in the manufacturing sector and in India it is opposed by many factors/barriers. To act for the eradication of these barriers, we need to systematically analyze them.

Design/methodology/approach – Based on the available literature and consultation with the experts, the authors identified 16 LM barriers for Indian SMEs. The authors analyzed the interdependencies among the barriers and prioritized them using integrated Grey-decision-making trial and evaluation laboratory (grey-DEMATEL) approach.

Findings – The findings show that limited financial resources, fear in adopting new technology, lack of top management commitment and poor leadership quality are the most critical barriers for LM diffusion in Indian SMEs.

Research limitations/implications – The present research is based on the experts' inputs, which may be subject to individual biases. In developing countries, such as India, geographical influences are also possible, which are neglected in this study.

Practical implications – This study provides significant insights that can help SMEs to focus on critical cause group barriers to accelerate the LM penetration.

Originality/value – The authors have proposed a Grey-DEMATEL-based LM barrier evaluation framework. Here, the authors analyze the interrelationships among the barriers for LM and segregate them in cause and effect groups.

Abstract: Precision farming is the latest trend in the agriculture sector which makes use of information technology to integrate all the procedures of farming from analysing the soil-moisture, weather forecasting, and the quality of seed to predicting the real-time of harvesting. India is an agrarian country where agriculture is the backbone of the economy and precision farming could be quite useful. In the present article, through a systematic literature review, the vital role of precision farming is outlined. Also, the article identifies various challenges and opportunities associated with the adoption of precision farming in India. In-depth interviews with ten farmers of the villages located near Hyderabad City of India were conducted. The article is among the first preliminary study to explore the awareness, usage, challenges, and opportunities behind the adoption of precision farming in India. The findings of the study will aid the policy makers in designing strategies for promoting precision farming in the emerging markets of India.

Application Of Big Data & Iot On Personalized Healthcare Services

Sashikala Parimi, Samyadip Chakraborty

Abstract: These Information is very vital any organization and betterment as there would be developments which are dynamic. Health care organizations like any other sector produce huge data that has many advantages and challenges. In today's dynamic and rapidly growing situations in all sectors including Health care Sector there is huge data. Every sector whether it is industry or academics there is lot of data which is generated for numerous purposes. In the current era of digitalization all the health records of the health care system are standardized. With this the medical history of the patients related to the past, present or future is used to capture, transmit, store and retrieve the data for the main purpose of providing health care and health related services. The merging of wireless communication, digital electronic devices and microelectronic mechanical systems technologies are developed which led to the evolution of Internet of Things(IoT). Computers, smart phones, tablets and Wi-Fi devices, sensors, wearable devices and house hold appliances are all items of IoT components

Index Terms: Minimum Big Data, Internet of Things, mHealth, Supervised learning

1 INTRODUCTION

Information is very vital for any organization as there would be developments which are dynamic. Data is important for any organization as it can be used to predict based on the current trends and certain parameter. In today's scenario there is huge amount of data from every aspect of the life such as social activities, work, health etc., Due to this there are advances in the technology which helps in generating more data may be tons of data which becomes unmanageable even with the current skills. This directed to the concept 'Big Data' which is large and uncontrollable. This creates a situation to develop new approaches in order to arrange the data in a proper way and extract eloquent patterns and has to encounter the current and forthcoming societal requirements. Health care organizations like any other sector produce huge data that has many advantages and challenges. In today's dynamic and rapidly growing situations in all sectors including Health care Sector there is huge data which is available and requires advanced technologies. Every sector whether it is industry or academics there is huge amount of data which is generated for numerous purposes. Managing this huge data whether it is organized or unorganized is a major challenging task for the organizations. In these situations, there is a need for advanced technologies, applications and software's that are cost efficient with high computational power. There is need for implementing Artificial intelligence and necessary to achieve automated decision-making system. This can be achieved using machine leaning techniques such as Neural networks and other artificial intelligence techniques. Nevertheless, if the suitable software and hardware backing is not available and big data can become explicit.

With suitable storage capabilities and analytical tools the information and acumens derived from big data can make the critical social services like health care, safety or transportation more attentive, interactive and efficient for the development of the society [1]. Heath care is a system which is derived with the objective of anticipation, finding and dealing of health-associated problems of humans. The main stakeholders of a health care system physicians or nurses, health services such as clinics, hospitals and other diagnosis or treatment technologies and a funding organization. Depending on the seriousness of the health problem, health care requires several levels. The initial point of consultation is the primary attention, the secondary attention is the acute care which requires skilled professionals. And the tertiary attention is at the advanced medical investigation. All these levels, the professionals require patient's information such as medical background, medical and clinical statistics and other individual medical data. The most traditional way of storing the data in the earlier days is hand written or typed reports [2].The case records of the patients is stored as an episode of illness in which the patient, family and doctors share the scheme [3]. In the current era of digitalization all the health records of the health care system are standardized and are of extensively in practice. With this the medical history of the patients associated with the past, present or future is used to capture, transmit, store and retrieve the data for the main purpose of providing health care and health related services. In these situations, the merging of wireless communication, digital automated devices and microelectronic machine-driven systems technologies are developed which contributed to the evolution of Internet of Things(IoT). The devices such as computers, smart phones, tablets and Wi-Fi devices, sensors, wearable devices and household appliances are all items of IoT components [4]. The Internet of Things means the generation of huge amount of smart data. The Big data analytics is used on this huge data generated by IoT [5]. The massive growth in the usage of internet along with the smart phones and machine to machine (M2M) communication has transformed the big data [6]. As the Internet of Things (IoT) model develops more predominant, a swarm of innovative prospects have arisen. Various knowhows such as tiny wearable bio sensors through the developments in big data led to the services such as eHealth and mHealth that are more tailored and accurate which improves the return on investment. Technologies like mini wearable biosensors,

(Received 28 January 2019; accepted 28 June 2019)

Abstract

India being a developing country still has millions of people who prefers to have traditional branch banking system rather than e-banking. The reason behind their preference is either they hesitate or they don't have sufficient knowledge about the e-banking services. The purpose of this study is to examine the relationship between perceived usefulness, perceived barriers, customer attitude, and perceived effectiveness of adoption of e-banking services. An effective number of responses of 470 respondents from both public and private banks' customers were used to examine the hypothesized relationships. Structural equation modelling are performed to test the constructs and their relationships. The study found that there is a direct relationship between perceived usefulness and technology adoption in developing customer attitude toward adoption of e-banking services; whereas, there is no relationship between perceived barriers and technology adoption. The sample size and potential respondents from a selected region of the study may limit its wider applicability and generalization.

Keywords: technology adoption, perceived usefulness, perceived barriers, perceived effectiveness, e-banking services, structural equation modelling

1. INTRODUCTION

In past decade, there has been a rapid growth in the adoption of e-banking or internet-banking services among customers; however, there has been considerable proportion of customers who still carry out banking transactions in the traditional way

Adoption barriers in engaging young consumers in the Omni-channel retailing

Manu Sharma, Manish Gupta and Sudhanshu Joshi

Abstract

Purpose – *The purpose of the study is twofold. The first objective is to identify adoption barriers (AdoBs) in engaging young consumers in the Omni-channel retailing (OCR). The second objective is to develop interrelationship among identified AdoBs.*

Design/methodology/approach – *The study used interpretative structural modeling–fuzzy (Matriced' Impacts Croisés Multiplication Appliquée a UN Classement) methods on 18 AdoBs identified from the existing literature and validated from 10 experts and 137 young consumers through pairwise comparison using the arithmetic hierarchical process method. The resulting ten barriers were further investigated for identifying the strength of relationships among them.*

Findings – *The study has identified price inconsistency as the dominant AdoB that restricts young consumers in engaging with OCR. The other critical AdoBs include lack of coordination among the channels, and information sharing and inconsistent price discount are the main barriers that affect all the other barriers among the 10 AdoBs identified in this study. The data also revealed that the young consumers exhibit the research-online purchase-offline effect in the purchase process.*

Research limitations/implications – *The research study has undertaken ten barriers only. The interrelationship among the barriers may be tested further with advanced techniques. The data have been collected from young consumers of emerging markets only which may be further extended for other markets.*

Practical implications – *This study helps practitioners and decision-makers understand about AdoBs faced by the young consumers influencing the purchase-intention process. Retailers or marketers are encouraged to focus on price consistency, advanced shared information system, proper coordination and developing trust of consumers in sharing their data to enhance the acceptability of Omni channels. Moreover, the identification of barriers and their strength offer marketers or retailers an opportunity to engage them in an effective manner and thus create value using communication channels.*

Social implications – *Social benefits of understanding barriers are helpful for transforming the existing retail channel into a fully integrated Omni-channel ecosystem. For this, AdoBs identified and their inter-relationships explored in this study could be used for engaging young consumers in OCR.*

Originality/value – *To date, the research on Omni-channel barriers in the present context is scant. The research provides insides on identified dimensions on young consumer engagement in OCR.*

Keywords *E-commerce, Omni-channel retailing, ISM–fuzzy MICMAC, Young consumer engagements*

Paper type *Research paper*

1. Introduction

The term, consumer engagement, is increasingly gaining popularity in the marketing literature, especially in the past decade (Pansari and Kumar, 2017). The primary reason for this increased attention is the interaction of consumers with the firms through myriad touch points in multiple channels and media, resulting in more complex consumer experiences (Manser Payne *et al.*, 2017). Because the firms are increasingly focusing on hastening media and channel fragmentation, the Omni-channel retailing (OCR) has become a new norm (Chauhan and Sarabhai, 2018; Chopra, 2016; Verhoef *et al.*, 2015). With the advancements in the digital infrastructure, the number of new sources of information has

Abstract: The purpose of this study is to examine the effect of R&D intensity and advertising intensity on profitability of Indian automobile industry. For this purpose twenty five automobile players were selected and data on R&D expenditures, advertising, net profits and sales turnover were extracted from CMIE PROWESS for time period 1998-2014. The findings reveal that 17 firms exhibit significant association between advertising intensity and profitability and 16 firms between R&D intensity and profitability. The study suggests that to reap the benefit of R&D expenditures complex procedure of R&D investment and to obtaining license for new designs should be dismantled.

Keywords: *Automobiles, Profitability, Structure, advertising, R&D*

I. Introduction

The traditional structure-conduct-performance model of industrial organization has assumed that the firms play a passive role in determination of market structure and market structure further influences the market or industry performance. But, in reality firms are active rather than passive and take decisions which can change the constraints under which they operate. Thus, market conduct takes a pivotal role in the analysis of industry or market performance. This study examines the effect of market conduct variables namely advertisement and research & development (R&D) on profitability of the Indian automobile industry. Markets conduct i.e. market strategies are concerned with the creation of value for firms through effective differentiation of products and services. It is well known that advertisement and research & development (R&D) are the main components of market conduct (Chauvin and Hirschey, 1993: pp. 128-140; Rajapathirana and Hui, 2018: pp.44-55). The R&D brings new technologies, products and processes which create value for firms. On the other hand advertising further helps increasing productivity of R&D programs by creating consumer awareness, increasing product sales and customer loyalty.

Present study is an attempt to evaluate the causal relationship between markets conducts and market performance in Indian automobile industry with following specific objectives:

Abstract

Purpose – The main aim of this paper is to empirically test at market level, the investors' differential reaction to information, contribution of their confidence level and adaptive behaviour to excessive market volatility in Indian stock market.

Design/methodology/approach – The Bivariate Vector Autoregression and Impulse Response Analysis are used to study whether investors over/under-react to private and public information. EGARCH models are used to study the contribution of investors' over/under-confidence and adaptive behaviour to excessive market volatility.

Findings – The investors over-react to private information and under-react to public information during pre-crash period, become overconfident and contribute to excessive volatility. They under-react to both private and public information during after-crash period, become under-confident and also conform to adaptive market hypothesis (AMH).

Research limitations/implications – The empirical results of the study can help investors to minimize the negative impact of over/under-confidence on their expected utility.

Practical implications – The investors shall perform a post-analysis of investment, become aware of their past behavioural mistakes and start adapting to changing market conditions. This shall move the markets towards a new equilibrium in long run thus conforming AMH. However, the investors sometimes display an apparently irrational behaviour during this process.

Originality/value – To the best of the author's knowledge, this is the first study at market level data examining investors' over/under-reaction, over/under-confidence and adaptive behaviour in the context of stock market crash.

Keywords Over/under-reaction, Over/under-confidence, Excessive market volatility, Adaptive market hypothesis

Paper type Research paper

1. Introduction

The constant debate concerning the efficient market hypothesis (EMH), which was first initiated by Fama (1970) is pervaded by reasoning from behavioural finance scholars about the fundamental assumption of the EMH and most important the rationality viewpoint of investors. Behavioural finance is one best approach to explain investor irrationality. By relaxing rationality assumption, some models are developed based on special trading strategies taken by irrational investors to explain the observed anomalies while others are derived based on investors' cognitive biases to solve the difficulties encountered by the traditional finance paradigm. For example, Barberis *et al.* (1998) offer a model of investor sentiment based on two assumptions of cognitive biases, i.e. conservatism and representativeness heuristic. Several behavioural finance models have also been motivated by offering a unified explanation of short-run under-reaction and long-run over-reaction. For example, Daniel *et al.* (2002) argue that if investors are overconfident, they overweight their own private information at the expense of ignoring publicly available information. As a result of overconfidence, investors over-react to private information and under-react to public

Future time perspective and group performance among students

Role of student engagement and group cohesion

Manish Gupta
Department of HR, IBS Hyderabad, A Constituent of IFHE, Deemed to be University, Hyderabad, India, and
Arnold B. Bakker

Abstract

Purpose – The objective of this study is to understand the mediating role of student engagement between future time perspective and group task performance. In addition, the study examines the interaction effect of group cohesion task with student engagement on group performance.

Design/methodology/approach – Data were collected from 170 (a total of 34 groups of five members each) business management students for three consecutive months. To analyze the data, multi-level modeling was carried out.

Findings – The results of the three-wave multi-level analysis indicate support for the hypotheses and suggest that future time perspective affects group performance through student engagement. Moreover, group cohesion interacts with student engagement to predict group task performance.

Research limitations/implications – The findings show how the application of engagement theory can help in understanding the relationship between two distant variables, namely, future time perspective and group performance.

Practical implications – The educators are encouraged to engage students for facilitating the positive impact of future time perspective on group task performance. The findings also imply that the students with future orientation perform well and thus, the educators may need to teach students to have futuristic perspective.

Originality/value – This study in one of its kinds to test the mediating role of student engagement between future time perspective and group task performance as well as the interaction effect of group cohesion task with student engagement on group performance at both the individual and group level over a period of time.

Keywords Group cohesion, Student engagement, Group performance, Time perspective

Paper type Research paper

Student engagement is increasingly becoming popular among scholars primarily because of its positive consequences for students and class (Bakker *et al.*, 2015). Engaged students invest their personal energies in the tasks aimed at achieving learning objectives. Such students are vigorous for, dedicated toward and absorbed in their studies. When they work as a cohesive group for a common goal, the productivity of the group sees an impressive growth (Ofstad and Brunner, 2013). These improved results can be explained by the synergetic effect of the work groups wherein, cohesion between group members multiplies their performance (Ferrazzi, 2012).

Not surprisingly, leaders have shifted their focus from recruiting self-oriented to group-orientated students (Groysberg, 2014). Therefore, the research that helps the teachers understand how team members' future time perspective could be an important determinant of group performance is of paramount importance (Edmondson, 2012). Few studies have pointed out the significance of forming groups based on students' future orientation to avoid conflicts and enhance group cohesion. For example, students with future orientation think deeper, show more persistency and perform better (Horstmanshof and Zimitat, 2007).

Forensic Accounting and Its Applications: Evidence from the Indian Life Insurance Sector

Joy Chakraborty, Arkaprabha Das** and Ishani Roy****

Though insurance fraud is a victimless fraud in India, the role of forensic accountants came into prominence in recent times due to rising instances of frauds and white-collar crimes in the country's insurance sector. It has been found that, on an average, 8.5% of the revenues generated from the country's life insurance sector are accounted to fraud loss every year. The first such instance of fraud in the country's life insurance sector was reported in the case of SBI Life, for violating the regulatory norms in safeguarding the policyholders' interest and maintenance of proper internal controls. In this context, the present study makes an attempt to investigate the possible anomalies in the operating expenses of SBI Life, covering a period of 10 years from 2011 to 2020. For this purpose, the application of Benford's Law, coupled with empirical analysis through chi-square, Z-test and mean absolute deviations, has been employed to check the conformity of the observed dataset in line with Benford's distribution. The study points out the necessity of investigation in case of a few leading digits showing higher deviations from Benford's distribution, thereby providing scope for further investigation of the observed dataset of SBI Life.

Introduction

The term 'forensic accounting' refers to financial fraud investigation which includes the analysis of accounting records to detect, investigate and prevent the recurrence of financial frauds and white-collar crimes. Forensic accounting in India has come to limelight in recent times due to rapid increase in frauds and scams in the country's financial sector with the belief that our law enforcement agencies do not have sufficient expertise to investigate such frauds. With India being ranked globally as the 88th most corrupt nation, the need for forensic accountants or fraud investigators becomes all the more profound. Moreover, growing

Financial Appraisal of RRBs: Evidence from Eastern Uttar Pradesh

Satish Chandra Tiwari, Kishan Jee, T. Sita Ramaiah, Neeti Mathur

Abstract: India's major population lives in rural area and adequate financial credit supply are much needed for speedy economic development of this region. Regional Rural Banks (RRBs) was established with the objective to provide financial support in rural areas. RRBs have been working as an economic agent and disbursing loan to the rural people since its inception. RRBs have performed to a great extent in terms of rural credit disbursement but Non Performing Assets (NPA) has become a key trouble. For the last few years RRBs have been facing a primary challenge of mounting NPAs, which is clogging the smooth credit supply in the rural areas. The present study aims to analyze the loan disbursement towards agriculture sector, overdue and NPAs of RRBs working in Eastern Uttar Pradesh.

Key words: RRB, Rural Credit, Agricultural Loan Disbursement, Recovery, NPA, JEL Classification: G21

I. INTRODUCTION

Indian banking system is playing significant role in the growth of economy by mobilization of requisite resources. Indian households mostly depend upon informal sector because of unavailability of credit. In the informal sector charges high rate of interest on loans with painstaking terms and conditions SB Mishra (2006). To achieve the purpose of production and productivity, the pose and policy towards rural credit should ensure prerequisite of adequate credit supply at reasonable rate of interest to the most possible segment of rural population.

RRBs were established to provide a source of credit financing for rural people. However, majority number of RRBs could not achieve their primary objectives in Eastern part of UP and have been declared infertile to perform due to non-recovery of loans and such non Recovered loan are being converted into Non Performing Assets (NPAs).

II. REVIEW LITERATURE

There is colossal quantity of literatures available on the performance of RRBs in India. Some of them literature reviewed as per the requirement of the study.Murthy and *et.al* (2012) evaluated the performance of RRBs towards disbursement of agricultural credit and found hurdle free credit delivery in rural areas. Kanika & Nency (2013) studied reasons to increase NPAs, the problem in the recovery of loan and how NPAs do effect on the performance of RRBs.

Their study found that quick loan disbursement causes overlook loan risk which later on causes NPAs. Bharat M. Kher (2013) observed the rural credit and the role played by the RRBs in the priority and non-priority sector lending. Later, researchers investigated how increased impacted NPAs loan on the RRBs. They found that banks with a high loan disbursement rate had higher NPAs. Salas V & Saurina J. (2002) revealed that banks with an aggressive loan supply had often ignored the credit risk undertaken while lending. Hence high loan growth resulted in higher NPAs. Bhatia, Mahajan and Chander (2012) suggested that bank portability has adverse relationship with NPAs. Ishwar P. (2011) evaluated performance of RRBs in his study and found that banks have become more efficient in managing NPA after amalgamation. Aparna K. (2011) found in her study that after amalgamation of four RRBs sponsored by State Bank of Hyderabad in Andhra Pradesh state has increased its turnover to 89.62% and the percentage of NPA to total advances was decreased to 1.72%. Louizetal.(2012) described that a well-capitalized bank tends to have lesser NPAs as the bank maintain credit risk levels at a low down while lending to borrowers.

As none of these studies analyzed disbursement, recovery, overdue and non performing assets (NPAs) of RRBs in Eastern Uttar Pradesh , there was need to carry out the present study.

III. OBJECTIVE OF THE STUDY

- To study the disbursement of loans towards agriculture sector by RRBs in Eastern U.P.
- To study the total loan disbursement, recovery and overdue of RRBs in Eastern U.P.
- To study Non-Performing Asset of RRBs in Eastern U.P.

IV. RESEARCH METHODOLOGY

Secondary data has been used in study in form of RBI Bulletin and RBI Report, Economic Survey, Reports of various commission and Annual reports of RRBs in Eastern Uttar Pradesh etc. We have selected a period of study from 2013-14 to 2018-19.We have taken variables like NPA and loan disbursement to evaluate the performance of the regional rural bank in agriculture sector. ANOVA and Tukey have been used as statistical techniques to achieve objective of the study.

V. ANALYSIS AND DISCUSSIONS

We have selected only 6 RRBs Kashi Gomati Samyut Gramin Bank (KGSGB),Baroda UP Gramin Bank (BUPGB),Pratama

Kritika Hurla
Student of Master of Business Administration Program (2018-2020), IBS Hyderabad, Telangana, India

ABSTRACT

The main focus of this report is to analyze which are the most important factors that affect recruitment process and also to understand the attitude of employees towards recruitment and selection process. The report starts with introduction to industry, objectives of doing this report, theoretical aspects related to recruitment and selection process. Further this report consists of conclusion along with recommendations and the sample questionnaires which have been used for analyses has been attached as appendix.

Key words: Recruitment and Selection, Real Estate Industry.

1. INTRODUCTION

1.1 Real Estate Industry

The real estate sector is one of the most globally recognized sectors. Real estate sector comprises four sub sectors - housing, retail, hospitality, and commercial. The growth of this sector is well complemented by the growth of the corporate environment and the demand for office space as well as urban and semi-urban accommodations. The construction industry ranks third among the 14 major sectors in terms of direct, indirect and induced effects in all sectors of the economy.

It is also expected that this sector will incur more non-resident Indian (NRI) investments in both the short term and the long term. Bengaluru is expected to be the most favoured

Consumer awareness,
Purchase intention,
Organic food

ABSTRACT

The study proposes to find out the factors which influence awareness among the consumers towards purchasing organic food product. The study is based on primary data by using tools Chi-square test, Cronbach alpha, KMO, and Bartlett's test, ANOVA, regression, correlation, and cross-tabulation. The study found that awareness driver's nutritional information, price, certification, brand name, and logos have an essential influence on the purchase intention of the product of organic food. However, labeling and food standards do not show a noteworthy rapport between labeling and organic food products' purchase plans. The core commitment and flow to explore are to analyze purchasers with respect to organic guarantee systems (accreditation, guidelines, logo, imprints, and confirmation) so we can distinguish the genuine organic products. The independent factors of awareness like organic buying preference and buying frequency, have a significant influence on the purchase intention of organic food. The research provided evidence of consumer awareness and purchase intention of organic food that would help the organic food industry to promote their products according to the attribute of customers.

Contribution/ Originality
In this paper, the research provided sufficient shreds of evidence against consumer awareness and purchase intention of organic food that will certainly help the organic food industries to promote their products according to the attribute of customers where nutritional values, awareness drivers & demographic variables played a significant role on the purchase intent of organic food products. This paper will also help firms and marketers to promote their brand and association with such manufacturers in consumer's perception.

ABSTRACT

Burnout is a condition where the physical, mental and emotional exhaustion is an outcome from the amalgamation of very high expectations and tenacious situational stress. It describes a state of diminution of a person's resources, particularly energy due to extreme demands made on them, which results in impassive behavior of the individual towards their work and the other aspects of life as well. The basic thrust of this conceptual paper is to bring into lime light the theoretical postulates of burn out phenomenon and its reflections on the contemporary workforce in IT industry. Besides reviewing theoretical works on the burnout from a contemporary perspective this paper tries to capture the emotional strength and perceptual understanding of this phenomenon prevailing in IT workforce through a limited study. We tried to analyze the things and propound formulae for dealing with the menace. Above all, a unique attempt is made here to correlate the spirit of theoretical models with that of empirical findings by taking the help of 'Copenhagen's Burnout Inventory'. Leaving scope for a more elaborate study on a bigger sample size the conceptual understanding about the theme Burn Out is clearly spelt out in this paper much to the better understanding of laymen particularly the management clan. This finds more justification in the context of flexible knowledge workers and management of their work life which amply fits to the popular phrase called 'VUCA' (Volatile, Uncertain, Complex, and Ambiguous) business environment.

(Key Words: burnout, stress, Indian, IT/ITES industry, fatigue, emotional, exhaustion)

The prime purpose of the article is to revisit past studies related to the link between export instability, export diversification, and economic growth. In this regard, an extensive literature survey has been made across academic journals that provided structured, comprehensive, and chronological findings and results. The authors have examined and reviewed the full text of eighty-eight important and relevant research articles published in various scholarly journals. Most of the articles provided robust evidence about positive impact of export diversification on economic growth and mixed results regarding the impact of export instability on economic growth. The paper also attempts to find the areas where the existing literature is silent or throws light that needs to be further examined with future research in this area. Since literature gives little evidence on various aspects of export diversification and economic growth from the perspective of a group of emerging economies identified by UNCTAD and IMF, therefore, the article recommends future research in this context to explore this less unexplored area.

1 | INTRODUCTION

Export diversification is nothing but change in country's export composition and structure which can be achieved either by making changes in the existing export commodities pattern or by expanding innovation and technology on them (Dennis and Shepherd, 2009). The phenomenon of export diversification has been considered as significant tool to accelerate the rate of economic growth in developing economies. Earlier theories of international trade proposed by Adam Smith, Ricardo, neo classical economics and model of international trade Heckscher, Ohlin and Samuelson stressed on export specialization was criticized by Prebisch-Singer hypothesis by arguing that export specialization raises the dependence of developing countries on the exporting of raw materials and agriculture products and import of consumer and manufacturing products from developed countries. Literature has given the evidences that through diversification of export basket, the risk of commodity shocks, price instabilities, and term of trade can be reduced and the rate of economic growth can further be accelerated.

The choice between export diversification or export specialization for economic growth of developing economies has been a debatable issue. Heckscher-Ohlin theory stressed on the fact that an economy must specialize in the production and export of those products with respect to which it enjoys comparative advantage due to difference in their factor intensities (Salvatore, 2009). The model was primarily focused on the link between factor endowment and pattern of product trade and the impact of free trade on factor distribution of income in the countries. It further states that countries should focus on the export of those commodities in the production of which they require that factor of production which is available in relative abundance. In this context, Prebisch-Singer hypothesis argue in favor of export diversification because export specialization will encourage dependence of developing countries. Furthermore, the imitation lag hypothesis (Posner, 1961) revealed the lag in technology available to nations which create difference on trade capabilities, hence challenges the Heckscher–Ohlin model on the pretext of uniform technology. Even the consumption of new products is not equally distributed across the countries which encourage these countries to imitate technology. So, innovation, the only solution left with these countries to succeed in export. The very idea is also supported by product life cycle (PLC) theory by maintaining that growth of the economy depends upon the export diversification and it can be increased only with continuous

Abstract

Purpose – Strict carbon-cap policy is one of the basic policies proposed by the regulatory bodies to reduce the anthropogenic greenhouse gas emission. The purpose of this paper is to examine whether it is beneficial for a company to invest in green technology or not under the strict carbon-cap policy and for that a two echelon supply chain model is developed. This paper gives insight about judicious decision about investment on green technology.

Design/methodology/approach – Mathematical modeling approach has been adopted to understand the effect of investment on green technology. All the cost and emissions parameters have been derived and the total cost (TC) and total emission equations have been formulated mathematically. Two constrained mixed-integer nonlinear programming (MINLP) problems have been formulated and solved considering with or without green investment. Further, supply chain cost is optimized without carbon constraint to understand the effect of carbon constraint.

Findings – The investment in green technology can reduce the total supply chain cost. The study reveals that handling different parameters optimally can reduce both cost and emissions.

Originality/value – This paper tries to assess the effectiveness of green investment on technology under strict carbon-cap policy on a supply chain and, thereby, added value to the existing work. It examines the role played by various parameters under strict carbon-cap policy to draw insights, which will be beneficial for the academic community and managers.

Keywords Supply chain, Strict carbon cap, Investment in green technology, Mixed-integer non-linear programming

Paper type Research paper

1. Introduction

The world has witnessed a sharp increase in emissions of GHGs (predominantly CO_2) mainly due to consumption of fossil fuels in the last few decades. Global warming, loss of human lives, melting glaciers, rising sea levels, loss of crops, increasing incidents of severe weather conditions are some of the deadly effects of emissions. To curb emissions governments and regulatory organizations have imposed different carbon policies worldwide over the years. Carbon cost/tax policy, carbon cap and trade policy and strict carbon-cap policy are considered as the major carbon policies (Ghosh *et al.*, 2018). Under carbon cost/tax policy, a financial penalty is imposed on organizations for every unit of carbon emissions (CEs) (Metcalf, 2009; Ghosh *et al.*, 2016). Under carbon cap and trade policy, companies get an upper limit for emissions, and if they require emitting more carbon, they can purchase carbon credit from outside. If they manage to emit less than the given limit, they can sell or keep as unused allowance (Jaber *et al.*, 2013). In case of strict carbon-cap policy, organizations get a threshold level for emissions, and when they cross

IMPACT OF DIGITAL TECHNOLOGY ADOPTION ON CARE SERVICE ORCHESTRATION, AGILITY AND RESPONSIVENESS

Samyadip Chakraborty, Vaidik Bhatt, Tulika Chakravorty

Abstract— With the help of digitization, it is feasible to provide healthcare services to the extended part of the society. This study proposes how digitized technology adoption in hospitals (healthcare sector) influences care service responsiveness at large, The study measures mediating effects of care service orchestration, care service transparency and care service agility on care service responsiveness. The study uses empirical data collected from tertiary care hospitals in India having at least 50 beds and empirically validates the conceptual model using EFA, CFA and SEM-based techniques. The study outcome provides an authorized adaptation framework which throws light on the digitization of healthcare in the Indian context and might prove as managerial motivation in the hospital sector.

Index Terms— Healthcare digitization, Digitized Technology adoption, Care Service Orchestration, Care Service Transparency, Care Service Agility, Care Service Responsiveness

1 INTRODUCTION

With an increase in standards of living, technology has played a significant role in human life. Technology is one of the daily requirements in human life for surviving and making daily work routine smooth. Every industry is using technology for providing services, creating products, management of internal affairs and working conditions, or managing the external environment. As one of the most promising industry, healthcare is also not left behind in technology usage. Healthcare industry is also using the technology in every field [1],[2]. Technology combined with healthcare sector plays a significant role in providing better healthcare services with sophisticated sensors, instruments and data exchange processes. Healthcare organisations, speciality hospitals and restorative organisations such as clinics can get a competitive advantage by practical usage of technology [3].In the current period, India is fighting with the reach to the healthcare services, because of low doctor's density ratio of 0.7 per 1000 population in comparison with the WHO's (World Health Organization) standard of 1 doctor per 1000 population [4]. On the other hand, some doctors do not practice their medical expertise due to one or the other reason like low incentive, low motivation, migration to the other country etc. [5]. This situation creates an additional gap in reach of the doctors apart from the low doctor density ratio. One side India is becoming an attractive country for medical tourism due to cost-effective healthcare services, and on the other hand, Indian population experiences high cost for healthcare with lower reach to the care services due to scarcity of medical experts and a lesser degree of coordination between healthcare facilities.

This study concentrates on with the help of technology adoption, how they reach to the doctors can be increased with the enhanced level of care service orchestration and care service agility and care service responsiveness to serve to the larger population of country with the limited workforce, as the study does not indicate increasing the current healthcare workforce. However, study helps in finding ways for expanding the reach of cost-effective healthcare with the help of digitised technology adoption in the healthcare sector. Although healthcare sector is using technology in every field like ophthalmology, radiology, management of lifestyle disorders and other acute as well as chronic situation, there is a significant need to streamline the workflow to increase the reach of healthcare services to the last mile and generates responsive healthcare services. The objective of the paper is to study the direct and indirect impacts of digital technology adoption in hospitals and therapeutic centres on care service orchestration, care service agility and care service responsiveness with analysis of intervening variables like care service orchestration and care service agility on care service responsiveness.

2 LITERATURE REVIEW

2.1 Cybernetic Control Theory

The theory postulates how digital, interactive and interrogative technologies enhance the performance of any process with the help of improving the process flow integration. The performance is increased due to the involvement of a feedback loop into the process. With the help of data provided, managers can build various strategies for the organization [6]. The theory shows the importance of timely feedback and controlling the deviations in the processes flow [7]. With the help of this theory, digital technology provides a platform by which healthcare organization can trace the real-time data and

Modeling Stock Market Monthly Returns Volatility Using GARCH Models Under Different Distributions

Rama Krishna Yelamanchili *PhD*
Associate Professor
Department of Finance and Accounting
ICFAI Business School, IFHE-Hyderabad
Hyderabad, Telangana, India
Email: yrk@ibsindia.org

Abstract
This papers aims to uncover stylized facts of monthly stock market returns and identify adequate GARCH model with appropriate distribution density that captures conditional variance in monthly stock market returns. We obtain monthly close values of Bombay Stock Exchange's (BSE) Sensex over the period January 1991 to December 2019 (348 monthly observations). To model the conditional variance, volatility clustering, asymmetry, and leverage effect we apply four conventional GARCH models under three different distribution densities. We use two information criterions to choose best fit model. Results reveal positive Skewness, weaker excess kurtosis, no autocorrelations in relative returns and log returns. On the other side presence of autocorrelation in squared log returns indicates volatility clustering. All the four GARCH models have better information criterion values under Gaussian distribution compared to *t*-distribution and Generalized Error Distribution. Furthermore, results indicate that conventional GARCH model is adequate to measure the conditional volatility. GJR-GARCH model under Gaussian distribution exhibit leverage effect but statistically not significant at any standard significance levels. Other asymmetric models do not exhibit leverage effect. Among the 12 models modeled in present paper, GARCH model has superior information criterion values, log likelihood value, and lowest standard error values for all the coefficients in the model.

Keywords: Stock Market Returns, Stylized Facts, Volatility Models, Leverage Effect, Asymmetric Model.

I. Introduction

The key characteristics usually we find in asset returns are, high kurtosis, high Skewness, volatility clustering, asymmetry, and leverage effect. The Generalized Autoregressive Conditional Heteroscedastic (GARCH) model of Bollerslev (1986) is helpful to capture the leptokurtic nature of asset returns and volatility clustering and also helps to model varying conditional volatility in asset returns. On the other side asymmetric GARCH models like GJR-GARCH of (Glosten *et al.*, 1993) Exponential GARCH of (Nelson, 1991) and Asymmetric Power ARCH (APARCH) of (Ding *et al.*, 1993) captures asymmetry in returns series and the leverage effect.

The aim of present paper is to exemplify volatility models by their efficiency to capture stylized facts of India's benchmark stock market index i.e., Sensex monthly returns. Similar research is conducted in the Indian context by few researchers like (Karmakar, 2007) who report leverage effect, volatility clustering, and high persistence in Indian stock market during the period 1990-2004. Similarly (Mittal *et al.*, 2012) report negative Skewness, high kurtosis, fat-tailed non-normal distribution, high persistence in volatility, presence of leverage effect. They suggest GARCH model for symmetric effects and P-ARCH model for asymmetric effects. In another context (Joshi, 2014) using three different models over the period 2010-2014 analyze Sensex and report mean reverting behavior, volatility clustering, persistence, and presence of leverage effect. This paper differ extant literature in multiple perspectives. First, we consider very long time period spread over 29 years. Second, we build symmetric and asymmetric GARCH models under different distributions. Third, we compare adequacy of each GARCH model under different distribution, and also among symmetric and asymmetric models. Finally, we apply robust information criterions to select the best fit model.

We estimate GARCH (1,1), GJR-GARCH (1,1), EGARCH (1,1), and APARCH (1,1) models together with three different distribution density functions for a total of 12 models. In this paper we evaluate GARCH models using the Gaussian distribution, Student *t*-distribution, and Generalized Error Distribution (GED). We apply two different information criterions to compare symmetric and asymmetric models. The first one is Akaike Information Criterion (AIC) (Akaike, 1974) and the second is Bayesian Information Criterion (BIC) (Schwarz, 1978). In addition, we also consider log likelihood ratio. We also use

Eurozone recession
The transmission of shocks
Bayesian vector autoregression
Growth spillovers

ABSTRACT

This paper analyzes the macroeconomic transmission of Eurozone shocks to an emerging economy — India using the mean-adjusted Bayesian Vector Autoregressive (BVAR) model. In its quantitative exploration, the study answers two key issues: (i) is there any evidence of decoupling from advanced economy business cycles? And (ii) what was the impact of the Eurozone recession on the growth performance of India? The findings suggest that Eurozone idiosyncratic shocks, on average, had large effects on economic activity in India. The variation explained by the innovations generated by the BVAR model range from 1.8 percent to 3.6 percent in the 1–12 quarter horizon. The main results are supported by the empirical estimations of the Wavelet analysis. The estimated output elasticities suggest that the Eurozone recession had a significant negative impact on India. The implication is that well-balanced diversity in the productive structure of emerging economies, particularly India, can diffuse the transmission of macroeconomic shocks from the advanced economies.

1. Introduction

The global financial crisis followed by the Eurozone debt crisis has laid bare the growing macroeconomic interdependencies among major regions of the world economy. The robust recovery phase in emerging Asia and the return to normal in intraregional trade evoked the decoupling of emerging Asia from the developed economies over the past decade. However, during the post-global financial crisis scenario, when the global economy was regressing to normalcy, the sudden breakout of the Eurozone sovereign debt crisis[1] caused the emerging economies to face further grim challenges to contain the drastic decline in their economic growth. The large economic weight of the Eurozone in the globe, the contagion of the crisis, and its adverse effects necessitate increased attention from the researchers and international financial institutions towards analyzing the nature and impact of the Eurozone debt crisis on emerging economies,

E-mail address: vighneswar@ibsindia.org.

[1] The derivation of the Eurozone crisis is in the high level of fiscal deficit and debt. A copious part of the fragile fiscal situation in the Eurozone is attributable to expenditure on entitlements due to an aging population without a commensurate increase in revenues coupled with the lack of growth-enhancing structural reforms. Owing to stumpy domestic saving rate, public debt was financed through borrowings resulting in widening of current account deficit and a growing external debt. While the membership of the Euro area gave a false sense of comfort to the periphery economies, the intra-Euro area financial imbalance continued to remain awfully. In addition, as the Eurozone crisis untangled, the interconnection between sovereigns and banks reflected in the positive correlations between sovereign and bank credit default swap (CDS) spreads especially for the periphery countries. Macroeconomic indicators of the PIIGS countries of the Eurozone for the period 2012 and 2013 indicate a disenchanting grim picture of these economies. Real GDP of these economies has been in negative during almost all the quarters of 2012 and the first two-quarters of 2013. While the domestic demand of all these countries continues to be in the negative zone, some signals of recovery are happening in the case of fixed investment and exports.

Short-term Economic Indicators, Stock Market Indexes and Indian Oil and Gas Stocks Returns

Rama Krishna Yelamanchili *PhD*
Associate Professor of Finance
Department of Finance and Accounting
ICFAI Business School, IFHE-Hyderabad, India
E-mail: yrk@ibsindia.org

Abstract

In this paper we examine the causal relationship between short term economic indicators, stock market indexes and oil and gas stocks returns. We postulate that economic indicators positively and significantly cause and predict stock market indexes and oil and gas stock returns in short run. In addition, we posit that stock market indexes cause and predict oil and gas stock returns in short run. To test our hypotheses we chose four short-term economic indicators, two stock market indexes, and 10 oil and gas companies. Our results indicate that there is no causal relationship between both short-term economic indicators and stock market indexes, and between short-term economic indicators and oil and gas stock returns. However, we receive support to one of our hypotheses that stock market indexes cause oil and gas stock returns. This causation is contemporaneous only and we observe that stock market indexes lack short-term predictive power of oil and gas stock returns. We conclude that investors need to be vigilant in considering coincident indicators as explanatory variables to predict stock returns. We suggest that stock market indexes are helpful to predict contemporaneous returns but not future returns of oil and gas stocks.

Keywords: Industrial Production, Oil Companies, Public Sector Undertakings, Predictive Analysis, Stock Markets.

JEL Classification: B1, C32, D4, G2.

I. Introduction

Traditionally, stock market index is viewed as a leading economic indicator and Index of Industrial Production (IIP) is viewed as a coincident or contemporaneous economic indicator. Few studies examine the causal relationship between stock market index and industrial production. Some argue that industrial production causes stock market movements, while others argue that stock market movements cause industrial production. We notice that most of the studies examine the relationship between economic factors and stock market movements rather than analyzing the influence of economic factors on individual stocks. We observe that there is limited research that examines the causal relationship between index of industrial production, stock market index, and individual stock returns. Therefore, this paper attempts to see whether stock returns can be explained with economic indicators and stock market indexes, and also to see whether stock returns can be predicted with those economic indicators and stock market indexes. It can be seen that industrial production increases during economic expansion and decreases during recession and thus change in industrial production would signal a change in economy. Similarly, stock market indexes reflect investors' current and future expectations about companies' performance. A positive movement in stock market represents investors optimistic outlook, and a negative movement indicates investors' pessimistic outlook. Our proposition is that high industrial production raise companies sales and profits, enhances investors optimism and leads to positive movement in stock market which rightly result in rise in stock returns. We postulate that stock returns are influenced by stock market movements and also by IIP which constitute the aggregate of manufacturing, mining, and electricity production.

This paper assumes significance in the light that India is the world's third largest consumer of primary energy and one of the fastest growing economies in the world. India produces less than one per cent of the world's crude oil, however, consumes nearly five per cent of the world's crude oil production. India imports 80 per cent of its crude oil. The oil and gas industry is among the eight core industries in India and plays main role in inducing decision making for all the other important industries of the economy. As a growing economy India's appetite for energy is also growing. In addition, as Indian households generating higher disposable incomes, there is significant boost in vehicle sales, transportation, tourism, and consumer goods. It is perceived that there exists a strong correlation between oil and gas companies' financial performance and the IIP, which is largely driven by economic activity. It is also observed that in the recent past there is a spurt in India's natural gas consumption and natural gas imports. Natural gas is seen to dominate the mainstay sectors of fertilizers, power, petrochemicals, steel, manufacturing industries, consumer goods manufacturers, domestic LPG and households. India's economic growth is closely related to energy demand. Therefore the need for oil and gas is projected to grow more, thereby making the sector quite favorable for investment.

AN EMPIRICAL STUDY ON ANALYZING CUSTOMER BUYING BEHAVIOR TOWARDS JCB BACKHOE LOADER MACHINE AT DECCAN SALES AND SERVICES PRIVATE LIMITED, INDORE

Dr. Niraj Chimote
Associate Professor, IBS Hyderabad, India

Nadeem Islam Patel
Student of MBA Batch-2019-2021, IBS Hyderabad, India

ABSTRACT

This study has been successfully conducted at Deccan Sales & Services Private Limited, Indore, Madhya Pradesh. Deccan Sales & Services Private Limited is an authorized distributor of Mahindra's Earth-Master backhoe loader, a mechanical excavator equipment. It draws itself a bucket attached to a hinged boom. The title of the study is, "An empirical study on analysing customer buying behaviour towards JCB backhoe loader machine at Deccan Sales & Service Private Limited". This study is a competitor study which is based on the hypothetical market structure, a concept of competitive strategies in Marketing Management. The aim of the study is to analyse the behaviour of customers of JCB backhoe loader and to identify the factors that are considered to be significant by the customer while making the purchase decision. A relevant literature on customer behaviour related to construction equipment has been reviewed and the research gaps have been explored accordingly. The gap analysis indicated that there is a need to explore factors that influence the purchase decision of the customer while purchasing backhoe loader machine. The objective of the project has been framed to explore the factors of brand selection of JCB backhoe loader machine and check which of these explored factors are significant in determining the purchase decision of JCB Backhoe loader machine. The variables are categorised as dependent and independent variables. The factors that influence purchase decision are independent variables (Brand name, Reliability, Service support, Past experiences, Recommendation, Resale value, Productivity, Fuel consumption, Operator comfort, Less downtime Parts network) and the number of sub decisions about purchasing backhoe loader machine are considered to be dependent variables (seller and location of a store, price of the product, Warrantee of the product, payment method like credit arrangements and maintenance arrangements). Received 10 June 2020
Revised 3 August 2020
27 August 2020
Accepted 27 August 2020

Abstract

Purpose – In recent times, several instances of anti-immigration-related hate crimes and religious bullying have been reported where South Asian expatriates have been victimized. The accompanying children of such expatriates may find such hostile perceptions very difficult to deal with due to their tender age and sensitive ego, which may also lead to the premature return of the expatriate. In this study, a qualitative investigation is conducted to understand the specific problems faced by South Asian expat kids with respect to religious stigma and anti-immigration sentiments.

Design/methodology/approach – A latent thematic analysis was adopted as the research method in this study. Responses were obtained from 27 South Asian adolescent expat kids through audiovisual interviews.

Findings – A total of three central themes were identified from the analysis: (1) coping against social stigma, (2) dealing with social isolation and (3) assimilating with host culture. The findings indicated that the expat kids from South Asia were mentally well prepared to cope with bullying related to the religious or political sentiment using several self-reflective orientations and through optimal use of technical resources.

Research limitations/implications – This study applies a qualitative exploratory design. Hence, a follow-up study backed by quantifiable data is needed to enhance generalizability of the findings.

Practical implications – Corporate practitioners may develop dedicated social media page for expat kids or an online community of such individuals as a support system.

Originality/value – The paper applies a critical lens on some deep-rooted sociopolitical issues which have not been addressed in extant literature on expat adjustment.

Keywords Adolescent kids, Religious stigma, Anti-immigration sentiment, Expatriate failure, Thematic analysis

Introduction

In the 21st century, several economic powerhouses of the world, including Japan (Ogawa, 2011), China (Mai *et al.*, 2013) and most nations in the European Union (Długosz, 2011) have been witnessing reduced fertility trends and a significant increase in aging population (McDonald, 2016). The problem is so acute in some countries that even traditionally anti-immigrant nation like Japan is contemplating radical changes in its immigration policies to manage the employment void that has become unavoidable for Japanese firms (Bloom *et al.*, 2012).

Asia represents more than 30% of the world's total population and majority of them are in the young adult stage (United Nations, 2019). South Asia alone comprises of three of the most populous nations in the world: India, Pakistan and Bangladesh (United Nations, 2019). The South Asian nations have a huge number of English-speaking, working-age adults. Hence, these nations may become the primary source of global labor force if they leverage their

REDUCING ENTREPRENEURIAL FEAR OF FAILURE THORUGH MINDFULNESS

Raghavendra Sode Kalaa Chenji
ICFAI Business School, Hyderabad India

ABSTRACT

The study inspects mindfulness practices to reduce entrepreneurial fear of failure and further test the mediation effect of positive reappraisal between mindfulness and entrepreneurial fear of failure. Startup entrepreneurs registered with incubators were targeted through email, explaining the concept and importance of mindfulness. The participants were administered mindfulness program short version for 7 days by a trained instructor. Data was collected pre- and post-mindfulness intervention to examine the proposed model. Entrepreneurial fear could be reduced by practicing mindfulness, further, it also proved that positive reappraisal partially mediates the between mindfulness and entrepreneurial fear of failure. The study proved that through practice of mindfulness an entrepreneur can overcome the fear of failure and pursue the entrepreneurial activity to become a successful entrepreneur. The study explored untouched aspect of reducing the fear of failure through mindfulness-based intervention and contributes to the entrepreneurial literature.

Keywords: Entrepreneurial fear of failure, mindfulness, positive reappraisal, mindfulness program

INTRODUCTION

The changing paradigm of business environment is characterized by fluctuating economic growth, rapid technological changes, and recession, lead policymakers, governments across the globe to emphasize on self-employment and entrepreneurship (ILO, 2011). Entrepreneurs are known to recognize and exploit new opportunities. Globally, entrepreneurship is considered as a shared concern (Degeroge, 2016) due to increased entrepreneurial activities, educational programs (Bechard & Gregorie, 2009; Boyles, 2012; Kakouris, 2015) and as a means to create new business and jobs (Boissin, 2013). Failure looms over enterprises and more often a new venture end as a failure (Mitchell, 2011). Inevitably there is increased interest among researchers to examine the aspects of entrepreneurial failure (Baron, 2011; Pretorius, 2011; Cacciotti,2015) over success.

A Note on the Performance of Index Funds and Mutual Funds: India Versus US

Rahul Bhatia* and Bhanu Sireesha**

For long, it has been an on-going discussion among investors, statisticians, fund managers, traders, etc. as to whether index funds are outperforming mutual funds or not. Index funds are passively managed and mutual funds are actively managed. The statistics shows that India behaves differently compared to US in this matter.

A mutual fund is a financial vehicle made up of a pool of money collected from many investors to invest in securities like stocks, bonds, money market instruments and other assets. Mutual funds are operated by professional money managers, who allocate the fund's assets and attempt to produce capital gains or income for the fund's investors. A mutual fund's portfolio is structured and maintained to match the investment objectives stated in its prospectus.

An index fund is a type of mutual fund with a portfolio constructed to match or track the components of a financial market index, such as the SENSEX or NIFTY. An index mutual fund is said to provide broad market exposure, low operating expenses and low portfolio turnover. These funds follow their benchmark index, no matter the state of the markets.

Regarding Wall Street of the US or Dalal Street of India, even an average person usually has an idea that it must be the most active and the best performing stock market, global or local, and probably the best place for him to invest. Well, indeed they are the most active stock markets in the world, and considering their performance across years, these markets are reasonably well performing too.

A lot of middle-class people, though interested in investing in stock market, do not have much knowledge about the stock market or do not have time to manage their funds actively, and usually prefer to invest in mutual funds, thinking that professional fund managers are actively managing their funds so they will get good returns over a long period of time.

Email: agrawalshivratan@gmail.com

Abstract: This study is unique in nature that focuses the waste characterisation by the present education system and its effects on the general environment as well as the education system itself. Therefore, to cope up with an issue, the study explores the concept of information and communication technology (ICT)-based education system to the protection of the environment as well as improving present education system itself from students' perspective. A total of 356 usable responses was gathered from engineering, management, and computer application students of four main cities of Madhya Pradesh, India. The AMOS 22.0 and SmartPLS 3.0 statistical programs were used for measurement validation and to test the structural model. The study identified the key constructs within this domain and indicated that all the paths are significant which implies that ICT-based education system significantly contributes to protect the environment and improve the present education system. Therefore, the findings of the study would help policymakers and academicians.

Keywords: information and communication technology; protection of the environment; education system.

Adoption of WhatsApp for Strengthening Internal CRM through Social Network Analysis

Shiv Ratan Agrawal

Marketing and Strategy Department, IBS Hyderabad, a Constituent of IFHE, Deemed to be University, Hyderabad, India

ABSTRACT

The present study aimed at how service firms can adopt the WhatsApp platform for strengthening internal CRM from employees' viewpoints through social network analysis. The study employed a descriptive research design with an interview method for collecting the data of 67 staff members from one the largest private sector bank's main branch situated at Bhopal, Madhya Pradesh, India. Earlier, it was confirmed that all the staff members were on their professional WhatsApp group. The study identified various essential characteristics of the WhatsApp platform. Most importantly, the study found that the network of 67 staff members on the professional WhatsApp is well-connected based on the key metrics. Thus, WhatsApp is one of the most popular social media platforms nowadays which can be adopted for strengthening the internal CRM system of service firms. The study unfolds a range of theoretical as well as practical knowledge for both managers and researchers.

KEYWORDS

WhatsApp; CRM; internal CRM; social network analysis

Introduction

New technological developments in Smartphones have played a significant role to grow the various multimedia-enabled instant messaging (IM) apps that have completely transformed the communication system (Foley, 2002). With the rise of wide ranges of IM apps including WhatsApp, Viber, WeChat, Hike, LINE, MessageMe, and Nimbuzz, people are no longer limited to a passive role in their relationship with others (Malthouse et al., 2013). WhatsApp is one of the emerging social media tools that facilitate to make social connections and contacts with distant relatives, friends, family members, and colleagues (Aharony & Gazit, 2016). Despite that, the efficacy of WhatsApp social media usage remains largely unexplored in the existing literature (Sultan, 2014). Some studies conducted on WhatsApp are limited to its little importance and explored more about its dark side (Church & de Oliveira, 2013; Simon et al., 2016). Undoubtedly, the excess

ADR ON CLIENT'S DISPUTE WITH TRADING MEMBER AT THE LEADING STOCK EXCHANGE IN INDIA: AN EMPIRICAL STUDY[1]

Dr. Bezawada Brahmaiah
Professor of Finance & Accounting
ICFAI Business School (IBS), IFHE, Hyderabad, India
E-mail: brahmaiahb@ibsindia.org

ABSTRACT

The paper evaluates trading rules and regulations of the Stock Exchange in cash segment of the stock market in India. The paper adopts case method to study the trading rules and practices of trading members of the Exchange. It investigates the stock market's misuses and abuses by the trading members. The paper provides guidance for the appropriate regulatory framework to Indian securities market and ensures investors' protection. The results may be generalized in the emerging markets. Hence, researchers are encouraged to study results further in other developed countries. The paper finds that these practices are not only violation of trading rules of the Stock Exchange but also unfair and unethical trading practices.

Keywords: Alternative Dispute Resolution, Arbitration, Stock Exchanges, Securities Market.

INTRODUCTION

This was a reference matter for the arbitration under Bye- laws, Rules and Regulations of the Stock Exchange. Client (Applicant) filed an application with the Stock Exchange that the sub broker colluded with the trading member and caused him financial losses and mental agony. Member, Investor's Grievances Redressal Panel (IGRP) dismissed his application and the claim for compensation as the payment made to the Smart Commodities Private Ltd (SCL) was not under jurisdiction and purview of Stock Exchange of India Ltd (SEIL). This arbitration has been preferred by the Applicant against the order of the IGRP. Accordingly, the arbitration proceedings were initiated and personal hearing for the matter was held on February 14, 2020 at the Regional Arbitration Centre of the Stock Exchange, Hyderabad, India. (Arbitration and Conciliation Act of India 1996).

[1].The paper is based on an arbitration matter resolved at the stock exchange of India by the author. Names of client, trading member, and Exchange are disguised to preserve confidentiality. The Arbitration mechanism of the Stock Exchange is framed under the Arbitration and Conciliation Act of India 1996.

Received 2 June 2020
Revised 18 August 2020
Accepted 21 September 2020

Abstract

Purpose – The current work explores the attributes that serve as motivation regulations for students' selection of a higher education institute (HEI).

Design/methodology/approach – With a self-determination theory (SDT) perspective, the current study used a mixed-method approach to develop a scale to measure HEI attribute-based motivation regulations.

Findings – A total of eight regulations were proposed: academic/extracurricular activities, infrastructure, faculty research expertise, teaching and learning quality, placement opportunities, marketing and promotion, education cost and social influence. The first four were autonomous motivations and the remaining were controlled motivations.

Research limitations/implications – The study leverages the SDT motivation continuum into a structured HEI attribute-based student motivation framework.

Practical implications – The study guides HEI managers with specific attributes to position the institute appropriately.

Originality/value – This is one of the few works in the higher education utilizing the complete SDT framework.

Keywords Higher education, Motivation, Mixed-method approach, Structural equation modelling, Engagement intention

Introduction

Higher education has witnessed many transformations in the last decade in scope, competition and diversity. Higher education institutes (HEIs) have become increasingly commercialized, and the concept of competitive advantage has gained relevance (Santelices *et al.*, 2019). Such competition leads to increased commercial unsustainability for many HEIs, with reduced admissions/revenues (Yousaf *et al.*, 2018). This necessitates considering HEIs as marketable products with the students as consumers (James-MacEachern and Yun, 2017). The customer-oriented approach compels HEIs to focus on primary choice factors of students and stay aligned with their evolving needs/expectations (Yunshan, 2019). An HEI which fulfils students'expectations drives the student commitment to support the institution through financial support, collaborative research, placements and/or word-of-mouth promotion (Yousaf *et al.*, 2018; Abdullah *et al.*, 2015; Tan *et al.*, 2016).

Extant works discuss the HEI attributes that students consider important (Garwe, 2016; Santelices *et al.*, 2019; James-MacEachern and Yun, 2017). However, not only are the attributes disjointed with limited theoretical underpinnings but also no work proposes a comprehensive motivation framework integrating these attributes. Consequently, Agrey and

Abstract: The purpose of this paper is to comprehend the causes and outcomes of smart phone application retention among young consumers belonging to generation Y in India. To address this question, we have proposed a construct called app engagement and have tried to establish antecedents and consequences of the same. This study conceptualises attachment with smart phone application as app engagement from customer brand engagement perspective. Based on insights from information technology and marketing perspectives, certain antecedents and consequents of app engagement are identified. We posit app interactivity and app involvement as antecedents of app engagement while trust, commitment and loyalty for apps as its valid consequences. PLS was used to analyse 232 completed survey responses for testing the validity of the proposed relationships. Findings suggested app interactivity and involvement contributes greatly for app engagement which in turn positively contributes towards the development of app trust, app commitment and app loyalty.

Received: 24 April 2020 Revised and Accepted: 04 July 2020

ABSTRACT: Product design & marketing communication is an area where companies devote a substantial amount of time concerning technology, ergonomics and sometimes even human touch. Marketers have often launched products with induced human features within products or through packaging or, they market a product through a human spokesperson (Aggarwal & McGill, 2007). This is an intentional effort by a marketer to enhance the acceptability of their product and improve on product evaluation. The reason being that consumers often perceive objects as human beings, and as marketing literature points out that products are often designed to give this effect. The phenomenon of perceiving objects like humans or having human-like intentions and behavior is termed as Anthropomorphism (Epley, Waytz & Cacioppo, 2007). The idea of this paper to give a systematic understanding of Anthropomorphism as a Phenomenon, Psychological Framework, and propose a conceptual understanding based on the existing literature with a relationship model. This understanding will help marketers use this phenomenon as a tool to enhance likability and sales of proposed products.

KEYWORDS: Anthropomorphism, Sociality, Effectance, Elicited Agent Knowledge, Partial Anthropomorphism, Literal Anthropomorphism, Accidental Anthropomorphism.

I. INTRODUCTION

Human beings tend to look for humanlike attributes or features in objects. They see faces in clouds or feel their car is their true friend and it has feelings. At times they feel that their computer is planning against them, when it gives trouble during an important work. As defined by Epley, Waytz and Cacioppo (2007), It is a psychological phenomenon where humans perceive actual or imagined behavior of objects also known as non-human agents with characteristics similar to humans that include motivations, intentions or emotions. A book by Guthrie (1993;1995) named as "Faces in the Clouds – A New Theory of Religion" summed up this concept and explained these acts of anthropomorphism, its forms and associated activities. Researchers suggest, human beings anthropomorphize to make sense of an object or an entity which enhances a human-like logic of utility and predictability (Epley, Waytz, Alkalis, Cacioppo, 2008). Past research suggests Anthropomorphism as a phenomenon is valuable for reasoning about objects and entities and it is relative to the object or entity being assumed to have humanlike features (Guthrie, 1993;1995).

Beyond the general psychological concepts, there is limited research on priming products with human features and their effect on anthropomorphism of products of different types based on complexity. This notion offers immense implications in marketing literature, however very few studies have systematically suggested the underlying process of the act of perceiving products as humans. Literature suggests that people have tendency to see humans or attribute humanlike intentions in products however this relationship is Psychological and qualitative in nature. Past research suggests that products are induced with human features in different ways, including Human Physical Features, Human Motivations, Human Intentions, and Human Emotions (Epley, Waytz and Cacioppo, 2007).

Adaptive market hypothesis

ABSTRACT

Using detailed survey data of 384 Indian investors, the study examines whether self-attribution bias and overconfidence bias exist in Indian stock market and also whether individual investors are adaptable to market dynamics or not. We find evidence for the existence of cognitive biases alongside rationality and the investors tendency to adapt to the changing environment once experience losses or uncertain events. This shall move the markets towards a new equilibrium in long run according to adaptive market hypothesis. However, the investors sometimes display an apparently irrational behaviour during this process. This study provides empirical evidence, at an individual investor level, for simultaneous existence of investors' rationality and cognitive biases thereby making investors adapt to the changing environment.

1. Introduction

Rational decision theory asserts that an individual attempts to generate various strategies and follow specific logical procedures to resolve problems according to the nature of problem, timing, and decision environment (Gianakis, 2004; Lindblom, 2005). The bounded-rationality framework (Simon, 1982, 1991) asserts that individual investors are regarded as attempting to make rational decision but they often lack important information on the definition of the problem, the relevant criteria, and so on. In general, the judgement of people is bounded in their rationality, so they will forego the best solution in favour of acceptable or reasonable one that is so-called the decision makers' satisfice (March and Simon, 1958). Tversky and Kahneman (1974) provided critical information about specific systematic biases that affect judgement. Thaler (2000) argue that investors have bounded willpower so they give greater weight to current concerns than to future concerns that will lead to a variety of ways in which their temporary motivations are inconsistent with long-term interests. It is understood that despite the investment decisions complying with rational decision-making process, the behavioural biases would still exist in the mind of investors.

Standard finance theory and economic models draw heavily upon two basic assumptions, namely, rationality and market efficiency. The assumptions of traditional economists portray humans as rational beings who always strive to maximize their utility. Whereas the proponents of behavioural finance continuously challenge this assumption and believe that numerous factors, including both rational and irrational thinking, drive investors' behaviour. They believe that market price is not always a fair estimate of the underlying fundamental value of the firm, and that investor psychology can drive market prices and fundamental value very far apart (Shefrin, 2000).

The adaptive market hypothesis (AMH) as formalized by Lo (2004) argues that both the market efficiency and inefficiencies co-exist in an intellectually consistent manner. He expands on the notion of behavioural biases based on the concept of bounded rationality by Simon (1955). The new orientation applies evolutionary ideas to financial markets and was suggested by Farmer and Lo (1999) and Farmer (2002). Lo (2005) debates that it is incorrect to presume that the market ought to change position toward a consummate equilibrium state or perfect efficiency. This presents a much more flexible view of market efficiency. Through concept of variable efficiency, AMH presents testable implication of time-varying return predictability dependent on market conditions such as market crashes, bubbles, economic boom and crises. The AMH can explain not only departures from the EMH and behavioural regularities, but also how markets shift from the wisdom of crowds to the madness of mobs and back again.

The cognitive biases are important research mediators and moderators for investor decision making. The decision-making biases discussed widely in the literature are self-attribution and overconfidence. It is understood from the literature that behavioural biases exist alongside rationality. The markets are also adaptable and switch between efficiency and inefficiency at different points of time from behavioural perspective according to adaptive market hypothesis. The main objective of this study is to examine, by way of a comprehensive survey, relationship between investors' rational decision-making process and two

ASPECTS INDUCING SHOPPER IMPULSE BUYING IN FASHION RETAILING-AN INVESTIGATIVE STUDY

***Dr.Santosh Alreddy**

Abstract
Impulse buying refers to acquiring products that are not part of the shopping list of customers i.e., the decision to obtain the product is made in the store itself at the spur of the second because the customer feels a bond towards the product or the offer. Impulse purchases have a higher occurrence in contemporary formats as these are larger in size and customer is free to go around and surf the merchandise as compared to over-the-counter conventional formats. For the retailer, the first step in motivating impulse purchase involves making the customer conscious of the product, customer should see the product, and hence best is charged to brands for more prominent locations in stores. Since the product is not part of the customers' shopping list, the product should remind the customer of a need or create excitement or urge to buy. Sometimes the need factor is communicated by placing the product adjacent to complementary categories that may be on the customer's shopping list. In some cases, retailers build a sense of necessity or superiority to coerce the purchase e.g., limited offers. The objective is to get a theoretical understanding of impulse buying, gain insight into factors influencing impulse buying in the retailing context about fashion retailing & understand the strategies carved by retailers to increase impulse buying. The methodology used was the review of relevant literature. It was found that pleasurable shopping experience, quality merchandise, price, in-store promotions, availability of credit card/debit card, brand, celebrity influence, social status are the most relevant factors in stimulating impulse purchase in the Indian fashion retailing context.
Keywords: Impulse buying, fashion retailing, strategy, shopping experience.

Introduction

Marketing divisions exist exclusively to develop ways to support impulse purchases. They make point-of-sale advertising plans that are planned to increase the likelihood of unplanned purchases. Many of these campaigns can be experienced within the checkout lines at various stores, indicative sales made by advertisers or food sellers, or pop-up advertisements on websites.

The philosophy following the marketing for unplanned buys is centered on a concept called immediate satisfaction. This feeling is considered a more illogical line of thinking than a logical one. During an impulse purchase, emotions may be relied upon more deeply, if not totally, than the buyer's practical needs and budget. There are many ways to classify factors influencing impulse buying behavior in a retailing context. One of the classifications consists of product-related factors, situational factors, shopping environment-related factors & person-related factors.

Some of the factors which are important under product-related are short product life cycle, low price, varieties offered, and quality. Under situational factors, the important ones are short term promotions, availability of cash, debit card/credit card facility. Surveys show that a large percentage of consumers do not look at ads before shopping, don't prepare shopping lists (or do diverge from the list) on one occasion in stores, and make fully unplanned purchases. Candy, cosmetics, snack foods, magazines, and other items are sold as impulse goods when placed invisible, high traffic areas in a store, catalog, or website. The important factors under shopping environment-related are in-store browsing, special display, shelf signs, tempting graphics, etc. The chief executive of P&G, the vast consumer products manufacturer, said: "More and more of our communication is moved to the store. And the reason it's moving to store is that more and more of our consumers are saying that they're making their purchase decisions in the store''.

Assessment of Satisfaction of Students Studying in the University based on their Choice

Sanjeev Malaviya[1], P. Venkateswarlu[2], Muddu Vinay[1]

[1] ICFAI University Dehradun
[2] IFHE, Hyderabad

ABSTRACT

The research paper examines the satisfaction of higher education students in Indian Universities. With the growing competition in the higher education, the universities, especially the private ones, are attempting various approaches to enhance students' satisfaction at the university and to attract more students. Students have several options to decide the universities as there are more universities offering higher education. A number of factors are taken into consideration before they make a decision. These may cover academic, non-academic and other issues such as the faculty their qualifications and experience, infrastructure, placements, reputation of the university, accommodation etc. The objective of the study was to examine there is a difference in satisfaction of the students studying in the university which has been their first choice or not. Responses were collected from the students of different universities in and around Dehradun, Uttarakhand. A total of 539 complete questionnaires were received. The questionnaire covered the student satisfaction measured on a on a 5-point Likert scale and the demographic attributes of the students like gender, age, course, university and their choice of the university etc. One-way analysis of variance was carried out to study the differences in satisfaction levels of the students who have got the university which was their first choice and others. The results indicate significant differences in the satisfaction levels between the two student groups. To be in the first choice of prospective students helps a University to have a bigger pool of contented students. The policy makers in the University should therefore deliberate to be among the preferred choice institution.

Accepted 2 December 2019

Abstract

Purpose – The majority of past studies on the physical store environment have focused on the impacts of distinct store environmental cues like music, crowding and décor on consumers' responses. However, recent research posits that consumer is more likely to experience several cues in a combination, rather than in isolation, i.e. different categories of store environmental cues are likely to impact consumer psychology holistically. Hence, our study aims to identify the relevant factors of store atmospheric cues impacting consumer's attitude in physical retail store context and validate scales to measure such factors.

Design/methodology/approach – This research develops and validates psychometrically reliable scales to measure two broad store stimuli factors namely: attractive and facilitating store stimuli, following the scale development method suggested by Churchill (1979).

Findings – The study shows that attractive store stimuli predict affective and sensory store brand experiences. The facilitating store stimuli moderate the effects of attractive store stimuli on affective and sensory store brand experiences. Affective and sensory store brand experiences predict store satisfaction.

Originality/value – This research contributes to the existing body of store ambience research by empirically understanding the psychological mechanism through which customers perceive different store cues holistically leading to the elicitation of store satisfaction.

Keywords Attractive stimuli, Facilitating stimuli, Brand experience, Satisfaction, Store brand love

Paper type Research paper

Introduction

Prior studies on physical store consumption largely focus on the effects of specific store atmospheric cues on consumer response, and help to measure the effect of each store environmental stimulus on consumer response separately (e.g. Milliman, 1982; Bellizzi and Hite, 1992; Hirsch, 1995). However, recent studies show that different factors of store environmental cues impact consumers' experiences holistically, rather than individual cue impacting customer response distinctively (e.g. Haug and Munster, 2015; Ballantine *et al.*, 2010). In this context, "holistic" implies that a consumer is likely to process different store cues together as a combination, thus generating a holistic and multi-dimensional perception about the store atmosphere (Ballantine *et al.*, 2010). Turley and Chebat (2002) state, "The environment created by retail managers is an important strategic variable" (p. 125). Hence, it is important to understand the psychological mechanism through which an individual perceives a multi-dimensional store environment. Several prior studies have examined the impacts of distinct store environmental cues like music, colour, scent and crowding on consumers' responses (e.g. Milliman, 1982; Bellizzi and Hite, 1992; Hirsch, 1995; Mehta *et al.*, 2013; Edwards and Meiselman, 2005). For example, past research demonstrates how distinct in-store cues can influence store satisfaction (Bloemer and De Ruyter, 1998; Balabanis *et al.*, 2006; Sands *et al.*, 2015). Consumer experiences various brand-related cues while consuming a brand generating brand experience, and this brand experience predicts consumer's overall satisfaction with the brand (Brakus *et al.*, 2009). Similarly, in the context of a physical retail store, various store cues generate consumer experience which in turn predicts store

Blockchain research: a bibliometric and text mining based review of literature

Sanjay Fuloria

ICFAI Business School (IBS),
Survey No. 156/157, IFHE-IBS Campus,
Donthanapally Shankarapalli Road,
Hyderabad, Telangana 501203, India
Email: sanjayfuloria@gmail.com

Abstract: This study utilised two bibliometric analysis methods and a text mining method to provide a systematic and holistic review of blockchain related academic literature. A total of 91 publications related to blockchain were identified from the Scopus[1] database. Citation analysis identified security, data integrity, and integration of blockchains as foundations of this area of research. The study then employed keyword analysis to identify themes in blockchain research. Foundation, application, and emerging trend were the themes identified. The emerging trend in blockchain research was identified as the integration of blockchain with internet of things. Text mining was employed to identify additional themes. Technological aspect, business perspective, application areas, security, integrity and trust, models and frameworks, and benefits of blockchains were the additional themes. Finally, the study called for a future research agenda on blockchain research.

Keywords: blockchain; citation analysis; bibliometric analysis; research agenda; themes.

He teaches project management, business analytics, business modelling and simulation. His research interests are in the area of technology, development, and information sciences.

1 Blockchain – the new kid on the block

Blockchains are decentralised transaction storage and asset ownership protocols. Unlike centralised protocols in which one authority is responsible for maintaining a unique common ledger, a blockchain operates within a network whose participants each have and update their own version of the ledger, which is thus distributed (Biais et al., 2019). Blockchain started gaining popularity around 2016 although the primary version was created in 2008 (Zīle and Strazdiņa, 2018). The idea of blockchain was provided by

Brand trust, institutional commitment, and their impact on student loyalty: evidence for higher education in India

Anish Yousaf[a], Abhishek Mishra[b] and Makhmoor Bashir[a]

[a]Marketing Department, ICFAI Business School, Hyderabad, Telangana, India; [b]Marketing Department, Indian Institute of Management, Indore, MP, India

ABSTRACT

Oversupply of higher education services in emerging countries, like India, implies an ever-increasing cost of student acquisition despite large student populations. Hence, creating trust through effective service delivery supported with full institutional commitment remains the only way to create student loyalty and bring the subsequent acquisition costs down. This study investigates the impact of four dimensions of brand trust, namely reliability, credibility, benevolence and integrity, on students' loyalty, and the mediating role played by institutional commitment for this relationship. Results show that reliability is the strongest direct determinant of loyalty followed by integrity, while benevolence can lead to loyalty only if the commitment is evident. These, as well as other interesting findings, have direct implications for top management/ administrator of a higher education institute (HEI) in the form of specific emphasis to elements of trust for creating higher student loyalty.

Introduction

The World Bank predicts India to be the fastest-growing large economy at 7.5% for FY 2018–2019 (Mishra 2018). This growth implies tremendous opportunities forthcoming in manufacturing and services sector, which, however, can be sustained only when there is skilled manpower, at technical and managerial levels, available to be absorbed. This rising manpower demand has created a rapid growth of HEIs, both public and private, in the last few years in India. For example, there are now twenty premier Indian Institutes of Management (IIM) and overall more than 5,500 institutes, serving just management education in India to approximately 350,000 students every year (Firstpost 2016). These numbers are even larger for the generic higher education sector in streams like engineering, arts, science, medicine, and commerce. However, with the supply of graduates outstripping demand gradually in recent years, the two-fold challenge facing most HEIs are (1) maintaining the quality of student intake and their subsequent employability and (2) increasing number of national institutes of eminence and foreign universities in India creates further student scarcity, specially the employable ones, and renders many other institutes non-profitable, leading to thousands closing shop every year due to poor admissions (ASSOCHAM 2017).

The competition to get the best students among HEIs results in an increased use of marketing to attract them and ensure long-term sustenance (Wilkins and Huisman 2015). This necessitates an inexorable mandate for institutes to progressively adopt the student-as-a-customer strategy (Koris and Nokelainen 2015; Koris et al. 2015; Guilbault 2016). As Rojas-Mendez et al. (2009) argue, and supported by Bunce, Baird, and Jones (2017): 'Although student performance may not be studied as a

Abstract: Building and sustaining brand loyalty are one of the fundamental subjects of research for strategists and marketers for ages. Online social media has come in forefront to support it in recent times. The objective of the current study was to examine the relationships among online social media, customer engagement and brand loyalty. The study model was estimated by using higher order structural equation modelling with IBS AMOS 21.0. The results of our study demonstrated that online social media is an important predictor of customer engagement and has significant direct impact on customer engagement. Further results confirmed direct impact of customer engagement on brand loyalty. We also found significant difference across the level of customer engagement with reference to gender. This study concluded that the use of Facebook as online social media to connect and engage with customers leads to building brand loyalty. The primary data comprised of 167 respondents.

Systematic literature review (SLR)

ABSTRACT

Consumer resistance and inertia related behaviors are as important as adoption behaviors. Resistance can lead to unwillingness on the part of the investors to invest in a particular financial product. On the other hand, inertia can potentially lead to loyalty, despite dissatisfaction with a financial product. Consequently, an understanding of the antecedents and outcomes of retail investors' resistance and inertia toward investments is valuable for firms selling investment products. Although the literature on resistance and inertia is around three decades old, empirical research related to retail investment decision making has only recently gained momentum, resulting in limited but interesting findings. The current study utilizes a systematic literature review (SLR) methodology to review prior studies in this domain. The SLR presents research profiling and an extensive content analysis of the studies selected by applying a robust search protocol. The study findings highlight numerous aspects of retail investment behavior, underscore research gaps in the prior literature, and offer recommendations for future research. Furthermore, a comprehensive framework, labelled resistance adoption inertia continuance (RAIC), is proposed to investigate the behavior of retail investors. The study concludes with meaningful theoretical and practical implications that can help counter resistance and inertia toward different financial products.

1. Introduction

The recent decades have witnessed a sharp growth in the retail financial services available for retail investors. Per a recent report by the International Trade Administration, retail financial services contributed $1.5 trillion (7.4%) toward the United States' gross domestic product (SelectUSA, 2019). Retail investors, as opposed to wealthy individual investors or institutional investors, hold modest investment portfolios (Graham and Kumar, 2006); they have considerably lower investment acumen and receive little personalized consideration from professional advisors (Bhattacharya et al., 2012). For these reasons, they tend to doubt the loyalty and impartiality of securities professionals and securities markets (Black, 2007). Despite the availability of a large number of retail investment products (e.g., equity and debt instruments; Das et al., 2014), retail investors are not generally aware of what to choose (Bhattacharya et al., 2012). Such lack of awareness is likely to hamper their reach toward investments. Furthermore, their investment choices are driven by numerous rational factors (Cuong and Jian, 2015) that come under the domain of traditional finance (Thakral et al., 2013). Interestingly, the choice behavior of retail investors is not always a result of a rational evaluation (Kannadhasan, 2015). Rather, at times, their investment decisions are driven by various irrational considerations, leading to some biased or uncalculated financial choices (Baltussen and Post, 2011). Such absurd manifestations fall in the behavioral finance domain. These irrational manifestations act as barriers that impede the investors' decision to invest. Furthermore, these barriers constitute retail consumer's (investor's) resistance to adoption (investment).

The dilemma in the investors' decision, continues post investment as well, especially if the outcome of the investment deviates from the

Abstract

The paper examines the regulatory compliances of the trading rules and regulations of the Stock Exchanges by trading members while serving its clients in the securities market in India. The paper opted for a case study approach to study the unauthorised trading practices of trading members on Indian Stock Exchange system and identified the nature and complexity of securities market's misuses and abuses. The paper identifies how trading members are violating and avoiding the compliances of trading regulations of the Stock Exchange. The paper provides empirical evidences and insights how the trading members were indulging in unauthorised trades and recovering the losses on account of unauthorised trades from the respective clients. The paper finds that these practices are not only violation of trading rules of the Stock Exchange but also unfair and unethical trading practices. The limitation in a case study approach, the research findings and results may lack generalizability. Hence, researchers are encouraged to study results in other countries. This paper provides inputs for the development of appropriate regulatory framework for prevention of unauthorised trading in Indian securities market, curtails capital market abuses and enables the investor protection. The findings and results provide critical perspectives on regulatory challenges and encourage the regulatory authorities to issue relevant guidelines to stock brokers to prevent executing unauthorised trades for clients. These guidelines will certainly prevent the menace of unauthorised trades and curtail capital market abuses and enhance investor protection.

Do Different Types of Related Party Transactions Impact Firm Performance Differently? Evidence from Emerging Markets

Nitya Nand Tripathi[*], *Sudhakara Reddy Syamala*[**] *and Kavita Wadhwa*[***]

This paper is a study of the effectiveness of different types of Related Party Transactions (RPTs) on firm performance in the Indian context. The corporate governance mechanism of India has changed evolutionarily after the implementation of Clause 49 the Listing Agreements. According to Clause 49, the Listing Agreements of RPTs are approved by the audit committee, a mechanism which is unique and different from other developed and emerging countries. Hence, this paper intends to investigate the impact and behavior of various RPTs on firm performance and whether the pre-approval mechanism helps to mitigate the management's opportunistic behavior of transferring the resources from the company through RPTs or whether it has no impact. The paper empirically examines the effect of RPTs on firm performance for the period 2003-2016. It uses 9,140 firm-years for the empirical analysis and also uses firm and fixed effect as part of the research methodology. The study finds that there are positive as well as negative impact of different types of RPTs on firm performance.

Introduction

Related Party Transactions (RPTs) denote any financial activities between related parties.[1] According to Accounting Standard[2]-18 (AS-18), related parties means "if one party has the ability to control or significantly influence the other in making financial and/or operating decisions in a particular reporting period." Presently, RPTs have emerged as a major issue in capital markets, which have become an essential concern between regulators and other stakeholders to monitor and audit RPTs (Johnson *et al.*, 2000). The major types of RPTs in India are related

Do HRD practices affect perceived market performance through operational performance? Evidence from software industry

Received 9 June 2018
Revised 26 November 2018
Accepted 30 January 2019

Ram Shankar Uraon
Department of Management Studies, School of Management, Pondicherry University, Pondicherry, India, and
Manish Gupta
Department of HR, IBS Hyderabad, a Constituent of IFHE, Deemed to be University, Hyderabad, India

Abstract

Purpose – The purpose of this paper is to examine the effect of human resource development (HRD) practices on perceived operational and market performances in the software companies in India, and also the mediating effect of operational performance in the relationship between HRD practices and market performance.
Design/methodology/approach – Data were collected from 516 professionals working in 37 software companies in India. Partial least square (PLS) was used to test the proposed structural equation model.
Findings – The findings reveal that the HRD practices significantly affect market performance. However, operational performance, as a mediator, was found to have a crucial role in transferring the effects of HRD practices to market performance.
Research limitations/implications – The findings of this study are in line with the theory of HRD which suggests a positive relationship between HRD and organizational performance.
Practical implications – The results suggest that to enhance the market performance, organizations need to enhance operational performance by meticulously designing and implementing the series of HRD practices.
Originality/value – This study is one of its kind to overcome the limitations of earlier studies to examine the effect of comprehensive dimensions of HRD on operational and market performance.

Keywords India, Operational performance, Market performance, Human resource development practices, Software companies

Paper type Research paper

Organizations are increasingly focusing on improving their human resource development (HRD) practices to enhance their marketing effectiveness and profitability (Chapman *et al.*, 2016; Liao *et al.*, 2016; Lin *et al.*, 2017). These HRD practices comprise of human resource (HR) planning, training and career development among others. However, HRD practices are context-sensitive and may vary extensively from industry to industry, as organizations choose such practices based on the nature of their products and services (Adhikari, 2010; Ngoasong and Groves, 2016).

Owing to the context sensitivity, understanding the role of HRD practices is pertinent in the industries with highly volatile market performance. One such industry is the Indian software industry, which often nurtures and develops a pool of readily available HR to meet their current and future needs through HRD interventions (Bhattacharjee and Chakrabarti, 2015; Ebert and Shankar, 2017; Uraon, 2018; Gupta *et al.*, 2015). In recent years, the Indian software industry has used advanced technological innovation, digital transformation and disruptive technologies extensively (Bhattacharjee and Chakrabarti, 2015; Chatterjee, 2017). These factors, coupled with huge revenue generating potential, business opportunities and the new companies entering into the market, make the Indian software industry highly competitive and volatile (Ebert and Shankar, 2017; Uraon, 2018). To face these operational

Do Skills and Challenge Affect Perceived Learning? Mediating Role of Engagement

Anitha Acharya, Department of Marketing and Strategy. IBS Hyderabad, a Constituent of IFHE, Deemed to be University, Hyderabad, India

Manish Gupta, Department of HR, IBS Hyderabad, a Constituent of IFHE, Deemed to be University, Hyderabad, India

ABSTRACT

Gamification, the usage of elements relating to game design to non-game activities, has gained considerable attention from academia and industry. It is uncertain as to whether students require skills and challenges to engage them in the game for enhancing their learning. Thus, the objective of this article is to examine the mediating role of engagement in the relationship between skill and perceived learning as well as between challenge and perceived learning in game-based learning environments. Data was gathered using a survey of Player Unknown's Battlegrounds (PUBG) players. A total of 233 young Indian players participated in the study. The results showed that engagement fully mediates the relationship between skill and perceived learning as well as between challenge and perceived learning. This study contributes to the literature on game-based learning by providing evidence for the educational video games to be one of the effective means of learning. Results of the present study imply that the educational game designers can design challenging games to engage the students.
