The reasons for students leaving college include some importunate educational problems such as behavioral and emotional difficulties, under - achievement in their examinations and problems in learning which they face in college (Jonassen & Blondal, 2005). The college dropout phenomenon has been theorized as a plodding process of college students' disengagement and alienation. This disengagement leads to late coming to the class, classes, not attending classes regularly, suspension from the college, and college-switching (Bridgeland et al., 2006). Prior research suggests that even graduates face alienation, get bored, and have a disconnect with the college (Larson & Richards, 1991). In particular, such students are characterized as jaded, waiting for the class to get over, and disconnected from the learning process (Chipchase et al., 2017). The reason for the dropout is that students are expected to manage isolation, new physical environment, time, and family to achieve their higher educational goals (Gillett-Swan, 2017). To excel in higher education, students find it stressful to always complete the task which is given to them by their faculty members in an efficient manner and within the deadline (Urban, 2016). With 25% of the students in the 35 Organization for Economic Co-operation and Development (OECD) countries classified as having low participation (Drigas et al., 2014; Willms, 2003), student disengagement (Chipchase et al., 2017) is both an international and a national problem.

Abstract

Mergers and Acquisitions (M&As) are being increasingly used the world over, for improving competitiveness of firms through gaining greater size and/or market share, broadening the product/service portfolio, reducing business/financial risk, entering new markets and geographies, and consolidation for achieving economies of scale etc. While there has been lot of hype and hope around mergers, and research about stock market reactions to such announcements, it is important to examine, if merging with other firms in same or other industries, actually improves the financial operating performance, for justifying such merger activities. This research study has aimed to study the impact of mergers on the operating performance of acquiring firms, by examining pre-merger and post-merger financial performance ratios, using the sample set of publicly traded acquiring firms in India between 1991-2015. Further, the sample has been segregated to study the impact for 1) mergers occurring among different industry segments, and 2) mergers between acquiring and acquired firms belonging to same industry (horizontal or vertical), or between firms in unrelated industries (conglomerate). The results from the analysis suggest that there are variations in terms of impact of mergers on operating performance, in different industry sectors in India. In particular, there was a positive impact on profitability for acquiring firms in the Banking & Financial Services industry, while the impact was significantly negative for mergers in Sugar & Agri-Products, Pharmaceutical and Textiles Sectors. The impact was mildly negative for Chemicals Sector, and mixed impact for the other sectors. Also, mergers seem to have caused significant decline in returns performance for horizontal mergers, while the impact has been neutral for vertical and conglomerate mergers.

Does the Indian Financial Market Nosedive because of the COVID-19 Outbreak, in Comparison to after Demonetisation and the GST?

Alok Kumar Mishra[a], Badri Narayan Rath[b], and Aruna Kumar Dash[c]

[a]School of Economics, University of Hyderabad, Hyderabad, India; [b]Department of Liberal Arts, Indian Institute of Technology Hyderabad, India; [c]Department of Economics, The ICFAI Foundation for Higher Education, India

ABSTRACT

We investigate the impact of COVID-19 on the Indian financial market and compare it with the outcomes of two recent structural changes of the Indian economy: demonetization and implementation of the Goods and Services Tax (GST). Using daily stock return, net foreign institutional investment, and exchange rate data from January 3, 2003 to April 20, 2020, we find negative stock returns for all the indices during the COVID-19 outbreak, unlike during the post-demonetization and GST phases. Markov switching vector autoregression shows the impact of COVID-19 on stock returns is severe in comparison to that of demonetization and the GST.

1. Introduction

As of June 9, 2020, the COVID-19 outbreak had spread to 213 countries, with nearly 7 million confirmed cases and 404,396 deaths worldwide (World Health Organization website, https://covid19.who.int/). This pandemic has impacted the world's economies, and India, the focus of our study, is not immune. One opinion is that India is facing a prolonged period of economic slowdown, although the exact magnitude of the economic loss cannot be predicted (Dev and Sengupta 2020).

This paper aims to examine the impact of the COVID-19 outbreak on the Indian financial market, proxied by stock returns, the exchange rate between the Indian rupee (INR) and the US dollar (USD), and foreign institutional investor (FII) net inflows. The aim is to compare the outcomes of the effects of COVID-19 with those of two other major economic policy events in India, namely, demonetization (November 8, 2016) and implementation of the Goods and Services Tax (GST, July 1, 2017). Both policies had implications for India's equity and foreign exchange markets. As India was adjusting to the aftermath of the demonetization and the GST, the unprecedented outbreak of

Department of Marketing, University of Nottingham Business School China, Ningbo, China

Abstract

Purpose – The purpose of this study is to examine the impact of brand credibility on purchase intentions toward global brands and domestic brands in an emerging market context. It further examines three drivers of brand credibility: perceived globalness, perceived local iconness and perceived authenticity.

Design/methodology/approach – A structured questionnaire was used for data collection. Systematic random sampling using the mall intercept technique was used to collect cross-sectional data from 836 customers in India. Hypotheses were tested by using structural equation modeling with AMOS 21.

Findings – The results demonstrate the significance of brand credibility on purchase intentions. Furthermore, brand globalness differentially influence brand credibility for global and domestic brands.

Research limitations/implications – The findings provide key insights for marketers regarding consumer evaluation of global brands and domestic brands in emerging markets.

Originality/value – This study contributes to the literature by proposing and testing the key role of brand credibility in consumer choice of global brands versus domestic brands in an emerging market context.

Keywords Emerging market, Brand authenticity, Brand credibility, Global brand, Local iconness, Perceived brand globalness

Paper type Research paper

Introduction

The increasing pace of globalization has accelerated growth in emerging markets such as the BRIC countries (Brazil, Russia, India and China) (Wang *et al.*, 2017). By 2025, emerging markets are expected to account for 50 per cent of the world's population and $30tn in consumption (RWS, 2018). These promising opportunities have led several global brands from developed countries to enter emerging markets (He and Wang, 2017). These global brands are making significant investments in emerging markets to tap their fertile territory and capture market share. For example, Amazon has invested over $5bn in India and has committed an additional $2bn (Abrar, 2019). Similarly, Starbucks is planning to open 600 new stores in China over the next year (Gray, 2019). Although emerging markets provide exciting opportunities for new growth, recent reports have suggested that global brands are facing fierce competition from domestic brands. According to Accenture Research, global brands have lost more than 5 per cent market share to domestic brands in major emerging markets (Gupta and Wright, 2019). Given these developments, an enhanced understanding of how consumers choose between global and domestic brands is important for marketers in crafting an effective strategy in emerging markets.

Emerging markets are typically characterized by high levels of market heterogeneity, sociopolitical governance, unbranded competition and inadequate infrastructure (Sheth, 2011). These features lead to higher levels of asymmetric and imperfect information, thus fostering a sense of uncertainty among consumer that adversely impacts their decision-making process (Erdem *et al.*, 2006). In such situations, firms often use signals to convey information about brand performance (Erdem and Swait, 2004). The literature on information economics posits that credible brand signals can reduce consumer risk, information costs and doubts about a brand's quality claims (Strizhakova *et al.*, 2011; Ponnam and Balaji, 2015). Accordingly, it is proposed that in an emerging market,

Abstract

Purpose – The purpose of this study is to examine how consumer-brand engagement on social networking sites (SNS) is an outcome of the message orientation/vividness.

Design/methodology/approach – Message design is proposed to include two components, namely, orientation and vividness. The message orientation is classified as either task/instrumental or socioemotional. The message vividness is measured through content type. The consumer-brand engagement is conceptualized at three levels, namely, cognitive (comment), affective (shares) and conative (likes). A total of 1,000 posts were collected from the official Facebook pages of the 10 most popular travel brands, five each from India and the USA. These two countries were chosen as they are culturally different, with the former representing a largely collectivist culture and greater social connectivity and the latter representing primarily an individualistic culture.

Findings – The study reveals that greater message vividness, with more interactive/audio-visual content, leads to higher engagement. The task/instrumental message orientation leads to low-/medium-level engagement. Overall, a combination of high-vividness and socioemotional orientation generates maximum engagement. India and the USA depict unique effects of message orientations/vividness on the consumer-brand engagement levels, indicating cultural implications for the brand SNS messages – effectiveness.

Research limitations/implications – The study's conceptualization of consumer-brand engagement reflected through the consumers – responses to brands – SNS messages, represents new knowledge. The unique effects of message vividness and orientation on consumer-brand engagement and the variations across cultures is also a novel contribution to the extant branding literature.

Practical implications – The brand marketers should not only design their SNS messages with appropriate vividness/orientation but also tweak them across cultures, for maximum consumer engagement.

Originality/value – The study is a novel attempt to deploy the interaction process analysis framework in an SNS setting.

Paper type Research paper

1. Introduction

Social networking sites (SNS) have created a paradigm shift for brand communications, with many firms using the mass advertising/communication platforms (Lee and Hsieh, 2019; Lim *et al.*, 2020; Luo *et al.*, 2019; Moran *et al.*, 2019). Since 2016, there has been a 47% increase in the consumers' interest in using SNS to follow/engage-with brands (Kavanagh, 2019). Leveraging SNS gives brands the capability to support marketing activities through disseminating information, product/brand promotion and customer service. The brand-hosted content on SNS enables a two-way conversation with consumers, creating an enhanced consumer-brand engagement (Moran *et al.*, 2019; Simon and Tossan, 2018).

The importance of SNS as marketing springboards is equally applicable for tourism brands, as consumers use them to procure pre-travel information (Buhalis, 2020; Harrigan *et al.*, 2017; Leung *et al.*, 2013, 2019; Luo *et al.*, 2019). Hence, tourism brands make substantial SNS investments to connect

Engaging customers through credible and useful reviews: the role of online trust

Musarrat Shaheen, Farrah Zeba, Namrata Chatterjee and Raveesh Krishnankutty

Abstract

Purpose – *Electronic commerce (e-commerce) is growing rapidly and the e-retailers are finding it pertinent to enhance customers' online shopping experiences and engage them with e-commerce portals. Against this backdrop, the purpose of this study is to develop a conceptual model of customer engagement, where credibility and usefulness of online reviews are found to trigger the adoption of reviews and customer trust that augments customer engagement.*

Design/methodology/approach – *A survey method design has been used to capture responses from 219 young customers (university students) of a reputed university in India. The hypothesized relationships have been examined through multiple regression analysis.*

Findings – *The findings of this study corroborate that the credibility and information usefulness of online reviews induce the adoption of reviews and propensity to trust e-commerce websites. The propensity to trust the reviews has been found to lead the adoption of reviews. The adoption of reviews is found to have a significant impact on the customer' engagement with these portals.*

Research limitations/implications – *The present study contributes to the theories of online marketing in the space of e-shopping, online reviews, customer trust, customer engagement and online shopping behavior. Further, this study provides a framework for managers to engage customers by triggering customers' online trust through the facilitation of credible and useful reviews.*

Originality/value – *The study aims at understanding the role of different attributes associated with the online reviews' credibility and information usefulness in driving customer engagement with specific focus on online shopping through the utility of online devices. The study is one of the pioneering empirical studies that explore the role of online reviews in driving customer engagement.*

Keywords *Customer engagement, Customer trust, Online shopping, Adoption of online reviews, Credibility of online reviews, Information usefulness of online reviews*

Introduction

Electronic commerce (e-commerce) has grown considerably over the decades through enhanced adoption of internet by the e-retail companies for increasing their business transactions (Liao *et al.*, 2017). The prolific usage of e-commerce sites is also aided by acute penetration of mobile usage, which has reached almost every corner of the country. Mobile devices have become a vital platform for the e-retail companies to attract and engage large number of customers because they are user-friendly and provide the ease of accessibility to the customers, which in turn escalates business for the e-commerce companies in India (IBEF, 2017). Furthermore, the survey reports of India Brand Equity Foundation (IBEF, 2017) depict that the young population of India propels the Indian e-commerce sector, which would trigger the Indian e-commerce industry to exceed the e-commerce market of the USA and take the second largest position in the global e-commerce market by 2034. Also, it is reported that the "daily users" of internet comprise the young demography of the country, that is, people between 15 and 34 years (IBEF, 2017).

EVALUATIVE STUDY OF BENEFICIARY~INTERMEDIARY RELATIONSHIP IN INCLUSIVE FINANCIAL WELL-BEING

Dr.Surjit Kumar Kar[1], Dr.Debasmita Panigrahi[2]

[1]Associate Professor (Marketing & Strategy), IBS Hyderabad, Under IFHE (A deemed to be University u/s 3 of the UGC Act 1956), Hyderabad, Telangana, India.

[2]Assistant Professor (OB and HR), IMIS Bhubaneswar, India

email: surjitkar@gmail.com , panigrahi.debasmita@gmail.com

Received: 14 March 2020 Revised and Accepted: 8 July 2020

ABSTRACT: Inclusive financial well-being initiatives are often undertaken or sponsored by various public and/ or private agencies in different geographical regions and contexts. However, such drives and programs often face challenges due to inadequate infrastructure, less telecom/ network connectivity, low general and financial literacy, unavailability of required documents for banking activities, slow adoption rate of technology, limited awareness and lack of local support etc. Usually there are many stakeholders at various levels in such drives. Intermediaries for distribution of banking and/ or non-banking financial products and services play pivotal roles in planning, implementation, monitoring, and control along with core activities related to distribution. This study attempts to assess perception of beneficiaries about such drives toward inclusiveness and general well-being with respect to their overall awareness, perceived utility and perceived satisfaction. As an empirical study, it draws sample from lower socio-economic strata based at rural, agrarian belt where such programs were launched. However, it excludes the macro-policy implications in this context. Although the study is backed by thoughtful deliberations and reflections of practitioners, it lacks on the generalizability of its findings.

KEYWORDS: financial well-being, financial literacy, technology adoption

I. INTRODUCTION

In most of the developing countries nationalization of banks were initiated so as to fulfill social objectives and pave ways for banking services to be inclusive for general well-being of people. Keeping this objective in mind, in due course banking correspondence models were also introduced. Non-government organizations, micro-finance institutions, entrepreneurs are mostly preferred partners to become banking correspondent or customer service points in far flung and remote location where it may not be feasible to start full-fledged bank branches. At times, corporates and profit making organizations are also allowed to operate in similar capacities to scale up the reach of banking. Public authorities keep enhancing efforts to increase the penetration of banking services. Inclusiveness drives in financial ecosystem aim at processes by which common public can access financial products in easy and affordable way. Financial products and services may include banking products like various deposits, loans, advancements, and non-banking products like mutual funds, insurance, share market & equity products. By these initiatives of public agencies underprivileged sections of the society become beneficiaries in the inclusive growth. Socio-economic development of common mass requires that financial products be available to households who need at convenience and affordable prices. This in turn can help alleviate poverty by providing equitable economic opportunity. Once the unbanked mass is within banking fold, many schemes, benefits and subsidies can reach the last mile without syphoning.

Setting up brick and mortar bank branch does not seem viable most often. Thus, as a part of the operative model, inclusiveness drives in financial systems need banking system to try multiple strategies and actions, e.g. agency model (including business correspondent, customer service points or kiosk banking etc.). Many times, people in lower economic strata show lack of awareness and lower tendency to save money. Taking banking system closer to habitat may help build higher literacy in this direction. few banking intermediaries represents the bank concerned and enable a bank to provide low cost services along with widespread expansion plans. The stakeholders in the agency model can exactly do the same servicing as would be done by a bank branch, but within a controlled regulatory environment. An insight into the agency model is vital for managing the said outreach approach of the public agencies.

Consumer-Brand Engagement With E-Commerce Market Place Brands

Pankaj Kumar Mohanty, Department of Marketing and Strategy, ICFAI Business School (IBS), IFHE University (Deemed), India

Dipanjan Kumar Dey, Department of Humanities and Social Sciences, Indian Institute of Technology, Ropar, India

ABSTRACT

Consumer-brand engagement (CBE) has gained much attention from both the academicians and practitioners. However, despite such scholarly attention, only a few studies have empirically tested the scale of CBE. Moreover, limited attention is paid toward examining the consumer-brand relationships in the e-commerce marketplace context. The study is an empirical investigation of the new ways for examining CBE by testing the impact of consumer advocacy (CA). Furthermore, the study has examined and validated the relationship between consumer involvement (CI) and CBE in the e-commerce marketplace context. The study has further examined the impact of CBE on two outcome variables, viz., positive word-of-mouth (PWOM) and brand usage intention (BUI). A sample size of 408 has been collected randomly from a postgraduate program of a large university located in south India. Various multivariate techniques (Confirmatory Factor Analysis & Path Analysis) have been applied to validate and test the proposed relationships. The results indicate that both CI and CA positively influence CBE. Further, CBE has a positive impact on PWOM and BUI.

Brand Usage Intention, Consumer Advocacy, Consumer-Brand Engagement, Involvement, Word-Of-Mouth

INTRODUCTION

In a dynamic and competitive market, firms are susceptible to competition. Hence, the retention of customers for a long period is a challenging task. Therefore, a firm needs to emphasize on the development of a strong consumer-brand relationship. Several researchers have highlighted the importance of such a relationship in building a strong customer base. The domain of consumer-brand relationship has gained much attraction from scholarly viewpoint (Bloemer and Kasper, 1995; Chang and Chiang, 2006; Aggarwal, 2004). Within the broader concept of relationship marketing, a novel concept of consumer engagement has gained increasing attention from the academicians and the practitioners of marketing (MSI, 2014-2016; Hollebeek et al., 2014; Koch, and Dikmen, 2015; Leckie et al., 2016; Islam, Rahman, & Hollebeek, 2018). It is found that highly engaged consumers will develop high level of loyalty (Hollebeek, 2011; Gummerus et al., 2012; France et al., 2016), generate satisfaction (So et al., 2014), create emotional bonding with the brand (Brodie et al., 2013), and spread word-of-mouth (Vivek et al., 2012; So et al., 2016).

However, over the last two decades, the concept of engagement has gained huge attention in the marketing domain (Brodie et al., 2013). Consequently, customer engagement with the brand is reported to have a significant impact on the marketing discipline (Verhoef et al., 2010). Moreover, prestigious institutions such as Marketing Science Institute (MSI) and renowned research outlets such

The objective of this study is to gain insights into the experiences of employees regarding their social media usage and consequences of social media overuse at the workplace. Fourteen semi-structured interviews were conducted, audio-recorded, transcribed, and analyzed using the Interpretative Phenomenological Analysis (IPA) procedures. The qualitative data was collected from the employees working in renowned IT/ITES companies in India. The themes that emerged are lack of sleep; backache and eye strain; feeling of envy; lack of depth in the relationships; tendency to seek approvals; not meeting deadlines; compromise with the work quality; distraction from work. The present study intends to assist human resource managers in designing appropriate policies and guidelines pertaining to employees' social media usage at the workplace. Keywords: Social Media, Social Media Addiction, Employee Wellbeing, Work Productivity, Interpretative Phenomenological Analysis

Introduction

Social media is a web-based platform that is used to build social networks and relations among people with similar backgrounds, interest, activities, and connections (Boyd & Ellison, 2007). The penetration of social media (Facebook, SnapChat, Twitter, WhatsApp, and Instagram, etc.) is led by the rise in number of accessible devices such as laptops, smartphones, and tablets. These digital devices provide people with ample opportunities to communicate virtually, irrespective of temporal and spatial boundaries (Junco, 2012; Nadkarni & Hoffman, 2012; Powell, 2009). Social media generally allow users to communicate and share images and videos with others in their social network. Thus, the content of social media is predominantly user generated (Soliman, 2012), relationship-based (Buettner, 2016; Haddud, Dugger, & Gill, 2016), and professional and social community orientated (Boyd & Ellison, 2007). People of all ages across the globe take advantage of the

Impact of Eurozone crisis on domestic bank lending in India

Vighneswara Swamy
Department of Economics, IBS-Hyderabad, Hyderabad, India

Received 27 July 2019
Revised 9 October 2019
Accepted 11 October 2019

Abstract

Purpose – The significant economic weight of the Eurozone in the globe caused the contagion of the Eurozone debt crisis on the emerging markets. The Eurozone debt crisis caused the sudden plummeting of the cross-border bank credit (BC) to India causing a significant impact on bank lending in India. Essentially, the purpose of this study is to find an answer to the question: Did the decline in cross-border cross-credit from Eurozone had an impact on domestic BC in India?

Design/methodology/approach – Using the data for the period from 2000 to 2013 sourced from Bank for International Settlements international banking statistics consolidated data sets, the novel specification of the study captures the impact of Eurozone cross-border credit on India by developing two regression frameworks that capture the pre-Euro debt crisis period scenario and post-Euro debt crisis period scenario.

Findings – The results offer a very interesting analogy of the behavior of BC and cross-border credit during the pre and post-Eurozone crisis scenarios of analysis. During the pre-Eurozone crisis period, cross-border credit displayed a significant negative relationship with BC indicating that cross-border credit to the Indian firms indirectly benefitted the banks by creating increased demand for domestic BC. The post-Eurozone crisis period witnessed a nexus between cross-border credit and BC during the pre-Eurozone crisis period, which gradually disappeared largely because of the onset of the Eurozone crisis.

Originality/value – This study is a first of its kind in investigating the impact of the Eurozone crisis on an emerging economy like India. This study supports the hypothesis of the existence of the transmission of financial shocks through the balance sheets of international banks. The findings conform to the policy concerns of most of the emerging economies that international banks transmit financial shocks from their home countries. The implication for India and other emerging economies is that international credit growth deserves careful monitoring.

Paper type Research paper

1. Introduction

Rapid expansion in cross-border credit deserves scrutiny as in many boom-bust credit cycles in the past, such credit tended to grow faster than overall credit during the boom. In economies experiencing credit booms, cross-border credit often poses challenges (Borio *et al.*, 2011). Indeed, turning back the clock, one can notice credit booms in Asian economies displayed the same regularity. In the buildup to the Asian crisis, cross-border credit grew to a substantial share of roughly one-third of the total credit to non-banks in Indonesia and Thailand and more than a quarter in Korea (Avdjiev *et al.*, 2012). Post global financial crisis, while the world was putting in place the policies and measures to resurrect from its devastating impact, the sudden breakout of the Eurozone sovereign debt crisis caused the

ABSTRACT: In recent times, where covid-19 is spread across the world, physicians, as well as patient, needs to keep the social distancing. On the other side, during the lockdown period, where the patient avoids to go outside of their home due to the fear of n-cov infection digital technologies like mHealth serves the purpose to connect with the physician. Physicians are not only able to give the advice based on the symptoms of a disease but are also able to share the preventive care as well as able to answer the queries of patient and advise them. With the help of a digital platform, a physician can share their knowledge and train each other. The study qualitatively validates the use of digital technology during the pandemic situation and develops the scale for the future empirical study.

Keywords: mHealth, Telemedicine, Coronavirus Disease (COVID-19), Healthcare, Knowledge sharing, patient-physician relationship.

I. INTRODUCTION

With the declaration of Novel Coronavirus -19 (COVID - 19) as a pandemic by the World Health Organization (WHO) on 11th March 2020, all the economic activities were closed (WHO Website). Like a bolt from the blue, the new year turned out to be a trying time for the healthcare providers across the world. Stage-wise as months passed worldwide the dread and fear of COVID –19 went on spreading. Border-closure, quarantine, sanitizers, thermal-scanning, self-isolation, work-from-home, N95 masks, etc. became the buzzwords and all print-media, electronic-media, social-networks, blogs, posts and awareness campaigns always highlighting about self-reporting, self-hygiene, safe social distancing, etc.; in turn across the countries hiking the fear of COVID-19 has been expanded in the citizens. With each day the number of COVID affected people spiralling up and the number of COVID-19 death increasing steadily, the daunting task in front of all administrative bodies happened to be reaching the remote and extensive parts of the country and also often across geographies through connected synced patient care information sharing. In the SAARC country head video conferencing conducted in the wake of COVID-19 pandemic situation, leaders across all SAARC (South Asian Association for regional cooperation) nations highlighted the importance of all countries staying on the same platform and page related to treatment processes and care delivery measures. Specific highlight and importance have been given to enhanced usage and application of Telemedicine and M-health to identify and extend primary care at the very onset to curb the spread of Novel Corona Virus a.k.a n-cov or covid-19. Since n-cov happens to be a highly contagious and rapidly spreading virulent strain as evident from its exponential spread, early detection, super synchronization in care delivery, patient-physician involvement and ultimately agile decision making will play a vital role in restraining the spread as highlighted by WHO (World Health Organization), IMA (Indian Medical Association), and various other global bodies including, the UK's NHS (National Health Service), American Red Cross and American Medical Association. Since in stage 1 and 2 containing the virus spread is easy to achieve through checks, and curbs and quarantine, however as evident from past virus epidemics and pandemics, once the stage 3 and 4 or the viral spreading is reached, the spread takes place very fast through social and community spreading, leading to exponential growth in the number of affected patients. At this stage, the synchronous care delivery and patient-physician involvement and interaction minimize as the patient to doctor ratio during treatment drops rapidly and as a result agile decision making and efficient care delivery setup plays a vital role. This paper conceptualizes and highlights those critical stages of rational and logical care service flow and links the antecedent and consequent variables to conceptualize an efficient care delivery synchronous stage-wise nuanced understanding with conceptual linkages. This study aims at logically and conceptually establishing the role of digital technology-enabled healthcare delivery platforms in terms of M-Health and Telemedicine as technology adoption and how it may be efficient in enhancing the synchronous care delivery under pandemic and rapid viral spreading situations through the careful stages of pervasive information sharing Patient-physician coordination.

RETURN INNOVATION DISTRIBUTION IN BEST-FIT GARCH MODELS FOR HIGH-FREQUENCY DATA

Yelamanchili Rama Krishna*

Abstract *This paper offers empirical evidence to extant literature on choice of return innovation distribution in GARCH family models. Statistical software packages have Gaussian distribution as default option and offer other distribution options to choose as per properties of data series. Most common choices are Gaussian, t-distribution, and GED. The choice of appropriate return innovation distribution for best-fit GARCH model is still an open inquiry. We posit that choice of return innovation distribution is influenced by frequency of data, time horizon, and symmetric or asymmetric models. This paper estimates four symmetric and asymmetric GARCH models with three return innovation distributions using high frequency and long horizon stock market return series. Daily log returns of NIFTY50 index over the period January 1, 1996, to December 31, 2019, a total of 5,971 observations are analyzed. Results suggest significant evidence in support of volatility clustering, fat-tailedness, mean reversion, volatility persistence, leverage effect, and long memory in return series. Results recommend student's t-distribution as ideal return innovation process for both symmetric and asymmetric GARCH models. The basic models have serial correlations, but no remaining GARCH effects. After multiple trials, it is observed that the ARMA (1,1)-GARCH (1,1) models have better log likelihood values, minimum information criterion values, no serial correlations, and no remaining GARCH effects. Finally, among the three asymmetric models, ARMA-EGARCH model has superior information criterion values. We recommend ARMA-GARCH (1,1) as best-fit symmetric model and ARMA-EGARCH (1,1) as best-fit asymmetric model for high-frequency data spread over long horizon.*

Keywords: *Volatility Modeling, Distribution Density, GARCH Models, High-Frequency Data, Long Horizon*

INTRODUCTION

Over the past few decades, the autoregressive conditional heteroscedasticity (ARCH) models have become the most popular models of conditional variance of financial time series. The ARCH framework was firstly proposed by Engle (1982) and was further extended to the GARCH model (Bollerslev, 1986), EGARCH (Nelson, 1991), GJR-GARCH (Glosten et al., 1993), APARCH (Ding et al., 1993), and many other models popularly known as GARCH family models. The popularity of GARCH models is particularly due to their ability to capture characteristics of financial time series such as volatility clustering, fat tail behavior, long memory, mean reversion behavior, time varying heteroscedasticity, and leverage effect. Because of high dynamic nature of financial time series data, researchers are continuously adding more and more models to existing GARCH family models. Return innovation distribution plays an important role in estimation process of GARCH family models. While estimating GARCH models, research applies different innovation distributions depending on the frequency of data, time horizon, and type of estimation model. Statistical software packages have Gaussian distribution as a default option and offer other distribution options to choose as per properties of data series. Most common choices are Gaussian, t-distribution, and GED. The choice of appropriate return innovation distribution for best-fit GARCH models is still an open inquiry. This paper offers empirical evidence to extant literature on choice of return innovation distribution in GARCH family models. This paper estimates symmetric and asymmetric GARCH models with three return innovation distributions using high frequency and long horizon stock market daily return series and suggests appropriate return innovation distribution for best-fit GARCH symmetric and asymmetric models.

The structure of this paper is as follows. Section 2 discusses extant literature. Section 3 explains data and methodology. Section 4 presents estimation results. Finally, Section 5 draws conclusions from empirical tests.

LITERATURE REVIEW

Different return innovation distributions are applied by researchers to model financial assets returns volatility.

ABSTRACT

The study attempts to examine the causal relation among export growth, inflation, foreign direct investment and real GDP growth rate for the period 1990-91 to 2018-19 using Vector Auto Regressive (VAR) model and Granger Causality test. Both the statistical techniques employed show similar results pertaining to the causal relationship among the variables selected for the study. The results show that FDI & Real GDP growth have positive effect on export growth and there is no evidence of inflation alone causing export growth, but inflation along with FDI and Real GDP cause the Export growth. There is also evidence that export growth, inflation, real GDP growth together cause FDI. The results also indicate that none of the aforementioned economic variables either individually or jointly cause real GDP growth. The authors opine that slow growth in exports had been compensated by domestic demand and services-led growth in the process of economic growth during the period of study. The study stressed the need for introducing structural reforms to enhance the competitiveness of Indian products in the international markets. The focus should be on designing a new strategy for technology-driven export-oriented sectors as the export stability is positively associated with economic growth.

Highlights

- The paper aims at analyzing the role of exports in economic growth and suggesting the suitable recommendation to the technology driven export-oriented sectors.

Keywords: Exports, Economic Growth, FDI, Inflation, Vector Auto Regressive Model, Granger Causality test

In the era of globalization, the liberalization of investment transactions and the development of financial markets have contributed to international trade. International trade facilitates the nations to procure adequate amount of foreign exchange reserves and optimum utilization of resources. Trade policy reforms introduced in India in 1991 have contributed to significant increase in India's foreign trade during the post-reform period. The total value of foreign trade which was ₹ 75,751 cr in 1990-91, gradually increased to ₹ 3,74,624 cr in 1999-2000 and then rose significantly to ₹ 59,02,401 cr in 2018-19 (Economic Survey 2019-20). India's international business with major trade blocks like European Union (EU), North American Free Trade Agreement (NAFTA), Association of South East Asian Nations (ASEAN), South Asian Association for Regional Cooperation (SAARC), South African Customs Union (SACU) and European Free Trade Association (EFTA) was widened. International trade was emerged as an engine of Economic Growth during the post-reform period.

Table 1 presents current account balance trends in emerging and developing Asia as % of GDP. It is

Sustainable human resource management and the triple bottom line: Multi-stakeholder strategies, concepts, and engagement*

ABSTRACT

As firms make the necessary transition to more sustainable business practices, human resource management scholarship and practice finds itself at an inflection point. To what degree does our discipline engage in sustainability, and expand to a multi-stakeholder triple bottom line (TBL) orientation? In this overview article to the special issue, we bring together papers which embrace the challenge of creating a new, more sustainable human resource management model with a multi-stakeholder triple bottom line orientation, which emphasizes environmental and social performance in addition to economic outcomes. In this paper, we coalesce the contributions of the manuscripts into an integrative framework for sustainable HRM, and identify six areas in which future research efforts should be directed to substantively advance this important work.

The climate change facts are startling, and the business challenges are daunting. Rising global temperatures and sea levels, enhanced frequency of extreme weather events, and agricultural growing region shifts are among many threats anticipated to cause population displacement, supply chain disruptions, raw material supply and price volatility risks for business (Duke University, 2019). These statements may once have been considered alarmist. However, recognition of this looming crisis is now mainstream. According to KPMG's Global CEO Outlook (2019), over three-quarters of CEOs (76%) say that their organization's growth will depend on their ability to navigate the shift to a low-carbon, clean-technology economy. In 2019, the Business Roundtable altered its statement on the purpose of a corporation to include "We respect the people in our communities and protect the environment by embracing sustainable practices across our businesses." (Business Roundtable, 2019). This recognition reflects the increasing acceptance of a multi-stakeholder model (Freeman, 1984) and triple-bottom line approach (TBL) (Elkington, 1997), whereby business contributes and measures not only its creation of economic value, but also its creation of societal and environmental value in a sustainable manner.

HRM involvement is essential in navigating this transition to a multi-stakeholder TBL business model. A large scale and systemic shift will be needed in organizational systems and processes to reflect this fundamental change in orientation. The one-dimensional single shareholder purpose of HRM, whereby the need to apply best practices (Fombrun, Tichy, & Devanna, 1984) to basic HRM functions (recruitment, selection, training and development, performance management, compensation), must be supplemented or replaced with strategic and operational people-management practices that take the development of social, environmental, and human capital into account (Guerci & Carollo, 2016; Jackson, Schuler, & Jiang, 2014). This approach, referred to as sustainable HRM, is defined as "the adoption of HRM strategies and practices that enable the achievement of financial, social, and ecological goals, with an impact inside and outside the organization and over a long-term time horizon" (Ehnert, Parsa, Roper, Wagner, & Muller-Camen, 2016, p. 90).

However, the authors in this special issue seem to agree that HRM is currently not accepted as a meaningful partner in influencing the development of firm-level sustainability strategies, nor in implementing them. HRM should be uniquely positioned to do so, since HRM can foster employee commitment and engagement in a firm's sustainability efforts, integrate its sustainability principles into existing HRM processes, and help create internal and external multiple stakeholder alignment. Further, HRM shares many similarities with sustainability management efforts. They both touch all functions of a business, and have an internal to the organization and an external element (involving multiple stakeholders). HRM seems uncomfortable to date in engaging substantively in sustainability, but will need to embrace a more strategic role in the future, as the complexity of the stakeholder-related challenges and the degree of

* This is the suggested revised title of the Special Issue originally titled "Sustainable HRM: Perspectives, Practices, and Prognoses". This revised title is also suggested as the title of this introduction to the Special Issue.

The Impact of COVID-19 Pandemic on the Relationship between India's Volatility Index and Nifty 50 Returns

Jyothi Chittineni *PhD*
Assistant Professor (Finance and Accounting)
IBS - Hyderabad, The ICFAI Foundation for Higher Education
(Declared as Deemed-to-be University U/s 3 of the UGC Act 1956)

doi: 10.46281/ijfb.v4i2.731 URL: https://doi.org/10.46281/ijfb.v4i2.731

Abstract
The paper intends to re-examine the relationship between India's Implied Volatility Index (IVIX) and Nifty 50 Returns during this COVID-19 pandemic. The study results are important for two reasons, one is to understand whether Indian VIX is fulfilling the purpose of measuring the near future volatility of Nifty 50 during this pandemic, and secondly, it reports the impact of COVID-19 on the investors' perceptions about the returns and its volatility. The study results documented that the Nifty return and IVIX are moving independently during the COVID-19 pandemic and there is no association between market size and the market move. The one period lagged Nifty returns have a significant influence on the future market volatility. The combined impact of negative and positive Nifty returns on IVIX is not significant during the COVID-19 period. This implies that the Indian investors are not much worried about the fluctuation in the market price or size of the market during the COVID-19 pandemic period. The investors might be taking the market decline as an opportunity to invest and market rise as an opportunity to sell the stocks. Indian investors are much focused on the fundamentals than the market movements during this pandemic. The study results are important for the fund managers, policymakers, and analysts to understand the dynamics of emerging market volatility and the trading behavior of Indian investors.

Keywords: India VIX, Inter-Temporal Relation, Asymmetric Relation, Nifty Returns, COVID-19.

I. Introduction

Unforeseen events like global recessions, terrorist attacks, dot-com bubble and pandemics will cause panic among the investors and it leads to large selling pressure, and increases market volatility. The literature documented on the panic selling and due to black swan events like SARS Outbreak and terrorist attacks (Chen & Siems, 2004; Chen, Jang, & Kim, 2007; Papakyriakou, Sakkas, & Taoushianis, 2019). Since this COVID-19 outbreak, many articles have been published on the impact of COVID-19 on people's health, businesses, and economies. Certainly, this unknown Coronavirus (COVID-19) is a game-changer for many industries, people, and Nations. It has changed individuals' perceptions, thinking, and habits. This unpredicted shift in the people's mindset has impacted the businesses heavily. Hence, the study results are important for us to understand the impact of individuals' perceptions on the market fluctuations and its future volatility during this COVID-19 pandemic period. The scholars and media reported how this pandemic affected the stock markets[1]. An inappropriate event generated an opportunity to measure the impact of the pandemic on the investors' perceptions about the stock market returns and its volatility dynamics.

I.I India VIX

The Indian VIX measures the expected future volatility of the Nifty index in the next 30 days period. While making investment decisions, investors look at this to understand the market sentiments. It is described as a fear gauge as it reflects the market participants' fear and greed. The correlation between its underlying series Nifty 50 and IVIX is negative. The value of IVIX is at its high when the Nifty closing is at its low and vice-versa. Figure 1 is a graphical representation of the Nifty closing price and IVIX.

Based on the research work published by Whaley (1993) CBOE introduced VIX in the year 1993, soon it has become the benchmark to understand the volatility of the US stock market. Currently there are around 68 implied volatility indices across all asset classes like equity, commodity, bond, and currency pairs. India introduced IVIX in March 2009. The IVIX is calculated based on the Nifty options order book. The purpose of IVIX is to depict the volatility of in the near future.

The Impact of Directors' Report Narratives on Stock Returns

*Richa Gupta**

The study aims to assess the impact of directors' report on the stock returns of selected firms. The sample considered for the study includes Nifty 50 companies, excluding 12 banking and financial firms for five years, i.e., from 2013-14 to 2017-18. Five parameters from the directors' report, i.e., Activity (AC), Optimism (OP), Certainty (CE), Realism (RE) and Commonality (CO), are considered as independent variables, whereas stock return is considered as the dependent variable. Beta, market capitalization and debt-equity ratio are control variables. The study applies panel fixed and random effects model and Panel Vector Auto-Regression (PVAR) to examine the impact of directors' report on stock returns. The study observes unidirectional causality from OP and CE to stock returns. Reverse unidirectional causality is observed from stock returns to CO. The study further reveals that CO and CE negatively impact stock returns. The implications of the study for the stakeholders of the companies are: first, they need to follow the directors' report in addition to financial statements and second, the kind of information which is important for them is related to CO and CE features of the report. The study contributes to the existing literature by using content analysis on directors' report and its impact on stock price. It also analyzes the informational dynamics between the content analysis parameters and stock returns.

Introduction

The directors' report of a company is a very critical part of an annual report. It is a forward-looking document fashioned by the board of directors under the requirements of Indian Companies Act, 2013 which spells out to its shareholders the current status of the company, material changes and commitments affecting the financial position in future.[1]

In other words, directors' report provides concise synopsis of financial results and key developments in the company. A comparison of the past three to five years' directors' reports enables us to identify whether management has accomplished the set revenue targets over the years or not. It also helps to assess the performance of the strategies adopted by the management in a dynamic and competitive environment. The performance of the company

The Impact of New Generation Private Sector Banks on Public Sector Banks in India

*D Sreenivasa Chary**

The study attempts to examine the differences between the performance of Public Sector Banks (PSBs) and that of New Generation Private Sector Banks (NGPSBs) and also the impact of the latter on the performance of the former in terms of customer service and service quality. To assess the customer perception on service quality provided by the banks, SERVQUAL/SERVPERF questionnaires were administered on a sample of 1,075 respondents across the states of Telangana, Andhra Pradesh and Maharashtra. Factor analysis was done to understand the factors that influence customer service, service quality and customer satisfaction. The elimination exercise performed iteratively in factor analysis resulted in retaining of 14 variables out of 22, grouped into four factors, namely, efficacy, empathy, expertise and efficiency. The results unequivocally proved that NGPSBs do influence the performance of PSBs.

Introduction

The banking sector, which was once dominated by the nationalized and Public Sector Banks (PSBs), was opened for the new generation private sector banks for enhancing competition since 1991. The new generation private sector banks are tech-savvy and 100% computerized banks. These banks gave a tough competition to the PSBs which were operating till then as extended hands of government for accepting deposits of money from public for lending and investment, following the traditional security-oriented norms and priority sector lending norms as a part of social lending activity. Capital adequacy norms introduced subsequent to 1991 warranted these banks also to be viable to survive. Moreover, the Reserve Bank of India (RBI) guidelines on customer service enabled the customers to become aware of their rights, and the duties and limitations of bankers. All these changes in the industry necessitated the PSBs to increase their efficiency to withstand the competition from the new generation private sector banks and retain the customer base.

The PSBs in India have more social obligations on account of their ownership pattern (major stake of Government of India and RBI) and wide branch network. In case of PSBs

Abstract

Using primary data from 575 employees of 209 organizations, the current study progresses the research between high-involvement work practices (HIWP) and organizational citizenship behaviour (OCB) in the Indian context. The results have revealed that the employees' perceptions of HIWP including contingent appraisal and compensation, extensive training, self-managed teams, flexible work arrangements and empowerment result in enhanced work motivation (WM), improved job satisfaction (JS), heightened organizational commitment and higher degree of engagement in citizenship behaviour among employees. With establishment of a multi-step partial mediation model, the findings further reveal that the relationship between HIWP and OCB is individually and serially mediated by WM, JS and affective commitment (AC). The implications of these results for theory and practice of progressive HR practices in the Indian context are discussed.

Earnings quality and corporate payout policy linkages: An Indian context

Rajesh Pathak[a,*], Ranajee[b]

Earnings quality
Corporate payout policy
Agency theory
Information asymmetry
Business groups
Crisis

ABSTRACT

We investigate the role of accounting quality as an antecedent of dividend payout decision of firms, for both dividend levels and dividend event, in an emerging market context. Using the data for Indian firms through the years 2006–2016, we evaluate the impact of discretionary accruals on payout decision employing Tobit and Logit regression models amid set of idiosyncratic controls. We report that better earnings quality, on average, is associated with large dividend payments for Indian firms. Moreover, the likelihood of dividend payment reduces with poor earnings quality and more so when earnings manipulation is done to increase earnings. Nonetheless, we show that higher earnings quality reduces dividends during the crisis period and also for group-affiliated firms. However, the same doesn't hold true for dividend likelihood. The relationship is robust to the idiosyncratic controls and the causality test confirms that results are not susceptible to endogeneity issue. Overall, we conclude that better earnings quality takes care of free cash flow problems and alleviates the agency and information asymmetry related costs, thereby stimulating payout policy.

1. Introduction

The purpose of this study is to examine the effect of earnings quality on corporate payout policy. By doing so, the study establishes relationship between accounting and a major corporate finance decision that occurs more often than not, involves significant money of firms, affects other corporate decisions, and is detrimental to firm value. The existing literature has devoted very limited attention to this linkage compared to the linkage of earnings quality and other corporate finance decisions (Koo, Ramalingegowda, & Yu, 2017).

Earnings quality refers to reporting of a firm's earnings, adhering to accounting standards and following the rules not only in words but also in spirit (substance over form). Good quality of earnings reporting brings inside managers and outside investors to the same level of information with respect to a company's future prospects and creates trust in the firm's reported earnings. In other words, the quality of earnings reflects firms' underlying economics precisely through increased transparency.

Dividend payout and earnings quality can be connected to each other through two major theoretical channels, i.e., agency theory and asymmetric information theory. The agency problem is created as the agents manage the company owned by the principals (Jensen, 1986). The principal–agent relationships create concerns for residual claimants if the managers are not disciplined in the usage of free cash flow available to them. Availability of free cash flow makes managers siphon off the cash flow for private benefits and underpay dividends. Better earnings quality helps mitigate this problem by administering discipline in managers through making

MATHEMATICAL models
AUTOMOBILE defects

Author-Supplied Keywords: carbon cap-and-trade policy
carbon emission
random defect rate
uncertain demand

Abstract: In this paper, we study a vendor-buyer integrated supply chain with uncertain demand and random defect rate under carbon cap-and-trade policy. We assume that the lot sent by the vendor to the buyer in each shipment contains a random fraction of defective item, and a fraction of defective items can be repaired. The defective items get screened at the buyer and sent back to the vendor, and the vendor sorts out the repairable items. At the end of each production cycle, the accumulated repairable items at the vendor are repaired in a single lot. We have taken into account the carbon emissions from all the major sources, i.e. production, inventory, transportation, repairing, and scrapping. Shortages at the buyer are partially backordered. A

ABSTRACT

Data mining, a branch of computer science and is the process of extracting patterns from data. Data mining is seen as an increasingly important tool by modern business to transform data into business intelligence giving an informational advantage. It is currently used in a wide range of profiling practices, such as marketing, surveillance, fraud detection, and scientific discovery. The purpose of video data mining is to discover and describe interesting patterns in data. audio content, because of the need to analyze enormous volumes of multidimensional data. The task becomes especially tricky when the data consist of video sequences. This paper investigates video data technologies The concepts, technical approaches and application of video data mining are discussed.

Key Terms: Video data mining, Object mining, clustering, video sequences, Data mining.

1. INTRODUCTION

With the development of multimedia and web technology, the multimedia data, including image, audio and video, have been produced massively. Digital video rapidly becomes an important source for information, education and entertainment. It is needed urgently the advanced technologies for organizing, analyzing, representing, indexing, filtering, retrieving and mining the vast amount of videos to retrieve specific information based on video content effectively, and to facilitate new and better ways of entertainment and multimedia applications. Content-base video analyzing and retrieval are important technologies, which have been an international research focus in recent ten years. As challenging problem, content-based video mining is also emphasized by lots of researchers. Although numerous papers have been published on data mining , few of them deal with video mining directly . Low features, such as color, texture, audio and motion, can be used to segment video sequence into shots and to extract caption or other region of interest for video data management and retrieval. However, the mining of video data based on its content is still in its infancy. Due to the inherent complexity of video data, existing data mining algorithms and techniques can not be used directly in video data. The new mining techniques or modified ones should be designed to facilitate the video data mining process.

Video retrieval has been a fast growing research area in the recent few years. Despite the substantial amount of research, video retrieval is still a difficult task other than for highly structured video. Accessing and retrieving relevant video segments from Unstructured video becomes especially important for electronic chronicles. Video retrieval from ubiquitous environments poses additional challenges. Larger and more real-life environments with a large number of cameras are being built. The amount of video is large, and increasing with time. The content is much less structured compared to a single video from a specific category. Retrieval is required at

Hyderabad-India.

Abstract—Target search in content-based image retrieval systems refers to finding a specific (target) image such as a particular registered logo or a specific historical photograph. Existing techniques, designed around query refinement based on relevance feedback suffer from slow convergence, and do not guarantee to find intended targets. To address these limitations, here to propose a new index structure and query processing technique to improve retrieval effectiveness and efficiency and also considered strategies to minimize the effects of users' inaccurate RF. Extensive experiments in simulated and realistic environments show that the approach significantly reduces the number of required iterations and improves overall retrieval performance. The experimental results also confirm that the approach can always retrieve intended targets even with poor selection of initial query points.

Key Terms: Data mining, Content Based Image Retrieval, Relevance feedback, Index structures.

1. INTRODUCTION

Data mining which is defined as the process of extracting previously unknown knowledge, and detecting interesting patterns from a massive set of data, has been a very active research. As results, several commercial products and research prototypes are even available nowadays. An example of image data mining is CONQUEST [1] system that combines satellite data with geophysical data with geophysical data to discover patterns in global climate change. The SKICAT system [2] integrates techniques of image processing and data classification in order to identify 'sky object' capture in a very large satellite picture set. The MULTIMEDIMINER [3] work has construct many image understanding, indexing and mining technique in digital media. Content-base video analyzing and retrieval are important technologies, which have been an international research focus in recent ten years. As challenging problem, content-based mining is also emphasized by lots of researchers. The mining of video data based on its content is still in its infancy.

Many CBIR system have been developed:QBIC[4],Phtobook[5],MARS[6], PicHunter [7], [8],Blovworld[9], and others [10],[11],[12].In CBIR system, low-level visual image features(e.g., color, texture and Shape) In a typical CBIR system, low-level visual image features (e.g., color, texture, and shape) are automatically extracted for image descriptions and indexing purposes. To search for desirable images, a user presents an image as an example of similarity, and the system returns a set of similar images based on the extracted features. In CBIR systems with relevance feedback (RF), a user can mark returned images as positive or negative, which are the n fed back into the systems as a new, refined query for the next round of retrieval. The process is repeated until the user is satisfied with the query result.

II. RELATED WORK

There are two general types of image search: target search and category search [13], [14]. The goal of target search is to find a specific (target) image, such as a registered logo, a historical photograph, or a particular painting. The goal of category search is to retrieve a given semantic class or genre of images, such as scenery images or skyscrapers. In other words, a user uses target search to find a known image. In contrast, category search is used to find relevant images the user might not be aware ahead of time. Their retrieval accuracy, however, depends on the effectiveness of the visual features used to characterize the database images. An effective CBIR system, therefore, needs to have both an efficient search mechanism and an accurate set of visual features their retrieval accuracy, however, depends

ABSTRACT

An accident is unpredicted, abnormal and unintended incident that happens at several time without any proper reason. The negligence of the automobile driver is the foremost factor of such type of accidents. Though the traffic officials has created sufficient awareness to the vehicle operators w.r.t traffic rules, many of the common peoples do not follow the proper traffic rules. At present, the majority of the countries force the automobile drivers to use the helmet and to avoid using automobiles when the driver is in drunken state. But still, the traffic regulations are being dishonored by the various automobile drivers. In this proposed system, a life saving helmet system has been developed, which repeatedly examines whether the automobile user is using the helmet and having non- alcoholic inhalation while igniting the two wheeler. Accelerometer sensor is used to identify the accidents and update the data the cloud using Wi-Fi module and government database. This database is used to identify the accident zone as soon as possible.

Keywords - Password, GSM, GPS, Push Buttons, Blue Tooth, Automobile

1.INTRODUCTION

Nearly 1.3 million peoples in every year are prone to fatal and injures more than 20-50 million all over the world because of road accidents. Only 28 countries, covering 7% of the world's total people, have complete road safety rules on five key risk elements like: drunk and drive, speed, failed to use helmets and seat-belts. In countries like India many people die due to not wearing gel met and seatbelts.

At present, bike accidents in road have increased. People get injured or dead due to not wearing helmet during driving. Due to the lethargic nature of the driver, road rules are violated frequently. Most of the people use accustomed helmet just to avoid the punishment by traffic police and not for the safety purposes. To overcome this problem, a suitable Intelligent/Smart Helmet system has been developed that lead an offer to trim down the amount of accidents and the death ratio.

2.RELATED WORKS

Priya Parameshwariet al., designed and implements a clever system for vehicle riders to detect and prevent accident. To prevent an accident Smart Helmet examines whether the drivers are wearing the helmet and having non- alcoholic consumable breath. The bike does not switch ON the bike engine if any one of the conditions is going to fail [1].Mohammed Khaja Areebuddin Aatif et al., developed a smart helmet to help people while riding. The user can be able to listen music, navigations, send messages in case of emergency and answer emergency calls also. All functions are achieved using android app and Bluetooth sensors. By using Bluetooth sensors send the data to the mobile and the helmet [3].

Mr.Sethuram rao et al., designed a project used for accident detection, notification and prevention. This smart helmet designed by using raspberry pi 3controller (WIFI based). Bluetooth and raspberry pi 3 are connected by using cloud-based services. The helmet is interfaced with both vehicle and the cloud in which image can be accessed and send to the receiver [4].

Sreenithy Chandran et al., proposed a new apparatus(smart helmet) is used to detect and reporting accidents. To design the above system various sensors, Wi-Fi facility processor, and cloud computing techniques are used. The

Relationship between Capital Expenditure and Economic Growth in Indian Economy during the Post-reform period

Dr Tamma Koti Reddy

Professor &Head, Department of Economics, IBS Hyderabad IFHE (A constituent of ICFAI Foundation for Higher Education), A Deemed to-be University u/s 3 of The UGC Act 1956

Abstract

The present study makes an attempt to examine the effect of central government capital expenditure (CGCE), gross fixed capital formation (GFCF), and foreign direction investment (FDI) on Real GDP growth rate for the period 1990-91 to 2018-19.Auto Regressive Distribution Lag (ARDL) model and Error correction model techniques have been The results suggest that there is a long run relationship between real GDP growth rate and CGCE, GFCF and FDI. The study confirm that the capital expenditure of the central government, Gross Fixed capital formation and Foreign Direct Investments have significantly contributed for economic growth in India during the post-reform period. As the central government terminated loans given to the states, the proportion of capital expenditure in the total expenditure was declined in a drastic manner during the post-reform period as compared to pre-reform period. The study also reveals that the proportion of development expenditure in the total capital expenditure should be raised in order to take up more capital projects.The study highlights that the government should focus more on enhancing the proportion of capital expenditure in the total expenditure to achieve higher economic growth.

Key Words:*Capital Expenditure, Gross Fixed Capital Formation, Economic Growth,Auto Regressive Distribution Lag model,Error Correction Model*

Stylized Facts and Conditional Volatility of NSE NIFTY Monthly Returns

Dr. Rama Krishna Yelamanchili PhD
Associate Professor
Department of Finance and Accounting
ICFAI Business School, IFHE-Hyderabad
Hyderabad, Telangana, India

Abstract
The aim of this paper is to study the stylized facts and conditional volatility of monthly returns of National Stock Exchange (NSE) NIFTY index. The analysis is based on application of both GARCH and EGARCH models with Gaussian distribution and student t-distribution. Monthly returns of NSE NIFTY for the period 1996 - 2019 are used in this paper. Results indicate that the average monthly return is approximately one percent with high volatility. Monthly returns series has negative Skewness and excess kurtosis. Portmanteau test results suggest that returns series behaves like white noise series and no significant serial correlations are found. Portmanteau test results of squared returns series indicate that they are not serially independent signifying the presence of ARCH effects. Diagnostic test results indicate that GARCH and EGARCH models with Gaussian distribution have minimum information criterion values and better log likelihood values. The paper does not find any leverage effect in monthly returns series. The paper suggests application of Gaussian distribution in symmetric and asymmetric GARCH models while modeling conditional volatility of low frequency monthly stock market returns series.

Keywords: Volatility models, stock markets, monthly returns, stylized facts, leverage effect

I. Introduction

The important features that asset returns exhibit are excess kurtosis, Skewness, volatility clustering, asymmetry, and leverage effect. The Generalized Autoregressive Conditional Heteroscedastic (GARCH) model of Bollerslev (1986) is useful to describe the leptokurtic nature of asset returns and volatility clustering and also helps to model varying conditional volatility in asset returns. On the other side asymmetric GARCH Exponential GARCH of Nelson (1991) defines asymmetry in returns series and the leverage effect.

The goal of present research paper is to demonstrate volatility models by their efficiency to portray stylized facts of National Stock Exchange of India's flagship index i.e., NIFTY. Similar research is conducted in the Indian context by few researchers like, Karmakar (2007) who report leverage effect, volatility clustering, and high persistence in Indian stock market during the period 1990-2004. Similarly, Mittal and Goyal (2012) report negative Skewness, high kurtosis, fat-tailed non-normal distribution, high persistence in volatility, presence of leverage effect. They suggest GARCH model for symmetric effects and P-ARCH model for asymmetric effects. In another context Prashant Joshi (2014) using three different models over the period 2010-2014 analyze Sensex and report mean reverting behavior, volatility clustering, persistence, and presence of leverage effect. This paper differ extant literature in multiple perspectives. First, we consider very long time period spread over 24 years. Second, we build symmetric and asymmetric GARCH models under different distributions. Third, we compare adequacy of each

Abstract- The task of discover useful editing patterns from a professional video, such as a movie, is one of the main purpose of video data mining. But, data mining on multimedia data like a movie is a challenging task due to the complicated contents of multimedia data Particularly, the discovered patterns need to be supported by their semantic features, because these features tells how to use the corresponding patterns during the process of editing the viedo. The video ontology which is a formal and explicit specification of events. Specifically, an event is combination of Location, time, moving, and shooting technique. For retrieving such events, to extract "semantic patterns" from videos. Here, a semantic pattern is a combination of low –level features such color, motion and audio. The video ontology by extracting new semantic patterns from segments of videos which cannot be retrieved by previously extracted patterns.

Keywords: Image Mining, Data Mining, Image Attributes, Pixels, Histogram, image pixel comparison, frame count, pixel comparison.

I. INTRODUCTION

Video editing is the process of selecting and joining various shots to create a final video sequence. A shot is defined as one exclusive stream of video frames recorded by a single camera. In video editing, there can be numerous ways to make the transition from one shot to another so that the quality of the created video depends on the user's skill. So, discovering the useful editing patterns from a video called "Video data mining". Advance in multimedia technology have yielded a video achieve, where a large amount and various kind of videos are stored. So, a user often spend a long time to find videos of his/her interest.

In order of retrieve various kinds of events from a video achieve, we first conduct Video data mining to extract patterns from video. Here patterns is a combination of low-level features such as color, motion, audio and so on specific to events of a certain kind. We construct a "video ontology" which is formal and explicit specification of events. The events is modeled to have semantic contents such as location,time,moving(motion) and shooting technique2.We extracted the syntactical editing patterns form a movie which is indexed by the metadata representing the aspect in every frame3Multimedia streams can be classified in to two types, "discrete" and "Continuous". A discrete stream consists of exclusive elements, where each element makes sense by itself and emerges at a single time point. The pattern is delivered as discrete function of time. Kleinberg4 proposed an efficient method to analyze a directed stream based on the video. On the other hand, a continuous stream e.g. movie

Does globalization affect export performance in India? An empirical insight

Aruna Kumar Dash

Department of Economics, IBS Hyderabad, Hyderabad, India

Correspondence
Aruna Kumar Dash, Associate Professor, Department of Economics, IBS Hyderabad, Hyderabad, India.
Email: akdash@ibsindia.org

The present paper examines the effect of economic globalization on India's aggregate export performance during the period from 1995:M1 to 2016:M12. We use various macroeconomic variables such as export, relative price, nominal effective exchange rate (NEER), GDP per capita, and economic globalization. We employ Auto Regressive Distributed Lag (ARDL) model to find out the long-run equilibrium relationship among the variables considered. The empirical results indicate that there exists a long-run equilibrium relationship between export, relative price, NEER, GDP per capita and economic globalization. Further, in the long run, we find that India's export performance is influenced by economic globalization, GDP per capita and relative price. However, in the short run, export performance is influenced by economic globalization, relative price, NEER and GDP per capita. In the short run, 1% increase in economic globalization will lead to increase in the volume of export by 0.77%; whereas, in the long run, it is 3.40%. Hence, sustainability of export in the long run is a matter of concern for policy makers.

1 | INTRODUCTION

Before World War II, there was rapid integration of the economies in terms of flow of goods and services and movement of capital. The inter-war period witnessed the erection of various barriers to restrict free movement of goods and services. After World War II, most of the countries across the globe were fragmented and divided into a number of poorly integrated economies. In order to protect their economy, quantitative restrictions and other barriers to commerce such as high tariffs, strict quotas, controls on capitals and currency movements, etc. were enforced. However, during the last two decades, this fragmentation of the globe into several different economies has tended to be reversed; and now most of the countries in the world have become economically and financially integrated. As a result, tariffs were substantially lowered in a series of negotiated stages. International trade was revived, and, indeed, the volume of world trade has increased more rapidly. In the financial sphere, exchange controls were largely removed, which permitted funds to flow rapidly from one country to another; this encouraged the integration of the financial markets.

In the current climate of globalization, the exchange rate has become an extremely important macro-economic variable, with potential influence on the whole economy. It is one variable through which global influences from other countries get transmitted across the borders, with a potential to affect two major macro-economic variables, namely output and inflation. After the introduction of economic reforms in the 1990s, India chose greater integration with the world economy as part of its development strategy. Even though integration deepened, the rate of growth of per capita income and investment level did not change much. However, in the first decade of the 21st century, the integration was very strong and also saw a sharp increase in volume of export, per capita income, capital inflows, savings and investment, etc. In the last three decades, world trade relative to GDP has seen substantial increase. The rapid development of the capital market has been one of the important features of the current process of globalization.

Globalization means integration of economies and societies through cross-country flow of information, ideas, technologies, goods, services, capital, finance and people (Rangarajan, 2003). However, the term "globalization" is used here in the limited sense of economic integration which can happen through the three channels of (a) trade in goods and services, (b) movement of capital and (c) flow of finance. Dreher (2006) developed an index of globalization covering its three

***Abstract--** Cloud computing has become one of the most emerging field in the technology park. Schemes such as attribute-based encryption technique are used for the access control of the third-party data. In this approach, hierarchical attribute-set based encryption (procedure is implemented by extending the cipher-text policy attribute-based encryption. The proposed system achieves fine access-control due to its hierarchical structure. It controls the access of complex structured data in a flexible and secured manner. The cipher-text policy enhances the flexible performance for the third-party data*

***Keywords--** Access control, cloud computing, Distributed Environment, Cryptography, Encryption, Decryption.*

I. INTRODUCTION

Cloud computing is based on the distributed computing, network security and service-oriented architecture. Due to its various benefits, cloud computing has become the most beneficial pattern in the IT industry. Cloud computing reduces costs and capital expenditures, increases operational efficiencies, scalability, flexibility and immediate market growth. Commercial cloud computing has been built such as Google App Engine ,Amazon's S3, IBM's Blue cloud , Sales' Customer Relation Management . One of the vital security concerns are privacy preserving and data security in cloud computing. Users send the data to the cloud service provider for storage while the cloud service provider is itself an innovative premises which cannot be trusted totally. So the confidential data are not to be disclosed to the business organization otherwise enterprise users will face serious outcomes. Henceforth the data security is at the priorest requirement.Fine-grained access control and flexible access is desired in the service-oriented architecture. For instance, the health-care system requires restricted access of medical records which should be displayed only to the eligible doctors, similarly, a customer relation management on a cloud should be allowed access of information to the high-level executives of the respective company only. Such sensitive records are either required by the legislation or by company regulations.

In this paper, first the hierarchical attribute set based encryption method is shown in extension with the ASBE algorithm with a hierarchical architecture to show flexible and scalable access of data [6] .Next this scheme enhances user grant , file creation, user revocation , file access and file deletion based on Hierarchical attributed set based encryption. Thirdly it analyzes its performance by enhancing CP-ABE technique. Lastly, hierarchical attributed set based encryption technique is implemented to experiment performance evaluation.

II PROBLEM DEFINITION

A. Existing System

The traditional method to protect sensitive data from third parties is to store encrypted data on servers, while the decryption keys are disclosed to authorize users only. Such solution requires an efficient key management mechanism to distribute decryption keys to authorized users, which has been pr oven to be very difficult. Next, this scheme lacks scalability and flexibility; as the number of authorized users becomes large, the solution will not be efficient any more. In case, legitimate user needs to be revoked, related data has to be re-encrypted and new keys must be distributed to the existing legitimate users again. Data owners need to remain online every time so as to provide keys to authorize users as well as to encrypt or re-encrypt data.

B. Disadvantage

- Ciphertexts are encrypted to multiple user.
- No administrator is there to maintain security.
- Complex to store data since ABE scheme is not flexible.
- User revocation is difficult in CP-ABE scheme.

III PROPOSED SYSTEM

The cloud computing system consists of five types of parties: a cloud service provider, data owners, data consumers, domain authority or a number of domain authorities, and a trusted authority organized in an hierarchical manner. The cloud service provider manages a cloud to provide data storage service. The data files are encrypted by the data owners. Data owners store the encrypted files in the cloud for sharing it with the data consumers. Data consumers access the shared data files by downloading the encrypted data files from the cloud and

Abstract

This Paper newly address the concept of growing Bitcoin, it offers the digital process or event innovation that creates a new technology as well as how it contacts with sustaining digital exchange to implements its potential payment system. This paper identifies subject to block chain and how Bitcoin technologies are integrated with block chain. Here the objective is achieved by means of various terminologies used in Bitcoin. In this paper we discussed applications of Blockchain and the types of Crypto currency applied in banking sector.

Keyword: Bitcoin, Blockchain, Cryptocurrency

I. Introduction:

Bitcoin initially came from Satoshi Nakamoto in 2009. It creates transaction process that are recorded in the Block chain, usually block chain, a stamped series of immutable records of data that are linked using cryptography. Block chain is challenging the status the most popular place to secure store, trusted crypto currency Wallet and the block explorer to search, verify transaction on the Bitcoin using special devices through Blockchain. From a business perspective Bitcoin, the best known cryptocurrency, a medium of exchange US dollar, different currencies and user encryption techniques, Regulatory implication and competing Platforms to verify, transfers, trades, voting applications far beyond cryptocurrency. The Bitcoin works with Block chain a shared public ledger. All confirmed transaction are included in the block chain. Here it allows Bitcoin Wallet on your mobile phone. The data and the transaction details, thereby ensuring actually owned by the spender. Here Blockchain are enhanced with cryptographic techniques. Each and every time Bitcoin enables secret key for protecting a piece of data termed as seed. The transaction used for broadcast to the network signals to be confirmed with 10-15 minutes. We ensure using Bitcoin Wallet. Bitcoin Wallet is a digital pace to store your transaction information. The important job of this is to store digital currencies with secured virtual space for more transaction. There are four types of Wallet.

The Impact of Self-Efficacy and Need for Achievement on Management Students' Perceptions Regarding Web Based Learning Resources

Vikas Gautam

Shalini Khandelwal
ICFAI Business School Gurgaon, India

Riyanka Dwivedi
Robotics Architect, Bangaluru, Karnataka, India

ABSTRACT

The increasing popularity of computers and computer networks has facilitated the use of Web Based Learning Resources (WBLR) in education. Many institutions are investing in the development of WBLR to facilitate the learning process, and WBLR have become very popular among management students. The present study investigated the impact of self-efficacy and need for achievement on management students' perception regarding Web Based Learning Resources. Our study results confirmed a significant impact of self-efficacy on WBLR. However, we did not find evidence of a significant impact on need for achievement on WBLR. The sample comprised of 150 respondents. Our findings imply that students' experience of seeking help from informal online channels is significant when they actively participate in a course that uses WBLR.

Key Words: *Web Based Learning Resources, self-efficacy, e-learning, need for achievement*

INTRODUCTION

Web Based Learning Resources (WBLR) have the ability to provide rich learning environments in a democratic and interactive manner. With better technologies evolving day by day, WBLR have become more accessible to facilitate learning. According to Kay et al., (2009), Web Based Learning Resources may be defined as "Interactive Web based tools that support learning by enhancing, amplifying, and guiding the cognitive processes of learners". Discussion forums via email, videoconferencing, and live lectures (video streaming) are a few examples of WBLR. WBLR provides an enterprise solution to course administration problems associated with the storage, collation and administration of teaching and learning resources.

Institutions and corporate trainers are finding it more beneficial to move their courses online and students are finding these interfaces convenient for anywhere, anytime learning. Through the effective use of such resources, meaningful learning environments and relevant learning opportunities can be created by carefully examining the issues that are important to students (Khan, 2000).

Developing an understanding of the demographic and personality differences among students that may affect their perception of the various dimensions of WBLR may be necessary to design and implement an effective learning management system. Web-based learning benefits students in making their selection of better subjects that subsequently improves their performance (Mahajan and Kalpana, 2018). A comprehensive understanding of WBLR and the impact on cognitive engagement of learners are essential to the successful implementation of the online learning experience. Learning satisfaction leads to student engagement with online resources,

Examining environmental friendly behaviors of tourists towards sustainable development

Vikas Gautam

Associate Professor, Department of Marketing& Strategy, ICFAI Business School, IFHE, Hyderabad, Telangana, 501203, India

ARTICLE INFO

Keywords:
Environmental knowledge
Subjective norm
Perceived behavioral control
Purchase intentions
Purchase behavior
Environmental friendly products

ABSTRACT

This study investigated the tourists' novel intentions to save environment and what parameters impact their pro-environment decisions. Structural Equation Modeling was used to test the integrated study model to get correct and unbiased path coefficients with the help of 227 responses. The study results revealed that greater the environmental knowledge of environmental friendly products, the more positive attitude towards environmental friendly products was perceived and international tourists perceived it significantly high in comparison to domestic tourists Interestingly Control on Availability didn't impact purchase intentions of tourists in the current study, a finding different from literature across other contexts. Attitude didn't have significant mediating effect in the relationship between environmental knowledge and purchase intentions. On the other hand, purchase intentions positively influenced purchase behavior of tourists. Practical implications are discussed at large.

1. Introduction

It has always been a challenge to discover effective methods for educating tourists about importance of environmental care. Promoting environmental friendly behavior among tourists is possible with the help of various awareness programs. There is a continuous requirement for improvement in designing pro-environmental policies and also identifying productive techniques to influence human behavior. Ecotourism, green tourism, spiritual tourism, culture-rich tourism, adventure tourism, and self-regulated responsible tourism are different types of tourism programs often used interchangeably with nature-based tourism. Environmental education is a crucial prerequisite to encourage ecological consumption and pro-environmental behavior by numerous stakeholders (Michelsen and Fischer, 2017). The primary focus of Environmental education should not move ever away from promoting environmental knowledge among masses (Otto and Pensini, 2017; Otto et al., 2016). These arguments led to include two main components namely; environmental information and education as main drivers of environmental knowledge.

According to Silverberg et al. (1996), nature-based tourism is helping in raising pecuniary assistances of the various stakeholders by conserving rich natural resources. Authors further argued that these benefits are helping all these stakeholders to achieve sustainable growth.in terms of growth, mass-market tourism grows very slow in comparison to nature-based tourism (Nyaupane et al., 2004). According to Ceballos-Lascurain, (1996), nature-based tourism can be defined as "The tourism which directly depends on the use of natural resources in relatively undeveloped or undisturbed natural areas including scenery, topography, water features, vegetation, wildlife refuges and nature reserve areas".

United Nations Conference on Environment and Development (UNCED, 1992) held in Rio de Janeiro accentuated environmental sustainability as the most important task of the Twenty First century (Harmsen Consultancy, 2012). According to Gardner and Stern (2002), there exists a fundamental relationship between human behavior and environmental issues. Authors highlighted environmental issues such as; climate change, global warming, heightened pollution leading to environmental degradation, biodiversity loss. It is of vital importance to comprehend and modify the pertinent human behavior for the very purpose of enhancing environmental sustainability (Steg and Vlek, 2009). Chen (2010) identified reasons captivating the companies to contemplate about environmental sustainability namely; compliance with the environmental regulations, keeping the presence in the fresh markets and value addition to the goods and services, keeping a stride with the competitors, revamping of the organizational image.

Majority of the damage to the environment is caused by the inorganic packaging materials (Koenig-Lewis et al., 2014). It is very important to create awareness about hazardous plastic packaging material (Yatna and Setyawan, 2016). According to Byrne (2017), the companies are using green packaging as a vehicle for showcasing pro-environmental

EXAMINING INTENSITY OF USE: A CASE OF FUNNY SELFIES

Vikas Gautam, Department of Marketing & Strategy, ICFAI Business School Hyderabad

ABSTRACT

We have been observing a prominent drift for last few years across various social media networks. Clicking own photographs ("Selfies") and sharing them across social media networks is on the rise among people. And, this typical change in behavior is not restricted here, but users are making use of many online tools (free / paid) to add fun aspect to the photographs. This type of self-posing behavior is becoming quite prominent among people of all ages; therefore, it is of great interest to know the motivations behind this type of behavior. To get some insights about this, study examined predictor (determinants) of funny selfie sharing behavior of people across various social media networks. A conceptual model, that incorporates narcissism, gratifications-sought, sensation seeking, sense of humor, and intensity of use is proposed and empirically tested by employing structural equation modeling. Results show that meta-message sensitivity, attitude towards humor and entertainment and relaxation needs are the significant predictors of an individual's intention to share funny selfies on various social media network sites. Implications of the results are deliberated with future scope for research.

Keywords: Narcissism, Gratifications-Sought, Sensation Seeking, Sense of Humor, Intensity of Use, Funny Selfies, Structural Equation Modeling.

INTRODUCTION

In the second decade of twentieth century, sharing text messages and other content is not that much in practice, rather sharing of pictures, audios, videos has become quite common and popular among masses. If we just glance through past few years, the change is humongous. The whole credit goes to the popularity of smartphones and also affordable and fast internet services available to the consumers. Social media has just changed the way we communicate, share and interact with each other. Selfie got a lot of popularity across all age groups people and has attained the esteemed title for *"Oxford Dictionaries Word of the Year 2013."*

Clicking selfies by adjusting to different angles has become a trend and there is no limit to this. There are numerous applications available free of cost to the users for applying editing to the photographs (selfies) and converting these into selfies with visual humors / audio-video humors (amusing background music / tunes). The creativity is not stopping here, but sharing these special effect selfies across social networking sites has becomes talk of the town. The younger generation specifically has become obsessed with this trend of sharing creative selfies and it had led to a new emerging phenomenon.

A few years back only, this phenomenon got attention of researchers. Earlier, selfie was called as self-portrait. According to Yeh (2007), the roots of selfie goes to Japan. A Japanese term *'Self-portraiture'* is believed to have given birth to it. To share photographs online, Wang (2009) used the Japanese term *'Internet self-portraiture'*. Online sharing of photographs and videos is a type of self-disclosure (Stefanoe & Lackaff, 2009). The choice of profile pictures for

Abstract

There has been a renewed interest in the wealth effects on household consumption expenditure mostly in the background of the global financial crisis and Eurozone turmoil. The available literature on wealth effects mostly focuses on advanced economies. Hence, this article studies the financial wealth effects on private final consumption expenditure (PFCE) in an emerging economy like India. We use the quarterly data for the period 1951–2015 and employ the ARDL method that has the flexibility in overcoming the econometric issues associated with the traditional methods in the analysis of time series models. The results suggest that financial assets wealth in the form of stock market capitalization (MC) significantly affects the PFCE. This article establishes the long-run positive relationship between financial wealth assets and household consumption. The major inference is that households are closely linked with the financial markets through their investments in the form of insurance, mutual funds, company deposits, company stocks, and other forms. Hence their consumption behavior is significantly affected by the financial wealth created by the financial markets. The policy implication is to make the financial markets more transparent, easy to access by reducing the related financial intermediation costs leading to a deeper integration of the households with the financial markets, which in turn would result in increased financial asset wealth generation and consequently increased household consumption to boost economic growth.

1 | INTRODUCTION

Wealth is an important determining factor in understanding consumption. Quite often the economists refer to the "wealth effect" suggesting the link between the level of personal wealth and the decisions about their spending or savings. The "wealth effect" is primarily grounded in the principle that consumers tend to spend more when there is a bull market as the rising asset prices make them feel wealthy. Arguably, the concept that the wealth effect stimulates private consumption expenditure is quite logical. Essentially, the wealth effect is a psychological feeling that influences people to spend more as the value of their assets grows. The proposition is that when consumers' homes or investment portfolios rise in value, they feel more financially secure, and hence are motivated to spend more.

Firm Performance and Top Executive Turnover : An Empirical Analysis of NSE Listed Companies in India[1]

NASEEM AHAMED *

I. Introduction

ONE OF THE key features of an effective corporate governance (CG) mechanism in any country is the existence of several provisions for holding accountability and penalizing for poor performance. The provision for executing top executive turnover is one way of penalizing poorly performing top executives. Several factors like the legal origin of the nation, regulatory framework and enforcement, objectivity of the board of directors are important factors in executing top executive turnover decisions. With many high profile corporate scandals impacting the corporate landscape in the last couple of decades around the world[1] including India[2], there has been a rising call by investors/stakeholders for tighter regulations and enhanced scrutiny of top executives by the board of directors. Several corporate governance committees[3] were constituted in different countries to address the concerns of stakeholders and restore investor confidence. These committees worked towards empowering the control mechanisms such as introduction of more independent directors for enhanced objectivity, constitution of different committees for matters of vital importance. Overall, the board is given more say in overseeing the affairs of a company. The board also appoints top executives with the expectation that they would undertake decisions which would maximize shareholder's wealth and would be beneficial to the financial health of the company at the same time. However, if they fall short of expectation and financial performance under their leadership is poor, then the board might execute the decision of removing the top executives. It is one of the many provisions to infuse faith

Abstract

This paper calculates the Portfolio Change Measure (PCM) developed by Grinblatt and Titman for a sample of 744 equity schemes of Indian mutual funds over a minimum period of more than two years and less than 11 years. PCM, based on holding of assets, is a measure which is free from 'benchmark' biases arising out of usage of a 'benchmark' portfolio. So, by using PCM as a measure, this paper, without using any benchmark, attempts to assess whether the selected mutual fund managers were able to add value and exhibit superior skills on the average and thus making a case for active fund management over a passive buy and hold strategy. Using the monthly holding statement of each scheme's portfolio, rolling PCM has been calculated monthly with a rolling window of one year. The results of our analysis supported by robustness checks, which include periods of pre-and post-Global Financial Crisis, shows strong evidence of active fund management adding value in the stock selection and hence in return generating process, thus justifying the possession of superior skill or superior information of fund managers at an aggregate level. Finally, using Quantile Regression, we identify some characteristics of the scheme like scheme size and ownership category, which influence PCM significantly.

1. Introduction and Literature Review

Mutual funds are one of the main pass-through financial instruments through which investors, both retail and institutional; participate in the traded securities market. Though several fund managers follow 'passive' management simply linking the corpus to a particular benchmark index, yet it is also a fact that majority of them claim to add value by managing the portfolios 'actively'. Thus, the long-standing question the academicians, regulators, and investors alike face is whether active fund managers can deliver superior performance, justifying their fees?

Consequently, starting from the sixties, since the development of the Capital Asset Pricing Model (CAPM), the literature on the evaluation of active fund management has grown enormously. Starting from the Treynor ratio (Treynor, 1965), Sharpe ratio (Sharpe, 1966) and Jensen's alpha (Jensen, 1968) up to Fama and French (1993) three-factor model, to which Carhart (1997) added momentum as the fourth factor (known as Carhart's alpha) and more recently 'Information ratio' (Sharpe (2007)) - all these approaches have looked into 'risk adjusted return' (alpha) above a benchmark portfolio return. In other words, these measures, collectively referred to as 'return based measures' which have

ABSTRACT

In the hyper-competitive Indian airline industry, the low-cost carriers as well as full-service airlines are in dire need of innovative marketing strategies to engage their customers. To understand the dynamics behind the process of customer engagement, the purpose of this paper is to gain insights into the lived experience of consumers about their online air-ticket bookings experiences. In total, 60 frequent air travellers were approached to participate in the study and the self-completion diary method was incorporated to record their ticket booking experiences. The responses recorded in the diaries were analyzed on the basis of their content from which eight themes were derived. The findings bring forth the importance of hedonic experiential values along with utilitarian experiential values toward the engagement of customers during the online air-ticket booking process. The current study is one of the pioneers in conceptualization of customer engagement as a third-order construct by uncovering the sub-dimensions of the second order factors—utilitarian and hedonic experiential values.

INTRODUCTION

Consumer buying behavior has changed drastically with the advancement of technology. The growth of the internet and e-commerce has brought revolution by connecting more than two billion people worldwide (Buhalis & Law, 2008). The impact of internet on the global economy is immense with its contribution of around three percent to the global GDP as stated in a report by McKinsey Global Institute (Manyika & Roxburgh, 2011). The influence of internet on the developing countries has also been reported, and it has been observed that nearly 50 percent of the internet users thrive beyond the advanced economies such as India, which is developing quickly and is one of the emerging economies. India is characterized by significant economic potential, social, and cultural diversity. Emerging economies have been defined as those economies that comprise of the fast-growing developing markets (Gnanasambandam et al., 2012; Khanna, Palepu & Sinha, 2005). The marketers are still struggling for effective marketing strategies to reap benefits from this market (Ramamurti 2008). The reason behind it is that these markets comprise of prosperous middle-class consumers who are different from the consumers of the developing market with regard to factors like socio-economic demographics (Biswas & Roy, 2015). Therefore, they exhibit different consumption pattern and consequently the motives behind their purchase decision varies. Thus, we want to enrich this body of literature by

User satisfaction
Continuance intention

ABSTRACT

Extant research examines the factors that cause the initial adoption of digital technologies, like mobile wallets, with limited focus on post-adoption behaviours. This work proposes a novel extended expectation–confirmation model which explores the impact of pre-adoption expectancies and confirmation on post-adoption satisfaction and continuance intentions. The model also explores the roles played by the post-adoption factors like perceived user interface quality, perceived security and self-efficacy. The findings indicate that pre-adoption performance/effort expectancies impact consumption-driven confirmation, which in turn affects the post-adoption perceived usefulness, post-adoption perceived security, and user satisfaction. Further, satisfaction, post-adoption self-efficacy and post-adoption perceived usefulness are found to be strong antecedents of the user's continuance intention. The framework contributes to the extant research by integrating both pre- and post-adoption constructs that determine post-adoption continuance intentions. The framework also guides the M-wallet application developers to enhance user satisfaction and continuance intentions by meeting their pre-adoption expectations through consumption-driven confirmation, in order to stay relevant in an extremely competitive m-payments business.

1. Introduction

The integration of wireless telecommunication, smartphone and banking systems has created digital payment ecosystems, gradually replacing the conventional paper currency (Sharma, Mangla, Luthra, & Al-Salti, 2018). With the evolving technological landscape, governments, especially those of emerging economies, are giving increasing impetus to digital payments. As a result, in India, for example, the contribution of digital payments to the overall economy is expected to increase from 8.2 % in 2018 to 14.8 % by 2021, with the market size forecasted to register exponential growth of 67.10 % for the next five years (PR Newswire, 2018[1] . Globally, mobile wallet M-wallet transactions, an important ingredient in the digital payments ecosystem, were valued at US$594 billion in 2018 and are expected to grow to US $3,142 billion by 2022, at a growth rate of 32 % (Zion Market Research, 2019[2]).

M-wallets facilitate digital payments, as well as store sensitive information for membership details, loyalty cards, debit/credit cards and encrypted shopping accounts (Dahlberg, Mallat, Ondrus, & Zmijewska, 2008; Slade, Williams, & Dwivedi, 2013). Despite the relative maturity of M-wallets, research in this domain is limited to initial adoption/rejection (Kalinic, Marinkovic, Molinillo, & Liébana-Cabanillas, 2019; Malaquias & Hwang, 2016; Oliveira, Thomas, Baptista, & Campos, 2016; Sharma et al., 2018; Singh, Srivastava, & Sinha, 2017; Singh, Sinha, & Liébana-Cabanillas, 2020; Slade, Williams, Dwivedi, & Piercy, 2015; Zhou, 2013). No study has specifically examined post-adoption implications for the technology, despite M-wallets being a means of regular use for many people. The application stores of smartphone platforms have multiple M-wallets with a variety of back-end technologies, yet only a few create the necessary user engagement and resultant business profitability (Bhattacharya & Anand, 2017; de Luna, Liébana-Cabanillas, Sánchez-Fernández, & Muñoz-Leiva, 2019).

This study utilizes data for the period 2006–2015 to estimate the determinants of road fatality rates in the Indian states. We employ baseline regression, where the total traffic fatalities, total traffic injuries, rural road fatalities, and urban road fatalities are the functions of human errors in driving, weather conditions, and some control variables. This paper is exclusively focussed upon different sets of human-driven factors in influencing the road fatality across the Indian states. Our empirical results show that reckless driving, defective motor conditions, bad weather, and reckless driving by bus, truck, and car drivers are found to cause road accidents. We further find that the increase in motorization rates and rash driving are the primary causes behind the road fatalities, and bad weather play a major role in causing road fatalities and injuries in urban areas. However, road fatalities are increasing; still, cases of under reporting, lack of proper road safety regulation, improper investigation procedures, increasing vehicle usages, and higher urbanization have made the matters quite worse in India.

JEL CLASSIFICATION
C33; Road safety H00; I18; J10; J14

1 | INTRODUCTION

Road traffic injuries are the leading reasons of mortality in the developing economies over the years and the biggest impediments to economic growth and public health development. Low- and middle-income economies globally constitute nearly 85% of the road deaths globally (Garg& Hyder, 2006). The World Bank Study in 2017 has shown that effective road safety management and reducing road fatalities could potentially result in long-term economic gains in many developing economies. The cost of road safety inaction in developing economies in the past 24years has resulted in the death of more than 1.25 million people annually in the developing economies[1] Using data for 135economies, the World Bank study has detailed that an average of 10% reduction in road fatalities leads to 3.6% increase in per capita economic growth during 24-year horizon[2]. As per World Health Organization (WHO, 2015) report, road accidents have dis-proportionately affected the economic growth of the developing economies. Traffic crashes and associated injuries pose serious problems to the public health over the years (García-ferrer, De Juan, & Poncela, 2007). The report *The High Toll of Traffic Injuries: Unacceptable and Preventable* by the World Bank has indicated that economies not investing in road safety measures could potentially miss the economic boost in the long run. An ever increasing number of road fatalities pose not only a considerable loss of human lives but also bears the rising economic cost to the society (Gracia-Ferrer etal, 2007).

Urbanization and ever increasing per capita income have led to the significant rise in the motorization in the developing economies of the global South. With the increasing population and urbanization, it has been predicted that nearly 2.5 billion vehicles will add to the city traffic in the India, China, and Africa. WHO report (2015) shows that the risk of dying from a road traffic injury is more than 2.7 times in low- and middle-income economies compared with higher income economies. Low- and middle-income economies bear nearly 3% of their gross domestic product (GDP) from road fatalities each year due to the ineffective road safety management, rapid motorization rate, and ineffective transport infrastructure conditions.

Impact of employee value proposition on employees' intention to stay: moderating role of psychological contract and social identity

Asha Binu Raj
Department of Human Resource Management and Soft Skills, ICFAI Business School (IBS) Hyderabad, A Constituent of IFHE (ICFAI Foundation for Higher Education - Deemed to be University), Hyderabad, India

Received 23 October 2019
Revised 6 April 2020

6 July 2020
Accepted 27 July 2020

Abstract

Purpose – This paper aims to examine the relationship between employee value proposition (EVP) and employees' intention to stay and analyse how psychological contract and social identity moderate this relationship.

Design/methodology/approach – The study was conducted in Indian IT sector among a sample of 268 employees using criterion sampling. Data were collected through structured questionnaires which revealed employees' perceptions of EVP, intention to stay, psychological contract and social identity.

Findings – The empirical results reveal that employees have greater intention to stay when their organisations deliver an EVP including development value, social value and economic value. Findings indicate that psychological contract positively strengthens the impact of EVP on employees' intention to stay. Also, when employees strongly identify with their organisation's image, they have higher intention to stay in presence of a strong EVP.

Research limitations/implications – Consistent with the existing literature, the paper contributes an integrative model of EVP based on social exchange process, moderated by social identity and psychological contract. As the study was limited to Indian IT sector, cross-sectional nature of data is a limitation for drawing inferences about the influence or causality in general.

Practical implications – The study provides a new perspective to managers to develop an attractive EVP to gain employees' increased intention to stay. Employers in IT sector may adopt this comprehensive model to strategise their value propositions.

Originality/value – This paper proposes a validated conceptual framework of EVP and intention to stay, tested for moderation effects by psychological contract and social identity. This moderation model based on social exchange adds value to employer branding literature.

Keywords Employee value proposition (EVP), Psychological contract, Social identity, Social exchange theory, Intention to stay, Employer branding

Paper type Research paper

1. Introduction

Contemporary organisations today face a great challenge to gain competitive advantage through a unique employee value proposition (EVP hereafter). This is due to the ambiguous job market in which employees consistently evaluate and compare their organisation's employment benefits with others. This article addresses EVP, which is a collective array of values/benefits an organisation offers in exchange of employees' services. Minchington (2006) defines EVP as "a set of associations and offerings provided by an organisation in return for the skills, capabilities and experiences an employee brings to the organisation". Hence, a clearly articulated EVP acts as a tool to communicate the employer brand among existing and prospective employees. As a contextual factor, the set of attributes associated with EVP highlights employees' intention to stay due to their attraction towards organisation (Jiang and Iles, 2011). Love and Singh (2011) refer EVP as what it is like to work for a

IMPACT OF MANAGERIAL ABILITY AND POWER ON CEOS COMPENSATION – AN EMPIRICAL EVIDENCE FROM INDIAN COMPANIES

SRIKANTH POTHARLA*

ICFAI Business School (IBS, A Constituent of IFHE, deemed to be a University), Hyderabad, India.

Abstract

The present study aims to test whether the rent extraction or efficient contracting which significantly influences the compensation of CEOs in Indian companies. By drawing the sample from all the listed companies providing data on CEO characteristics from the year 2006 to 2018, the study tests the empirical model using ordinary least squares regression and quantile regression. The results of analysis reveal that CEO compensation is tenure-variant and there is a trivial difference between the impact of CEO power and CEO tenure. It is in line with the bargaining theory of managerial ability view on CEO compensation. It supports efficient contracting in CEO compensation. The results of the analysis also reveal that impact of CEO power is comparatively less for long-tenured CEOs. It implies that managerial ability view is maintained, and CEO compensation is influenced by their bargaining power. The results also prove that power premium is more in case of group companies compared to non-group companies.

Keywords: CEO Compensation, Rent Extraction Theory, Efficient Contracting Theory, CEO Power, CEO Tenure, Indian Companies.

1. Introduction

Academics, government officials and media have expressed concern about the high level of compensation for CEO of Indian enterprises and observed that corporate governance and regulation have failed to curb excessive compensation and rent extraction (Chakrabarti et al., 2012; S. Ghosh, 2010; M. Jaiswall & Firth, 2009; S. S. K. Jaiswall & Bhattacharyya, 2016; Pande and Dubey, 2014; Rai, 2009; Singh, 2007). Against this backdrop, research on factors influencing the compensation premium of CEOs is drawing the attention of the academic researchers and policymakers. The extant literature was mainly confined to developed economies (Core et al., 1999; Morse et al., 2011; Murphy, 1985; Song & Wan, 2019). The findings and implications which are derived from the studies in developed economies cannot be applied verbatim to emerging economies. Several economists have already made strong enough argued that the corporate structure, market, and organization of developed and developing countries have some fundamental institutional structural differences. It is also argued that there is no apparent difference between ownership and control in emerging economies. The perennial problems in emerging economies like India are underdeveloped managerial markets, interference of founders of the companies in the appointment of CEOs.

Abstract

Purpose – This study aims to explore the oil–stock market nexus from a novel angle by examining the predictive role of oil prices over the excess returns associated with the market, size, book-to-market and momentum factors via bivariate cross-quantilograms.

Design/methodology/approach – This study makes use of the bivariate cross-quantilogram methodology recently developed by Han *et al.* (2016) to analyze the predictability patterns across the oil and stock markets by focusing on various quantiles that formally distinguish between normal, bull and bear as well as extreme market states.

Findings – The study analysis of systematic risk premia across the four regions shows that crude oil returns indeed capture predictive information regarding excess factor returns in stock markets, particularly those associated with market, size and momentum factors. However, the predictive power of oil return over excess factor returns is asymmetric and primarily concentrated on extreme quantiles, suggesting that large fluctuations in oil prices capture markedly different predictive information over stock market risk premia during up and down states of the oil market.

Practical implications – The findings have significant implications for the profitability of factor- or style-based active portfolio strategies and suggest that the predictive information contained in oil market fluctuations could be used to enhance returns via conditional strategies based on these predictability patterns.

Originality/value – This study contributes to the vast literature on the oil–stock market nexus from a novel perspective by exploring the effect of oil price fluctuations on the risk premia associated with the systematic risk factors including market, size, value and momentum.

Keywords Predictability, Quantile, Cross-quantilogram, Risk premia, Oil return

Paper type Research paper

1. Introduction

The relationship between oil and financial markets is well documented in a large strand of the energy economics literature (Degiannakis *et al.*, 2018; Smyth and Narayan, 2018, for recent comprehensive surveys of this large literature). These studies propose at least three broad channels in which the oil market can affect return dynamics in stock markets. One channel highlights the informational content captured by oil price fluctuations regarding the current and future cash flows as well as macroeconomic conditions (Jones and Kaul, 1996; Kilian, 2009; Hamilton, 2013; Basher *et al.*, 2018). The second highlights the risk premium

Abstract: Enterprise resource planning (ERP) applications are complex and difficult to implement. Even after implementation many ERP projects are not used or adopted by employees. Organisations are struggling to convince and motivate employees to adapt smoothly to them. Several personal, managerial and organisational issues contribute to successful adoption. This research paper attempts to identify potential issues that lead to failures in the adoption of ERP systems in enterprises. Earlier studies have identified different contributing issues to the failure of ERP systems. A questionnaire was developed around these significant influencing issues reported in literature and industry people mostly senior managers having good experience with ERP systems were asked to rate the importance of these factors. TOPSIS method was applied to rank the factors based on their importance in the failure of ERP systems. From the results, it is found that poor top management support and poor quality of testing were the two most important critical failure factors for ERP adoption. While implementing ERP systems, an organisation has to give importance to these failure factors based on this rank to ensure ERP implementation success.

Keywords: enterprise systems; enterprise resource planning; ERP; ERP failure factors; ERP adoption; TOPSIS.

Undoubtedly, menstrual pads have made menstruation hygienic and comfortable. However, these commercial disposable sanitary pads have a devastating effect on the environment and are eco disaster. This case discusses about an initiative taken by an Ahmedabad-based social enterprise and manufacturing company Saathi and founded by three Massachusetts Institute of Technology graduates -- Amrita Saigal, Grace Kane and Kristin Kagetsu. Their eco-friendly, biodegradable sanitary pad is an alternative to non-biodegradable commercial pads which when discarded ends up in sewage, landfills, fields and water bodies posing threat to environment. Moreover, this pad is also an alternative to commercial pads which are made of plastic, cellulose gel, laded with chemical, bleach and fragrance which leads to serious health issues including cervical cancer, urinary tract infection, infertility and birth defect. The present case of Saathi tries to surface out the relationship between sustainability and marketing by focusing on the concept of sustainability marketing. The case discusses the marketing mix strategy used by Saathi. In a country where menstruation is still a social taboo, the case also talks about the challenges faced by Saathi related to price, the environmental awareness and lack of knowledge about menstruation and ill effects of using commercial pads on women health and whether it should consider expansion of its business and enter into the B2C market in India.

1 | INTRODUCTION

> *"O earth, whatever I dig out from you, must that have to be filled up again and restored as fast as possible. O pure one, I indeed have no intention to hit you at your heart of hearts."*(Atharva-Vedasamhiti*)

Adolescence has been recognized as a crucial stage of life in females which signifies the transition from girlhood to womanhood. It involves both physical and psychological changes, Menstruation being one of them. Undoubtedly, menstrual pads have made menstruation hygienic and comfortable. However, these commercial disposable sanitary pads have a devastating effect on the environment and are eco disaster (The Guardian, 2017). Authors, Stein and Kim (2009), in their book *Flow: The Cultural Story of Menstruation* reveals that an average woman discards 250 to 300 pounds of used "pads, plugs, and applicators" in her lifetime which end up in sewage, landfills, fields and water bodies posing threat to environment (Hindustan Times, 2017). These non-biodegradable pads contain chemicals, toxins, and plastic (Economic Times, 2017; Hindustan Times, 2017; Syren, 2018). In fact, sanitary pads contain more than 90% plastic (Hindustan Times, 2017) and some pads are made up of four plastic bags worth of plastic (The Guardian, 2017). The plastics decompose very slowly and can remain in soil up to 1000 years, thereby, inhibiting the breakdown of biodegradable materials in or around it (Stevens, 2001). Menstrual waste has created a serious dent on the environment across the globe, India notwithstanding. According to a survey, approximately 121 million of women are using disposable sanitary napkins in India (Hindustan Times, 2017) and rising incomes and changing demographics and preferences has resulted in an increase in the number of, non-biodegradable sanitary pads used by them. While Indian government is struggling to ensure that all women get sanitary pads to manage menstruation, managing menstrual waste is also a major concern

Venkata Narasimha Chary Mushinada[1]
Venkata Subrahmanya Sarma Veluri[2]

Abstract

The article provides an empirical evaluation of self-attribution, overconfidence bias and dynamic market volatility at Bombay Stock Exchange (BSE) across various market capitalizations. First, the investors' reaction to market gain when they make right and wrong forecasts is studied to understand whether self-attribution bias causes investors' overconfidence. It is found that when investors make right forecasts of future returns, they become overconfident and trade more in subsequent time periods. Next, the relation between excessive trading volume of overconfident investors and excessive prices volatility is studied. The trading volume is decomposed into a first variable related to overconfidence and a second variable unrelated to investors' overconfidence. During pre-crisis period, the analysis of small stocks shows that conditional volatility is positively related to trading volume caused by overconfidence. During post-crisis period, the analysis shows that the under-confident investors became very pessimistic in small stocks and tend to overweight the future volatility. Whereas, the analysis of large stocks indicates that the overconfidence component of trading volume is positively correlated with the market volatility. Collectively, the empirical results provide strong statistical support to the presence of self-attribution and overconfidence bias explaining a large part of excessive and asymmetric volatility in Indian stock market.

Keywords

Behavioural finance, self-attribution bias, overconfidence, market volatility

Introduction

Standard finance theory and economic models draw heavily upon two basic assumptions, namely, rationality and market efficiency. The assumptions of traditional economists portray humans as rational beings

Social comparison and continuance intention of smart fitness wearables: an extended expectation confirmation theory perspective

Anil Gupta[a], Neeraj Dhiman[b], Anish Yousaf[c] and Neelika Arora[d]

[a]SHTM, Faculty of Business Studies, University of Jammu, Jammu, India; [b]Department of Management Studies, National Institute of Technology, Hamiprur, India; [c]IBS, IFHE University, Hyderabad, India; [d]School of Business Studies, Central University of Jammu, Jammu, India

ABSTRACT

Technological innovations, especially smart fitness wearables, are playing a critical role in the future of fitness and overall well-being. Extant research has examined the adoption of smart fitness wearables, with limited attention paid to continuance intention. The current study attempts to investigate users' continuance intentions of using smart fitness wearables by combining expectation confirmation theory and social comparison theory. In particular, this paper extends the expectation confirmation model by adding perceived health outcomes and social comparison tendency to understand the continuance intention of smart fitness variables. The model explains 72.8% of continuance intention, and the findings reveal that perceived health outcome and users' satisfaction predict continuance intention leading to intention to recommend. Furthermore, the findings confirm the positive impact of social comparison tendency on perceived health outcome and users' satisfaction. Users' satisfaction is influenced by perceived usefulness, confirmation, perceived health outcome and social comparison tendency. Our study confirms that mere post-adoption perceived usefulness does not guarantee continuance intention, unless the perceived health outcomes are achieved.

1. Introduction

The global market for smart wearable devices (including smart watches, fitness wristbands and ear wears) is witnessing exponential growth, growing at an annual rate of 7.9%, with global sales expected to reach 302 million units by 2023[1] (IDC Quarterly Wearable Device Tracker, June 2019). The smart wearable device is defined 'as a user worn accessory, with integrated electronics and computing technologies, that captures or reports on some form of data' (Puri 2017). Smart wearables ranging from smart glasses, smart shoes, smart watches, smart eyewears and even implantable multi-location sensors work on sensors, which are directly connected to the internet, with the purpose of sharing valuable information (Pal et al. 2019). Smart fitness wearables (smart watches and fitness trackers/wristbands) constitute approximately 60% of the overall market and are popular among people of all age groups (Canhoto and Arp 2017), because of their multi-functionality and as extended communication device with smart features (Fang and Chang 2016; Dehghani 2018). A smartwatch is defined as 'a wrist-worn device with computational power, which can connect to other devices via short range wireless connectivity; provides alert notifications; collects personal data through a range of sensors and stores them' (Wu, Wu, and Chang 2016). Similarly, fitness trackers is defined as 'devices that are designed for private users and worn on the body as small digital devices with biometrical sensors to continuously generate physical health information (PHI) without the need for health professionals' (Becker et al. 2017).

Competition in this segment is intense and players like Apple, Samsung, Fitbit, Garmin and Xiaomi are competing for market share. Even traditional watchmaker brands, including TAG Heuer, Swatch and Fossil Group, are offering their own smart watches or hybrid versions that offer smart functions while retaining traditional designs ('Old-school watchmakers push', 2018). Existing research on smart wearables adoption has used different theories, including innovation diffusion theory (Emani et al. 2018; Min, So, and Jeong 2018), technology acceptance model (Kim and Shin 2015; Li et al. 2019), unified theory of acceptance and use of technology (Dhiman et al. 2019; Talukder et al. 2019; Reyes-Mercado 2018; Yuan et al. 2015), to explain consumer adoption of smart wearables; however, the findings are still fragmented (Dehghani 2018). Kalantari (2017) in her detailed literature review on consumer adoption of wearable technologies calls for advancing the existing research by delving deeper into more

Strategic human resource management and employees' intention to leave: testing the moderated mediation

Subhash C. Kundu and Archana Mor
Haryana School of Business,
Guru Jambheshwar University of Science and Technology, Hisar, India, and
Neha Gahlawat
Department of Human Resources, ICFAI Business School (IBS),
IFHE (ICFAI Foundation of Higher Education) University, Hyderabad, India

Abstract

Purpose – The purpose of this study is to examine the relationship between business strategies (i.e. cost reduction, quality enhancement and innovation strategy) and employees' intention to leave (ITL), through the mediating role of high-performance work system (HPWS). It also attempts to study variability in the relationship between business strategies, HPWS and employees' ITL on the basis of nature and ownership forms of the firms.

Design/methodology/approach – Primary data based on 573 respondents from 192 organizations operating in India were analysed using structural equation modelling and conditional process modelling.

Findings – This study has revealed that HPWS mediates the relationship between business strategy (specifically innovation and quality-enhancement strategy) and employees' ITL. Findings further indicate that the mediated relationships between quality enhancement and innovation strategy, HPWS and ITL do not vary across nature and ownership forms of the firms.

Practical implications – In context of dynamic business environments in developing countries, the findings provide some important insights in exploring the relevance of strategic human resource management in improving employees' behavioural intentions.

Originality/value – By applying a three dimensional business strategy system (innovation, quality and cost) and by exploring the relevance of several contextual factors, this study attempts to expand the focus of turnover research.

Keywords Strategic human resource management, Business strategies, High-performance work systems, Employees' intention to leave, India

Paper type Research paper

1. Introduction

It has been often thought that Asian firms, especially Indian firms, lay little importance on managing human resources rather than other technical aspects of business like productivity and competitiveness (Cooke and Saini, 2010; Sharma and Khandekar, 2006). Following which, employees in Indian firms have been reported to put up with increased pressures of job, work–life imbalance and monotonous nature of work that eventually result in enhanced turnover intentions amongst them (Budhwar *et al.*, 2006; Guchait and Cho, 2010). Recently, several authors have also highlighted that Indian firms are dealing with issues of higher turnover rates, gaps in workforce demand and supply, and costs associated with higher attrition rates (Cooke and Saini, 2010; Holtbrügge *et al.*, 2010; Kundu and Gahlawat, 2016). In this regard, researchers have contended that an effective means of shrinking turnover rate is to ascertain the motivational factors that aid in lowering the employees' intention to leave (ITL) (Carmeli and Weisberg, 2006). One amongst the crucial factors which is often proclaimed to have effects on this significant behavioural intention is strategic human

Abstract: The present paper investigates consumer's intention toward adopting internet railway ticket booking in Indian context by integrating theory of planned behaviour (TPB), technology acceptance model (TAM) and an additional construct, i.e., perceived risk. 220 usable responses were collected using snowball sampling from consumers through internet survey. Structural equation modelling was used to analyse data and to evaluate the strength of model fit. Result revealed that PU significantly influenced both, consumers' attitude and intention to use Indian railway online ticketing system. Further, PEOU was found to positively influence consumers' attitude towards online ticketing. Attitude, subjective norm and PBC significantly influenced consumer's intention to adopt Indian railway online ticketing system showing TPB can be used in predicting consumer's intention toward online ticketing system. Finally, perceived risk had significant negative influence on consumers' intention to buy ticket online. Railway management may use findings for developing policies and strategies related to online ticketing in the Indian scenario.

Keywords: online ticket booking system; technology acceptance model railway; theory of planned behaviour; TPB; behavioural intention; BI; perceived risk; PR; India.

Abstract: Elderly diabetic patients in developed countries have been widely using digital health wearables for many years to manage their diabetes-related health data accurately. To encourage the increased adoption of digital health wearables among elderly diabetic patients in a developing country, Bangladesh, this study investigated the factors that influenced the existing elderly users' continuance intention to use this technology. The Technology Acceptance Model (TAM) has been used here as a theoretical basis. A model using structural equation modelling was developed for the elderly diabetic patients' continuance intention to use digital health wearables. Survey-based data were collected in Bangladesh from 223 diabetic patients aged sixty years and older. This study found that all six constructs, namely, perceived usefulness ($\beta = 0.183$), perceived ease of use ($\beta = 0.165$), perceived irreplaceability ($\beta = 0.138$), perceived credibility ($\beta = 0.165$), compatibility ($\beta = 0.285$) and social influence ($\beta = 0.226$) had a positive influence on elderly diabetic patients' continuance intention to use digital health wearables. Along with the theoretical contributions, the findings of this study can be used by developers of digital health wearables, manufacturers, marketers and health practitioners in developing better strategies to increase the elderly diabetic patients' continuance intention to use this technology.

Keywords: digital health wearables; healthcare technology; diabetes; technology acceptance model (TAM)

1. Introduction

The diffusion of innovation (e.g., artificial intelligence, big data, design thinking and robotics, etc.) has offered groundbreaking solutions to various needs and challenges of the global healthcare industry. With the advances in healthcare technology and increased health consciousness among many people, the ageing population is growing worldwide. In 2015, there were around 900 million people who were 60 years old or more; in 2017, there were around 980 million [1], and it is expected that by 2050 this figure will have more than doubled and will represent around 16% of the total population of the world [2]. According to Khanam et al. [3], 80% of elderly people have at least one chronic disease, and 60% of elderly people have more than one chronic disease. Diabetes is one of the common chronic diseases among the global population and people older than 60 years of age are more

Abstract

Purpose – This paper aims to build upon the various studies conducted on the ecosystem and expands the understanding of the ecosystem of microfinance institutions (MFIs) in India. The discussions in this essay entail a literature review that analyzes the discourse on the ecosystem of MFIs, and based on this an attempt has been made to conceptually design a model for the ecosystem of MFIs in India.

Design/methodology/approach – The authors design the "Indian microfinance ecosystem model" based on the actors in the broader financial ecosystem (Bloom and Dees, 2008; Ledgerwood and Gibson, 2013) and the capital infrastructure and the context-setting factors of the social entrepreneurship ecosystem (Dees *et al.*, 2008) that best describes the Indian MFI scenarios.

Findings – The ecosystem of MFIs in India is found to be very complicated. The interactions among numerous actors – who are core product or service providers, facilitators, client, beneficiaries, resource providers, competitors, complementary organizations, regulators, opponents and influential bystanders. The authors also observed that the capital infrastructure and context-setting factors such as policy, politics, media, economic and social conditions are equally crucial for the MFIs to survive and flourish. Moreover, the ecosystem is also dynamic and could change with the environmental conditions and entry of new entrants into the ecosystem.

Research limitations/implications – Understanding the ecosystem of MFIs from the strategic perspective would also be of interest to stakeholders such as donors, investors, banks, government and so on. For MFIs, knowing their place in the ecosystem is an essential step in determining their strategy.

Practical implications – Understanding the elements of the ecosystem would help MFIs to assess whether they have achieved the minimum critical environmental conditions in the ecosystem for their business model to succeed.

Social implications – Better understanding of the ecosystem will help create social benefits through better service delivery to the low-income population.

Originality/value – Expands the existing business ecosystem literature by extending it to the social policy, social entrepreneurship and more specifically to the microfinance sector. Fills a void in ecosystem literature by designing a comprehensive ecosystem model of MFIs in India. Understanding the ecosystem would help market system actors and facilitators to understand what they have to do to achieve their objectives of participating in the ecosystem. Knowing their place in the ecosystem is an essential step in determining what they should do and how they should do it. In addition to MFIs, it could have important implications for policymakers, particularly the government, that are trying to achieve financial inclusion.

Cascading Effect of Boeing's 737 Max Technology Development

Saradhi Gonela, Mohammed Laeequddin, Ramkrishna Dikkatwar, Sudesh N S

Abstract: ***During March and April 2019, many countries had grounded Boeing's 737 Max 8 jets following two fatal crashes in a space of five months, between October 2018 and March 2019, killing 346 people. It was widely reported that the problem was with the software called Maneuvering Characteristics Augmentation System (MCAS). Aviation experts across the world accused Boeing of being lax in following safety protocols during 737 Max jet's development stage. It was reported that the company was in a hurry to face the fast growing competition from archival Airbus. Boeing faced a sever threat of losing its market share in the North American short haul market after the runaway success of Airbus A320. The A320 deployed several first of the kind technologies and grabbed significant market share in European and Asian short haul market. This article explores the strategies that Boeing followed while developing Boeing 737 jet technology over the years. Also the article focuses on the competitive strategy of Boeing in general while playing catch-up with its competitor Airbus. Secondary data was analysed to illustrate cascading effect on the technology development.***

Keywords: ***Boeing, Airbus, Global Aviation, MCAS, Technology Life Cycle, Crisis at Boeing, Competition in Global Aircraft Manufacturing***

I. INTRODUCTION

During March and April 2019, many countries had grounded Boeing's 737 Max 8 jets following two fatal crashes. In October 2018, a Lion Air, 737 Max 8, crashed into Java sea minutes after takeoff from Jakarta killing all 189 passengers on board.[1] In March 2019, an Ethiopian Airlines aircraft, also 737 Max 8, crashed shortly after taking-off from Addis Ababa, killing all 157 people on board.[2] Aviation experts across the world expressed concerns over safety of Boeing's 737 Max 8 and recommended grounded of 737 Max jets. On March 12, 2019, The European Union Aviation Safety Agency announced the suspension of all Boeing 737 Max 8 flights in Europe after China, Australia, the UK and several other nations announcing grounding of Boeing 737 Max 8 flights.

More than 300 Max jets were grounded by various operators across the world, "Of the top 10 countries by air passenger travel, all but the United States and Japan have halted flights of the 737 MAX."[3] (Please refer to Annexure I (A and B) for list of countries and operators that grounded 737 Max jets).

The 737 had been the Boeing's largest selling aircraft model and accounted for almost one-third of operating profit. Between 1958 to March 2019, Boeing delivered 23,167 aircrafts of all its models, of which 10,533 units were from the 737 family. (Please refer to Annexure II for year wise delivery of Boeing's all models). By 2019, the company had an order for over 5,000 units of 737 worth around $600 billion[1] Grounding of 737 Max jets had a severe impact on company's financial position and reputation. Consequently, company's share that traded at $440.62 on March 1, 2019, dropped to $375.41 on March 12 and further to $362.17 on March 22, 2019, on the NYSE bourse [2] By March 12, 2019, the company's market capitalization was reduced by $40 billion [3] compared to March 1, 2019, of which over $26.6 billion was lost in two days, March 11 and 12, 2019.

In response to technologically advanced A320 airplanes which were quickly snatching away market share, Boeing had developed the Next Generation 737 (called 737NG) which included the 600, 700, 800 and 900 variants. (Please refer to Annexure IV for market share comparison of Boeing's 737 and Airbus A320 families). The 737NGs, were entirely new aircraft, sharing only the fuselage frame with previous B737s. The most significant engineering changes in Boeing 737 NGs were its new wings, new avionics and bigger engines. To accommodate the larger engine fan, Boeing lengthened the nose landing gear of the 737 Max, which necessitated the relocation of aircraft's electronics/equipment (E/E) bay. Boeing 737 chief programme engineer John Hamilton said,[4] heavy engine used in 737 Max was also placed forward compared to engine placement in 737, which altered designs involving aerodynamics, software, the design of the wings, strengthening of fuselage and many other components.

In order to lift the engine higher, nose wheel was increased by 8 inches. Therefore, engines had to mounted forward. This resulted in nose of the aircraft pitching in certain phases of flight upbringing. With the possibility of a stall [4] Boeing fixed a new system called MCAS on 737 Max, to prevent the possibility of aircraft entering a stalling in the flight phases. It was widely reported that the problem was with the software called MCAS which automatically intervened and controlled the plane when the plane flies at a very steep angle. Many pilots said they do not know that such software existed until after the Lion Air crash. Consequently, when the planes were flying at a steeper angle, both manual correction and auto

Corporate Governance, Capital Structure and Financial Performance: An Analysis of Indian Automobile Industry

Neeti Mathur[1], *Payal Khandelwal*[2], *Satish Chandra Tiwari*[3] *and Radha Mohan Chebolu*[4]

Corporate governance ensures transparency, accountability, responsibility, and fairness of the firms. If the company demonstrates a high level of corporate governance, then the stakeholders of the company trust it. Corporate governance is essential for corporate growth and success. Raising capital, maintaining investors' interest and positive impact on share price, and creating brand loyalty and brand image take care of all the stakeholders of the business. In this paper, an attempt is made to explore the significance of corporate governance practices and their impact on the financial performance of listed Indian companies. The data is collected for Indian automobile companies listed on NSE top 500 for the period 2014 to 2018. The relationship between corporate governance parameters and financial performance parameters and corporate governance and capital structure is explored. Descriptive statistics, correlation and multiple regression analysis have been used to study the influence of independent variables such as composition of board, independent directors, qualified and independent audit committee, board of directors, remuneration of the directors and CEO duality. The dependent variables are financial performance and capital structure represented by ROE and total debt/total asset.

Introduction

Corporate governance is increasingly finding acceptance for its relevance, pertinence, and underlying importance in the industry and capital markets. Growing firms have voluntarily put in place a system of good corporate governance. This has been accepted for a long time worldwide. The financial scams and crises in emerging markets have led to renewed discussions on the issue of corporate governance.

Investor protection has become a much more vital issue for all businesses and financial markets. Indeed corporate disclosure acts as a basis for investment decisions of various primary

ABSTRACT

A glaring paucity of a measuring instrument for place branding effectiveness and place brand equity still remains. This study contributes theoretically by exploring and developing the dimensions and instrument of customer based place brand equity (CBPBE) quantitatively, in the context of international relations (public diplomacy) between two places, West Bengal (in India) and Bangladesh. To this end, the study employed: focus group discussion, depth interviews and survey, in order to develop and validate the items generated to measure CBPBE. Confirmatory factor analysis was used on a total sample of 437 respondents that resulted in a nine (9) item CBPBE scale, represented by multidimensional constructs namely: place brand salience, perceived quality and place brand engagement. The CBPBE construct is then tested with brand loyalty – investment attractiveness construct in a conceptual model in order to verify the nomological relationship of the instruments developed.

1. Introduction

Place branding and public diplomacy are two important concepts that enhance a country or a place's brand image. While place branding is considered as the marketing, branding and the commercial aspect of a place or a country, with the aim to increase sales and profit of the place or a country (Anholt, 2010), public diplomacy traditionally relates to a country's foreign policy through its public relation (PR) communication, with the intention to influence both international and domestic audiences' (or public) perception to create a favorable opinion and image towards the country. Although the two concepts differ in the way they are communicated and promoted, both concepts have similarities, as they both promote the place or the country's brand image (Gilboa, 2008) through citizen engagement. Szondi (2008) in this regard observes that in countries like UK and Canada branding strategies are used for better communication and engagement with citizens.

The efficacy of public diplomacy lies in influencing views, decisions and behavior of the place's stakeholders including friends, enemies and own people. Therefore, it is now a known fact that states and governments are venturing into public diplomacy with a motive to influence its targeted audience (both international and domestic) and targeted stakeholders. Similar to a marketer's desire to generate specific set of behavior(s) from its existing and targeted buyer, one way of achieving this is via branding the product or service. In the context of a place, Ham (2001) points to this very phenomenon of public diplomacy as a branding tool.

It is a testimony to the fact that place branding and public diplomacy are essentially inter-twined that the first dedicated journal on place branding is titled 'Place Branding and Public Diplomacy'. In its second issue the editor observed (Anholt, 2005 p. 119) "*that ministries of foreign affairs and their foreign services must practice something called 'public diplomacy'; likewise the fact that public affairs has become an international affair, and that investment promotion and tourist promotion must be as sophisticated as the most sophisticated commercial marketing, since both are competing for consumer mindshare in the same space.*" He went on to state that in a globalised marketplace, places compete with one another for share of reputation, goodwill and trust (the very essence of public diplomacy). Therefore, it is most logical that places look into domains of marketing to understand how to prosper in a competitive world.

However, despite the relatedness of the two concepts, they have been studied separately in the past. This is due to the fact that most previous studies in public diplomacy were historical and mostly dealt with anecdotal or personal opinions, which lacked conceptual or

Engaging young consumers

Introduction

Engagement is increasingly becoming popular in the marketing literature. Though a relatively new concept, it has attracted the attention of both academics and practitioners. This popularity can primarily be attributed to the finding that engaging consumers have considerably positive consequences for the organizations (Sawhney *et al.*, 2005). An engaged consumer is typically the one who is physically, emotionally and cognitively attached to an organization or brand. Adapted mainly from the organizational behavior literature (Gupta *et al.*, 2018; Uraon and Gupta, 2019; Gupta, 2019), its definition is under scrutiny for gaining clarity on the specifics of it. Given this ambiguity, engagement in marketing literature has been looked through several lenses (Jaakkola and Alexander, 2014; Verhoef *et al.*, 2010).

Today, marketers are facing the challenge of engaging consumers for sustainable sales, and researchers are moving toward finding the potential ways and means of answering the questions so raised. Though youth buying behavior and attachment behavior is different from others, the marketing literature has limited studies that explore such differences. Therefore, the main motif for this special issue is in exploring the engagement construct and examining the antecedents and consequences of engaging young consumers in different contexts.

Objective of this special issue

The main objective of this special issue is to explore and examine the factors relating to engage young consumers. The sub-objectives of this special issue are as follows:

- to understand the factors affecting consumer engagement among youth;
- to explore the consequences of engaging young consumers; and
- to gain clarity on the constructs relating to engagement in the marketing literature.

Relevance of engaging young consumers

Several scholars have urged to examine the ways in which young consumers can be engaged. For example, Harris and Dennis (2011) emphasized on the need to investigate whether youths can be more engaged in social media, specifically Facebook, than others. Similarly, Pantano and Viassone (2015) examined the role of store atmosphere, channel availability and service quality on purchase intention, but their results led them "to speculate that the presence of innovative technologies is a basic element for attracting young consumers" (p. 110). Similar arguments for engaging young consumers in technology were put forth by Pantano (2016) that young participants often are experts of advanced technologies such as smartphones and are also greater aware of internet and mobile tools for shopping. Another reason for engaging young consumers was given by Morris (2019) that it is beneficial for companies to engage with consumers at an early age because it helps them develop profitable business in long run. Scholars suggest that because of the same reason,

Environmentally sustainable organizations: present potential and future promise

The concept of "sustainability" assumed worldwide significance when it was documented for the first time in the Brundtland Report released in 1987 by the World Commission on Environment and Development. Sustainability aims at meeting the needs of the present without compromising the ability of future generations to meet their needs. In the present-day context, it has assumed enormous significance owing to people's awareness of the impact businesses and individuals can have on the environment. Consumers and organizations alike are seeking options to alleviate urgent environmental demands resulting from constant population and economic growth (de Medeiros *et al.*, 2014). Seidel *et al.* (2013) discuss how the deterioration of the environment is a pressing concern for our society and business organizations continue to remain a significant contributor to this challenge. It is observed that numerous organizations have an opportunity to engage in sustainable development practices while enhancing efficiency, boosting productivity, minimizing costs and maximizing profitability. Their poor business practices lead to detrimental effects for the environment in the forms of waste: unused or underused resources, energy inefficiency, elevated noise levels and harmful emissions, all of which are waste products causing negative externalities and diminution in economic efficiency (Watson *et al.*, 2010). "Greening" organization theorists have tailored existing paradigms of organizational tactics to embrace environmental demands and organizational responses, from the standpoint of making firms more proactive (Jennings and Zandbergen, 1995). Thus, there is considerable understanding and recognition that the economic sustenance of a firm is entwined with environmentally sustainable development (Bauer *et al.*, 2012).

Supporting the contention that organizational effectiveness is contingent upon environmental sustainability (Jennings and Zandbergen, 1995). Sarkis (2001) points that the long-term viability of an organization depends on the sustainability of the natural environment; organizations, therefore, are obliged to take on a worldwide perspective, neither merely departmental nor a single project at a time, while assessing environmental concerns. Customers, too, are mindful and have concerns for environmental protection and preservation (Sheth *et al.*, 2010). Organizations realize this and appreciate that an opportunity exists for them to stand distinct among competitors based on their commitment to environmental sustainability. They are increasingly facing the necessity to transform their businesses for attaining environmental objectives (Marcon *et al.*, 2017).

The main objective of this special issue is to know how organizations encounter uncertainties for transforming their current practices and the steps they take to attain the desired goals of environmental stewardship.

Papers in our issue

In the direction of accomplishing the objective as mentioned earlier, the first article in this special issue, "Enhancing Business Performance through Green Human Resource Management Practices," quantitatively identified green HRM practices as the drivers of environmental and business performance in the Malaysian manufacturing businesses. The study used natural resource-based view theory to propose eight hypotheses to understand the relationships of green recruitment and selection, green training and development, green reward and compensation, green performance and appraisal, green employee empowerment

Impact of Internal Branding on Employee Engagement: An Empirical Study Conducted among Medical Staff's Brand Supporting Behaviour in Indian Hospitals

Asha Binu Raj

Assistant Professor-Organizational Behaviour, Human Resource Management, Department of Human Resource Management and Soft Skills, ICFAI Business School (IBS), Hyderabad, ICFAI Foundation for Higher Education (IFHE), (Declared as Deemed to be University u/s 3 of the UGC Act 1956), Hyderabad, Telangana, India

Abstract

Building an internal brand is a critical function of service organizations today. The employee's attitude and behaviour must represent the organization's brand, values and culture. Internal branding is highly relevant in healthcare, where it includes a range of strategies aimed at employees to help them deliver the desired service to patients. This empirical research paper focuses on the impact of internal branding dimensions on employee engagement among medical staff in select Indian hospitals. The analysis of the data collected from a sample of 176 respondents using structured questionnaires show that internal branding dimensions such as internal communication, HR processes during internal branding, brand focused training and leadership assist in engaging the medical staff while providing healthcare services. Considering social exchange theory (SET) as the theoretical foundation, the research indicates that medical staff show high level of engagement when hospitals implement internal branding programs.

Keywords: *Internal branding, employee engagement, employee behaviour, internal communication, HR processes, brand focused training, leadership, hospital.*

Introduction

Employee engagement is a measurable degree of an employee's positive or negative emotional attachment to their job, colleagues and organization that influences their willingness to perform at work. It is defined as the "harnessing of organization members' selves to their work roles"[1]. When engaged, employees express themselves cognitively, behaviourally and emotionally at work during role performance.[1,2,3]

Engaged employees often display positive emotional connection with their work and workplace and are likely to display high level of attentiveness and psychological involvement in their work.[2] They are more productive, better performers, satisfied, healthier and less likely to leave their employer.[4,5] To create a service delivery driven organization, it is important to equate employee engagement with both long term (relational) as well as short term (transactional) relationship with the organization. Some healthcare organizations highly focus on implementing employee oriented initiatives to reap the benefit of brand supporting behaviour of their staff. Past studies predict a deficiency of medical staff comprising of nursing staff, specialists, generalist physicians and other clinicians, which will hamper healthcare organizations' ability to deliver high-quality healthcare services in the coming decade. Hence to

enhance the healthcare productivity and patient safety through quality service delivery, employees need to be engaged and aligned with the hospital brand.

Internal branding is one such multidisciplinary practice which helps in aligning hospital's strategies and values with the employee's values, thus creating a brand which employees can trust. It provides a competitive advantage as it consists of activities which help employees feel connected to their hospital. Internal communications and involvement of HR during internal branding implementation, along with proper brand focused training give them a feeling of belongingness which is crucial in aligning the staff with the hospital.

Literature Review: The studies conducted by Punjaisri et. al[6,7] in hospitality sector provide an extended view of the internal branding. Löhndorf & Diamantopoulos[8] suggested the link between social identity and internal branding leading to employee behaviour. These studies have indicated that there are many internal branding factors which lead to employee engagement. Although Lee et al.[9] suggested internal communication, training and reward as key factors of internal branding, they fail to explain the descriptive influence of these factors in detail as well as how they affect engagement. Asha[10] explained the role of internal branding resulting in employees' brand based outcomes such as employee engagement in services sector through employees' well-being. Similarly, Huang & Lai[11] showed that successful hospital brand management enables employees to understand the hospital's brand value which affect their behaviour and job performance. Internal brand expresses the hospital's ability to align its mission, vision, values and professional practices which support a consistent health service to patients.[12] Hence the first hypothesis is formulated based on the above rationale.

Hypothesis H1: Internal branding has a positive impact on employee engagement.

Internal branding is a means to create a powerful corporate brand.[13,14] While expecting an employees' brand supporting behaviour, hospitals need to communicate their brand message. Hence internal communications should be the first point of focus in an internal branding program aiming to secure people's commitment and encourage behavioural change to support patient orientation. It plays a significant role in internal branding as it influences employee's brand knowledge, attitudes and behaviour in hospitality industry.[13] Based on these arguments, the second hypothesis was formulated.

Hypothesis H2: Internal communication during internal branding has a positive impact on employee engagement.

Involvement of HR in internal branding has been studied by de Chernatony et al.[14] who claim that HR plays a vital role in implementation of internal branding through recruitment, rewards and other practices aligned with the brand values. Hence HR department need to be aware of brand values and should help in instilling these values in daily operations.[15] This is because it is the responsibility of HR practices to create a work environment to induce engagement.[16] Hence the role of HR in engaging the employees while implementing internal branding initiatives is explicit. The third hypothesis was based on these arguments.

Hypothesis H3: HR practices during internal branding have a positive impact on employee engagement.

Using training programs for building an internal brand is also considered very effective by employees.[17] Unlike the traditional trainings, these programs must be focussed on instilling brand values among the employees, educating them about the importance of brand values and how to align their work with brand values, how to carry out their specific roles,[16] how to treat customers,[18] which further engages them with their work and workplace. This has provided a rationale for the fourth hypothesis.

Hypothesis H4: Brand focused training during internal branding has a positive impact on employee engagement.

Another variable, leadership was repeatedly mentioned in the services branding literature as a mechanism of motivating employees to "live the brand".[19] Research indicates that change oriented, dynamic and people oriented leadership style can induce engagement. Patient orientation and service delivery are also essentially affected by the way internal brand is managed by the leaders in hospitals. Therefore leaders have an inevitable role in developing an internal brand in hospitals, which employees can trust and finally represent during their on role performance and interactions with patients. The fourth hypothesis was based on this rationale.

Abstract

Young consumers' preferences shifted from only emotional to both emotional and rational while buying their preferred product or service. They are looking for more benefits than they are getting versus the cost it is to them. In this, we can see the young consumers' buying decision making which does not depend on one or two attributes or one or two brands. It may have combinations. There is a wide scope to the young consumers when companies are offering a competitive edge within the expected price range of young consumers. There are several studies conducted in developed countries. No study was carried out to denote exclusively young consumers' mindset towards automobiles, attributes that are influencing buying decisions. Many studies proved that young consumers' buying preferences are more on branded clothing, automobiles, and cell phones. Hence this study has taken up to study the young consumers' buying preferences in an automobile (midrange car) attribute. There is a paucity of specific literature also. The main purpose of this paper is to identify the most influencing attributes of a product on young consumers' who are in the age group of 21 to 35. The present study was done just a month before the pandemic across India through an online survey. The conjoint analysis is administered to identify the most preferable attributes rank wise. This study found the fact that young consumers have a higher preference for a brand in a car purchase. At the same time, the preference is going for low priced cars. It is a fact from this study that there is the least priority for Safety in a car by young consumers.

Key Words: Consumer Preferences, Product Attributes, Conjoint Analysis.

Introduction

Young consumer preferences are rational and emotional (Ebrahim, et al. (2016), (Lin, et al. (2007). They like a wider variety of lifestyles and choose the products/ brands according to their personal characteristics (Valentine & Powers, 2013). In purchasing automobiles, consumers are more rational (Bobeth, S., & Kastner, I. (2020) than emotional. Consumers will look for several features/ attributes that are more influential, comparable, and highly involved while buying an automobile (Liao, F., Molin, E., & van Wee, B. 2017). The reports are saying Mileage, Fuel type, Brand, Safety and are more preferred attributes in a midrange car for a young buyer (Kukova, M., Diels, C., et al., 2016)

A young consumer will look at several referential information for knowing the things. Indian consumers consider the brand as a key attribute in the selection of a car (Deloitte 2014). Maruti is the most preferred brand in India and followed by Hyundai and Honda (Economic Times 2019). Consumers consider the price of a car as one of the main attributes while purchasing a car (Dong, X., Zhang, B., Wang, B., & Wang, Z. (2020).The car buyers consider fuel type (A. Chtinicht, 2002; Kabadayi et al., 2013), consumers value fuel economy (Sallee, J. M., West, S. E., & Fan, W. 2016), car buyers' preference is very high toward safety (Dangi, A. (2017).

Regarding 'safety', the most common point is the New Car Assessment Program (NCAP). As per the global New Car Assessment Program (NCAP) safest cars 2020 in India Mahindra XUV 300 ranked first and followed by Tata Nexon, Tata Altroz, Tata Tiago, and Mahindra Marazzo(Hindustan Times July 2020). These cars incorporated advanced features like dual front airbags, electronic stability program, hill-start assists, reverse parking assist camera to augment safety. Young consumers are willing to accept multiculturalism and look for international brands (Ercis, Unal, and Bilgili 2016). These consumers' exhibit rational behaviours and they pay attention to the utility value of a product/service very much. (Mitchell, Walsh, 2004).

Time Value of Money : Concepts and Applications

Naseem Ahamed [1]

Abstract

The case, at its core, explored the concepts of time value of money from the perspective of a newly joined intern in Money Smart Consultancy Pvt. Ltd. The value of money doesn't stay static because of certain factors such as inflation at play. The value of money changes as it moves on the timeline either forward or backward. The concept of compounding was used for finding out the equivalent amount of money in the future when one moves forward on the timeline. Different types of cash flows such as lump sum, annuity, perpetuity, etc. were discussed to make the reader understand through the questions of the protagonist of this case. The rates used for compounding/discounting are indicative of the cumulative risk assumed by the investor for which he/she ought to be compensated. Through different cases of various companies, Joy discussed the concepts and their applications with his intern.

Keywords : time value of money, compounding, discounting, timeline

JEL Classification : C40, E43, P44

Paper Submission Date : December 3, 2019 ; Paper sent back for Revision : February 14, 2020 ; Paper Acceptance Date : February 25, 2020

"Compound interest is the eighth wonder of the world. He who understands it, earns it ; he who doesn't, pays it."

- Albert Einstein

It is the first of January 2020 and Joy Sircar (Joy, hereafter) is feeling elated today as it is the fifth anniversary of his company Money Smart Consultancy Pvt. Ltd. He reminisces the tinge of hesitation before leaving his comfortable position in a reputed MNC where he worked in the capacity of senior consultant for almost a decade before starting his own enterprise. After realizing that there are a large number of small and medium tier investors and firms that don't opt for consultation in the large consultancies, he decided to start a venture of his own where he would provide consultation to these clients at an affordable price. Clients can subscribe the consultation service for a 1 year period for a fee of ₹ 150,000.

Few of the clients associated with Joy's previous firm were so impressed with his work that they switched to his new company. Notable clients among them who had subscribed for a 3 - year unlimited consultation service are Ranjan Textiles Pvt. Ltd., Nilay Sudhiram Entertainments Pvt. Ltd., Singh & Jeevan Constructions Pvt. Ltd., Vipin Heavy Metal Works Pvt. Ltd., and Medsafe Medical Instruments Ltd. His new intern, Keya just walked in the office, wished him "Happy New Year!," and brought him a set of files belonging to various clients.

Abstract: The advent of internet has brought about a paradigm shift in the way shopping is done. From brick and mortar to virtual store, e-shopping is easy and time saving. However, consumer still perceive buying products online risky, especially if the items are luxury. The present study investigates the impact of perceived risks on consumers' online purchase intention of luxury items. Snowball sampling was administered to collect 242 usable responses from consumers. The present research takes into consideration apparel and watch as it is bought by both the genders. Structural equation modelling analysed data and evaluated the strength of model fit. Result revealed that perceived financial risk, perceived functional risk and perceived psychological risk had a significant negative effect on online purchase intention. However, perceived physical risk had insignificant negative effect on online purchase intention. Marketers may use these findings for developing policies and strategies to provide safe and trustworthy online shopping experience. This research is one of the prefatory investigations in Indian context that examine the impact of different perceived risks while purchasing luxurious items online.

Keywords: online purchasing behaviour; behaviour intention; luxury products; perceived risk; perceived financial risk; perceived functional risk; perceived psychological risk; perceived physical risk; purchase intention; India.

Central Government Expenditure and its Impact on GDP: Evidence from India

Tamma Koti Reddy

Department of Economics, IBS Hyderabad, India
(A Constituent of ICFAI Foundation for Higher Education)

Email: tammamuralimanohar@gmail.com

Abstract: This study examines the impact of Central Government spending on Real Gross Domestic product (GDP) Growth in Indian Economy for the period 1981-82 to 2018-19. Augmented Dickey-Fuller Unit Root Test indicates that the log of Government Spending and GDP were stationary. Unrestricted Vector Autoregression (VAR) is applied to test the association. Result indicates no association from total spending to GDP in India. The study emphasised the role of zero based budgeting as a long term budgetary reform process. Spending management should be designed in such away to improve the allocative efficiencies in the existing spending classification system, including focus on capital spending and greater use of IT tools. The author opines that appropriate measures should be taken by the government to enhance domestic consumption, direct and foreign direct investments, manufacturing production, more public spending towards promoting human development, and to raise in development spending and service sector production to accelerate the GDP growth in the economy.

Keywords: GDP, Revenue Spending, Capital Spending, Zero Based Budgeting, Spending management

1. Introduction

The spending of the central government has been growing very rapidly since 1951 towards socio-economic development during the planning era. Increase in public infrastructure investment should be effectively implemented by the central government as it boosts aggregate demand and enhances the productive capacity of the nation (IMF, 2014). The effect of government expenses on economic growth depends on what the government spends money on, and how well the institutional system established to administer spending works in delivering value for money (Favaro and Lahiri, 2006).

The total spending of the central government as a percentage of Gross Domestic product (GDP) has increased from 15.21 per cent of GDP in 1980-81 to 19.7 per cent of GDP in 1990-91 and then declined to14.9 per cent in 2011-12 and further to 12.7 per cent in 2017-18 (BE) due to reduction in spending by the government under various heads. In 2018-19 the central government spending as a percentage of GDP was 13.04 per cent and is expected to reach 13.2 per cent in 2019-20 (Arum, 2019). Development spending is

RELATIONSHIP BETWEEN INFLATION AND ECONOMIC GROWTH

DR. TAMMA KOTI REDDY[1] & DR IRS SARMA[2]

[1]*Professor & Head, Department of Economics, IBS Hyderabad IFHE (A constituent of ICFAI Foundation for Higher Education), A Deemed to-be University u/s 3 of The UGC Act 1956, India*

[2]*Associate Professor in Economics, IBS Hyderabad, IFHE (A constituent of ICFAI Foundation for Higher Education), A Deemed to-be University u/s 3 of The UGC Act 1956, India*

ABSTRACT

This paper examines the relationship between Wholesale Price Index Inflation (WPI) and GDP growth in India for the period 1990-91 to 2018-19 using Multiple Regression Analysis. Policy makers and academicians would prefer WPI Inflation than Consumer price Index-Industrial workers (CPI-IW) and GDP Deflator because of its wide coverage and data availability. The study indicates a negative effect of inflation on GDP growth; while both Broad Money (M3) and Gross Domestic Capital formation has a positive effect on GDP growth. The results of the study also indicates a negative effect of GDP on inflation where as Broad Money has a positive effect on Inflation. The authors opine that policy makers should focus on raising output and infrastructure development to achieve a better macroeconomic environment in which growth and social justice can be ensured. The authors stressed the need for attracting private investments in order to enhance the investment level in the economy as it directly contributes for higher economic growth.

KEYWORDS: Inflation, Broad Money, Gross Domestic Capital Formation & Multiple Regression Analysis

1. INTRODUCTION

India has been experiencing the problem of continuous raise in prices since 1956-57. The general economic conditions in an economy can be assessed by fluctuations in the prices over a period of time. Persistent increase in the general level of prices can be described as Inflation. Demand-pull factors like High level of Investments, Raise in Money Supply, Raise in Government expenditure, Deficit financing, Black money; cost-push factors like raise in International oil prices, fluctuations in output & supply, Increase in tax rates and Administered Prices; Other factors like Devaluation, lack of proper implementation of Public Distribution system, Lack of proper formulation and implementation of rational price policies, black marketing and hording of essential commodities etc are the factors responsible for inflationary pressures in any economy. Though Wholesale Price Index is the most widely used price index, GDP at deflator or Consumer Price Index can also be used to measure the variations in the price level in India.

Inflation is inversely associated with economic growth as it affects the interest rate, aggregate demand, exchange rate and international trade. Higher inflation will affect the competitiveness of business firms in the global market, Investments, future profitability of the projects, standard of living of different sections of the people in the society, production, employment and economic growth. Trends in major macroeconomic indicators indicates the health of the economy. Progress in domestic macroeconomic indicators will play a major role in determining the inflationary situation in the economy. Trends in major macroeconomic indicators like Per capita NNP, Money

THE IMPACT OF CURRENT ACCOUNT DEFICIT ON ECONOMIC GROWTH: AN ARDL APPROACH

ABSTRACT

In this study, we examine the linkages between External debt, Exchange rate, Current account deficit, and GDP at Factor cost for India over the period of 1975-76 to 2018-19 using the Unit root test and Autoregressive Distributed Lag (ARDL). The results of the unit root test reveal that GDP growth rate and External debt are integrated at the level I(0); while the Current Account deficit and Exchange rate are integrated at first order I(1). The results of the ARDL technique reveal that the current account deficit has a positive and significant impact on Real GDP. It clearly reflects the role of imports in accelerating the growth of a developing economy like India. There is also evidence that the external debt has a positive and significant impact on the Current account deficit while the Exchange rate does not have an impact on the Current account deficit. The authors opine that the external debt assists in a gradual reduction in the current account deficit and contributes to economic growth by narrowing down the saving-investment gap. As the demand for Indian exports is inelastic in the global market, the country has not benefitted from the depreciation of its currency. The authors stressed the need for focusing on further diversification of its export markets, creating a conducive environment for attracting longer-term FDIs, liberalization, promoting commercial services exports, and achieving exchange rate stability in the context of the USA-China trade war and stagnation in the world output growth. Huge untapped potential for IT-enabled services should be exploited to promote service trade. The authors point out the current account deficit in the range of 2-3 percent of GDP can be manageable.

Key Words: Current account deficit, External debt, Exchange rate, Real GDP, Autoregressive distributed lag

THE IMPACT OF GROSS CAPITAL FORMATION ON ECONOMIC GROWTH : EVIDENCE FROM INDIA

DR TAMMA KOTI REDDY* & DR T SITA RAMAIAH**

Abstract: *The study examines the effect of Gross Capital formation on Real Gross Domestic product growth for the period 1970-71 to 2018-19 using the Unit root test and Autoregressive Distributed Lag(ARDL) technique. The unit root test results reveals that GDP growth rate, General Government expenditure, Inflation are integrated at level I(0); while gross capital formation and gross domestic saving are integrated at first order I(1). The results of the ARDL technique indicates that Gross Capital Formation, General Government expenditure and Inflation have significantly contributed for the Economic growth in India . There is also evidence that the Gross Domestic Saving is not significant to boost economic growth. As per International Rating Agencies and IMF, India's growth rate is expected to decelerate to below 2 %in 2020 due to COVID-19, pandemic and contraction in the world output growth. More public investments on productive activities would address the economic slowdown in the coming years. The authors stressed the need for formulating a rational Monetary-Fiscal Policy mix for addressing the economic slowdown in India in the coming years. The authors point out that there is a need to create conducive environment for enhancing savings and investments in the economy which contribute for sustained economic growth.*

Keywords: *Gross Capital Formation, Gross Domestic Saving, Inflation, Government Expenditure , Real GDP Growth , Autoregressive Distributed Lag*

INTRODUCTION

Capital formation is considered as a prime determinant of economic development in any economy. It consists of both tangible goods(i.e., plants, tools and machinery)and intangible goods (i.e., high standards of education, health, scientific, tradition and research).The size of capital formation in any economy depends upon domestic saving and Investments .Capital formation accelerates the economic growth whenever savings are diverted as investments into productive activities. The rate of capital formation in India is at low as compared to most of the developed and

Board Characteristics and Performance of Indian Banks: An Empirical Study

Brahmaiah Bezawada

Professor of Finance and Accounting Area
ICFAI Business School (IBS), IFHE
Hyderabad, India

Email: brahmaiahb@ibsindia.org

Abstract: The paper examines the board characteristics of Indian banking industry with special reference to the size of the board, composition of directors and number of meetings and analyzes its influence on banks' performance. We use a sample of 34 commercial banks consisting of 19 public sector banks (PSBs) and 15 private sector banks (PVBs) for the period of 2010 to 2018 accounting for the 90 per cent of the total banking business in India. We use two ratios such as Tobin's Q and return on assets (ROA) to measure performance of banks. The study finds that the percentage of busy directors and number of meetings has had significantly positive effect on bank performance. The board size and number of meetings are associated negatively with Tobin's Q significantly and the percentage of busy directors has significantly positive impact on Tobin's Q. The board size has a significantly negative impact on bank performance. The research findings may provide some insights of corporate governance to the banks and Securities and Exchange Board of India for considering appropriate policy guidelines on corporate governance to banking industry.

Keywords: Corporate governance, Board characteristics, Tobin's Q, Indian banking

JEL Classification Number: G21, G28, G32 and G34

1. Introduction

The Indian banking sector is the second largest and most complex among the emerging economies. Most of the banks in public and private sectors are listed on the stock exchanges and are actively trading at the stock exchanges. Banking industry supports commerce, industry, trade, and personal segments of the economy by providing different types of banking products. The role and importance of the board of directors in the corporate governance of financial and banking institutions have become more important during the post global financial crisis of 2008. The Basel Committee on Banking Supervision (2015) lays emphasis on importance of corporate governance. The primary objective of corporate governance should be safeguarding stakeholders' interest in conformity with public interest on a sustained basis. Good corporate governance practices in banking institutions are essential conditions in achieving and maintaining public trust

Do Dynamic Asset Allocation Schemes Exhibit Superior Performance to Balanced Schemes? Indian Experience

VDMV Lakshmi*

Department of Finance and Accounting
ICFAI Business School-Hyderabad **
Hyderabad, Telangana, India

Abstract: Despite both dynamic asset allocation schemes and balanced schemes investment in equity and debt, they differ in their approach in asset allocation. Dynamic schemes rebalance their portfolios actively. As dynamic schemes are expected to perform better than the balanced schemes in stock selection and market timing due to active rebalancing of portfolios, the study attempts to examine the same. There is negligible evidence of dynamic schemes outperforming balanced schemes of the same fund house either in stock selection or in market timing.

Keywords: Dynamic Schemes, Balanced Schemes, Stock Selection, Market Timing, Superior Performance

JEL Classification Number: G11

1. Introduction

Both dynamic mutual fund schemes and balanced mutual fund schemes invest in equity and debt, but they differ in their approach in their asset allocation. Balanced schemes maintain steady exposure to equity and debt, whereas dynamic asset allocation schemes shift from equity to debt and vice versa dynamically. Asset allocation to equity in case of balanced schemes varies between 65% and 80%, whereas dynamic schemes allocate between 0% and 100%. When the equity valuations go up, dynamic schemes sell off equity at high price and keep the money in debt and cash. When equity markets go down, they liquidate bond investments and use the cash to buy equity at lower levels. Dynamic schemes usually experience lower risk measured by standard deviation than balanced schemes. Despite dynamic schemes have the flexibility to rebalance the portfolio as per market conditions, frequent rebalancing may result in excessive cost overweighing the benefits of flexibility? Hence, there is always a question, whether dynamic asset allocation schemes outperform balanced schemes or is it an old wine in new bottle? The study examines to answer the question.

Abstract

Purpose-The purpose of this study is to examine the relationship between Human Resource Development (HRD) Climate and Employee's Perception of Organizational Effectiveness (OE) in India. As per Pritchard and Marasick (1973), the HRD Climate is conceptualized as comprising of three human resource dimensions, namely General Climate, HRD Culture (measured through OCTAPACE sub-dimensions(Rao,1999),and HRD Mechanisms.

Methodology-The empirical study has followed a questionnaire based survey research design on a group of employees (N=290) working in a large scale Public Sector Manufacturing Unit in India. Data analysis was performed using multivariate techniques, namely Multiple Linear Regression (MLR) and covariance-based Structural Equation Modeling (SEM) using SPSS 20.0 and AMOS 20.0 packages respectively.

Findings-The study found that HRD Climate in an Organization and Employee's Perception of Organizational Effectiveness are positively associated. The result implied that the employees of an organization having favourable HRD climate perceive the organization to be more effective. The study encompasses intervening (mediating or moderating) role of Organizational Commitment

Macroeconomic Impact of Eurozone Debt Crisis on India: Sensitivity Analysis Using Measures of Dependency

Vighneswara Swamy

Published: June 2020

The eurozone represents a significant market for emerging markets like India; hence, any stagnation or a downturn in the eurozone leaves a dent in their export growth. Sensitivity analysis using measures of direct and indirect export dependency through international production networks and other economies suggests that the eurozone crisis impacted through the trade channel. As the impact of the eurozone debt crisis was significantly negative, the levels of dependence on the USA and China continued to be stable without experiencing any sharp deviations. It is desirable for India to diversify its export markets and to further strengthen domestic institutions and policies to reduce the impact of such crises and shocks.

Macroeconomic Impact of Eurozone Debt Crisis on India

Sensitivity Analysis Using Measures of Dependency

*Vighneswara Swamy**

Key Points

- The eurozone represents a significant market for emerging markets like India; hence, any stagnation or a downturn in the eurozone leaves a dent in their export growth.
- Sensitivity analysis using measures of direct and indirect export dependency through international production networks and other economies suggests that the eurozone crisis impacted through the trade channel.
- As the impact of the eurozone debt crisis was significantly negative, the levels of dependence on the USA and China continued to be stable without experiencing any sharp deviations.
- It is desirable for India to diversify its export markets and to further strengthen domestic institutions and policies to reduce the impact of such crises and shocks.

Introduction

The eurozone debt crisis had far-reaching consequences. Starting from Greece, Ireland, Portugal, Spain, and more recently Italy, these eurozone economies witnessed a severe downgrade in the rating of their sovereign debt, fears of default and a sudden rise in borrowing costs. These

Measuring the Efficacy of Financial Intermediation: A Transaction Costs Approach

Vighneswara Swamy

Published: December 2020

This study focuses on the transaction costs of borrowing by the poor and provides an empirical assessment. In doing so, this study addresses two salient questions: (a) what are the transaction costs for borrowing poor? and (b) how significant are these transaction costs for the poor in deciding whether to borrow from an institutional or an informal source? The study area includes southern, western, northern, eastern, and central regions of India. Using a stratified random sampling approach this study captures comprehensively all the forms and variants of microfinance intermediation in India. The sample also covers three broad social categories—scheduled castes and scheduled tribes, other backward classes, and other social groups—and studies three major approaches to financial intermediation: the direct lending model, self-help groups (SHG) and microfinance institutions (MFI). The results indicate that borrower transaction costs in the direct lending model are 9.06% in rural areas, 9.57% in semi-urban areas and 10.93% in urban areas, with an overall average of 9.85%. Under the SHG lending model borrower transaction costs range between 3.62% in rural areas, 3.70% in semi-urban areas and 3.93% in urban areas, with an overall average of 3.75%. Similarly, the MFI lending model has borrower transaction costs of 7.70% in rural areas, 7.91% in semi-urban areas, 8.43% in urban areas, and the average is 8.02%. The findings provide the required insights for policy support needed to lessen the burden on the beneficiaries of microfinance. Accordingly, the SHG lending model, with the lowest borrower transaction costs, is suitable for microfinance intermediation in rural areas.

Monetary and Fiscal Policy Coordination During Fiscal Dominance Regimes

*Vighneswara Swamy**

Key Points

- This study empirically examines the interaction between monetary and fiscal policy by using vector auto regressions (VAR) and a vector error-correction model (VECM) and explores the need for coordination.
- We also analyse a Stackelberg interaction model with government leadership to know the strategic interaction between monetary and fiscal policy.
- The findings show that an unexpected increase in the monetary policy effect:
  (i) has a contractionary impact on economic growth;
  (ii) leads to a gradual decline in inflation;
  (iii) tightens liquidity conditions; and
  (iv) leads to a rise in bond yields.
- On the other hand, an unexpected increase in the fiscal policy effect:
  (i) has a positive effect on GDP growth;
  (ii) prompts an initial decline, then a gradual rise in inflation levels; and
  (iii) leads to falling bond yields.
- Monetary policy is found to be more responsive to fiscal policy effects. The results imply that there is a greater need for effective coordination between monetary and fiscal policy as a sufficient condition to achieve economic stability.

Online Young Consumer Shopping Self-Efficacy: An Indian Exploration

Vikas Gautam[a,*], Vikram Sharma[b]

[a] *Associate Professor, ICFAI Business School Hyderabad, India*
[b] *Faculty Member, ICFAI Business School Gurgaon, India*

ABSTRACT

The current study examined the Indian young consumer online shopping self-efficacy in an integrated model. Authors tested the study model (antecedents and consequences of online shopping involvement) with the help of 225 sample data by using first order structural equation modeling. Online shopping enjoyment was found most important predictor of online shopping involvement followed by online accessibility. Further, the impact of online shopping involvement on online shopping self-efficacy was quite high in comparison to online technical self-efficacy. We strongly recommend that the marketers must use internet strategically in establishing dialogue between seller and online shoppers.

Keywords: Online Shopping Enjoyment, Online Shopping Value, Online Accessibility, Online Parental Attitude, Online Shopping Involvement, Online Shopping Self-Efficacy, Online Technical Self-Efficacy

I. Introduction

The entire world has witnessed rapid growth in commerce by internet mostly in last two decades. The internet has paved numerous opportunities to marketers across the globe. Online Shopping has become a trend in all age groups of consumers. E-retail revenues are projected to grow to 6.54 Trillion US dollars in 2022 (Statista, 2020). According to a joint ASSOCHAM -Forrester study paper, Indian electronic commerce revenue will reach USD 120 Billion by 2020 with annual growth rate of 51% (The Economic Times, 2016) The contributing factors for this mammoth growth will be high internet penetration, good economic growth and demographic dividend specific to India.

In this 21st century world, young generation is flooded with information at very high speed. Same is the case with Indian young generation. They are well versed with usage of internet. It has become very easy for marketers to target young consumers towards online shopping. Young consumers prefer

Working Capital Management Efficiency of Cement Sector of India

D S Prasad and I R S Sarma*

IBS Hyderabad, ICFAI Foundation for Higher Education
Hyderabad, India

Abstract: India's cement industry is an integral part of its vibrant and growing economy, providing employment to over a million people. Ever since its deregulation in 1982, the Indian cement industry has attracted large investments, both from India and abroad. Due to the ever increasing demand from various sectors such as housing, commercial construction and industrial construction, cement industry's production capacity is expected to reach 550-600 million tonnes per annum by the year 2025. This study attempts to analyze the efficiency of working capital management in the selected list of 23 cement companies in India covering the period from 1991 to 2018. In analyzing the efficiency of working capital management, three indices were used, namely, utilization index of working capital management (UI_{WCM}), performance index of working capital management (PI_{WCM}), and efficiency index of working capital management (EI_{WCM}). Results reveal that the cement industry in India has managed its working capital satisfactorily, by and large, during the study period. While some of these companies have performed remarkably well, there exists ample scope, for a few Indian cement companies to improve their current assets management.

Keywords: Working Capital Management, Efficiency Index, Cement Industry

1. Introduction

A company's working capital essentially consists of its current assets and current liabilities. Working capital management refers to monitoring these two components or the short-term liquidity of a firm. Proper management of working capital is a sine-qua-non to a company's sound financial health and operational success as a business. A critical indicator of good business management is the ability of the firm to manage its working capital effectively so that a fair balance is maintained between three basic financial variables growth, profitability and liquidity. Further, efficient management of working capital is an integral part of the overall corporate strategy (Padachi, 2006) and is expected to contribute positively to the creation of a firm's value (Afza and Nazir, 2009).

Efficient working capital management is one of the fundamental elements for the financial and operational success of any business. Transformational value can be created by effectively combining the strengths of people, process and technology to improve the balance between profitability and liquidity (EY). The corporate finance literature has

Demonetisation: a move towards cashless economy in India

Laila Memdani

Published Online: November 13, 2020 · pp 205-211

ABOUT

Abstract

The objective of the paper is to study the impact of demonetisation on the digitalisation of the cash transactions and move towards a cashless economy in the India. For this purpose data is collected from RBI website on the volume of transactions through debit cards and credit cards for the months of September and October (pre), November and December (during), January and February (after) and May and June (later) demonetisation, for all the banks of India. The statistical technique of paired sample t-test is used to find out whether there is any significant change or not. The results reveal that there was significant change in pre, during and post demonetisation period but not in the later period.

Special Issue on E-Commerce Companies: Engaging the Stakeholders

Manish Gupta, Department of HR, ICFAI Business School (IBS), IFHE University (Deemed), India Anitha Acharya, Department of Marketing and Strategy, ICFAI Business School (IBS), IFHE University (Deemed), India

INTRODUCTION

Statistics from several credible reports suggest that the e-commerce industry is growing rapidly across the globe primarily because it saves customers' time, efforts, and money (United Nations Conference on Trade and Development [UNCTAD], 2019). However, this industry is sensitive to external factors (Alqahtani, 2019; Sila, 2013). It has led to several acquisitions (Razak & Vattikoti, 2018). Those who could constantly engage their internal and external stakeholders could survive and thrive (Acharya & Gupta, 2020; Gupta & Bakker, 2020;Sharma et al., 2019; Westerman et al., 2020; Gupta, 2018; Novoa et al., 2018). To fully utilize the employees' potential, the e-commerce companies need to engage their internal stakeholders, the employees, cognitively, physically, and emotionally into their work (Ojo, 2016; Gupta et al., 2019; Gupta, 2019; Gupta & Shaheen, 2018; Gupta et al., 2018). To remain agile, cost effective, and attractive, these companies also need to make sure that their external stakeholders such as customers, investors, and suppliers are engaged (Singh & Srivastava, 2019). Therefore, it is of paramount significance for the e-commerce companies to know the factors that may affect them. Surprisingly, the research in this area is sparse.

OBJECTIVE OF THE SPECIAL ISSUE

The objective of this special issue is to explore and examine the causes and consequences of engaging stakeholders in the e-commerce industry. The six articles in this special issue present current and rapidly evolving research focusing on the ways and means in which stakeholders in the E-commerce industry can be engaged by the companies. Academic researchers will be valued with the findings and the opportunities presented in the research papers as avenues for future research. The findings of the research paper will also help practitioners to plan their activities in a better way and engage all the stakeholders of the company.

Abstract

The raising thickness of the present programming items joined with consistently expanding expenses of programming breakdown has pushed the requirement for testing to new pinnacles. The effective execution of the control over programming quality requires programming measurements. Utilizing compelling programming measurements we can screen necessities, foresee advancement assets, following improvement advance, and limit the support cost. The primary target is to execute the testing process with different traits associated with measurements to optimize effort and software performance. The proposed look into work is to recognize the conceivable measuring properties of programming test execution and test audit forms. This work presents a novel structure called vector space show, to perceive programming measurements identified with test execution and test audit stages additionally to distinguish the help of such measurements for the quantifiable characteristics. In addition, it is essential to break down the suspicions in the computation of the measurements. The measurements examined against each ascribe should be evaluated for their common sense as far as venture's unique circumstance and advantages to the testing group.

Interaction among Crude Oil Price, and Indian Stock Market Indices

Rama Krishna Yelamanchili

Department of Finance and Accounting, ICFAI Business School IFHE-Hyderabad, Hyderabad, Telangana, India

Email: yrk@ibsindia.org

Abstract: By using daily data of crude oil price, oil sector index returns, and benchmark stock market index returns in India from April 1, 2004 to March 29, 2019 this paper aims to measure the interactions among these three variables. During this period oil price appreciates by 100 percent, benchmark index surges by 5.7 times and oil sector index surges by 3.7 times. In this context, our paper investigates whether the causal relationships between oil price and stock market indexes are positive, negative, or insignificant in an emerging economy setting. Our results indicate that there is statistically significant positive association between oil price and stock market indexes. However, these associations are very weak. Our causal relationship analysis reveals that the explanatory power of oil price about SENSEX and Oil & Gas index is negligible. We find similar results for four different sample periods analyzed in this paper. We conclude that fluctuations in oil prices do not have significant impact on Indian stock markets.

Keywords: Commodity Market; Emerging Market Economy; Sectorial Index; Stock Markets

JEL Classification Number: G14; G15

1. Introduction

The causal relationship between oil price and stock markets have received much attention and are research topics of interest for many researchers. Much of research on these causal relationships is bivariate. Extant research reports multiple facets of these interactions. In brief, increase in oil price has positive influence on stock markets in oil exporting countries and negative impact on stock markets in oil importing countries and vice-versa. In this paper we extend extant knowledge by extending bivariate interactions to multivariate interactions and empirically examine the effects in an oil importing country which is transforming from developing country to developed country.

Economic theory suggests that oil price has significant positive effect on the stock markets. According to Jimenez-Rodriguez and Sanchez (2005) a positive association between oil price movements and stock market returns is expected in the case of an oil exporting country, as the country's income will increase. It follows an increase in expenditure and investments which in its turn create more employment opportunities and

Global Crude Oil Price, Exchange Rates, Impact on Domestic Dynamic Retail Oil Prices and Stock Market Indices

Sagar Reddy Adavelli

Department of Finance & Accounting
ICFAI Business School, IFHE-Hyderabad

Email: sager@ibsindia.org

Abstract: This paper examines the causal relationship among dynamic retail oil prices, global crude oil prices stock market indices, and exchange rates. First, a causal relationship between global crude oil prices and domestic retail oil prices are examined. Next, relationship between exchange rates and retail oil prices are examined. Finally, impact of dynamic domestic oil prices on stock market indices is examined. For the purpose of this study, daily prices of all the variables are obtained for the period of June 16, 2017 to December 31, 2019 for a common sample size 613 observations. All the analyses are performed on log returns in percentage terms. A series of statistical models, which include simple and multivariate regressions, are applied to analyse the data and to test hypotheses. Results indicate significant positive relationship between domestic retail oil prices and oil and gas index of Bombay Stock Exchange (BSE) and between domestic retail oil prices and energy index of BSE. The paper does not find any causal relationship between domestic oil prices and global crude oil prices and between domestic oil prices and exchange rate.

Keywords: Crude oil price, Exchange Rate, Retail oil Price, and Stock market

1. Introduction

A thorough understanding of the relationship among crude oil prices, foreign exchange rates, domestic gasoline prices, and stock markets are important for investors, analysts, and for policymakers. The conventional evidence shows that high and increasing crude oil prices boost the economy of oil exporting countries and decreases the growth of oil importing countries. Increased prices of gasoline cause decrease the available amount of disposable income which consumers have for spending on other essential goods and services (Haung et al, 1996). Increase in the prices of crude oil is one of the important reasons in increasing the inflation of the nation, thus central bank of the concerned nation put many efforts to avert the increasing prices of necessities. Another study conducted by Ghosh (2011) reveals that Indian currency depreciates in the short-run, as there is increase in the returns of crude oil prices and concluded that both the positive and negative price shocks had similar effect on exchange rate volatility for the study period.

A concealed sequence ties currency to crude oil in the world. This forces a contrasting and considerable reaction to each other as the price actions in common venue. Oil price

Abstract

The satisfaction of the students at university is in general interpreted as the happiness and contentment that students experience when their needs and expectations are fulfilled. This paper is aimed at understanding the factors that influence the students' satisfaction using Kano model of customer satisfaction as the basic premise. The survey was conducted amongst 193 students studying at the private universities in Uttarakhand state. The results indicated that the key determinants of satisfaction for the students studying at the private universities included the qualified and knowledgeable faculty resources that private universities attract, and the world class infrastructure with state of the art technology for academic delivery. Only aspect that students have shown slight dissatisfaction towards was the cost of the program which is an important factor to be considered.

Satisfaction, Kano Model, Loyalty

1. Introduction

Education is described as a process of facilitating learning, knowledge acquisition, and development of skills, beliefs, habits and values. Several methods of education are in vogue such as storytelling, teaching, discussion, training and research. Conventionally, it happens under the guidance of a learned person in a formal or informal setting, and the experience people acquire, has a formative effect on their thinking, feeling and behaviour.

The definitions indicate that education is essentially a service. The academic delivery at university is also considered as a service delivery process and the

The Leadership Mantle

BY DR. K N VISWANATHAM | JUN 26 2020

The pandemic-driven crisis has posed a challenge never confronted previously by today's leaders. So unique and peculiar is the problem that the fundamental assumptions of businesses are being transformed.

Executives operating amid the COVID-19 pandemic are experiencing disruptions in every aspect of their daily lives. The morbid fear of contracting a potentially lethal illness apart, they are causing a variety of concerns such as forced isolation, social distancing, economic hardship, an unsettled feeling, helplessness, and hopelessness. And the response to the COVID-19 led crisis by the organisations' leaders is a huge and delicate matter of concern. At such a crucial juncture, it becomes essential to explore the challenges before leaders and organisations and the quintessential positive leadership behaviours.

The Challenges

The pandemic-driven crisis has posed a challenge never confronted previously by today's leaders. So unique and peculiar is the problem that the fundamental assumptions of businesses are being transformed since their very existence is under threat. It is therefore natural for leaders and managers to panic in such a situation. However, they need to distinguish between facts and opinions, and thereafter, shift their focus on facts alone to successfully navigate the COVID-19 times. Leaders need to be highly calibrated in their responses and identify key vulnerabilities and pressure points keeping the organisation's survival in focus. Leaders focusing on organisational growth has now become an old paradigm. The missed leadership lesson is the setting up of a crisis response/management team in organisations. In-depth networking, gaining greater employer and consumer loyalty, and demonstrating trust among all the stakeholders are essential leadership competencies during this crisis.

TOP

They must hope for the best and prepare for the worst. Pessimism is counter-productive, and therefore, it is essential to deliberately inculcate an optimistic outlook. A heightened level of preparedness to accept the fact that businesses will not be as usual and will remain otherwise needs to be cultivated. They must look at this situation of crisis as a test of leadership and organisations must adopt newer technology and processes.

1 | INTRODUCTION

Does the inordinately high level of finance cause a decline in economic growth? Does the positive effect of finance on economic growth vanish as the financial thresholds are surpassed? Is there an "optimal" level of financial development that is more vital in accelerating growth? These have been the more often asked important questions in the finance–growth nexus debate.

As the financial development indicators in Euro area countries are growing at astonishingly high levels, there is a need being felt among the researchers and policymakers to understand the effects of the upsurge of financial development on economic growth. The macroeconomic data reveal that while the domestic credit in Spain has more than doubled from 74% to 171% of GDP over the last three decades, economic growth has gone into a negative trajectory from 1.77% to −1.23%. The domestic credit in Portugal has more than doubled from 73% to 169% of GDP, while the economic growth has plummeted from −0.17% to −1.36%. Similarly, domestic credit grew from 47% to 117% of GDP in Italy, and the economic growth slumped from 1.17% to −1.93%. Chong, Mody, and Sandoval (2017) observe that a negative association between bank credit and economic growth has emerged stronger after 1990 and was exceptionally prominent in the Eurozone, consistent with the view that an overgrown financial sector wanes economic growth potential. This leads us to ask: Is there a non-monotonic relationship between higher financial development and economic growth as growing finance is linked with less growth? However, we do not find a comprehensive study that explores the finance–growth nexus in the Euro area. Therefore, this paper investigates the presence of thresholds in Euro area countries beyond which the financial development changes in magnitude.

The global financial crisis has, indeed, necessitated a re-examination of the role and benefits of financial development, predominantly from the perspective of the upsurge of complex financial instruments. The sophisticated contemporary finance has intensified the gravity and frequency of crises while producing not enough gains to the broader economy. Financial innovation and liberalisation, in this notion, has in fact favoured a few substantially but hurt many. In this context, Rodrik (2008)

Email: vighneswar@ibsindia.org

Abstract

This study explores the finance and economic growth nexus in G-7 economies as these countries experience significantly higher levels of financial development. Using a balanced panel of 31 years from 1983 to 2013, we provide new evidence on the finance–growth relationship. We show the presence of nonlinearity as there is an inverted U-shaped relationship between finance and growth in the long run. Estimating the thresholds in the finance–growth nexus, we notice that there exists a threshold effect of finance at 109% of Gross Domestic Product (GDP). We observe that exceeding the threshold would hinder the countries instead of furthering economic growth as too much finance is harmful. Based on the panel Granger causality test results, we claim that financial development should be associated with optimal growth performance. Our findings for the G-7 economies offer some useful policy inferences to the emerging and developing economies in designing their financial development strategies.

The relationship between trading volume and exchange rate volatility: linear or nonlinear?

Satish Kumar
Department of Finance, Indian Institute of Management, Amritsar, India

Received 26 February 2018
Revised 17 April 2018
Accepted 4 May 2018

Abstract

Purpose – The purpose of this paper is to examine the linear and nonlinear relations between returns volatility and trading volume for the Indian currency futures market.

Design/methodology/approach – To examine the contemporaneous relation between returns volatility and volume, the author uses the generalized method of moment estimator. For the linear causal relation, the author makes use of Granger (1969) bivariate vector autoregression model. The author tests for nonlinear Granger causality between returns volatility and trading volume based on a modified version of the Baek and Brock (1992) nonparametric technique developed by Hiemstra and Jones (1994).

Findings – The results indicate a negative contemporaneous relation between returns volatility and trading volume; therefore, the mixture of distribution hypothesis is not supported. The results of both linear and nonlinear Granger causality between futures returns volatility and trading volume indicate a significant bidirectional relation between the two variables lending support to the sequential arrival of information hypothesis. The results are robust to divergence of opinions as proxied by open interest.

Practical implications – The findings of this paper are important for the participants in the market and regulators. The participants in the market require alternatives to diversify their risk. The significant causal relation between returns volatility and trading volume implies that trading volume helps predict the futures prices and should lead to creation of more reliable hedging strategies for investment purposes. Furthermore, it may interest the regulators who need to decide upon the appropriateness of their policies in the currency futures market.

Originality/value – To the best of the author's knowledge, there is no study that investigates the forecast ability of trading volume to futures returns volatility in an emerging currency futures market. Given that currency futures market is one of the largest markets in the world, and Indian rupee has seen wide fluctuations in the recent years, it seems exciting to explore the price–volume relation in the Indian currency futures market.

Keywords Volatility, Exchange rate, Volume, Nonlinear

Paper type Research paper

1. Introduction

The relationship between exchange rate volatility and trading volume has received considerable attention recently (see e.g. Melvin and Yin, 2000; Chang, 2005; Bauwens *et al.*, 2005; Mougoué and Aggarwal, 2011). Under the fixed exchange rates regime, many of the fundamental variables such as interest rates differentials, relative money supplies and balance of payments were the primary determinants of exchange rates' movements (Mougoué and Aggarwal, 2011). However, none of these fundamentals are able to explain the increased variability in the exchange rates in floating periods at least in the short or medium run (Frankel and Rose, 1994). Therefore, to account for the lack of explanations, other alternative models are required which would be successful in modeling changes in exchange rates. One such potential area of research is the market microstructure models where trading volume, among other variables, better explains the movements in exchange rates (Lyons, 2001).

Higher volatility of returns is another persistent puzzle documented in the exchange rate markets. We provide a pioneer study on the relation between trading volume and returns volatility for an emerging Indian currency market. Specifically, we investigate which of the two major hypotheses, the mixture of distributions hypothesis (MDH) or the sequential

Managing the Work-Family Conflict among the employees of IT Companies

NIRAJ KISHORE CHIMOTE

INTRODUCTION

Constructs and Variables: The study deals with the following constructs which are discussed further in Literature review:

Work-Family Conflict (WFC): When expectations and demands from work and family are incompatible, they result in a form of inter-domain conflict called as work-family conflict (WFC). It includes transfer of stress at work to one's personal life, inability to spend quality time with family/friends and giving up attending functions when they are in conflict with important job related functions. The proposed sub-variables in this category that may probably create this conflict are multiple commitments of employees like commitment to friends, partner and children to devote quality time and provide happiness to them,emphasis of an organization on maintaining good relationships among employees,the extent of perceived schedule flexibility in the number of working hours, mental and physical health, support from the supervisor, mentoring relationships,self presentation,creating opportunities,marital status,work-status of spouse,presence of children and dependents,employee welfacre services like referral services, health program, exercise facilities and equal access to promotion.

LITERATURE REVIEW

Work-family conflict: Multiple definitions of Work-family conflict have been provided by prominent authors of various countries to highlight the imbalance caused by the employees in their work and life. Work-family conflict is a form of inter-role conflict in which the role pressures from the work and family domains are mutually incompatible in some respect.In the work domain, the person decides which career choices to use to decrease the time and uncertainty for the attainment of career objectives. In the non-work domain, the person decides the amount of time, effort, attention to devote to personal, family and social roles (Greenhaus & Beutell, 1985).

Image Substance Extraction using Data Mining Clustering Method

D.Saravanan

Abstract. ***Dater retrieval is one of the key challenging factor for today. Because of increasing the volume of data sets every year due to various factors. Information extraction in image data sets are too multifaceted compare with normal text data recovery. Image data set consist of different attributes those attribute sets are normalized before it extract from the stored data base. This required additional burden to the user who wish to extract any information from this data sets. This key challenges invite more researchers in the field of image data mining. Today many of the data sets in the form of image it gives more accurate result and more outputs. For extracting any image data image attributes are properly trained for better result. The proposed work based on grouping the data sets using image attributes. The entire process of this work divided into two major separate operations. Experiments dons against various data sets, and outputs verified proposed work gives more accurate results than the existing techniques.***

Key words: ***Image clustering, image histogram, Image attribute selection, Threshold values, Doming attribute selection and image content mining.***

I. INTRODUCTION

Increasing the demand of data sets extracting the correct data are more challenging today. Many research contributing an enormous effort for extracting the needed information from this huge data set. Extracting the hypermedia data are more challenging factors than normal text extraction because of the hypermedia data sets nature. Today image data sets are used for various application domains such as in medical patient test analysis, pattern matching, diagnosing, categorization and more. In law and order identify the previous record matching information especially in psycho type criminals, analysis the given data. Climate analysis, risk analysis and education and more. For all the above domain the image data sets plays very vital role [1]. From the above example information's are collected over period of time, and huge image attributes are used to analysis and stored the data based on the image properties. This data sets helps the user bring the new knowledge based on the analysis [2]. Because of the increasing in demand today most of the research work devoted in this domain.

This image data sets satisfies the user query with greater accuracy. For performing this operations video data mining play major role in knowledge extraction process.

This require more additional domain knowledge because of the nature of the data sets. Like other searching user can specify the query, the corresponding information are retrieved and present to the user. But image processing required both training and storing phase. For extracting and storing any image data sets requires some additional knowledge it helps to brings the needed information more accurate and efficiently. For making this operation more automated way more knowledge skills are required for the users [3]. Existing may techniques and procedure works well for image data sets. But increasing of the technology today creating and storing of this data sets are easier for many users. From this huge respiratory extract the need content are really a challenging factor for the researchers. This new technology helps the users to extract the need content used in many application domain such as medical, education, training, security and more [4]. Any image extraction process done the following steps of operations. 1. Apprehend the input data sets- It helps the researchers and the users what type of data sets are there, what all are the attributes are used to define, store, extract this data sets for knowledge extraction. 2. Categorize the input data sets – This one of the most important steps for image extraction , image contents are stored based on any of the image attributes .This attributes not only used to categorize the data sets it also helps for retrieve the particular content. 3. Knowledge extraction- This step done either content based extraction or properties based extraction. In both technique image attribute sets help to extract the relevant information from the stored sets. 4. Knowledge representation – This step helps to present the extracted knowledge to the end user in terms of any visualizing technique. [5]. In most the existing image based technique works based on the image content based methods here any of the image information are consider for extraction process. The proposed technique image attribute are consider it helps to bring the more accurate result and more number of similar output also generated though the proposed technique. In comparison normally done based on the user input query but the proposed technique information extraction done both user side i.e. training the input data sets, due to extraction done effectively. The second phased in storage side here also contents were trained and stored for beings the better result [6]. Proposed method works separately attributes properties are treated separately for both user side and storage side. Based all this assumption the proposed technique categorized into structure conversion finding the repetition, grouping the relevant frames, user side training, storage side training, knowledge query, and knowledge extraction. Performing the structure conversation the motion operations are converted to static operation then image properties helps to segregate the structured information [7].

21 December 2016
24 June 2017
Accepted 17 August 2017

Abstract

Purpose – Muslim's hope that the holy month of Ramadan will create something more valuable for them. Through fasting and good actions, they can get rewarded twice than they normally can achieve. With this motivation, the purpose of this paper is to investigate the holy month of Ramadan effect on the returns and volatility of the Shariah index in India.

Design/methodology/approach – Using the ordinary least square methods, this paper examines the impact of Ramadan effect on the returns of the Shariah index in India. This paper further investigates the impact of the holy month of Ramadan effect on the volatility of the Shariah index by applying GARCH-modified models. This paper categorizes the Ramadan days into three parts, namely God's Mercy, God's Forgiveness and Emancipation from hellfire to examine the relationship between the Ramadan effect and the returns and volatility of the Shariah index in India.

Findings – The results show that the returns during the month of Ramadan as a whole are statistically significant. The results further motivate that its last ten days have high influences than other days over the period. Finally, the study examines the Ramadan effect on volatility by applying GARCH modified models and finds an evidence of Ramadan effect during the first ten days of Ramadan month.

Originality/value – The positive impact of Ramadan increases on the days associated with higher worship intensity. The study provides an important information to the ethical investors to invest in the Shariah stocks during Ramadan days. This information is very useful for the investors to get an abnormal return during the Ramadan days.

1. Introduction

Religion is a central force in the lives of people. It affects their preferences, decision-making, and mood. The mood and emotions play an important role in investor behavior. Wright and Bower (1992) state that a positive mood state can make investors more optimistic and willing to undertake riskier investment decisions. Similarly, Ramadan is the most precious month of the Islamic calendar (Hijri) and it is obligatory for the Muslims to fast in the month of Ramadan. It is the ninth month of the Muslim Hijri calendar during which the Quran was revealed to the Prophet Mohamad, observed by both Sunni and Shia Muslims. The month of Ramadan [is that] in which was revealed the Quran, a guidance for the people and clear proofs of guidance and criterion. Therefore, whoever sights [the new moon of] the month, let him fast it; and whoever is ill or on a journey – then an equal number of other days. Allah intends for you ease and does not intend for you hardship and [wants] for you to complete the period and to glorify Allah for that [to] which he has guided you, and perhaps you will be grateful. (Source: Sahih International, Al-Quran, 2:185). It is an important month in the

EXIM Bank's Rampal Project Financing Dilemma

"It seems unlikely that a coal-fired power plant can be constructed at this location (Rampal) without construction itself constituting a high risk of severe environmental damage, even if extensive new measures are implemented."

— Council on Ethics,
The Government Pension Fund Global[1]

This case was prepared by Professor D. Satish of ICFAI Business School (IBS), Hyderabad, The ICFAI Foundation for Higher education (IFHE), India, as a basis for classroom discussion rather than to illustrate either effective or ineffective handling of an administrative or business situation.

It was a warm summer afternoon in 2016 and Yaduvendra Mathur (Mathur), Chairman and Managing Director, Export Import Bank of India (EXIM Bank), was gazing out of the window of his 8th floor office in South Mumbai, India's Central Business District and financial hub, deep in thought. He had just received an open letter from 70 NGOs located in 29 countries including BankTrack[2], Greenpeace International[3], Rainforest Action Network[4], and civil society groups from India and Bangladesh calling on him not to finance the construction of the Rampal Coal-based Thermal Power Plant (Rampal Plant) in Bangladesh to save the Sundarbans, the world's largest single block of mangrove forest[5].

EXIM Bank intended to provide US$1.62 bn as debt financing for the construction of the Rampal Plant and had backed a bid by Bharat Heavy Electrical Limited (BHEL)[6] the supply of equipment to the plant. It was in the process of providing the entire debt portion of the capital for the project. Mathur thought back on the agreement entered into by EXIM Bank to sponsor the Rampal project some time ago and the growing agitation against the plant by environmental and human rights activists and organizations since then.

India

ABSTRACT

This paper investigates the performance of Shariah and conventional stock portfolios in India during the period 2001–2017 by using asset pricing models. We first examine the influence of Shariah investment principles on the stock returns' cross-section. Then we assess the overall risk of Shariah and conventional portfolios, focusing also on financial crises. We provide evidence of a positive Shariah effect on stock returns in India. Therefore, Shariah stocks offer higher returns than non-Shariah stocks. We also find that Shariah portfolios have lower risk than unconstrained conventional ones. Overall our results reveal that both portfolios have similar performance, but the Shariah portfolio has a lower level of risk. Finally, the results clearly indicate that the volatility of the Shariah portfolio is lower during the crisis period.

1. Introduction

Gradual growth in the savings and abundance of people have brought about an expanded interest for new financial and non-financial instruments in the world. In this context, Islamic financial instruments are one of the newest financial innovation in the global capital markets. Islamic finance differs from the conventional financial system. Firstly, payment and receipt of a fixed rate of return or interest are prohibited in the Islamic finance framework. Secondly, an investment in unethical business such as alcohol producers, pork, pornography, and tobacco is prohibited. Finally, the investors are not permitted to game the gambling and speculations in the markets. The Islamic finance has been growing a tremendous and innovative way during the last two decades (IFSB, 2017). As a result, the demand for Islamic financial instruments has been increasing in the international markets. Many individual and institutional investors try to invest in stocks that are consistent with a moral guideline (Al-Khazali, Lean, & Samet, 2014). The investment in companies that are compliant with religious ethics is consistent with socially responsible and ethical investment, where investors select their stocks based on their religious beliefs.

The need for Shariah instruments by a developing worldwide Islamic population has prompted a huge interest in Shariah products (Merdad, Hassan, & Hippler, 2015). As a result, Islamic banking, Shariah stocks, Islamic mutual funds, Shariah ETFs, Shariah indices, Islamic Insurance (*takaful*), Islamic bonds (*sukuk*), and Islamic microfinance have been introduced in the financial market. Therefore, ethical, and socially responsible investors (Renneboog, Ter Horst, & Zhang, 2008) have the chance to take part in the distinctive capital and money markets with their identity, beliefs, values, and morals.

Despite its popularity, the academic research on Shariah compliant portfolios and Islamic financial instruments has slowly developed during over the last decade.

There are two conflicting hypothesis regarding the performance of Shariah portfolios. On the one hand, Islamic investments could

Given the rapid curriculum reforms and pedagogical innovations that have taken place recently in the Indian higher education system and the repeated concerned raised over low employability levels among Indian youth, the present study aims to measure the effect of student leadership dimensions on students' academic performance and perceived employability. To achieve this objective, a scale development exercise was carried out by collecting data from 153 students enrolled in leadership course. A longitudinal approach with a gap of two months was followed to obtain six self- reported and four observed dimensions of student leadership at time 1 and time 2 respectively. Focus group interviews were conducted for item generation followed by factor analysis to explore student leadership dimensions. Finally, multiple regression analysis was conducted to test the study hypotheses. The results revealed that student leadership dimensions were positively related to academic performance and perceived employability of higher education students in India. This study, apparently, is one of the first in the Asian context to explore the student leadership dimensions and measure its effect on students' objective and subjective outcomes i.e. GPA scores and perceived employability respectively.

Investor attention/sentiment
Quantile regression

ABSTRACT

This study investigates whether the investor attention measured by the Google Search Volume Index (GSVI) is effective in forecasting stock returns. The evolving literature on investor attention suggests that higher GSVI can predict higher returns for the first one or two weeks, but with a subsequent price reversal. We use a more recent dataset that covers S&P BSE 500 companies listed on the Indian stock exchange for 2012–2017 and employ the quantile regression approach because it alleviates the statistical problems arising from biased distribution data. The results suggest that a higher GSVI predicts positive and significant returns in the subsequent first and second weeks. Higher quantiles of GSVI experience higher excess returns. The panel cointegration test results support the findings regarding the cointegration of the GSVI and stock returns. Our empirical evidence shows that our model is robust when using a trading strategy based on the Fama-French four-factor model. Thus, the model with GSVI acts as a better predictor of both the direction and magnitude of the excess returns than the model without GSVI.

1. Introduction

Conventional asset-pricing models are founded on the assumption that market prices reflect the available information (Fama, 1976). Extant literature in this domain argues that stock prices are driven by new information and therefore follow a random path, as the new information appears randomly (Fama, 1965). On the other hand, in the real world, investors have access to limited information, as investor attention is a scarce cognitive activity (Kahneman, 1973). Investors' attention is more often associated with the determination of stock prices and liquidity (Merton, 1987).

In this study, we examine the investor attention effect of Google search intensity for an emerging economy equity market. We have quantified how the Google Search Volume Index (GSVI) can predict future stock returns. Moreover, our study increases our understanding of how the investors' online search intensity can generate useful information for investors to predict stock returns using GSVI.

Researchers increasingly focused on the impact of investor sentiment in the search for new information (Baker and Wurgler, 2006). Some authors, such as Tetlock (2007) rely on news articles. Bollen et al. (2011) use Twitter and Moat et al. (2013) rely on Wikipedia to ascertain investor sentiment. More recently, Da et al. (2011), in their seminal paper on investor attention through

Non-monotonicity

ABSTRACT

This study investigates the relationship between finance and economic growth in advanced economies as these countries experience significantly higher levels of financial development. Using a fully balanced panel of 31 years from 1983 to 2013 for 24 economies, we provide new evidence on the finance-growth relationship. We evidence the presence of nonlinearity as there is an inverted U-shaped relationship between finance and growth in the long run. The results show that there exists a threshold effect of the finance-growth relationship estimated at 142 percent of GDP. We find that surpassing the threshold would cost the countries instead of furthering economic growth as too much finance is harmful. Based on the panel Granger causality test results, we argue that financial development should be associated with optimal growth performance. Our findings for the advanced economies provide useful inferences to the emerging and developing economies in designing their financial development strategies.

1. Introduction

Do countries with high levels of financial development tend to grow slowly? This has become an important policy question in recent times. As the current financial development indicators in advanced economies around the world are rising at startlingly high levels, there is an emergent need being felt among policymakers, central banks, and international policy organizations to understand the effects of the frenzied rise of financial development on economic growth. While the domestic credit by the financial sector in the US has doubled from 96 to 192 percent of GDP over the last three decades, economic growth has halved from 4.64 to 2.22 percent. While the domestic credit in the UK has quadrupled from 44 to 184 percent of GDP, the economic growth has dwindled from 4.2 to 1.73 percent. Similarly, as against the growth of domestic credit from 209 to 367 percent of GDP in Japan, economic growth has nosedived from 3.06 to 1.61 percent. This leads us to the question – Is there a non-monotonic relationship between economic growth and the size of the financial sector at high levels of financial depth, as more finance is associated with less growth? This paper seeks to investigate the presence of common or country-specific thresholds beyond which the financial development changes in magnitude.

Undoubtedly, the recent global financial crisis has compelled a thorough reassessment of the role and benefits of financial development and innovation, particularly in the context of the explosion of complex instruments. Some experts argue that this sophisticated modern finance has amplified the severity and frequency of crises while providing little benefit to the broader economy. From a societal perspective, it has brought limited gains, but many costs. Financial innovation, in this view, has indeed favored a few handsomely but hurt many. Is there evidence that financial innovation has made our lives measurably and unambiguously better (Rodrik, 2008)? And hence, Wolf (2009) argued that there is something wrong with a situation in which, "instead of being a servant, finance had become the economy's master." Many advanced economies despite having high levels of financial development continue to face the growing

Pavana Jyothi[1]
Jayasree Mangalagiri[1]

Abstract

The purpose of this article is to examine the impact of women directors on firm performance of Indian companies and to check the impact after controlling their firm-specific and corporate governance variables. Further, the study explores the impact of women directors on firm performance of group firms and standalone firms. Regression models used in the study reveal that women directors create a positive and significant impact on firm performance as measured by return on assets (ROA) and Tobin's *Q*. Further, the study found that the relationship becomes stronger if a firm belongs to the business group. This article adds to the existing literature on gender diversity at the board level, by analysing the impact of women directors on firm performance in the Indian context. This study is the first to examine the aspect of gender diversity in the Indian context.

Key Words

Women Directors, Firm Performance, Gender Diversity, ROA, Tobin's *Q*

Introduction

The corporate world is experiencing a change in the regulatory norms related to the gender diversity at the board level. The regulations of Norway, Spain, Iceland and France require that the board of directors of publicly traded firms are to be comprised at least 40 per cent of women (Bøhren & Staubo, 2014). During 2006 and 2007, Canada and Israel governments mandated 50 per cent of gender quota at the board level for state-owned enterprises (SOEs) (Terjesen & Singh, 2008). During 2010 and 2011, Kenya, Italy and Belgium made it compulsory for all SOEs to have at least 33 per cent of female representation on their boards (Terjesen, Aguilera, & Lorenz, 2015). Further, between 2008 and 2012, Australia, Denmark, Germany, Malaysia, the Netherlands, Nigeria, Poland and South Africa made recommendations in their corporate governance codes to have a gender quota at the board level (Terjesen et al., 2015). In India also, the Securities and Exchange Board of India (SEBI) has made it mandatory to have at least one woman director on the board of all the listed firms (Sikand, Dhami, & Batra, 2013). However, this change in the corporate laws related to the mandatory appointment of a woman director as a board member raises an important question. Would this mandatory appointment of at least one woman director at the board level really improve the firm performance? The existing literature on the appointment of women directors and their contribution to the financial performance of the firm has been extensively examined in the Western and developed countries. In Spain, the impact of the presence of women directors on firm performance was positive (Campbell & Mínguez-Vera, 2008). A similar observation was found in the US context (Dezső & Ross, 2012). However, Adams and Ferreira (2009) pointed out a negative relationship between gender diversity and firm performance return on assets (ROA) in the US context. The theoretical base for the relationship between women at the board level and firm performance can be established on the basis of two important theories, namely human capital theory and social identity theory. The human capital theory provides the economic perspective and argues that the value of an individual depends on the amount of skill, education and experience. Applying this to the gender-based research, skills, education and experience of women differs from that of men (Metz & Tharenou, 2001). This may result in the differential performance and may result in the

Social Media Addiction, Culture Code and Mediation Effect of Mindfulness: A Structural Equation Modelling Access

Anuradha, Thangaraja Arumugam, N.Akbar Jan, A.K. Subramani

Abstract: This study has been initiated with a view to understand the social media addiction and its influence on culture codes a mediation effect of mindfulness. The social media addiction would be a very common problem in the social and the organizational set up. The employees are getting distracted easily because of social media addiction. The organisations are taking much action to rectify this problem but end up with the talent lose because the employees are ready to quit the job when they are not allowed to use social media in the organisation. It has been an inevitable problem for the organisations so many techniques have been initiated in order to solve this problem. Many studies are concentrating on mindfulness which is a tool to remove the distractions and to be a focused employee in the organisation. The social media addiction many a times create a toxic culture among the employees. It needs a high attention to be cured. The employee relationship are highly under stake when they are social media addict. This study would attempt to understand the empirical evidence on this relationship by examining the association among addiction in social media and its effect on culture code and mediating role of mindfulness. This study also concentrates on the moderating role of gender on the proposed model.

Key words: Social Media addiction, Culture code, Mindfulness, SEM

INTRODUCTION

This study has been initiated with a view to understand social media addiction and its influence on culture codes as mediation effect of mindfulness. The social media addiction would be a very common problem in the social and the organizational set up. The employees are getting distracted easily because of social media addiction. The organisations are taking much action to rectify this problem but end up with the talent lose because the employees are ready to quit the job when they are not allowed to use social media in the organisation. It has been an inevitable problem for the organisations so many techniques have been initiated in order to solve this problem. Many studies are concentrating on mindfulness which is a tool to remove the distractions and to be a focused employee in the organisation. The social media addiction many a times create a toxic culture among the employees. It needs a high attention to be cured. The employee relationship are highly under stake when they are social media addict. This study would attempt to understand the empirical evidence on these relationship.

RESEARCH OBJECTIVE

To examine the association among addiction towards social media and its effect on culture code and mediating role of mindfulness. This study also concentrates on the moderating role of gender on the proposed model.

REVIEW OF LITERATURE

Cultural Codes

Interdependence amid levels and therefore the discernment of culture is habitually demonstrated via the usage of codes. The concept of 'Codes' maybe a confidential structure of behaviours, signs or words that are made to transfer messages that are circumstantially bound. Codes are often revealed at a perceptible level through rhetorical and plainspoken medium. Codes maybe the aftermath of the reactions of and exchange with varied cultural levels. This holds that what is noticed generally may not seem sensible to the outsider. Inventors and authors of codes constitute the insider group and codes are familiar only to them. These codes can be made use of as calligraphy by such groups for compactness or in allowing speedy communications. Codes may also be used to hide authentic messages and to conceal them from external forces. This applies not just to intelligence workers and masons but also for fulfilling research objectives as well.

Codes are made use of both voluntarily as well as involuntarily and they are hard to understand. Similar to a mysterious puzzle, it is indispensable to beguile the directive that will reveal the fundamental theme to make the crossword juxtaposed. Nonetheless the codes are split; we are left stumbling in a sphere of presumption, speculation and erroneous premise. This indicates our potential to impact metamorphosis via appraisal and other indistinguishable processes is consequentially diminished. We are in a peril of appearing on misinterpretation which indicates that our attempts to bring about differences are likely to be lead astray.

Codes subsist in gross cultures. Not just in cultures but in sub cultures as well. After all, they would materialize to be exceptionally supreme episode in a country like Europe (Both Eastern and Central) in the post-Communist epoch.

ABSTRACT

Unbiasedness and informational efficiency of futures markets under different market conditions is a claim that still remains unsettled in the theory of non-arbitrage and asset pricing and in empirics as well. This study investigates this claim using a novel causality-in-quantile model of Balcilar et al. (2016) for two energy commodities, crude oil and natural gas, and two precious metals, gold and silver. The model estimates causalities-in-mean and -variance between spot and futures market in a time varying context conditioning on the states of the markets represented by the quantiles of the conditional distribution of the dependent variable. The causality in return is asymmetric and unidirectional from futures to spot market for all commodities. That means the predictability of the futures market, due to its informational efficiency, is strong in the normal market and declines when the spot market enters into extreme bearish and bullish conditions. The causality-in-variance is bi-directional in the normal to bull markets except for natural gas where it is unidirectional from futures to spot only. It is a confirmation of the risk management and price discovery role of futures market. Lack of causality in the bear market entails some kind of disconnectedness between the spot and futures markets in a bad market where intervention is called for from the exchange and regulators to restore stability in the spot and futures market dynamics. Although economic uncertainty is found to have no impact on the causality-in-mean except gold; however, the causality-in -variance is influenced in the case of gold and crude. This is a kind of reaffirmation of the fact that under economic uncertainty, futures contracts are used for hedging under different market conditions. However, the causality between commodity spot and futures are resilient to exchange rate.

1. Introduction

Studies are enormous in the literature on commodity markets in general and price discovery and risk management dynamics between spot and futures market in particular. Mostly, causality and co-integration are studied between these two markets, using regression, linear and non-linear, and time-varying, frequency domain and wavelet models. The findings delivered from those studies could be classified into three categories. The first category includes studies which assume that the average causality and co-integration holds across time and frequency and in different market conditions. The second category of studies assumes that time-varying causality holds across frequency and market states. The studies in the third category assume frequency domain causality holds across time and market conditions. Thus, the literature on causality and co-integration between spot and futures market assumes that those phenomena hold in different states of both markets. The results will be spurious if changes in conditions of the markets over time and frequency are neglected.

One of the important inferences on the importance of the states of the markets that can be drawn from the prospect theory (1979) of Kahneman and Tversky and the reference dependent theory of consumer choice of Tversky and Kahneman (1991) is that the investors base their investments and trading decisions on the recent market performance (i.e. the states of the market at least when those markets are in trend, that is, when the markets are in bullish and bearish states). Alizadeh and Tamvakis (2016) supplement this by uncovering the market dependent (i.e., conditions of the market) impact of trading activity on energy futures market returns. Rezitis and Sassi (2013) emphasise the importance of market levels in their study of futures and spot market dynamics.

We have estimated the time-varying causality between the spot and futures markets of major energy commodities and precious

Abstract

The debate on the impact of corporate social responsibility (CSR) on firm value is still unsettled. Empirically, research designs cannot unequivocally prove that CSR affects firm value because CSR and firm value could be predetermined. Using a natural experiment, we prove that CSR positively affects firm value. In this study, we use the mandatory CSR spending regulation implemented by India in 2015, as a natural setting. We compare the changes in the firm value during the pre- and postregulation period. Our results show that market value increases for firms that were forced to spend on CSR during postregulation period.

1 | INTRODUCTION

Theories diverge on the impact of corporate social responsibility (CSR) on firm value. Stakeholder theory, advanced by Freeman (1984), addresses morals and values in corporate management and argues that corporations should attempt to increase value for various parties such as shareholders, employees, suppliers, government agencies, environment, and so on. Collectively, we can address these parties as society. A corporation that increases value for all or many of the social parties should also witness a positive change in the market value (Navarro, 1988). As predicted by the stakeholder theory, various researchers report a positive association between the CSR and firm value (Dhaliwal, Li, Tsang, & Yang, 2011; Margolis, Elfenbein, & Walsh, 2009). Literature diverges about the channels that deliver a positive relation between CSR and firm value. A socially responsible firm should enjoy positive consumer perception (Ellen, Mohr, & Webb, 2000; Sen & Bhattacharya,

An empirical analysis of stock market interdependence and volatility spillover in the stock markets of Africa and Middle East region

Ajaya Kumar Panda
Department of Accounting and Finance, National Institute of Industrial Engineering, Mumbai, India
Swagatika Nanda
Department of Economics, Vidyalankar School of Information Technology, Mumbai, India, and
Rashmi Ranjan Paital
Department of Economics, Faculty of Management, IBS Hyderabad, Hyderabad, India

Abstract

Purpose – The purpose of this paper is to examine the short-term and long-term interdependence among the stock markets of Africa and Middle East region. It also attempts to analyze the pattern of volatility spillover among the regional stock markets.

Design/methodology/approach – The study has used Granger causality test, variance decomposition test of vector auto-regression (VAR) model, vector error correction model (VECM), multivariate generalized conditional heteroskedasticity (MGARCH-BEKK) models and Johansen and Juselius multivariate cointegration techniques.

Findings – The study finds that the interlinkages of the stock markets are not uniform across all the countries of the region. The stock market of Israel, South Africa and Jordan are found to be highly connected stock market of the region followed by Egypt and Botswana. The study also finds significant spillover of lagged standardized volatility across the stock markets of the region. But the magnitude of the response of volatility spillover and its persistence is very minimum. However, the stock markets are found to be co-integrated and expected to share long-run equilibrium relationships among each other.

Research limitations/implications – The study has the scope to be extended to capture the time-varying integration of market returns with transmission of monetary policy and exchange rate changes within the region. The results obtained from this study may assist the firm managers and international investors to understand the key drivers of market connectedness.

Originality/value – Empirically investigating the pattern of stock market connectedness in Africa and Middle East region with advanced methodology over a long study period is the originality of this study.

Keywords Co-integration, Stock market interdependence, Volatility spillover, VAR, VECM

1. Introduction

African and middle-eastern countries have undergone many economic reforms, and their financial systems are as diverse as their economy (see Naceur *et al.*, 2007; Ncube, 2015). Allen *et al.* (2011) found intense challenges African stock markets are facing in terms of listing and measuring its depth. However, these capital markets experience enormous underutilized options and provide attractive opportunities to achieve portfolio diversification. Measuring the degree of interdependencies, Collins and Biekpe (2003) found a significant impact of correlations and interdependencies among African markets following the Asian crisis in 1997

Participatory HRM and firm performance

Unlocking the box through organizational climate and employee outcomes

Neha Gahlawat
Department of Human Resources, ICFAI Business School (IBS), Hyderabad, ICFAI Foundation of Higher Education (IFHE) University, Hyderabad, India, and
Subhash C. Kundu
Haryana School of Business, Guru Jambheshwar University of Science and Technology, Hisar, India

Abstract

Purpose – The purpose of this paper is to examine the relationship between participatory HRM and firm performance through a series of mediators.

Design/methodology/approach – Primary data were collected from 569 respondents belonging to 207 organizations operating in India. Structural equation modeling and bootstrapping via PROCESS were used to analyze the hypothesized relationships between participatory HRM and firm performance.

Findings – The study has highlighted that participatory HRM in the form of self-managed teams, flexible work arrangements and empowerment results in better organizational climate, heightened affective commitment, reduced intention to leave and enhanced firm performance. Furthermore, it has been established that organizational climate, affective commitment and intention to leave serially mediate the relationship between participatory HRM and firm performance.

Practical implications – The study gives strong indications that adopting bundle of participatory HRM practices is beneficial for generating positive organizational climate, enhanced employee attitudes and superior firm performance.

Originality/value – By establishing serial mediation through organizational climate, affective commitment and employees' intention to leave, this study brings new insights into the interpretation of underlying mechanism existing between participatory HRM and firm performance, thus uniquely contributes to the HRM and OB literature.

Keywords India, Firm performance, Affective commitment, Intention to leave, Organizational climate, Participatory HRM

Introduction

Over the last two decades, business environment in India has accelerated at a very fast pace both economically and socially, along with the dramatic improvements in HR practices in organizations (Bhatnagar and Sharma, 2005; Cappelli *et al.*, 2010). Constant increase in the number of western organizations having business relations or established branches in India has transformed HRM function to a considerable extent both in theory and the practice (Gomes *et al.*, 2015). The HRM function in India has evolved from traditional "personnel management" perspective to a more focused and holistic approach "strategic HRM" (Budhwar and Varma, 2010). Organizations have now realized that in order to survive and compete in modern knowledge-based developing economy, it is vital to attain and retain the world class human resource competencies through developments in HR practices essential for sustaining such resources (Khandekar and Sharma, 2005; Moideenkutty *et al.*, 2011). With the use of progressive HRM systems, HR managers put emphasis on developing the human capital in organizations while ensuring that the right environment is created for employees to reap the benefits of these participation-related practices (Bardi *et al.*, 2008;

Workplace ostracism and employee creativity: role of defensive silence and psychological empowerment

Kalaa Chenji and Raghavendra Sode

Kalaa Chenji and Raghavendra Sode are both based at the Department of Human Resources, ICFAI Foundation for Higher Education, Hyderabad, India.

Abstract

Purpose – *The purpose of this paper is to study the impact of workplace ostracism and defensive silence on employee behavior within an organization. The paper attempts to study the impact of workplace ostracism on employee creativity. The paper also aims to train the employees to withstand the negative effects of workplace ostracism.*

Design/methodology/approach – *This is an empirical study. Primary data were collected from 454 employees working in the service sector in India. The data were collected from an IT sector unit, an insurance company and a bank. Utmost care was taken in order to select organizations where there was frequent interaction between the supervisors and co-workers in order to measure the relevant variables. Mean, standard deviation and correlation were used for descriptive studies, and structural equation modeling was used to measure several dimensions of the hypothesized model. A bootstrap method is used to measure the impact of workplace ostracism on employee creativity.*

Findings – *The study found that defensive silence mediates between workplace ostracism and employee creativity and psychological empowerment moderates between workplace ostracism and employee creativity. Workplace ostracism negatively effects employee creativity and positively influences defensive silence. The study reveals the moderating effect of psychological empowerment on workplace ostracism and employee creativity such that low levels of psychological empowerment negatively influences employee creativity and high level of psychological empowerment has a positive effect on employee creativity.*

Practical implications – *Workplace ostracism is proved to be a stressor. The study contributes to the literature on stressor–strain relationship workplace ostracism and employee creativity. Psychological empowerment has indirect influence on workplace ostracism and employee creativity. Organizations may train employees to combat the negative effects of workplace ostracism through concepts like psychological empowerment.*

Originality/value – *The study is one of its kind as it aimed to measure the impact of workplace ostracism on employee creativity. Though there are several studies on workplace ostracism, its influence on employee creativity perhaps is covered by the present study.*

Keywords *Psychological empowerment, Defensive silence, Employee creativity, Workplace ostracism*

Paper type *Research paper*

Introduction

Owing to the enormous amount of time spent by employees in the workplace, interpersonal relations, rapport and collegiality amongst them nurture the bond between each other and help in boosting their performance and productivity. The extent of inter-social relationship amongst the organizational members considerably influences their behavior and attitudes. Affirmative interactive relation with organizational members positively impacts job performance, well-being, job satisfaction and overall productivity (Farmer *et al.*, 2015). However, research in this area indicates universal existence of supervisor and co-worker ostracism acting as a hurdle in maintaining inter-personal relationship in the organizational setup. Several studies have reported workplace ostracism to negatively influence the social association among members of the organization (Chung, 2018).

Received 17 May 2019
Revised 17 May 2019
Accepted 6 June 2019

Ostracism is explained as the feeling of exclusion experienced by employees (Ferris *et al.*, 2008). Employees feel they are ignored and left out of the team and their presence does not make

Abstract

Purpose – In environments characterized by high cultural diversity, the ability to understand the cultural makeup of the workforce and the environment would equip business owners with knowledge required to innovate, take risks and proactively change their business offerings. Drawing on the upper echelons theory and action-characteristics model of entrepreneurship, the purpose of this paper is to test how competencies of small business owners, namely, cultural intelligence (CQ) and entrepreneurial orientation (EO) contribute to the performance of their firms.

Design/methodology/approach – Using a sample of 106 small and medium enterprises (SMEs) from the UAE, the data were collected through structured questionnaires and analyzed using partial least squares–structural equations modeling.

Findings – Results showed that CQ of the SME owner has a positive effect on firm performance (FP) through the mediating role of EO. Also, CQ of the SME owner was found to have a direct effect on FP, thus asserting its importance as a valuable competency that SME owners need to cultivate when operating in a multicultural environment.

Practical implications – Skills of the top managers greatly influence the choices and decisions they make, which in turn impact the effectiveness of their organizations. This study focuses on the role of managerial competencies that need to be cultivated among SME owners that would contribute to the growth of their firms.

Originality/value – This research studies the role of an individual's cross-cultural and entrepreneurial competencies that enable the organization to achieve higher performance.

Keywords Entrepreneurship, Culture (National)

Paper type Research paper

Introduction

Small and medium enterprises (SMEs) are viewed as the engine for economic growth and play a vital role in contributing to the nation's economy (Arshed *et al.*, 2014). They are a primary source of entrepreneurship, innovation and employment creation (Audretsch, 2004). The flexibility that SMEs have due to their size permits them to be more resilient during economic downturns and enables them to quickly adapt to the changing environment and ensure their sustenance (Rosenbusch *et al.*, 2011). However, SMEs often face challenges since they have limited access to resources unlike the large players in the industry. Difficulties in obtaining capital, limited access to new technologies and lack of trained

Macroeconomic significance of transaction costs in microfinance intermediation

Vighneswara Swamy
Department of Economics, IBS-Hyderabad, Hyderabad, India

Received 21 January 2018
Revised 27 April 2018
22 July 2018
6 September 2018
Accepted 5 October 2018

Abstract

Purpose – The purpose of this paper is to analyze the macroeconomic significance of transaction costs in microfinance intermediation and explain how the deposit mobilization and micro lending impact the microfinance transaction costs. It presents some empirical evidence as building blocks for the theory of financial intermediation that aims at strengthening the efficiency of financial intermediation in the context of preferential credit and or the microfinance sector.

Design/methodology/approach – The study uses the panel data consisting of different groups of banks in India (such as public sector banks, private banks and foreign banks) data across a period from March 1993 to March 2009 to estimate the panel VAR model to determine the determinants of transaction cost model in financial intermediation. The study also uses the panel Granger causality analysis to test the direction of causation to know the behavior of the operating expense of the banks in their financial intermediation process.

Findings – The study reveals that there is a positive direct relationship between operating expense and priority sector lending by banks. The findings show that the transaction costs act as a barrier for the banking firms in microfinance intermediation; and, the banks are able to manage the transaction costs of microfinance intermediation with an increase in overall deposit mobilization and increased non-microfinance lending. The study recommends that there is a need to upscale the functional efficiency of microfinance intermediaries.

Originality/value – This study offers to bridge the research gap and adds novel information to the literature on microfinance intermediation. It is the first empirical paper showing the macroeconomic significance of transaction costs in microfinance intermediation.

Keywords Growth, Banks, Microfinance, Transaction costs, Financial markets

Paper type Research paper

1. Introduction

Financial intermediation exerts a positive influence on financial development as an efficient finance leads to economic development. The financial intermediation theory argues that it is because of this significant role the financial intermediaries exist. Savings/investment process is integrated around financial intermediation, thus making the financial intermediaries as central to economic development and growth. In view of the huge socioeconomic importance of financial intermediaries, more particularly in rural finance, there is an increasing role of financial intermediaries much beyond the traditional viewpoint of information asymmetries and transaction costs (Swamy and Tulasimala, 2011). Of late, we are noticing a gradual decline in the growth of rural finance, especially in the microfinance sector, mostly due to the increasing transaction costs and sometimes due to the declining repayment levels.

The intermediation costs of microfinance services have been contested since microfinance institutions (MFIs) typically charge a much higher interest rate policy than conventional commercial banks or former credit programs (Armendàriz and Morduch, 2010; Dehem and Hudon, 2013). This debate has been reignited by the financial crisis and the rising overindebtedness in some countries, and more especially in South India.

Mostly, the high interest rates were due to the small size of the loan and the related high transaction costs (World Bank, 2007; Rosenberg *et al.*, 2009; Dehem and Hudon, 2013).

Investor attention using the Google search volume index – impact on stock returns

Vighneswara Swamy
Department of Economics, IBS-Hyderabad, Hyderabad, India, and
Munusamy Dharani
Department of Finance, IBS-Hyderabad, Hyderabad, India

Abstract

Purpose – The purpose of this paper is to investigate whether the investor attention using the Google search volume index (GSVI) can be used to forecast stock returns. The authors also find the answer to whether the "price pressure hypothesis" would hold true for the Indian stock market.

Design/methodology/approach – The authors employ a more recent fully balanced panel data for the period from July 2012 to Jun 2017 (260 weeks) of observations for companies of NIFTY 50 of the National Stock Exchange in the Indian stock market. The authors are motivated by Tetlock (2007) and Bijl *et al.* (2016) to employ regression approach of econometric estimation.

Findings – The authors find that high Google search volumes lead to positive returns. More precisely, the high Google search volumes predict positive and significant returns in the subsequent fourth and fifth weeks. The GSVI performs as an useful predictor of the direction as well as the magnitude of the excess returns. The higher quantiles of the GSVI have corresponding higher excess returns. The authors notice that the domestic investor searches are correlated with higher excess returns than the worldwide investor searches. The findings imply that the signals from the search volume data could be of help in the construction of profitable trading strategies.

Originality/value – To the best of the authors knowledge, no paper has examined the relationship between Google search intensity and stock-trading behavior in the Indian stock market. The authors use a more recent data for the period from 2012 to 2017 to investigate whether search query data on company names can be used to predict weekly stock returns for individual firms. This study complements the prior studies by investigating the relationship between search intensity and stock-trading behavior in the Indian stock market.

Keywords Stock returns, Predictability, Google searches

Paper type Research paper

1. Introduction

The traditional asset-pricing models are premised on the assumption that market prices reflect the available information (Fama, 1976). However, in the real world, investors have access to limited information, because the attention is a scarce cognitive activity (Kahneman, 1973). Investors' attention is mostly related to the determination of stock prices and liquidity (Merton, 1987). Previous research in this strand of literature observes that the stock prices are guided by new information and hence follow a random path as the new information occurs randomly (Fama, 1965).

In the search for new information, researchers have increasingly focused on the impact of investor sentiment (Baker and Wurgler, 2006). Some researchers have relied on available data from news articles (Tetlock, 2007), Twitter (Bollen *et al.*, 2011) and Wikipedia (Moat *et al.*, 2013). However, it is difficult to measure the degree of investors' attention. In their seminal paper Da *et al.* (2011) propose a novel and direct measure of investor attention using an aggregate search frequency in Google which we term as Google search volume index (GSVI). The recent literature in this domain provides support to the "price pressure hypothesis" or "attention theory" as it reveals that the Google search intensity provided by the Google Trends is positively related to stock returns and the trading volume (Bank *et al.*, 2011;

Elucidating investors rationality and behavioural biases in Indian stock market

Venkata Narasimha Chary Mushinada
Department of Finance and Accounting, ICFAI Business School, IFHE Hyderabad, India, and
Venkata Subrahmanya Sarma Veluri
Department of Commerce and Business Management, Kakatiya University, Warangal, India

Received 10 April 2018
Revised 3 August 2018
Accepted 18 August 2018

Abstract

Purpose – The purpose of this paper is to empirically test the relationship between investors' rationality and behavioural biases like self-attribution, overconfidence.
Design/methodology/approach – The study applies structural equation modelling to understand whether individual investors, besides being rational, are subjected to self-attribution bias and overconfidence bias.
Findings – The study shows the empirical evidence in the support of behavioural biases like self-attribution and overconfidence existing besides investors' rationality. Moreover, there is a statistically significant positive covariance found between self-attribution and overconfidence, implying that an increase/decrease in self-attribution results in the increase/decrease in overconfidence and vice versa. It is also observed that the personal characteristics of an investor such as gender, age, occupation, annual income and their trading experience have an impact on behavioural biases.
Research limitations/implications – The study focused on rational decision making, self-attribution and overconfidence biases using primary data. Further studies can be encouraged to test the existence of behavioural biases based on both market level and individual account data simultaneously.
Practical implications – Insights from the study suggest that the investors should perform a post-analysis of each investment, so that they become aware of past behavioural mistakes and stop continuing the same. This might help investors to minimise the negative impact of self-attribution and overconfidence on their expected utility.
Originality/value – To the best of the authors' knowledge, this is the first study to examine the relationship among investors' rationality, self-attribution and overconfidence in the Indian context using a comprehensive survey.

Keywords Structural equation modelling, Behavioural finance, Bounded rationality, Self-attribution bias, Overconfidence bias

1. Introduction

The decision makers generate various strategies and follow specific logical procedures to resolve problems according to the nature of problem, timing and decision environment. Rational decision theory asserts that an individual attempts to reach an optimum decision by categorising decision making into three types based on the level of rationality. First, pure rationality which allows decision makers to reach optimum decisions and achieve the highest efficiency out of unlimited time, resources and knowledge in order to make decisions. This type assumes the administration dichotomy, in which the former identifies goals for the latter to achieve (Gianakis, 2004). Second, the incremental type which is a less rational model in which goals are politically feasible and decisions are made by comparing several immediately available alternatives (Lindblom, 2005). Third, the bounded rationality type which is a mixture of the above two types that refers to the achievement of given goals subject to subjective constraints (Simon, 1982, 1991).

The bounded rationality framework asserts that individual investors are regarded as attempting to make rational decision but they often lack important information on the

Received 4 May 2017
Revised 31 October 2017
7 February 2018
Accepted 29 March 2018

Abstract

Purpose – This study aims to examine the adoption and efficacy level of progressive human resource management (HRM) practices in various organizations operating in India.

Design/methodology/approach – Primary data based on 615 respondents from 103 domestic firms and 116 foreign multinational corporations (MNCs) operating in India were gathered and analyzed using statistical techniques like *t*-test, confirmatory factor analysis and structural equation modeling.

Findings – The results reveal that the adoption of progressive HRM practices in form of self-managed teams, flexibility to work flexible hours, use of online mediums to invite applicants, selection of candidates using assessment center and integrity test, performance based incentives, flexible benefits, facility of e-learning and innovative management development programs is positively related to firm performance in Indian context. Using institutional and cultural perspective, the findings have also demonstrated that their exist differences in adoption of progressive HRM practices between foreign MNCs and domestic firms.

Practical implications – Domestic firms in India are needed to learn some important managerial lessons from the foreign MNCs, especially when their adoption of progressive practices results in more increase in firm performance. These are suggested to implement a broad range of innovative HR practices like MNCs to improve growth potential, instead of focusing on two or three practices.

Originality/value – By exploring the differences between domestic and foreign MNCs, this study has offered some key insights on the extent of adoption and operationalization of progressive HRM in current Indian business environment.

Keywords India, Firm performance, Domestic firms, Foreign MNCs, Progressive HRM

Paper type Research paper

Introduction

Since the triggering of liberalization and economic restructuring programs in 1990s, India has witnessed a remarkable growth (Som, 2008). With this outstanding progress, the issues pertaining to increased globalization, ever changing customer and investor demands, and heightened competition to generate innovative products and services have become the standard backdrop for the organizations operating in India (Budhwar, 2012). Organizations have now realized that to manage these issues, they have to constantly increase their performance through reduction in various costs, improvement in quality of products, and differentiation in their products and services. In the opinion of Subramaniam and Youndt

Abstract

Purpose – This paper aims to examine the influence of the work–family interface on both work engagement and the psychological capital (PsyCap) of the liquid workforce. Also, drawing from the literature on consumer behaviour, the second objective of this paper is to investigate the impact of work engagement and PsyCap on customer advocacy.

Design/methodology – A dyadic study was conducted, comprising 200 nurses and 200 patients from different healthcare service providers of India. Structural equation modelling was used to analyse the responses collected from nurses and the patients whom they served.

Findings – The results confirm that the home–work interface has a positive impact on work engagement and PsyCap. The findings also confirm a positive impact of PsyCap on customer advocacy, but the effect of work engagement on customer advocacy was not significant.

Research implications – This study confirms that to keep liquid workers engaged in their work and to enhance their personal PsyCap, an organisation should provide the opportunity to maintain a balance between work and home needs. The findings also confirm that personal psychological resources (PsyCap) facilitate prosocial helping behaviour, which keeps customers closer and maintains them as true representatives of the organisation.

Originality/value – The present study is one of only a few preliminary studies examining the predictors of work engagement of liquid workers. Also, an inter-disciplinary approach was taken to understand the link between employee-level variables (home–work interface, work engagement and PsyCap) and a customer-level variable (customer advocacy).

Keywords Quantitative, Work engagement, Psychological capital, Hospitals, Patients, Nurses, Customer advocacy, Liquid workforce, Home-work interface

Paper type Research paper

Introduction

In the healthcare sector, customers are not typical customers because they are patients who are suffering from diseases (Torpie, 2014). These customers are often ill, injured and in distress and can be vulnerable, confused and frightened. In addition, they are paying for the services, which has a huge impact on their health and well-being (Alrubaiee and Alkaa'ida, 2011; Torpie, 2014). Therefore, they need to experience the utmost care, trust and transparent information regarding the various services provided at these hospitals

Manish Gupta
Department of HR, IBS Hyderabad, a Constituent of IFHE, Deemed to be University, Hyderabad, India

Abstract

Purpose – The purpose of this paper is to examine the mediating role of work engagement between the relationship of perceived career support and work performance as well as between the relationship of career adaptability and work performance.

Design/methodology/approach – Data were collected form 606 i-generation liquid knowledge workers. They had completed their internship program in the industry for a period of at least one month. Regression analysis was carried out to test the hypothesized framework.

Findings – Most of the results indicated support for the hypotheses. Work engagement was found to be mediating the perceived career support and work performance relationship fully. However, work engagement was found to be mediating the career adaptability and work performance relationship only partially.

Research limitations/implications – Engaging liquid workers plays a crucial role in passing the positive effects of perceived career support and career adaptability to work performance.

Practical implications – The findings suggest that managers may take steps to enhance engagement levels of the employees so that it can help the interns high on perceived career support and career adaptability perform well at work.

Originality/value – To the best of the authors' knowledge, this study is unique that tests and finds the intervening role of work engagement between work performance and the two career-related constructs.

Keywords India, Work engagement, Quantitative, Work performance, Liquid knowledge workers, Career adaptability, Perceived career support

Paper type Research paper

Current academic and industry discourse acknowledges the need for engaging employees to enhance work performance. Work engagement is popularly defined as a psychological state composed of vigor, dedication and absorption (Schaufeli *et al.*, 2002). It is currently one of the most practiced themes in organizational science. The importance of work engagement is so great that companies invest almost three-quarters of a billion dollars to engage their employees every year (Graber, 2015). Though there are several studies that advance the understanding of what makes employees engaged in their work, scholars emphasize the need for additional research to examine the largely neglected relationships between career factors and work engagement (Morgan, 2017). In addition, the role of career adaptability and perceived career support are two career factors that help managers engage employees (Lee *et al.*, 2016).

Also termed as "high end human resource outsourcing", the increasing trend of human resource outsourcing of knowledge workers in India makes it important to examine the techniques that organizations are deploying to increase productivity (Singh, 2018). Recently,

Launch of Bajaj-V: Why and How

Surjit Kumar Kar

IBS Hyderabad
Email: surjitkar[at]gmail[dot]com

Abstract

Indian automaker Bajaj Auto Ltd. (BAL) unveiled its most glorified 150 cc commuter bike model 'Bajaj V' on 1st February 2016. It was probably for the first time an Indian automobile company was trying to experiment with an innovative brand concept by emotionally connecting the brand to history and patriotism. The model 'V' contained metal sourced from the scrapped INS Vikrant- India's 1st aircraft carrier known for its war time military legacy. 'V' was launched as a bike that someone could ride with pride. The case explores the strategic reason that made the company launch 'V', and the way the brand positioning was done.

Key words: *Branding, Role of advertising agency, Heritage Branding, Brand Positioning*

"This is, as our managing director Rajiv Bajaj pointed out, what we wanted to help stand out from what we have in the market. We were trying a lot of concepts, but nothing was working out. We kept trying our concepts[1] "

-Mushtaq Anis, Design Engineer of Model 'V', in 2016

"If Taj, Dhoni can be global Indians, so can the Vikrant."[2]

-Rajiv Bajaj, MD, Bajaj Auto Ltd, in 2016

"It was a marketing idea that got an artistic fold to it. We were working on a new brand, a new bike, which was to be strong, and stood tall and proud. So, there was perfect synergy between the two."[3]

-Sumeet Narang, Sr. VP-Marketing, Motorcycles, Bajaj Auto Ltd., in 2016

"The brave legacy of INS Vikrant will now remain alive in lakhs of Indian homes, in the form of V"[4]

-Bajaj Auto Ltd., in 2016

Achieving Student Satisfaction and Student Loyalty in Higher Education: A Focus on Service Value Dimensions

Rik Paul[a] and Sudeepta Pradhan[b]

[a]School of Management, BML Munjal University, Gurgaon, Haryana, India; [b]IFHE Hyderabad, IBS Hyderabad, Hyderabad, Telengana, India

ABSTRACT

Service value has received a great deal of attention in recent marketing literature because of its multidimensional nature and its ultimate impact on customer's satisfaction, behavioral loyalty, and ultimately, firm performance. The present study attempts to explore the value dimensions in higher educational services parlance and subsequently analyses the impact of these dimensions on student satisfaction and student loyalty. The results indicate functional value, customer intimacy, service quality, appurtenant value, image, and social value as the dimensions of service value. This study supports the notion that institutes providing higher education can achieve competitive advantage by focusing on service value.

KEYWORDS

Service value; dimensions of service value; higher education; satisfaction; loyalty

Introduction

India has the third largest higher education system in the world next, only to China and the United States. The Indian higher education system provides education and training in a variety of subject domains like arts and humanities, natural, mathematical and social sciences, engineering, medicine, dentistry, agriculture, law, commerce, management, music and performing arts, national and foreign languages, and culture to mention a few. The higher education structure in India consists of universities created by an act of Parliament (central universities), universities created by state legislature (state universities), deemed universities, which have been given university status and the authority to grant their own degrees, institutes of national importance given the said status by the Indian Parliament, colleges affiliated to the universities and privately run institutes and colleges. Since post independence, the growth in number of institutes of higher education in India have been manifold and as of 2009, India has 20 central and 215 state universities, 100 deemed universities, 13 institutes of national importance, over 16,000 colleges affiliated to these universities, and a number of

Downloaded by LUND UNIVERSITY At 22:57 13 February 2019 (PT)

Abstract

Purpose – The purpose of this paper is to understand consumers' intention to adopt internet banking. The study adopted the technology acceptance model with additional constructs (i.e. consumer innate innovativeness (II), domain-specific innovativeness (DSI) and perceived security risk (PR)).

Design/methodology/approach – The data were collected through a questionnaire-based survey (487 usable responses) from Indian consumers. A two-step SEM approach (i.e. measurement model and structural model) was used to analyze the data.

Findings – The findings show the significant positive influence of perceived usefulness, ease of use, attitude, II and DSI on consumer's intention to adopt internet banking. The PR was found to have a significant negative influence on consumers' intention to adopt internet banking, and DSI was found to negatively influence PR.

Research limitations/implications – The study is limited to users of a particular region of India. Furthermore, the study limits itself in determining consumers' intention only, not actual usage.

Originality/value – The study is a preliminary attempt to examine consumer's intention to adopt internet banking in India by analyzing innovativeness and perceived risk.

Keywords Technology acceptance model, Perceived risk, Internet banking, Domain-specific innovativeness, Innate innovativeness

Paper type Research paper

1. Introduction

Information communication technology has changed the delivery of modern-day retail banking services, by using the internet as an effective medium (Littler and Melanthiou, 2006) and has become vital in the future development of retail banking (Bradley and Stewart, 2003). Internet banking is growing at a rapid pace, as its services are beneficial to both consumers and banks (Durkin, 2004; Xue *et al.*, 2011). However, internet banking is more popular, has wider reach and has better penetration in developed nations (Kannabiran and Narayan, 2005) than in developing nations, such as India. Over time, banks in developing nations such as India are also showing significant growth in terms of electronic banking delivery channels (Chauhan and Choudhary, 2016), but consumers' adoption of internet banking appears slow. According to a joint report conducted by the Boston Consulting Group and Facebook in 2017, internet banking is only used by 12 percent of existing banking customers in India (Tripathi *et al.*, 2017). However, a huge opportunity for potential growth exists. The Internet and Mobile Association of India report says that the total number of internet users in India will reach 462m by June 2016, which offers the Indian

Customer-based place brand equity and investments: study of West Bengal

Sunny Bose[1] · Sudeepta Pradhan[2] · Dwarakanath Siriguppi[1] · Santosh Kumar Alreddy[1]

Revised: 11 September 2018
© Springer Nature Limited 2019

Abstract
Some places command greater interests among tourists for prospective visits owing to its place brand equity. Similarly, the places that command higher interests among prospective investors attract higher investments as well. Administrative machinery of 'places' engages in public diplomacy so that the 'place' can create positive impact among the target audience. This study tests the relationships between the perspectives of customer-based place brand equity (CBPBE) namely, destination branding, public diplomacy and investment attractiveness. The study checks for the impact of destination branding and public diplomacy perspectives of CBPBE on the investment attractiveness perspective. Considering 'West Bengal' as the place brand, the study also tests the operationalizability of recent place brand equity scales. Finally, based on the responses given about West Bengal's brand equity policy implications and insights are discussed.

Keywords Place branding · Customer-based place brand equity · Destination branding · Investment attractiveness · West Bengal

Introduction

Over the years, marketers and scholars have observed a similarity in the way that certain places (cities, regions and nations) affect the customer's imageries, similar to that of a brand. Places can be considered as brands as they have developed brand equity for themselves. Places like Venice or regions like Tuscany (Italy) and Santorini (Greece) command a price premium and loyalty from customers (especially honeymooners) for their specific offerings (www.usnews.com). Places compete for a share of the customer's wallet, which has resulted in gradual development of a new stream of marketing in the form of place branding (Anholt 2010; Dinnie 2004). Place branding attempts at integrating traditional and non-traditional approaches to marketing, specifically focusing on branding strategies for promotion, development and enhancement of a particular place or region towards its prospective customers. These prospective customers include tourists, investors including foreign direct investments (FDIs), students and exports. Places, including countries that are considered as powerful brands, enjoy increased inflow of FDIs, tourists and students. This, in turn, makes a place desirable for investment as the returns can be high. These tangible and intangible manifestations of positive returns because of a strong place brand can be alluded to the traditional concept of brand equity. Customer-based brand equity (CBBE) (Aaker 1996; Keller 1993) is the differential effect that a brand has on customers. The differential results in price premium and/or repeat purchase, positive images and associations, and a perception of superior quality/value propositions from the customers that the branded product/service command. Places that act like 'brands' command greater awareness and attention, and superior knowledge structure among their target customers/

dynamic panel threshold, economic growth, financial development, non-monotonicity

1 | INTRODUCTION

Does the inordinately high level of finance cause a decline in economic growth? Does the positive effect of finance on economic growth vanish as the financial thresholds are surpassed? Is there an "optimal" level of financial development that is more vital in accelerating growth? These have been the more often asked important questions in the finance–growth nexus debate.

As the financial development indicators in Euro area countries are growing at astonishingly high levels, there is a need being felt among the researchers and policymakers to understand the effects of the upsurge of financial development on economic growth. The macroeconomic data reveal that while the domestic credit in Spain has more than doubled from 74% to 171% of GDP over the last three decades, economic growth has gone into a negative trajectory from 1.77% to −1.23%. The domestic credit in Portugal has more than doubled from 73% to 169% of GDP, while the economic growth has plummeted from −0.17% to −1.36%. Similarly, domestic credit grew from 47% to 117% of GDP in Italy, and the economic growth slumped from 1.17% to −1.93%. Chong, Mody, and Sandoval (2017) observe that a negative association between bank credit and economic growth has emerged stronger after 1990 and was exceptionally prominent in the Eurozone, consistent with the view that an overgrown financial sector wanes economic growth potential. This leads us to ask: Is there a non-monotonic relationship between higher financial development and economic growth as growing finance is linked with less growth? However, we do not find a comprehensive study that explores the finance–growth nexus in the Euro area. Therefore, this paper investigates the presence of thresholds in Euro area countries beyond which the financial development changes in magnitude.

The global financial crisis has, indeed, necessitated a re-examination of the role and benefits of financial development, predominantly from the perspective of the upsurge of complex financial instruments. The sophisticated contemporary finance has intensified the gravity and frequency of crises while producing not enough gains to the broader economy. Financial innovation and liberalisation, in this motion, has in fact favoured a few substantially but hurt many. In this context, Rodrik (2008)

Modelling the dynamics of Bitcoin and Litecoin: GARCH versus stochastic volatility models

Aviral Kumar Tiwari [a], Satish Kumar[b] and Rajesh Pathak[c]

[a]Department of Finance, Law and Control, Montpellier Business School, Montpellier, France; [b]Indian Institute of Management Amritsar, Amritsar, India; [c]Department of Finance and Accounting, Goa Institute of Management, Ribandar, India

ABSTRACT

We examine and compare a large number of generalized autoregressive conditional heteroskedastic (GARCH) and stochastic volatility (SV) models using series of Bitcoin and Litecoin price returns to assess the model fit for dynamics of these cryptocurrency price returns series. The various models examined include the standard GARCH(1,1) and SV with an AR(1) log-volatility process, as well as more flexible models with jumps, volatility in mean, leverage effects, *t*-distributed and moving average innovations. We report that the best model for Bitcoin is SV-*t* while it is GARCH-*t* for Litecoin. Overall, the *t*-class of models performs better than other classes for both cryptocurrencies. For Bitcoin, the SV models consistently outperform the GARCH models and the same holds true for Litecoin in most cases. Finally, the comparison of GARCH models with GARCH-GJR models reveals that the leverage effect is not significant for cryptocurrencies, suggesting that these do not behave like stock prices.

KEYWORDS

I. Introduction

If you put the word Bitcoin into Google, you get the following four adverts at the top of the list: 'Trade Bitcoin with no fees', 'Fastest Way to Buy Bitcoin', 'Where to Buy Bitcoins' and 'Looking to Invest in Bitcoins'.[1] Bitcoin as a cryptocurrency has received considerable attention in the recent times, especially among the institutional investors across the globe which could be attributed to its innovativeness, simplicity and increasing popularity (Urquhart 2016). By the end of 2017, the total market cap of cryptocurrencies around the world had gone past USD 600 billion, almost as much as the GDP of Argentina.[2] Bitcoin constitutes almost 40% of the total cryptocurrency market cap, highlighting the importance of this market from an economic perspective (Katsiampa 2017).

Literature has focused on different aspects of cryptocurrencies. Scopus database (as of September 2017) includes 742 documents with 'Bitcoin' in its title or keywords which explain its legal, economic or computer aspects (Bariviera 2017). For instance, Moore and Christin (2013) examine the Bitcoin-exchange risk. Garcia et al. (2014) analyse the connections between social signals and Bitcoin price through a social feedback cycle. Hencic and Gouriéroux (2015) model predict the Bitcoin/USD exchange rate using a non-causal autoregressive model. Kondor et al. (2014) study the evolution of Bitcoin transaction structure and network. Sapuric and Kokkinaki (2014) examine the volatility of Bitcoin against six major currencies. Urquhart (2016) argues that Bitcoin returns do not follow the efficient market hypothesis. However, Nadarajah and Chu (2017) show that Bitcoin returns do satisfy the efficient market hypothesis using a simple power transformation of returns. Bariviera (2017) revisits the informational efficiency of the Bitcoin market using the Hurst exponent and shows that the returns' behaviour is more informational during the recent times.

Dwyer (2015) finds that the average monthly volatility of Bitcoin is higher than that of gold or a set of foreign currencies and the lowest monthly volatility for Bitcoin is less than the highest monthly volatility for gold and currencies. Cheah and Fry (2015) show that Bitcoin exhibits

Abstract

This paper was conceptualized with an objective to ascertain the entrepreneurial intentions amongst the students pursuing management program and to assess the influence of respective specialization such as HR, Operations, Finance and Marketing on the entrepreneurial intentions. Ajzen's [1] Theory of Planned Behaviour was applied to explicate the behavioural intentions. The results indicated that Personal Attitude and Perceived Behaviour Control had significant influence on the entrepreneurial intentions while Subjective Norms did not have any influence. It was identified that overall specialization had no significant influence on the entrepreneurial intentions. However, the students who have taken Marketing as their domain for Specialization in their management program have shown interest to choose entrepreneurship as their career with complete knowledge and larger intent to have control on their business comparatively followed by the students who have taken Finance as specialization. Students of HR and Operations specialization were identified to be lowest in having entrepreneurial intentions.

Identification of Instructional Design Strategies for an Effective E-learning Experience

B S S Karthik
EBS Universität für Wirtschaft und Recht, Germany

Brig Bhuvanagiri Chandrasekhar

Rajasekhar David and A Kranthi Kumar
IBS Hyderabad, IFHE University, India

The objective of the study is to identify various instructional design strategies used by the instructional designers for effective the E-learning experience. Thematic analysis is used to generate the factors accountable for the successful implementation of E-learning process. To fulfill the purpose of the study, semi-structured in-depth interviews were conducted with the instructional designers, students, and corporate employees, who are associated with E-learning apps. Interviews conducted are broadly classified into three sections. The first section dealt with the personal profiles of the respondents; second part dealt with the discussion on successful instructional strategies adopted by the designers, and the third part dealt with the ease and comfort experienced by the learners while undergoing the E-learning course. Thematic analysis of the interview transcripts generated six themes, namely Technical assistance; Problem based learning, Aesthetics, Gaming, Storytelling, and Social support. This study will help the instructional designers to understand, what kind of expectations the learners have while taking up an E-learning course and how best these expectations can be addressed through design strategies by the instructional designers. Keywords: E-learning, Instructional Design Strategies, Instructional Designers, Thematic Analysis

In the age of technological advancement, the approach towards teaching and learning needs to be given a new thought and there is a need to bring the old practices on to the technology platform (Beetham & Sharpe, 2013). In the last decade, the learning domain has undergone a drastic change (Adams Becker et al., 2017; Alper & Gulbahar, 2009; Hwang & Tsai, 2011; Wu et al., 2012). On one side, there is a remarkable growth in the usage of learning technologies likewise learning through games (Tobias, Fletcher, & Wind, 2014), MOOCs (Reich, 2015), sign-based learning (Sheu & Chen, 2014), magnified reality (Bower, Howe, McCredie, Robinson, & Grover, 2014) and so on to ensure teaching and learning. On the other hand, there has been a marked decrease in ineffective face-to-face training technology (Bayne, 2015; Bingimlas, 2009; Cuban & Jandric, 2015; Spector, 2013; Spector, Merrill, Elen, & Bishop, 2014; Venkatesh, Croteau, & Rabah, 2014).

E-learning is a fast developing area and is found useful to the learners as they can share the content of learning online without any need of meeting the end-user in person (Area & Adell, 2009; Bates, 2015; Docebo 2014, 2016). There were significant gaps in the study of E-learning, its definition and terminology as observed by Guri-Rosenblit and Gros, (2011).

Abstract

This study was conceived as an attempt to explore the entrepreneurial intentions of management scholars with the objective to ascertain the contribution of selected variables in shaping and defining the entrepreneurial intentions of these students. For the same reason, Shapero's model for explaining the entrepreneurial intentions was applied on the students studying the management program in a business school at Ahmedabad. The model was based on three fundamental variables as perceived feasibility, perceived desirability and propensity to act. Data collection was made through a questionnaire and analyzed for descriptive statistics and partial least squares regression analysis using SPSS. As the study was primarily directed towards the students pursuing management program, important conclusions pertaining to the entrepreneurial intentions of these students were drawn using Shapero's model as the key premise. Among the three independent variables, perceived desirability was identified to have significant contribution to the entrepreneurial intentions followed by perceived feasibility. The study indicated that students were enthusiastic about becoming entrepreneurs and believed that being entrepreneurs positively brings in a larger sense of gratification. A course on entrepreneurship with specialized modules if introduced, is expected to create interest and develop their attitude towards business. These modules would also enhance the entrepreneurial skills of the students.

Predictive Analytics for Insurer Risk Management: Behavioral Traits of Fraudsters

V Padmavathi* and Ishaan Sengupta**

Insurance organizations around the world have often come across individuals or companies which are their insureds, trying to claim much more than what they are liable to receive after the standard deduction. These are cases which fall under the bracket of fraudulent claims. Such cases prompted the insurance firms to set up investigation teams to verify the authenticity of the claim. However, despite having improved the loss percentage, the Special Investigation Teams (SIT) of insurance companies could not predict potential fraudsters. It is after this that predictive analytics was used to profile insureds based on a huge number of parameters. Despite this development, insurance organizations still lose 10% of the claims as they are fraudulent in nature. What can really aid in the reduction of losses is the ability of the organization to profile applicants and the insured based on behavioral traits. To address this issue, what better than to use the tools already at the disposal of insurance companies for profiling the same? This paper addresses the importance of globally accepted psychometric tests to assist insurance organizations in knowing more about the clientele they intend to serve.

Introduction

Behavioral science and econometrics have often gone hand in hand in establishing cogent relations between behavioral traits and their impact on certain managerial tools. However, the use of the same behavioral tools has not seen the light of the day in emphasizing or analyzing the risks involved in insurance fraud. The paper takes into consideration two major psychometry tests, namely, the dark triad and the fraud triangle, and establishes a relationship between these traits and the risk level of the person claiming an insurance reimbursement. This is unique as no research in the same field has been done with quantitative models backing each trait.

There are cases where blatant criminality is involved and therefore what would have been an assured trip to the jail, ends up resulting in the insurance organizations' losing money. It is such cases which prompted insurance firms to set up investigation teams to verify the authenticity of the claim. However, despite having improved the loss percentage, the Special Investigation Teams (SIT) of insurance companies could not predict potential fraudsters. It is

Causality-in-quantiles

ABSTRACT

We investigate the presence of short- and long-run asymmetric relationships between energy and non-energy commodities for weekly data from January 2010 to June 2018. Using the non-linear ARDL methodology, we show that oil prices have significant long-run negative effects on the prices of gold and silver, indicating that for both metal commodities, oil price increases lead to more decrease than the subsequent oil prices decrease. Crude oil, among other energy commodities, is found to offer more diversification benefits when combined with gold or silver; however minimal diversification benefits can result from combining crude oil with wheat or platinum. Gas futures, among other energy markets, offer more diversification opportunities when combined with copper, wheat, platinum or palladium, while coal offers maximum diversification benefits when combined with gold, silver or wheat. Our results are robust when NARDL is applied to the daily data and also when the analysis is conducted using the causality-in-quantiles test.

1. Introduction

Ever since the commodity futures markets have been recognized to produce likely diversification advantages, they have become a popular investment choice for investors and financial institutions, partially prompting the practice of financialization (Algieri and Leccadito, 2017). Accordingly, large amounts of money have flowed into the commodity market, leading to the emergence of commodity futures as a valuable asset class (Tang and Xiong, 2012) that is constituted of various types commodities such as energy, metals and agricultural. Interestingly, the process of financialization has intensified the correlation between energy and non-energy commodities, making portfolio allocation decisions more challenging. A large number of studies examine the associations between oil, precious metals and agricultural commodities (Soytas et al., 2009; Cabrera and Schulz, 2016), and mention that several essential non-energy commodities such as precious metals and agricultural commodities are sensitive to the movements in energy commodities such as oil, coal and natural gas (e.g., Kang et al., 2017; Ji et al., 2018, 2019).[1]

Kumar (2017) shows that gold prices are highly sensitive to increasing oil prices. Yahya et al. (2019) find that the linkages among the oil and agricultural commodities have increased, especially after 2006, and that the rate of such linkages is higher in the long-run. Furthermore, much of the prior analysis is focused on gold acting as a hedge against oil price fluctuations (e.g., Reboredo, 2013). Other precious metals have been widely ignored[2] despite the fact that these metals could also provide suitable hedging opportunities (Shahzad et al., 2018) since precious metals have low correlations with oil prices. Accordingly, in this paper we examine short- and long-run asymmetric relationships between energy and non-energy commodities and make inferences regarding potential diversification possibilities. We do this while including other precious metals such as silver, copper, platinum and palladium along with gold to examine the impact of crude oil, gas and coal on these metals.

Our article contributes to the literature in several ways. Firstly, we examine the relations between several energy and non-energy

Abstract

This study was conceived as an attempt to study the relationship of Entrepreneurial Orientation and Business Performance in the Small and Medium Enterprises (SMEs) of Kurunegala District in Sri Lanka. The study was conducted on 275 SMEs in Kurunegala engaged in varied businesses including coconut products, rubber based products, garments and apparels, cement and clay pots, housing and real estate etc. The Entrepreneurial dimensions *viz.*, Innovativeness, Risk Taking Propensity, Pro-Activeness, Competitive Aggressiveness and Autonomy were tested to assess their impact on the business performance. The entrepreneurial orientation and business performance relationship was found to be strong and significant indicating that the SMEs in Kurunegala district adopted better EO postures towards achieving promising returns in their business.

ABSTRACT

We examine the dependence structure between the BRICS stock and foreign exchange markets using a dependence-switching copula model. In particular, we examine dependence and tail dependence for four different market conditions, namely rising stock–appreciating currency, falling stock–depreciating currency, rising stock–depreciating currency and falling stock–appreciating currency. Our results indicate that dependence and tail dependence in the four market conditions are symmetric for all countries except Russia during negative correlation regimes. During positive correlation regimes, dependencies generally asymmetric but tail dependence is symmetric for all countries. The results further suggest the dominance of return chasing effects for India, Brazil and South Africa, and portfolio rebalancing effects for China and Russia most of the time. We further show that the co-dependencies computed using R-vine copulas are best suited to compute the portfolio VaR during the considered time period.

1. Introduction

We examine a time-varying dependence between stock and foreign exchange markets. Information concerning the interdependence of these markets is particularly relevant to international portfolio managers because they are concerned with not only the volatility of both areas but also with the extent to which the two are integrated. For instance, a negative dependence between the foreign currency market and the stock market decreases the return volatility in local currency terms and makes foreign investment more attractive. International equity portfolios therefore depend on exchange rate dynamics. Conversely, dynamic portfolio rebalancing can concurrently affect the exchange rate.

The literature posits two hypotheses on the dependence between foreign currency and stock markets based on the stock price fluctuations. First, the portfolio rebalancing hypothesis predicts a positive relationship between both markets (Hau & Rey, 2004). This is because investors' wealth and fund demand are likely to depend on the performance of the stock market (e.g., Gavin, 1989). For instance, an increase in stock prices of domestic market motivates investors to recoup profits from the domestic market and to reallocate their capital to other countries whose market offers better investment opportunities. In such cases, selling of domestic equity holdings leads to domestic currency depreciation, that is, an increase in the nominal exchange rate which is measured as the number of units of national currency per US dollar. This in turn causes a positive correlation between the stock and foreign currency markets.

The return chasing hypothesis, on the other hand, predicts a negative relationship between both markets. The key argument here is that whenever domestic equity markets outperform foreign equity markets, international investors can be attracted to the domestic market. In other words, international investors rush to buy when the domestic market is increasing and rush to sell when the domestic market is plummeting.[1] In fact, Kim and Wei (2002), and Chai-Anant and Ho (2008) document the return chasing behaviour of foreign portfolio investors for emerging market. In this paper, we argue that inflows of international investors are likely to increase the demand of domestic currency, which in turn leads to an appreciation of domestic currency, that is, a decrease in the

Abstract

The Ajzen's [1] Theory of Planned Behaviour was applied to study the entrepreneurial intentions of the construction workers. The effects of the TPB variables, gender and age on the EI were examined using the statistical tool of multiple linear regression and analysis of variance. The results have indicated that all the three TPB variables such as Attitude towards entrepreneurship, Subjective Norm and Perceived Behaviour Control had significant affect and were the strongest predictors to become entrepreneur. It was evident that females have shown lesser attitude and perceived behavior control than males to become entrepreneurs. Among the respondents, people of 40 and above age have shown inclination to become entrepreneurs. There is a need for the governments to recognize the unorganized construction sector and provide some basic education in strengthening their entrepreneurial skills and enhance their confidence to become better entrepreneurs.

1. Introduction

Entrepreneurship serves as a vital element for any country's economy. Because of its contribution in strengthening the socio-economic fabric of the country and the thrust it provides to economic growth and development, entrepreneurship indeed has become national agenda. A term that describes the struggles of an individual who invests all efforts to build a business of his/her own which in turn

Determinants of Cloud Computing Adoption: A Comparative Study

Shailja Tripathi

IFHE University, IBS Hyderabad, India, shailja.tripathi@ibsindia.org

Abstract

Background: *This study investigates the determinants that influence the user's behavioral intention to use cloud computing in adopter and non-adopter firms. The research model is based on the theory of the Valence Framework of Behavioral Beliefs and Technology Acceptance Model (TAM). The present study examined the factors of perceived ease of use, perceived usefulness, perceived ubiquity, perceived benefits, perceived costs and perceived risks in determining behavioral intention to use cloud computing for the adopter and non-adopter firms.*

Method: *Data were collected using a questionnaire-based survey method. The valid responses received were 458. The sample size of adopters and non-adopter of cloud computing were 239 and 219, respectively. Exploratory Factor Analysis (EFA) and Structural Equation Modeling (SEM) was used for data analysis. Data analysis was done separately for both samples of the adopter and non-adopter firms The results showed that, for adopters firms, perceived usefulness, perceived ease of use, ubiquity, perceived benefits, and perceived risks were found to have a significant and direct influence on behavioral intention to use cloud computing. For non-adopters, perceived usefulness, perceived ubiquity, perceived benefits, perceived costs, and perceived risks were found to have a significant and direct influence on behavioral intention to use cloud computing. A comparison testing was also performed by examining the difference in the strength of path coefficients between adopters and non-adopters firms.*

Results: *The findings showed that the impact of favorable factors of perceived ubiquity and perceived benefits were found relatively more significant in the case of adopter firms than negative factors. Likewise, the impact of negative factors of perceived risks and perceived costs were found relatively more significant in the case of non-adopter firms.*

Conclusions: *The major contribution of this study is that it contributes to the understanding of progressive changes in the impact of behavioral beliefs and cognitive factors on behavioral intention to use cloud computing in adopter and non-adopter firms. This study also provides managers' practical understandings for cloud computing adoption during each phase of the adoption process.*

Determinants of Cloud Computing Intentions to Use: Role of Firm's Size, Managerial Structure and Industrial Sector

Dr. Shailja Tripathi
(IFHE University, IBS Hyderabad, Telangana, India)

ABSTRACT

Currently, many companies are adopting cloud computing to accomplish their diverse purposes and to create an elastic and responsive environment that can rapidly respond to new business requirements. This paper attempts to investigate the factors influencing cloud computing adoption from the managerial perspective with the inclusion of the size of the firm, organizational structure and type of industry as control variables. The model is developed with various technological, economic and cognitive factors that affect the behavioral intention to use cloud computing using the technology acceptance model (TAM). Questionnaires were randomly distributed to around 1000 senior managers of various firms in India. Hierarchical multiple regression (HMR) was performed to test the impact of control variables on the factors that influence managerial intention to adopt cloud computing. The result showed that all the independent variables (perceived usefulness, perceived ease of use, perceived risks, perceived benefits, perceived ubiquity, perceived costs, and job relevance) explain an additional 32.3% of the variance in intention to use cloud computing. Based on standardized beta coefficients (β) values, the result showed that the impact of firm size is found highest among other control variables in explaining the amount of variability in behavioral intention to use cloud computing. The result of this study will enable the firms to focus on managerial perspectives of cloud-based applications and their attitude towards adoption.

Keywords: Cloud computing, Technology acceptance model, Hierarchical multiple regression

INTRODUCTION

ABSTRACT

Internet of things (IoT) is the buzzword and pioneering breakthrough approach highlighted in today's industry 4:0, where the devices are seamlessly integrated with each other, sharing vital information in real-time sync. With the wearable IoT devices, the diagnostic readings and physical measurements of the patients can be shared with the physician on the go and suitable diagnosis can as well be shared with patient in the real-time on their own mobile devices through IoT applications. This study empirically examines the importance of m-IoT adoption on the information pervasiveness across the network and patient stakeholders and in turn investigating how efficiency of healthcare services and care process improvement got affected. Study outcomes based on 221 completed responses from the healthcare professionals concludes that, m-IoT adoption opens new opportunities and challenges with the process innovation in the healthcare services and increases the efficiency of services.

Keywords: Mobile IoT, Service Efficiency, Service Improvement, Healthcare, Information Pervasiveness

INTRODUCTION

The field of healthcare is one of the most highlighted and evolving sector in the current societal perspective. Immense pressure to provide superior quality of care service in synchronized perspective and also in real-time aspect on the go has led the sector leaders to introduce and practice varied digital platforms and tools connecting the disparate healthcare stakeholders, predominantly, physicians,

Market Access and Aggregate Sale through Value Chain in Agri-Produce: The Role of Community Owned Women Association

Vijayudu Gnanamkonda, Anitha C, Sashikala P

Abstract: *Gram Abhyudaya Mandali (GRAM) functions as the parent NGO, conceptualizes the requirement of social and economic development of rural poor women through self-help groups. It conceptualizes, the idea of Aggregate Sell Model for its members, endeavors to create a successful platform by collective pooling and marketing and the sale of its agricultural commodities (like Soya, Paddy, and Maize), by surpassing local mediators transparently using technology. This model benefits its women service members (around 50,000) through 20 Mutually Aided Cooperative Societies (MACS) located across villages in tribal districts of Nizamabad and Adilabad of Telangana, India.*

The methodology adopted for research study is based on Focused Group Discussions (FGDs). FGDs were conducted and the results were analyzed. Results showed that elimination of intermediaries and adopting transparent process facilitated profitability to the members of the society. The contribution of the study is to elevate the 'Collective Sale' (through community owned hub point for its agricultural products), that is uniquely adopted by GRAM. This model could be either adopted or modified to other societies that are operational in rural/semi-urban areas.

Keywords: *aggregate pooling, Community owned society, Cooperative sale, Market Price, Mutually Aided Co-operative Society.*

I. INTRODUCTION

'Neeradi Boja Bai'[1], hails from one of the remote villages of Adilabad district of Telangana, literate with few years of schooling and has a humble background, yet her speech in local language (Telugu) at the auditorium[2], mesmerized the villagers and academicians gathered. Her personality portrayed confidence, zeal to inspire and displayed the willing to encounter any challenges. She along with a group of women turned a surplus on INR. 4.14 crore surplus soya crop and gave back 15.25 lakh to her members by fuelling a silent revolution in collective procurement and sale of farm produce making her way into male-dominated area.

The success story of Boja Bai, that enabled her team to build a transparent process of collective 'sale of Soya' for her community members of Adilabad, can be attributed to GRAM, the parent NGO. The unique 'Sell Model', conceptualized by GRAM endeavors to provide quality transmission to its service members through collective pooling and marketing of agricultural commodities (like soya, paddy and maize). Through this platform, MACS (Mutually Aided Co-operative Society) scouts bulk buyers bypasses the local intermediaries to provide competitive price to agri-producers in a transparent environment.

The authors were quite keen to observe the impressive model of collective sale, avoiding local intermediaries – and choose to explore and comprehend the entire transparent process through primary research, and paid a visit to Nizamabad and Adilabad to document the process.

II. BACKGROUND OF THE STUDY

A. Grama Abhudaya Mandali (GRAM)

Samson, a social worker conceived the idea of building a community based Sustainable organization established an NGO, Grama Abhyudaya Mandali (GRAM) [1] in the tribal districts of Nizamabad and Adilabad. Currently caters to target Schedule Casts (SC) 18.5%, Schedule Tribes (ST) 8%, Backward Class (BC) and Muslim minorities of 56%. During the 1980s, the financial economic conditions of Dalits, women and disabled were quite wretched as the Nizamabad was prone to frequent droughts and Adilabad District was socially and economically completely backward due to largest tribal community with illiterate, poor population, coupled with unemployment.

GRAM was committed to create a community based institution in governance designed its products, delivery process with an emphasis on member (women) centric society. It consciously had to work on advocacy and governance continuously to establish a community owned co-operative society to provide quality financial services to its members without compromising on social mission in place.

In pursuit of its long-term objective to bring together a large number of the rural poor and disadvantaged in the area through a process of social

Capacity Development for Sustainable Water Resources Management in India

E. J. James and Thomas J. Menachery

1 Introduction

1.1 Sustainable Development

Capacity building has gained considerable importance and also attained new dimensions and dynamism in the context of sustainable development. Several discussions and debates took place on the theme 'development versus environment' since the Stockholm Conference in 1972, in which the then Prime Minister of India gave a thought-provoking talk on 'Man and Environment'. There has been a general recognition that development and conservation have to go hand in hand for the existence of humanity, since the annunciation of World Conservation Strategy (IUCN et al. 1980). Towing in the same line, an attempt was made to define sustainable development as the one which takes into account the requirements of future while meeting the needs of the present (UN 1983). Ever since, there has been an emphasis on the 'ecosystem' or 'holistic' approach for attaining sustainable development of natural resources (CBD 2004). Though there have been several theoretical works available on ecosystem approach, there are only limited practical lessons and best practices to share the success stories of ecosystem approach. There are certain limitations in understanding and appreciating linkages in ecosystem approach. In this context, capacity building, keeping in view the sustainability considerations, gains importance.

ABSTRACT

This study investigates the extent of time-varying volatility and correlations between crude oil, natural gas, and stock prices in India using various multivariate generalized autoregressive conditional heteroskedasticity (MGARCH) models with and without asymmetry. Our empirical results reveal that there is no long-run cointegration between crude oil, natural gas, and stock prices in India. We find that the VARMA-DCC-GARCH model is more efficient compared to the CCC model with asymmetry in estimating time-varying correlations. We also analyze optimal portfolio weights and hedging ratios through pair trading between stocks and energy commodity futures. Our results have several implications for portfolio investors dealing with the Indian stock market and energy commodity futures for forecasting potential market risk exposure and determining the existence of portfolio diversification benefits.

1. Introduction

The growing demand for oil and natural gas is concomitant with the economic growth worldwide. The increased demand for oil in emerging countries has caused a manifold rise in prices, which has augmented the interest among policymakers to understand the relationship between oil prices, stock markets, and the overall economy (Herrera and Pesavento, 2009; Basher et al., 2012; Sadorsky, 2014; Bal and Rath, 2015). Higher oil and natural gas prices lead to cost-push inflation in oil importing countries and, consequently, have a negative impact on the financial markets, particularly the stock markets (Cong et al., 2008).

Many studies have found evidence of a long-run cointegration relationship between oil and natural gas prices (Brown and Yucel, 2002; Villar and Joutz, 2006; Panagiotidis and Rutledge, 2007; Hartley et al., 2008; Asche et al., 2012; Nick and Thoenes, 2014; Batten et al., 2017; Brown, 2017). However, Ramberg and Parsons (2012) argued the stability of the cointegration relationship due to the decoupling of oil and gas prices. Similarly, other studies have examined the relationship between oil prices and stock markets (Hammoudeh et al., 2004; Basher and Sadorsky, 2006; Boyer and Filion, 2007; Henriques and Sadorsky, 2008; Park and Ratti, 2008; Hayat and Narayan, 2011; Narayan and Sharma, 2011, 2014; Sadorsky, 2014). However, to the best of our knowledge, no study has investigated the relationship between natural gas prices and stock prices in India.

Although many empirical studies have explored the relationship between oil prices and stock prices, very little is known about the volatility of crude oil, natural gas, and stock prices, and possible correlations among them. We intend to fill this important gap. The inclusion of natural gas makes our paper unique due to the following reasons. First, natural gas is one of the leading energy commodities as it supplies 22% of the energy used worldwide, contributes to a quarter of electricity generation, and plays a significant role as feedstock for industry (International Energy Agency (IEA)). Second, natural gas releases lower levels of CO_2 than oil and coal and is the most commonly used alternative fuel in vehicles. The growth of natural gas is linked with environmental benefits, which makes it a crucial source of energy to be used in transportation.

Unlike previous studies, which mostly focused on the United States or the European countries, we analyze this relationship in the context of India. The case of India is useful for several reasons. First, India has

Abstract

The Internet of things (IoT) has become an interesting topic of research as it assimilates several sensors and objects to communicate directly with one another without human interference. IoT helps businesses and society in many ways such as it improves public safety, transportation, and healthcare by providing better information and faster communications. The adoption of IoT is going to create a persistent impact on society and business. This paper develops a model based on system dynamics and identifies the factors influencing IoT adoption. The dominant factors of IoT adoption are communication, control and automation, efficient business processes, self-configuration, and cost savings. IoT adoption is also affected by negative factors including privacy risks and security risks, interoperability, reliability, poor infrastructure, less skilled IT professionals, etc. Businesses can reap the potential benefits of IoT by solving the issues related to their adoption. Besides, this paper attempts to derive a framework for the successful adoption of IoT in organizations. This study is, therefore, a significant contribution towards understanding the factors that influence the adoption of IoT in businesses.

Corporate cash holding during crisis and beyond: what matters the most

Ranajee
IBS-Hyderabad, ICFAI Foundation for Higher Education, Hyderabad, India, and
Rajesh Pathak
Department of Accounting and Finance, Goa Institute of Management, Sattari, India

Abstract

Purpose – The purpose of this paper is to examine the cash holding of firms during a crisis and test the widely accepted determinants of corporate cash holding (CCH) for their consistency across periods of crisis, stability and recovery, and across firm categories, in the emerging market context of India.

Design/methodology/approach – The study employs panel data and Fama–Macbeth regression techniques on publicly listed firms during 2001–2015, amid controls for idiosyncratic factors. Further empirical analysis is carried out through the disaggregation of firms based on group affiliation, controlling stake of promoters, financial constraints and firm size.

Findings – The study reports that cash levels are significantly higher during crisis periods for Indian firms. Moreover, promoter holding is observed to be a strong predictor of CCH, which is an addition to the list of predictors in existing literature. Additionally, most of the predictors of cash holding turn out to be consistent through periods of financial crisis, stability and recovery. A firm's age and growth prospects do not determine cash levels for Indian firms; however, cash-flow volatility, firm size, leverage and non-cash working capital requirements help to determine the cash levels of the firm consistently through different periods. Group-affiliated firms are less likely to engage in cash accumulation as opposed to firms that are large and financially constrained and have high promoter stakes.

Originality/value – The study is unique because it examines the consistency of determinants of cash holding across good and turbulent times and across firm classifications. Moreover, the study uses a broad sample of firms and investigates the topic for a relatively long period in an emerging market setup.

Keywords Determinants, Financial crisis, Emerging markets, Business groups, Corporate cash holding

Paper type Research paper

1. Introduction

Cash is the lifeline of a firm. Firms accumulate cash for their transaction, precautionary and speculative motives to avoid costly external financing (Habib and Hasan, 2017; Chauhan *et al.*, 2018; Al-dhamari and Ku Ismail, 2015). Transaction motive ensures the availability of enough cash in the firm to make necessary payments, whereas precautionary motive relates to unexpected cash requirements. Speculative motive encourages firms to hold cash for an exceptional, potentially profit-creating set of circumstances. Recent studies report growing levels of cash holding across firms around the world (Kalcheva and Lins, 2007; Pinkowitz *et al.*, 2012). Researchers have empirically examined and confirmed the widely held motives of cash holding by firms (Baumol, 1952; Mulligan, 1997; Opler *et al.*, 1999; Harford, 1999) and its various determinants (Ferreira and Vilela, 2004; Chen and Chuang, 2009; Duchin, 2010; Al-Najjar, 2013; Chauhan *et al.*, 2018). However, the existing literature is largely silent on the issue of what happens to corporate cash holdings (CCH) during a crisis when the credit supply in the financial system dries up significantly. Moreover, whether the widely accepted predictors of CCH are consistent through certain types of periods (i.e. stable, crisis and recovery) and certain firm classifications (i.e. group affiliate and financially constrained) also remain scantly explored.

Student Intervention System using Machine Learning Techniques

Shubhangi Urkude, Kshitij Gupta

Abstract: Now a days, the educational institutes are adopting technologies for betterment of student's quality, in respect to teaching methodologies etc. For which the huge information available with educational institutes can be used to predict student's future in academics. The main objective of this paper is to predict the student performance in the examination and also to predict the student will graduate or not. Hence forth we are using statistical analytical method which is F1 score. F1 score or F measure is used to test the prediction accuracy by considering precision and recall to compute the score. To fulfill this requirement in machine learning, classification technique is used. The dataset used in this analysis contains 395 student records, having attributes, such as age, health, internet, school, father job, mother job etc. Using support vector machines (SVM), Decision Tree and Naïve Bayes (NB) classification algorithms F1 score is calculated for each algorithm. Based on the analysis done the F1 score of support vector machine is giving the better prediction compared to rest of the two algorithms.

Keywords: Support Vector Machines (SVM), Decision Tree, Naïve Bayes (NB), Classification Algorithm, Prediction.

I. INTRODUCTION

In educational institutes like colleges and many universities huge data is collected on daily basis. This data contains examination data, student's internal marks, their personal data, health data, various evaluation components data and logs of student's activity.

The data is caught through learning administration frameworks like Canvas and Edmodo. Canvas and Edmodo are particularly intended for online classrooms, which are getting to be well known in the highereducation.

This huge collection of data can be used to analyze the student's performance in the future to increase the graduation rate. Graduation rates are frequently the criteria of decision for this. Graduation rate is defined as the time when student enters the institution and completed the degree with in four years, it is usually expressed as % graduation rate. To finalize the graduationrate the data collected from different sources should be converted into single form so that this data can be retrieved and analyzed to make specific decision. To take any decision, data is analyzed in such a way that it should able to answer certain questions such as

Who are the students likely to fail?

What is the courses student may fail?

What is the quality of the student'scontribution to the marks he obtained?

Which courses should be focused more to help the student?

What are the easy subjects to get good score?

Revised Manuscript Received on 14 September, 2019.

Shubhangi Urkud, Department of Computer Science and Engineering Faculty of Science and Technology The ICFAI Foundation for Higher Education, Hyderabad.

Kshitij Gupta, Department of Computer Science and Engineering Faculty of Science and Technology The ICFAI Foundation for Higher Education, Hyderabad

Based on the answers collected in the analysis phase, the perfect decision can be made by using different machine learning techniques and students can be guided in a particular direction without diluting educational standards.

Student's academic performance influenced by numerous components, like personal, financial and other environmental variables. Learning about these factors and their impact on student performance can help dealing with their impact. Recently, much aid has been paid to educational mining research. Educational Data Mining (EDM) concerns techniques, tools, and research planned for automatically extracting meaning from big repositories of data generated by or related to people learning activities in educational surrounding. Anticipating student's performance turns out to be all the more challenging because of the expansive volume of information in educational databases.

Forecasting of academic performance is widely explored. The ability to foresee student performance is important in educational institutions. Expanding student's achievement is a long-haul objective in every single educational institute.Predicting student'sacademicperformance ahead of schedule before their last examination is really a great achievement. At this point additional measures can be taken by educational institutes to orchestrate appropriate help for the low performing students to enhance their studies and help them to progress. On the other hand, distinguishing characteristics that influence course achievement rate can aid courses enhancement. Recently created web-based educational technologies and the use of quality standard offer researchers' novel chances to contemplate how students realize and what ways to deal with learning lead to progress. The main objective of this paper is to distinguish the two factors that influence student's performance, courses achievement rate and student's achievement rate. By considering these components as early indicator analysis can be done and necessary action can be taken to improve.

II. LITERAYURE SURVEY

Many researchers have used statistics and machine learning algorithms for predicting the student's performances in educational institutes.

Edin Osmanbegovic etal. [1]uses three supervised learning algorithms, Bayesian, Decision trees and Neural Networks on the assessment data to predict number of students got success in a course and the performance of the teaching,learning methods were evaluated based on their predictive precision and ease of learning and user-friendly features. It is proved that this method can be used to benefit students and teachers to progress students performanceand decrease failing ratio by taking proper steps at right time to improve the quality of education.

Exploring the Medical Representatives' Perception towards Motivational Measures Implemented by Selected Pharma Companies, Chennai City.

- **Source:** Indian Journal of Public Health Research & Development . Dec2019, Vol. 10 Issue 12, p6-13. 8p.

- **Author(s):** Subramani, A. K.; Jan, N. Akbar; Chebolu, Radha Mohan; Azhagan, C. Thirumal; Arumugam, Thangaraja

- **Abstract:** Background: Indian Pharmaceutical industry has significant growth in recent decades and faces hyper competition in the local and international market. Aim: The primary objective of this research is to explore the medical representatives' perception towards motivational measures implemented by selected pharma companies, Chennai city. Method and Material: The primary data of the research was collected through the structured questionnaire. The questionnaire was prepared based on Work Motivation Scale. The final sample size of the survey is 227. Results: The findings of the study indicates that earnings & benefits given to the medical representatives has highest positive effect on work motivation of medical representatives, which is followed by working conditions, success orientation, task orientation, task orientation, mission orientation, coworker relations, managing others, and supervisor relations. The results of confirmatory factor analysis confirms that all the factors of the conceptual model has significant positive effect on work motivation of medical representatives working in selected pharma companies. Conclusion: The medical representatives in Pharma industries can be motivated through the adoption of appropriate strategies by considering the right blend of above-mentioned factors.

Board Structure and Composition in Manufacturing, Telecom and IT and ITeS Industries in India

Mohammed Abdul Nayeem, Siddharth Kushwaha** and Bharath Supra***

Corporate governance came into being to check the unlawful business practices in the corporate world and safeguard the interests of the shareholders. Lack of corporate governance will have an effect on businesses. Anglo-American model is being followed by the developing nations, particularly by India, for corporate governance. However, the overall corporate governance structure is still at a rudimentary level. The present study examines the relationship between board structure and ownership structure and its composition across different companies listed on Bombay Stock Exchange (BSE) Index in three industries, namely, Manufacturing, Telecom, IT and ITeS. The reason for picking up these industries for the study is that together these three industries contribute more than a quarter of the GDP of India. So it becomes inevitable to study the relationship between board structure and ownership structure in these industries. A two-stage methodology is used—First stage: Analysis of Descriptive statistics, i.e., mean and standard deviation (Liu and Fong, 2010); and Second Stage: Correlation analysis among variables. The results inferred from the work highlight the relationship between board and ownership structure of these three industries.

Introduction

Corporate governance has gained quite a good amount of momentum across the world due to scams, scandals, unethical business practices and insufficient disclosure in the corporate world. A lot of new standard regulations have been set and changes in accounting and reporting practices have also been made with the aim to bring down the unethical business practices and reduce the greed to a certain extent (Bekiris, 2013). Thus, the need of the hour is to build and develop a robust pattern of good corporate governance which takes care of all these unethical issues and addresses the problems arising out of it.

Abstract

Purpose – The present study aims to investigate the influence of key factors on the success of women micro-entrepreneurs in select states of India.

Design/methodology/approach – An empirical study is carried out to understand the influence of the psychological, socio-cultural, skill and resource-related factors on the success of women entrepreneurs. To achieve the set goal, a comprehensive questionnaire is developed for collecting data and is analyzed using the *t*-test, the chi-square test and structural equation modeling.

Findings – The proposed model is validated using structural equation modeling, and the fitness values indicate that the model is fit to explain the entrepreneurial success of women entrepreneurs in India.

Practical implications – The result advocates that the participation of women entrepreneurs may be increased to not only improve national growth but also empower women in India.

Originality/value – In the context of the women micro-entrepreneurs, no such study covering such a vast area of India has been carried out.

Keywords Structural equation modelling, Women entrepreneurship, Micro-enterprises

Paper type Research paper

1. Introduction

Women entrepreneurs' concept is about a woman or a group of women who initiate, establish and become operant of one or more business enterprises. Women entrepreneurship

Abstract: This paper is an attempt to investigate the interdependence of market structure, conduct and performance in Indian automobile industry. For this, secondary data have been obtained from Centre for Monitoring Indian Economy (CMIE) from 1998 to 2014 and Two Stage Least Squares (TSLS) method is applied to examine the inter-relationship among structure, conduct and performance variables. We found weak relationship between proxy variables of Structure-Conduct-Performance (SCP) model. The study is an endeavor to apply SCP paradigm in case of Indian automobile industry at segment level.

Keywords: Automobile, Structure, Conduct, Performance, Price-Cost Margin, Advertising, R&D

JEL Classification Number: L620, L10, L62, L91

1. Introduction

In Industrial organization, the relationship between firm behaviour and market structure had always been a matter of discussion. In 1930, Edward Mason and Joe S. Bain originated an outline for empirical analysis named Structure-Conduct-Performance (SCP) to describe how key aspects of market structure, conduct and performance are related to each other. Edward Chamberlin's theoretical work was the main inspiration for both Mason and his student Joe Bain to study empirically how pricing and production policies of firms are determined. SCP Paradigm postulates causal relationships between the structure of a market, the conduct of firms in that market and economic performance (Ferguson & Ferguson, 1994). Traditionally, industrial organization (IO) theory assumed a one way causal relationship between market structure and market conduct and also market structure and market performance. It means market structure is taken as exogenous variable. Figure 1 and 2 illustrates the simplest version and new industrial organization (NIO) version of this framework respectively.

Answering key questions on green consumption: A qualitative study among Indian youth

Manish Gupta ✉, Anitha Acharya,

First published: 23 October 2019
https://doi.org/10.1002/nvsm.1661
Citations: 2

Abstract

The main objectives of this study are to (a) comprehend the definition of green consumption, (b) identify the products that are considered green by consumers, (c) understand the reasons behind green product consumption, and (d) decipher the possible implications of consuming green. To achieve these objectives, information-rich young consumers were depth interviewed. Subsequently, thematic maps were developed using thematic analysis technique. In that, three major themes emerged as (a) personal factors, (b) social factors, and (c) environmental factors. These findings have implications primarily for scholars as this paper advances prior literature on the theory of planned behavior by looking at green consumption through the lens of young Indians. Also, it has implications for marketers as they may formulate strategies to market their green products on the basis of the factors identified in the paper.

Abstract: The Regional Rural Banks (RRBs) are established with the motive to meet the financial needs of agricultural and non-agricultural sector. RRBs disburse loan to microenterprises, small and marginal farmers, self-helped group (SHG) and rural artisans. However, RRBs has been less effective to supply financial credit to needy most. Government of India has taken many initiatives to improve the performance of RRBs. The paper intends to evaluate the performance of the RRBs which are functioning in Eastern part of Uttar Pradesh in respect of profitability, Credit-Deposit ratio, NPA, Loan Disbursement and recovery of loans.

Keywords: RRB, NPA, Credit Deposit ratio, Loan disbursement

JEL Classification Number: G21

1. Introduction

Indian banking system is playing important role in the development of the country by mobilization of required resources. Indian households requirement mostly depend upon informal sector because of non availability of credit. In the informal sector, loans are given at high rate of interest with rigorous terms and conditions (Mishra, 2006). Thus rural people become economically weak because of debt burden by unorganized indigenous bankers. In the year 1975, the RRBs were set up for the purpose of providing banking service to the rural people, predominantly in areas where banking services was unavailable. The first five Regional Rural Banks (RRBs) were Prathama Bank, Gaur

Decisional factors driving farmers to adopt organic farming in India: a cross-sectional study

Md Sikandar Azam and Musarrat Shaheen
ICFAI Business School (IBS), Hyderabad, India

Received 30 May 2018
Revised 21 October 2018
Accepted 22 October 2018

Abstract

Purpose – The purpose of this paper is to carry out an empirical investigation of the role of various factors such as economics, social, marketing, cultivation and government in adoption of organic farming. Further, this study examines the factors that influence farmers' choice of adopting organic farming, based on their demographic classification such as education level, farm size, farming experiences and land ownership of the organic farmers.

Design/methodology/approach – To address the research objectives, the primary data were collected with the help of a structured questionnaire from 200 respondents. In this study, the QUAL–QUAN sequence of mixed method design was used. Four focus groups were conducted to identify the factors of organic farming adoption. Further, multinomial regression analysis was applied to analyze the differential impact of these factors in relation to the farmers' demographic classification.

Findings – The study found five major factors that affect the adoption of organic farming (economic, social, marketing, cultivation, government policy) in India. The study also observed that marketing and government policy factors were most crucial in influencing all types of farmers irrespective of their educational level. The farmers with more farming experience were more concerned about social factors. Similarly, the farmers using lease farms were found to be concerned about the economic viability of organic farming.

Social implications – This study suggests that without government support, the adoption of organic agriculture seems to be a highly challenging task in a situation, where majority of the farmers fall under the small and marginal category. Hence, to promote organic farming in a developing country like India, the government has to invest more in schemes where farmers should get exclusive training and support to strengthen their intention behind the adoption of the organic farming.

Originality/value – Based on the collective insights from the studies, the different stakeholders with interest in organic agriculture may frame necessary strategies to promote organic farming.

Keywords India, Demographic classification, Marketing challenges, Organic farming adoption, Types of farmers

Paper type Research paper

Introduction

After the green revolution, there is a constant increase of various chemical fertilizers and pesticide in agriculture production (Pimentel *et al.*, 2005; Carvalho, 2006), which has led to numerous challenges such as deterioration of human health, especially the reproduction and central nervous system (Duszeln, 1991; Singh, 2000; Bretveld *et al.*, 2006). The reliance of agriculture on synthetic chemical fertilizers and pesticides has emerged as a major factor, which affects public health and environment (Pimentel *et al.*, 2005). Moreover, previous studies have revealed that the excess use of chemicals degrades soil health and deteriorates environmental conditions (Taylor *et al.*, 2003; Arias-Estévez *et al.*, 2008; Fenner *et al.*, 2013).

For this reason, the inclination toward organic farming has increased over a period. Organic farming is considered as eco-friendly agriculture systems that largely avoid synthetic chemicals and fertilizers (Venkataraman and Shanmugasundaram, 1992; Roitner-Schobesberger *et al.*, 2008; Mahdi *et al.*, 2010; Suthar, 2010). Organic farming further refers to "sustainable agricultural production system." The term sustainable largely includes environmental, economic, and social sustainability (Padel, 2001). The inclination toward organic farming has led to reduction in the overall damage to the environment (Pimentel *et al.*, 2005; Carvalho, 2006) and further improved public health. Moreover, the ecological and

Dependence risk analysis in energy, agricultural and precious metals commodities: A pair vine copula approach

Satish Kumar, Aviral K. Tiwari, Ibrahim D. Raheem & Qiang Ji

January 2019

Abstract

We apply pair vine copulas, specifically the C-vine and R-vine copulas, to examine the conditional multivariate dependence pattern/structure and R-vine copula-based value-at-risk (VaR) to assess financial portfolio risk. We examine the co-dependencies of 13 major commodity markets (which include three energy commodities, six agricultural commodities and four precious metals prices) from 2 January 2003 to 19 December 2016. Dividing our sample into three sub-periods, namely pre-GFC, GFC and post-GFC, we find that the dependencies among commodities undergo changes in a complex manner, changing in different financial conditions, and that the Student-*t* copula appears on the maximum number of occasions, especially during the GFC period, signifying the existence of fatter tails in the distributions of returns. We further show that the co-dependencies computed using R-vine copulas are best suited to compute the portfolio VaR during the considered time period.

Keywords: R-vine; VaR; Dependence structure; Tree structure; Commodity markets

Abstract: Usage of mobile applications has become pervasive as part of digital transactions. If not all, most of the desired services (like shopping, banking, ticketing, etc.) are available ubiquitously with the advent of smartphones. The present study builds upon the model of the unified theory of acceptance and use of technology 2 (UTAUT2). The same model is extended to suit the context of mobile ticketing app adoption. Descriptive-cross-sectional research design is employed with purposive sampling to achieve the desired objective. A structured questionnaire is given to the 305 respondents working in information technology (IT) sector of Bengaluru city in South India. The structural equation modelling (SEM) is used to test the extended model using 'plspm' package of the R software. The results obtained has portrayed performance expectancy, price value, habit, trust, perceived risk, mobility and compatibility as the important factors which would affect mobile ticketing app adoption.

Keywords: UTAUT2; smartphone; mobile ticket; PLS-PM; structural equation modelling; SEM; R software; mobile app.

Empowering leadership and job performance: mediating role of psychological empowerment

Subhash C. Kundu and Sandeep Kumar
Haryana School of Business, Guru Jambheshwar University of Science and Technology, Hisar, India, and

Neha Gahlawat
Department of Human Resources, ICFAI Business School (IBS), The ICFAI Foundation of Higher Education (IFHE), Hyderabad, India

Received 28 April 2018
Revised 2 August 2018
14 November 2018
Accepted 27 November 2018

Abstract

Purpose – The purpose of this paper is to check the effects of empowering leadership on job performance of employees through the mediation of psychological empowerment.

Design/methodology/approach – Primary data were gathered from 418 Indian banking employees. Statistical techniques like factor analysis, multiple regressions and bootstrapping via PROCESS were used to analyze the data.

Findings – Initially, the results of multiple regression analysis revealed that empowering leadership behaviors have positive influence on psychological empowerment and job performance of subordinates. Further, bootstrap analysis revealed that the individual dimensions of psychological empowerment serially mediate the effects of empowering leadership behaviors on subordinates' job performance.

Research limitations/implications – The study indicates that the empowering leadership style is not applicable to Western culture only, but it is also very effective in high power distance cultures like of India. The major limitation of the study is that the data have been gathered from a single source. This may lead to common method variance.

Practical implications – In banking context, empowering leadership can improve the performance of employees by means of psychological empowerment. Training should be provided to organizational leaders in banks with special focus on facilitating the empowering behaviors among them.

Originality/value – The research studies on measuring the effects of empowering leadership on job performance through mediation of psychological empowerment are very limited.

1. Introduction

Employee productivity is very crucial for organizational performance and growth. More specifically for service organizations, where the performance of employees is a determining factor for higher growth, as the perceptions of the consumers regarding service quality are reported to be influenced by their interaction with the employees (Fong and Snape, 2015). It has been reported that employees cannot perform at their optimum level without full control or autonomy over their jobs (Spreitzer, 1995). Too much adherence to rules and regulations has adverse effect on service quality of employees (Kundu and Vora, 2004). Now, the era of traditional hierarchical structures, directing and controlling employees is gone; it is the time to enable and empower the employees (Chen *et al.*, 2011). Empowered employees have higher

Executive Compensation: The Critique and the Ideal

Purna Prabhakar Nandamuri and Radha Mohan Chebolu***

Consequent to the subtle and dynamic business environment and recent corporate failures, the focus shifts towards the emerging challenges for the social, moral and ethical objectives of corporate governance around the world. Executive compensation has emerged as the most contentious issue during the current decade. The exorbitant compensation packages of the senior managers and the resultant extensive gap between the remunerations of the senior managers and the employees and staff at the middle and lower levels has been the focal point for bitter comments from various sections of the society. Corporate boards seem to think that large pay packages stem from fierce competition for talented managers capable of leading global organizations through the turbulent environment. But critics argue that executives get rich at the expense of shareholders and other workers. However, the reality is that the average ratio of CEO pay to average worker pay was 335 times in 2015 compared to 40 times in the 1980s, making a mockery of the ethical ideals, such as Plato's, that no person should be worth more than five times of another. In this background, the present paper attempts to analyze the issue of executive compensation in the light of the ethical ideals.

Introduction

"As things stand now, many CEOs earn more in a single workday that the average worker makes in an entire year", observes Manfred Kets de Vries, INSEAD Professor of Leadership Development and Organizational Change. In the era of high profile corporate failures, Corporate Governance (CG) obviously draws public interest and especially the issues that have devastating impact such as executive remuneration, which emerged as a problem itself rather than serving as a mechanism to resolve agency problems. As per an economist's calculation, the histrionic progression of executive compensation during the 1990s was outpaced by only one thing—rise in the volume of research papers on the subject (Murphy, 1999). Executive compensation has become an international issue that routinely featured in front page headlines and cover stories of business periodicals and even an issue of debate in the Congress and television news

Factors Behind Dissuasion to Green Products Among Young Consumers: A Qualitative Study

Anitha Acharya
IBS Hyderabad, a Constituent of IFHE, Deemed to be University, India

The current estimated market share for green consumption is less than five percent worldwide, therefore it is very important to understand the factors that stimulate non green consumption among young consumers since this can promote environmental thinking at an early age and also to increase the demand for green products. In these circumstances, emerging countries like India have contributed very less to the consumption of green products and environmental effects. India is among the fastest growing economies in the world. With the increase in population as well as in disposable income, India is expected to see a growth in green consumption. However, that does not seem to be the case. Although, consumption of products is widely prevalent in India and has been growing steadily over the years, the same is not seen with regards to green products in particular. The present paper attempts to investigate the factors for less consumption of green products in the emerging market of India. 31 college students aged 21-25 years participated in the study. An unstructured interview technique was employed to find out the reasons for less consumption of green products among young Indian consumers. Thematic analysis was used to analyze the data. Four main themes namely incomprehension, extortionate, limited product range and non-availability emerged out of the study. The implications of these results for policy makers are discussed at the end of the paper. Keywords: Green Products, Thematic Analysis, Young Consumers

The main cause of emergence of green marketing is because of the environment and environmental related problems. As per American Marketing Association green marketing refers to marketing of products that are supposed to be environmentally safe. Thus green marketing subsumes an extensive range of activities like changes in the existing production process, transformation in how the product is packaged, and modification in the product advertisement. Green marketing is also termed as holistic marketing concept since the product and service consumption and disposition happens in a manner where there is less damage to the environment. Due to global warming and pollution customers and marketers are becoming increasingly sensitive to the need for switching into green services and products. Very few studies have addressed young consumers, especially in the context of green products (Lu et al., 2013; Smith, 2010). It is now 25 years on from the Brundtland report and also the euphoric discovery of the environment by the academics and research practioners, still nothing has happened to green marketing in the new millennium (Petrişor & Petrişor, 2014). In the past years, we have seen new products being launched in the market (Moser, 2015); many campaigns on green marketing (Ritter, Borchardt, Vaccaro, Pereira, & Almeida, 2015); many papers were presented in the research conference held by United Nations Industrial Development Organization (UNIDO). The fifth Green Industry, Conference organized by the United Nations Economic and Social Commission for Asia and the Pacific (ESCAP), the Government of Thailand, and United Nations Industrial

Impact of Informational Characteristics of the Recruitment Website on Graduating Students' Job Pursuit Intention:
A Moderated Mediation Study

Chetna Priyadarshini, IBS Hyderabad, IFHE University, Hyderabad, India
Sreejesh S., School of Management Studies, Cochin University of Science and Technology, Kochi, India
Rajneesh Ranjan Jha, IBS Hyderabad, IFHE University, Hyderabad, India

ABSTRACT

The purpose of this article is to examine the dimensionalities, mechanisms, and the conditions under which information characteristics of the corporate employment website influence job seekers' job pursuit intention and recommendation intention. Drawing on the stimulus-organism-response (S-O-R) framework, the data collected from 181 active job seekers posit that the effects of information characteristics, such as information relevancy, information accuracy, and information timeliness on organizational attractiveness are mediated by job seekers' attitudes towards the website, which in turn direct to create job pursuit intention and intention to recommend. Furthermore, it is also postulated that the relationship between the above-said characteristics and attitude towards the website is moderated by the perceived privacy concern of the job seekers. In addition, the article results also supported that the relationship between job seekers' website attitude and organizational attractiveness is moderated by perceived organizational reputation.

KEYWORDS

E-Recruitment, Intention to Recommend, Job Pursuit Intention, Organizational Attractiveness, Organizational Reputation, Perceived Privacy Concern

INTRODUCTION

During the last two decades, we saw rapid growth in the use of online recruitment, and this mode of recruitment witnessed the sudden transformation as a highly demanded platform for companies to get their workforce (Breaugh & Starke, 2000). It is also reported that e-recruitment has gained popularity amongst human resource managers during the last two decades (Braddy, Thompson, Wuensch, & Grossnickle, 2003; Pfieffelmann, Wagner, & Libkuman, 2010; Simon & Esteves, 2015). This surge in demand is due to the benefits it carries with respect to low-cost, shorter recruiting cycle time, better quality of response, and opportunity for global coverage regardless of employers' physical location (Galanaki, 2002; Ensher, Nielson, & Grant-Vallone, 2003; Sylva & Mol, 2009). In support with this, a survey among 26,874 students and graduates in the North American, European, and Asian countries supported that 74% of job seekers use company-owned websites as a job search platform, and they also supported that this platform is one of the important sources of job-related information (Potentialpark, 2013; Simon & Esteves, 2015). Thus, in order to attract the potential

Abstract

The objective of this paper is to examine the impact of tactical green marketing orientation (TGMO) and strategic green marketing orientation (SGMO) on small & medium scale enterprises (SMEs) performance and environmental performance. This study uses data from owners/managers from different Industry Associations and clusters in the SMEs domain in South India and uses a two-step approach for data analysis. In the first step, a measurement model was used to assess the validity and reliability of the measures, and then in the second step structural model was used to test the proposed hypotheses. The results indicate that tactical green marketing orientation impacts firm performance. To author's knowledge, this paper is unique in the terms of finding impacts of TGMO and SGMO on firm performance and environmental performance.

Keywords

Strategic Green Marketing Orientation (SGMO), Tactical Green Marketing Orientation (TGMO), SMEs Performance, Environmental Performance

1. Introduction

Although the green marketing thought has progressed since 1960s and early 1970s with extending stress over the impact of use and patterns of production on nature [1]; in any case, it has gotten enormous attention from late 1980s with a development in the component of green consumerism [2]. Until today, the concept has not been grounded broadly. Lee [3] remarked that the enterprises which at first conveyed green products were not productive in their undertakings. Ob-

Abstract: This paper investigates whether the economic growth of India is supportive to foreign tourist arrival or not during 1990:M5-2015:M4. We employ ARDL model by considering the variables such as foreign tourist arrivals, Index of Industrial Production (IIP) which is a proxy of Gross Domestic Product (GDP), inflation and exchange rate. In our empirical analysis, we find that inflation and IIP of India has a positive impact on foreign tourist arrival in the long-run. A 1% increase in economic growth will increase the foreign tourist arrival by 0.18%. The exchange rate carries expected sign and statistically significant in the long–run. In the short-run, we find that IIP and inflation of India are positively related to foreign tourist arrival. Our study supports the growth led tourist arrival of India. Hence, there is a need for policy intervention. The policy authorities should focus more towards promoting economic growth in order to attract more foreign tourist arrival into India. In this circumstance, transfer of the support and funds from tourism sector to another sector may not have a harmful effect on economic growth.

Keywords: Tourism, Economic Growth, ARDL Model, India

JEL Classification Number: C32; L83; O40.

I. Introduction

Tourism has a huge growth potential in India, and, being a labor–intensive activity, it has the capacity to generate employment on a large scale. For instance, tourism sector has a very high employment potential with approximately 90 jobs creation per Rs. 10 lakhs of investment (Annual report 2015-16, Ministry of tourism). At present, it is one of the 11

Motivators and barriers to sustainable food consumption: Qualitative inquiry about organic food consumers in a developing nation

Rambalak Yadav, Pankaj Kumar Singh ✉, Ankur Srivastava, Anees Ahmad,

First published: 10 September 2019
https://doi.org/10.1002/nvsm.1650

Abstract

The present research attempts to qualitatively explore the motivators and barriers of organic food consumption in the Indian context. The data were collected using semistructured in-depth interviews and analyzed using grounded theory. The theoretical sampling technique was used to interview 34 consumers who have purchased organic food in the past. The findings reported health consciousness, environmental consciousness, social identity, consumer ethnocentrism, and concern for farmers as the factors that motivate organic food purchase among consumers. The factors such as high prices of organic food, unavailability, trust issues, and limited marketing communications from the firms were identified as major barriers to organic food purchase and consumption. The study is one of the initial attempts to qualitatively explore the consumers' motivation for organic food consumption in the Indian context. The findings will help policymakers to devise suitable strategies so that they can effectively target the organic food choices by understanding the motivators/barriers, and promote the sustainable lifestyle in the society, as food consumption plays a crucial role in achieving environmental sustainability.

Abstract

Purpose of the Study: The fundamental determinants of entrepreneurship are entrepreneur and the society and the interlinked categories of human, financial, and social capitals. The present study takes a competency approach to test the human capital of women to understand the reasons for disparity in entrepreneurship. **Data/Methodology:** 164 management students—102 male and 62 female, interested to take up entrepreneurial career, were administered with PEC Self-Rating Questionnaire and the responses were analyzed with ANOVA and t test for difference between group means, followed by effect size measurement to derive practical significance of the relationship. **Findings:** Out of 13 entrepreneurial competencies tested, differences are observed for eight components and larger effect is observed only for two components while the mean differences were not more than 0.66 on a scale of 5.00. **Originality:** The originality lies in the findings that gender-specific competency-gap has been narrowing down in the Indian emerging economy.

The Impact of Demonetization on Indian Stock Market: A Sectoral Analysis of Bombay Stock Exchange

Surya Dev and Pranati Mohapatra***

In 2016, the Indian government demonetized the ₹500 and ₹1,000 notes, the two highest denomination currencies in the system. This was a rare event that affected the entire Indian economy. The present study aims to find out the impact of the demonetization on the stock market by applying the event study methodology on 19 sectoral indices of Bombay Stock Exchange. The period of study spans from April 1, 2015 to November 24, 2016. The estimation period is from April 1, 2015 to September 30, 2016. The Cumulative Abnormal Returns (CAR) are calculated for 25 trading days before the event day to 10 days after it, with November 9, 2016 considered as the event date. The results of the study show that demonetization had a positive impact on indices like the public sector enterprise (CPSE), power (SIPOWE), infrastructure (Infra), banks (SIBANKEX), healthcare (SI0800), metals (SI1200) and utilities (SPBSUTIP), and negative impact on indices like auto (SI1900), FMCG (SI0600), consumer discretionary goods (SPBSCDIP), realty (SIREAL), basic materials (SPBSBMIP), and tech (SIBTEC), while capital goods (BISO200), oil and gas (SI1400), energy (SPBSENIP), industrials (SPBSIDIP), and telecom (SPBSTLIP) indices were not affected. The findings also reveal that there is no leak about the event to the market as the CAR for the pre-event period is not significant for any sector.

Introduction

On November 8, 2016 at 20.00 IST, the Prime Minister of India announced on television that the Indian government would withdraw ₹500 and ₹1,000 notes from November 9, 2016. These notes accounted for 86% of the total currency in circulation at that time. (Dharmapal and Khanna, 2018). The announcement came as a surprise to the nation. The drive of demonetization was intended to remove black money and fake currency from the

Building Green Infrastructure Across University Campuses: A Research

Jaideep Motwani, Nikhat Afshan, Pradeep Charath

Abstract: ***Universities and corporations across the United States are investing in Leadership in Energy and Environmental Design (LEED®) green buildings as they are more economically, socially, and environmentally friendly. By means of a case study, this paper shows how a regional university in the Midwest part of the United States, has successfully incorporated sustainability as its core value and has made significant progress in all areas of the triple bottom line. This paper focuses mainly on its commitments to LEED® green building certification and green infrastructure. It discusses its journey and success in these two areas through a real case application of converting one of its oldest buildings on campus from a "no" LEED® certification to "Silver" LEED® certification. Throughout this paper, specific recommendations as to how these initiatives can be implemented across the globe, and the benefits that can be expected to be accrued, are presented.***

Keywords: ***Climate, Environment, Green Infrastructure, LEED, Sustainability***

I. INTRODUCTION

According to the Intergovernmental Panel on Climate Change (IPCC), a 1.5°C increase in global temperature relative to pre-industrial levels leads to substantial increases in the frequency and/or intensity of certain extreme events [1]. However, it also states that "stringent demand-side policies (e.g., tightened efficiency standards for buildings and appliances) driving the expansion, efficiency and provision of high-quality energy services are essential to meet a 1.5°C mitigation target while reducing the reliance on CDR" [2]. The United States Green Building Council (USGBC) establishes one such efficiency standard through its Leadership in Energy and Environmental Design (LEED®) certification program. This paper focuses mainly on its commitments to LEED® green building certification and green infrastructure. It discusses its journey and success in these two areas through a real case application of converting one of its oldest buildings on campus from a "no" LEED® certification to "Silver" LEED® certification. Throughout the paper specific recommendations, processes and best practices are provided. The authors recommend that these suggestions be integrated in infrastructure projects by both developing and developed nations. If the construction companies are truly committed to sustainability and would like to reap economic, environmental, and social benefits; focusing on LEED buildings and green infrastructure is the right way to go.

II. PRESCRIPTIVE LITERATURE

A. Submission of the paper

LEED® certification provides an independent validation of the highest level of sustainability in the construction and operation of a building. The certification is earned through the scoring of points as a part of a rating system across many categories such as Location & Transportation, Sustainable Sites, Water Efficiency, Energy & Atmosphere, Materials & Resources, Indoor Environmental Quality, Innovation and more. The construction or renovation project must adhere to prerequisites and credits across various measurements for building excellence "from integrative processes to building materials to indoor air quality" [3]. Prerequisites are mandatory elements which must be achieved in the course of a building project to be awarded LEED® certifications. Credits on the other hand, may be selectively pursued to gain points toward LEED® certifications. Based on the number of credits achieved, a "Certified", "Silver", "Gold" or "Platinum" certification is awarded to the building project.

The prerequisites and credits are part of an appropriately selected rating system that most matches the building project. The latest version of the LEED® certification (version 4.1) consists of six rating systems i.e. Building Design & Construction (BD+C), Operations & Maintenance (O+M), Interior Design & Construction (ID+C), Residential, Cities & Communities, Recertification. The rating system are, in practice, selected such that maximum number points are scored with the least amount of resource burden. With every new version, there is an increased stringency in terms of the level of standards of sustainability.

According to the International Energy Agency, the combination of buildings and buildings construction sectors are responsible for nearly 40% of total direct and indirect carbon dioxide emissions [4] which is represented in Figure 1. As stated by the IPCC, to simply limit the temperature increase to 1.5°C to there must be a significant decrease in the amount of these emissions as well as improvement in energy efficiency in the buildings and buildings constructions sectors. LEED® certified buildings, when compared to buildings with no LEED® certification, were found to emit 34 percent less CO_2, consume 25 percent less energy and 11 percent less water, and have diverted more than 80 million tons of waste from landfills [5]. This varies with the level of certification awarded with Platinum LEED® certified buildings having the best savings amounts. In addition to the sustainability aspect of LEED®, health and happiness of the occupants of the LEED® certified

IV. CONCLUSION

Adopting an initiative to prioritize the energy efficiency, efficient resource consumption and minimization of its carbon footprint through LEED® certifying its buildings, Grand Valley State University has been able to improve its campus' operational efficiency and to live up to its core value of Sustainability. The financial benefits through the energy savings and the added benefits from modernizing one of GVSU's original buildings with its historic value, may be replicated on any university's campus through becoming familiarized with and prioritizing the LEED® certification process. Institutions that serve to imbibe knowledge in future generations should value and adopt sustainability practices to express their focus on the future.

Can reviewer reputation and webcare content affect perceived fairness?

Amar Raju
Department of Marketing and Strategy, ICFAI Business School (IBS), Hyderabad, India

Received 17 May 2018
Revised 3 January 2019
11 July 2019
Accepted 15 July 2019

Abstract

Purpose – This paper aims to explore the effects of webcare content type and webcare source credibility on perceived fairness, in the presence of reputation of a reviewer as a moderator.

Design/methodology/approach – The experiment used a 2 (Webcare content type: Specific vs Vague) × 2 (Webcare source credibility: High vs Low) × 2 (Reviewer reputation: Good vs Bad) between-subjects design. ANOVA was used to test the hypotheses.

Findings – A significant main effect and interaction effect of independent variables was found on perceived fairness. The moderating role of reviewer reputation was also found significant in the relationship between content type and perceived fairness. However, reputation of the reviewer did not moderate the relationship between webcare source credibility and perceived fairness.

Practical implications – Marketers should respond to negative reviews by paying attention toward review and webcare attributes highlighted in the paper because doing so might satisfy the consumer.

Originality/value – This paper attempts to study a combination of webcare and review characteristics together on consumers' perceptions of fairness.

Paper type Research paper

Introduction

Today, consumers can access a variety of information about products and services, on various user-generated and brand-generated websites (Ward and Lee, 2000; Labrecque *et al.*, 2013). The opportunity for consumers to cater negative word of mouth (NWOM) in the form of online reviews has turned into a serious threat for marketers (Hennig–Thurau *et al.*, 2010) primarily because NWOM shared online is public in nature and involves a multitude of other consumers (Fournier and Avery, 2011). NWOM possesses potent harm-inflicting characteristics that can significantly erode image of brands and engender other negative outcomes like decreased brand attitude (Purnawirawan *et al.*, 2015), purchase intention (Lee and Youn, 2009), product trial (Huang and Korfiatis, 2015), sales (Cui *et al.*, 2012), brand loyalty (Vermeulen and Seegers, 2009) and brand choice (Chiou and Cheng, 2003). Furthermore, they are public in nature and involve multitude of other consumers thereby creating a cascading effect of negativity bias (Fournier and Avery, 2011). Therefore, marketers need to safeguard the reputation of their brands by effectively controlling the detrimental effects of negative reviews (Hennig–Thurau *et al.*, 2010; Van Noort and Willemsen, 2012), and for this purpose, companies have recently started to monitor and intervene in NWOM (Shankar and Malthouse, 2007), a practice commonly referred to as *Webcare* (Van Noort and Willemsen, 2012). Webcare has been defined as "the act of engaging in online interactions with complaining consumers by actively searching the web

CEO gender, firm performance and agency costs: evidence from India

Nemiraja Jadiyappa
Institute of Management Technology, Nagpur, India
Pavana Jyothi and Bhanu Sireesha
IBS-Hyderabad (IFHE), Hyderabad, India, and
Leila Emily Hickman
Anderson School of Management, The University of New Mexico, Albuquerque, New Mexico, USA

Abstract

Purpose – The purpose of this paper is to examine the effect of CEO gender on the performance of Indian firms and to explain the economic channel for any such effect.

Design/methodology/approach – Using a panel of 100 Indian firms, the authors test whether there is a significant difference in the performance – measured as return on assets (ROA) and return on equity (ROE) – of firms with male vs female CEOs, in both time and space dimensions, using the difference-in-differences approach.

Findings – The average ROA of the sample firms decrease by about 10 percent after a female enters the CEO role. This negative result remains robust in both the time series as well as cross-sectional analyses. The decline is also observed when using ROE to measure performance. Further, the authors show that this negative effect is associated with an increase in agency costs that is observed following the appointment of a female CEO.

Originality/value – Previous studies have produced mixed results regarding the effect of having a female CEO on firm performance, and the research to date has not explored the economic channel through which this effect occurs. In this study, the authors show that the decline in performance observed among Indian firms flows from an increase in agency costs under female management.

Keywords Firm performance, Gender diversity, CEO gender, Women CEO

Paper type Research paper

1. Introduction

Gender diversity is known to affect the performance of the corporate firms (Dezső and Ross, 2008; Adams and Ferreira, 2009; Khan and Vieito, 2013). However, there is no consensus regarding the direction of this effect. Some studies document a positive effect (e.g. Dezső and Ross, 2008; Francoeur *et al.*, 2008; Khan and Vieito, 2013), while others report a negative impact (e.g. Adams and Ferreira, 2009; Inmyxai and Takahashi, 2010; Singhathep and Pholphirul, 2015). Still other research has found no significant effect (Lam *et al.*, 2013; Liu *et al.*, 2014; Chauhan and Dey, 2017). One important observation regarding the extant literature is that the positive effects have been reported largely in the context of the developed world (Adler, 2001; Dezső and Ross, 2008; Francoeur *et al.*, 2008; Jurkus *et al.*, 2011; Khan and Vieito, 2013)[1], whereas the negative or insignificant effects tend to be reported in studies of developing countries (Inmyxai and Takahashi, 2010; Liu *et al.*, 2014; Singhathep and Pholphirul, 2015; Chauhan and Dey, 2017).

The conflicting results of prior literature motivate this research, which seeks to address two remaining gaps in this area of inquiry. First, there is a need to understand the effect of

CRUDE OIL IMPORT ELASTICITY OF DEMAND IN INDIA: AN EMPIRICAL ANALYSIS 1987-2016

Rashmi Ranjan PAITAL *,
Subhendu DUTTA**,
Aruna Kumar DASH ***

Abstract. This study analyses the crude oil import elasticity of demand during 1987-88 to 2016-17 by using Auto Regressive Distributed Lag (ARDL) cointegration technique. By using macroeconomic variables such as real crude oil price and real GDP an attempt is made to determine the long-run and short-run elasticities of crude oil demand in Indian context. In our empirical analysis, we found that the long-run income elasticity coefficient was found to be statistically significant with expected sign. It was found that the crude oil import demand is highly elastic to income in the long-run suggesting that a one percentage increase in GDP of India leads to a 2.89 percentage increase in crude oil import demand. It was also revealed that the responsiveness of international crude oil price changes in import demand are insignificant. We can say crude oil demand in India is very sensitive to income rather than price changes.One of the reasons might be full control of the retail price of the petroleum products by the Government of India during our study period. Indian government fully regulated the petroleum prices for which any changes in international crude oil price have not reflected the Indian retail price. Another reason is that as a growing economy, the government needs to import large quantities of crude oil irrespective of price changes to meet the rising domestic demand. The paper suggests that there is a need for a policy framework for reducing the domestic crude consumption and exploring alternative energy sources.

Keywords: Crude oil elasticity of demand, Income and price elasticity, ARDL, India.
JEL Classifications: Q41,Q43,C32.

1. Introduction

Understanding the sensitivity of crude oil demand to changes in prices and income has important implications as it not only impacts macroeconomic variables but also offers meaningful interpretations to policy makers. Demand for crude oil has bearings on its growth and it is the economic growth that fuels more demand for crude oil (Mallick, 2009). However, for a developing country like India high demand for crude oil, albeit inevitable, is one of the reasons for high current account deficit. The oil price surge not only increases the government's subsidy burden, but also widens the current account deficit and hence pressure on the rupee to depreciate. The rupee has depreciated 67% against the USD during the last 10 years. Looking at the current account deficit figure, it was evident that it widened to 1.2 % of gross domestic product, or $ 7.2 billion during July-Sept., 2017 from 0.6 % ($3.4 billion) in the same period a year ago. India is the fourth largest importer of crude oil in the world. India's domestic consumption of oil mainly depends imports. In 2017, its crude oil imports were worth $60.2 billion, which was around 7% of the total imports of the world.

Debapratim Purkayastha[1]

Abstract

There is growing concern among management educators regarding how to keep their graduate and undergraduate students engaged in their classroom. Even educators who rely on the relatively more engaging case method of teaching have expressed concerns over inadequate preparation of students, their reluctance to read the assigned case and their relatively lower attention spans. Graphic novels or comic book cases have emerged as one of the formats that some educators have started experimenting with. But do cases in comic book format aid learning? If so, how? What are the issues and constraints in designing and deploying such cases? Are there limitations? And what's the way forward? While reflecting on our experience of designing and deploying a comic book case, we find that this format may not be a silver bullet to tackle all the problems faced by instructors today, but it has great potential to drastically enliven any classroom.

Risk premium
Component GARCH-M
Uncovered interest parity

ABSTRACT

There is a general consensus emerging that the uncovered interest parity (UIP) does not hold or ex-post exchange rate change predicts the interest rate differential in the wrong direction. This paper provides a pioneer study to offer a risk premium based solution to the popular UIP failure using a dataset of 44 advanced and emerging currencies. We report that in the absence of risk premium, UIP failure is more prominent in emerging countries relative to advanced countries since only 34% of the total beta coefficients range between 0.5 and 1.5. Next, we include the risk premium in the main UIP equation using a component generalized autoregressive conditional heteroskedastic-in-mean (CGARCH-M) model and show that the results conform more to the UIP theory since 73% of the beta coefficients range between 0.5 and 1.5. Such a finding validates our argument that risk premium is the main factor responsible for UIP violation and including it in the main equation helps uncover the UIP puzzle, especially in the case of emerging countries. Overall, in the presence of risk premium, in most countries, ex-post exchange rate change bear a positive relationship with the interest rate differential as UIP predicts. This is our key contribution to the literature.

© 2019 Elsevier B.V. All rights reserved.

1. Introduction

The uncovered interest rate parity (UIP) theory postulates that a high interest rate currency would depreciate against those with lower interest rates such that the higher returns in high interest rate currencies are compensated by the equivalent loss associated with the currency depreciation. In other words, the ex-post exchange rate change should equal the interest rate differential between two countries (or a regression of ex-post exchange rate change on interest rate differential should generate a beta coefficient close to one). On the contrary, empirical research has reported a large and negative beta coefficient implying that high interest rate currencies generally have a tendency to appreciate, particularly over a short-term horizon (Aysun and Lee, 2014; Cho and Chun, 2019). This is the UIP failure, a condition when the exchange rate change is negatively related to interest rate differential (or forward rate is not an unbiased predictor of the future spot rate), popularly known as *forward premium puzzle* (Fama, 1984). This puzzle has now become a stylized fact and has been reported in many

Enablers of clinician involvement inclination, care delivery agility and clinical productivity

An empirical investigation

Samyadip Chakraborty
Department of Operations and IT, IBS Hyderabad, IFHE University, Hyderabad, India, and
Santanu Mandal
Department of Operations and Analytics, Amrita School of Business, Amrita Vishwa Vidyapeetham University, Coimbatore, India

Received 19 June 2017
Revised 14 June 2018
Accepted 20 June 2018

Abstract

Purpose – Healthcare services have enormous potential for growth in the country. However, the drivers of clinical productivity are yet to be explored. The purpose of this paper is to examine the effect of clinician buy-in, clinician ease of use, clinician work stream flexibility and device placement comfort on clinician' s involvement. The study further examines the effect of converged devices implementation and wireless portable devices adoption on care delivery agility. Lastly, the authors examine the influence of clinician's involvement and care delivery agility on clinical productivity.

Design/methodology/approach – Measures for the constructs were developed from extant literature and expert feedback complemented with pre-testing. Further, perceptual responses were collected from 221 doctors through internet surveys and were analyzed using partial least squares.

Findings – The study identified clinician's ease of use and workflow streamlining flexibility as key enablers of clinician's involvement. Findings further reveal that converged devices implementation and wireless portable adoption as prominent enablers of care delivery agility. Further, the authors found clinician's involvement and care delivery agility to have a positive contribution in enhancing clinical productivity.

Research limitations/implications – The study has collected perceptual responses from doctors practicing both in hospitals and private clinics and their perceptions have been based on their experiences at those specific institutions or sites, which may limit generalizability of the current study findings. This study incorporated only doctors and ignored other assistant staffs' perceptions who assisted and aided doctors in executing treatment procedures either in private clinics or hospitals.

Practical implications – The study has practical implications for enhancing clinical productivity.

Social implications – The study findings highlight the role of process focus and infrastructure focus on the human elements of involvement and agility which often play pivotal role for motivation for individual physicians and their productivity.

Originality/value – The study is the foremost to develop perceptual measures for several constructs in the healthcare services.

Keywords Involvement, Agility, Productivity, Ease of use, Clinic

Paper type Research paper

Introduction

While the Indian healthcare industry has enormous potential for growth (IBEF, 2017), delivering healthcare services at the right time is becoming a challenging task. While recent studies have increasingly focused on enhancing (Tang *et al.*, 2016; Batra and Pall, 2016; Fortenberry and McGoldrick, 2016; Jonas and Roth, 2017) healthcare performance, there is dearth of studies on the enablers of clinician involvement, agility in healthcare delivery and clinical productivity (Bisset, 2017; Halpern, 2017; Aitken *et al.*, 2002).

Clinician involvement inclination is a crucial factor that deserves empirical attention. Several factors actually contribute to enhance a clinician's involvement in his routine duties. With enhanced involvement, the speed of services delivery to patients is also enhanced.

Abstract

Massive growth in Industrialization and Gross Domestic Product (GDP) and a stronger relation between India and China have led to an increase in bilateral trade between the two countries. This paper examines the intensity of Intra-Industry Trade (IIT) between India and China using A-Index over a two-decade period (1999 to 2018). Further, the study examines trade patterns of commodities traded between the countries and how have they changed over the years. The study used data of 99 commodities and conducts a decade wise comparison. Recent developments and policy changes on the bilateral trade front between India and China have also been discussed. The research has important implications for policymakers, economists and business involved internal trade.

Keywords

India-China Bilateral Trade, Intra-Industry Trade, India-China Trade Deficit

1. Introduction

China and India, the world's most populous country, have seen tremendous economic growth in recent years. China's average GDP growth rate has been more than 9.5 percent from 1989 to 2019, and the country is expected to become the world's largest economy by 2030 [1]. On the other hand, India liberalized its economy in the early 1990s and has witnessed an average growth rate of over 6 percent since then [2]. The Asia-Pacific region has also seen tremendous growth from the late 1980s as the economies within the heterogeneous region have flourished. This can be attributed to the increased regional capital flow, trade, and other forms of economic and political interactions. The region has recognized

Abstract

Purpose: The purpose of the study is to find the market dynamics across executive garments rental service for men and to assess the importance of determinants of the growing consumer preferences for renting the garments for personal consumption. **Methodology:** Initially following a qualitative preliminary study and a review literature review, five factors are identified as feasible determinants of a preference for rental consumption. The determinants are examined through structured data analysis using multiple regression analysis and Cronbach's alpha. **Findings:** The results found that the constructs "importance of possession, convenience, and experience orientation" were significant. Price and trend were insignificant. **Originality:** This research is contributing to a new area of sharing economy, which has been preferred by the modern younger generation. The empirical evaluation among modern younger generation has proposed several determinants for garment rental preference.

Keywords

Shared Economy, Rental Service, Non-Ownership, Garment Rental Service

1. Introduction

A new industry based on sharing or renting Garments, electronics and small appliances is evolving in recent years in India. Youth preferences for fashions on rental are screaming up. Fashion goes beyond just clothes. It can be extended to bikes, mobiles, shoes, jewelry and even how you style your hair. The fashions are linked with youth life style; it also mixed up with youth social life. Using smart phones, following western food culture, wearing branded clothes, having fun in their regular life, etc. set forth the trend of anonymous life style and self-expression. People are more specific in distinguishing themselves from others in gar-

Exploring the Influence of Strategic Orientations on Tourism Supply Chain Agility and Resilience: An Empirical Investigation

Santanu Mandal[a] and D. Saravanan[b,c]

[a]Amrita School of Business, Amrita Vishwa Vidyapeetham, Coimbatore, India; [b]Faculty of Operations & IT, ICFAI Business School (IBS), Hyderabad, India; [c]The ICFAI Foundation for Higher Education (IFHE) (Deemed to be university u/s 3 of the UGC Act 1956), Hyderabad, India

ABSTRACT

Addressing role of strategic orientations, the study explores the influence of entrepreneurial, environmental, supply chain, technology, market and learning orientations in the development of tourism supply chain agility and tourism supply chain resilience. The study adopted a multi-unit study of different tourism supply chains. Using an online survey, 276 completed responses were gathered and analysed using Partial Least Squares. While entrepreneurial, supply chain, technology and market orientations were found to enhance tourism agility, environmental orientation was found to inhibit agility with learning orientation being not a prominent enabler for tourism agility. For tourism resilience, the study found environmental, supply chain and learning orientations as prominent enablers. Entrepreneurial and technology orientations, although had positive path coefficients, their effects were not significant. Market orientation had a negative but significant influence on tourism resilience.

KEYWORDS

Tourism supply chain; agility; resilience; strategic orientations; technology; market

Introduction

As a service supply chain, the tourism supply chain management faces more challenges in synchronising its operations and sustaining performance (Azmi, Hamid, Ahmad, & Ramli, 2017). Furthermore, with increasing uncertainties in a business environment, firms in such complex service supply chains are also facing a tough time satisfying the dynamic needs of their customers (Guo, Ling, Dong, & Liang, 2013). The industry has seen substantial development in the last two decades. However, tourism entities are in constant search for developing strategies that could lead to a sustained competitive advantage. Tourism firms are also on the way of implementation of newer information technologies that could enable them to achieve better coordination resulting in efficiency and effectiveness (Zhang, Song, & Huang, 2009). As the tourism industry composed of profoundly different entities regarding operations for example hotels, restaurants, travel agents, achieving coordination is often vital to competitive advantage.

There has been a constant debate regarding the tourism industry and a supply chain perspective on the same. However, more recent studies have established that a supply

Abstract

The purpose of the present study is to investigate the impact of the multiple dimensions of perceived value on customer experience metrics and loyalty. It also advances the concept of consumer value in the service industry, through modeling and measurement in service set up like banking. A web-based survey among 345 m-banking users was employed to gather data regarding the proposed set of constructs. A Structural Equation Modelling (SEM) technique was used to analyze the conceptual model and test the proposed set of hypotheses. The study results supported the fact that banking perceived value consists of five dimensions, such as Behavioral price, Monetary price, Emotional response, Quality, Reputation. The total configuration of these dimensions influences customer loyalty via the development of evaluation of customers towards banking services.

Keywords

Service Perceived Value, Customer Loyalty, Customer Service Experience, Banking Service, Indian Economy

1. Introduction

Customer perceived value over the years has gained a lot of importance from both academic community and practitioners due to its significant role in assessing consumer buying behavior [1] and for attaining a sustainable edge in the competitive market [2]. In fact, perceived value has become one of the critical business issues from the 1990s and continues to be one of the focal areas of research. Even though it has become a key factor of strategic management [3] and consumer behavior, due to the scattered and non-conclusive patterns of research

FINANCIAL INCLUSION AND THE RESILIENCE OF POOR HOUSEHOLDS

Vighneswara Swamy
IBS-Hyderabad, ICFAI Foundation for Higher Education, India

ABSTRACT

Financial inclusion through microfinance is found to promote resilience strategies of the poor as it has become more demand sensitive. Extant literature suggests that there have been perceptible changes in the living conditions of the rural poor mainly on the economic side and relatively on the social side owing to the role of self-help groups (SHGs). Further, it is widely believed that SHGs have had a positive impact on the poverty levels and standards of living of the poor and more particularly on the economic empowerment of women. Given this context, this study reviews the financial diaries of the poor and provides evidence of the impact of financial inclusion program on the poor beneficiary households in India. More specifically, this study answers the specific question: what is the impact of SHGs on the annual income of the participating poor households. Based on stratified random sampling this study uses the nearest-neighbor matching method to construct the control groups to estimate the program impact. Keeping in view the stabilization of the financial inclusion program, this study covers the financial inclusion beneficiaries in the Shimoga district of Karnataka state in India for the period 2010 – 2015. Using the Paired-Sample t-test and the difference-in-difference approach, the study notices a significant positive change in the income levels of the beneficiaries resulting in the resilience of the poor households. This study notices perceptible changes in the living conditions of the rural poor mainly on the economic side and relatively on the social side owing to the role of SHGs. Financial inclusion has a positive impact on the poverty levels and standards of living of the poor and more particularly on the economic empowerment of women. This approach has enhanced the resilience of the poor households as there has been an increase in the mean annual income to the extent of 72% from the pre-SHG situation to the after-SHG impact. The results suggest that the financial inclusion is more beneficial in strengthening the resilience of the poor households particularly that of the downtrodden classes in India. Further, these findings provide direction for policymakers and practitioners involved in building and measuring changes in household resilience. This study implies that effective implementation of financial inclusion program has greater benefits and a win-win situation for all the stakeholders.

INTRODUCTION

There is a growing interest in the potential of microfinance. We refer to microfinance as formalized financial services to low-income and otherwise disadvantaged households that are not served by the traditional banking sector. Approaches to microfinance exist in terms of the type of financial services offered, whether non-financial services are offered, the legal status of provider, ownership and management structures, the source of funds, lending mechanisms, and borrower liability (Dunford, 2001; De Aghion & Morduch, 2005).

Amarnath Mitra[2]

Abstract

The case presents a real-life situation faced by a research analyst to improve the performance of the funds under management by exploring the opportunities in the options market. Golden Chariot Capital (GCC), an investment firm with ₹500 million worth of assets under management, was failing in its objective to provide long-term capital appreciation with a steady income to its investors. GCC had its funds invested in publicly traded common stocks and corporate bonds. In the last 8 months, GCC failed to match up with the benchmark index. Ms Indira, a research analyst at GCC, was given the task to identify and suggest alternate avenues of investment. Indira brought forward a proposal to explore the derivatives market in general and options market in particular to improve the fund performance. After going through Indira's proposal, few fund managers at GCC were reluctant to expose their funds to the speculative market of options. Hence, Indira was asked to conduct a pilot study on the payoffs resulting from selected income strategies using options. As an illustration, Indira came up with five income strategies comprising covered call, covered put, short straddle, short strangle and long iron condor that involved either selling of options resulting in income or reduction of cost of the portfolio. The case will help the students to learn about options and their payoffs, as well as strategies involving various options. The case is equally useful for practitioners taking a balanced view of the market to develop appropriate options related to income strategies.

Keywords

Options strategy, covered call, covered put, short straddle, short strangle, long iron condor

Introduction

It was 31 August 2016. Ms Indira confidently sat across the plush conference room carefully glancing through the compiled reports. As she anxiously waited for the others to join in, she quietly rehearsed her opening pitch. Indira had joined Golden Chariot Capital (GCC), a mid-sized investment firm, only

Shiv Ratan Agrawal[1]
Divya Mittal[2]

Abstract

The study is an attempt to identify the preferred transparency components from customers' viewpoint which complements customer satisfaction and loyalty through assurance and reliability in the Indian restaurant business. The study focused on the traditional restaurant settings in Madhya Pradesh (MP), India. A total of 477 usable responses were gathered from customers who dine out frequently in the traditional restaurants. The study disclosed the relative importance of transparency dimensions to improve service-quality dimensions (assurance and reliability) that in turn complement customer satisfaction and loyalty towards the restaurant business.

Keywords

Transparency, assurance, reliability, customer satisfaction, customer loyalty

Introduction

In recent years, there has been a drastic change in consumer behaviour in the restaurant industry. Developing a high-quality dining experience is the prime motive of restaurant managers to attract more customers and retain the existing ones (Hoare & Butcher, 2007). If customers are satisfied, they may frequently come to dine and say positive words to others which ultimately will increase restaurant profits (Gupta, McLaughlin, & Gomez, 2007). Mattila (2001) studied that the net profit can be doubled to increase the percentage of loyal customers from 76 to 81 per cent in the restaurant business. But it has been noticed that customer dining trends have also been changed (Bijnen et al., 2002). These trends have forced a change in the entire food industry. Increasing competition in the food market is forcing traditional restaurants to change their operating strategies. The modern fast-food industry is not an exception, it has created a competitive environment for traditional restaurants (Momtaz, Alizadeh, & Vaghefi, 2013).

Abstract

The main purpose of this study is to investigate the impact of implementation of goods and services tax on national stock exchange (NSE) of India by considering nifty 50 index of NSE India and by applying event study technique. India embarked upon a new era of global practices by embracing and implementing goods and services tax on 1st July 2017 which was considered as the "event" for this study. Nifty 50 index daily data from 12th June 2017 to 21st July 2017 (t ± 14 days) are used for the study. The result of the study suggests that implementation of GST impacted nifty 50 index of NSE in a positive way resulting in abnormal returns which is statistically significant. The results of the study provide fresh evidences on our understanding about impact of structural changes on stock market in short-run to regulators, potential investors and high net worth individuals, fund managers, hedge funds and policymakers.

Keywords

National Stock Exchange (NSE), Nifty 50, GST, India, CAAR

1. Introduction

India embarked upon a new era of global practices by embracing and implementing goods and services tax (GST) on 1st July 2017. After 13 years' post initial thought process and consideration by Kelkar Task Force report related to value added tax and indirect taxes, Goods and Services Tax has been introduced in India [1]. Implementation of Goods and Services Tax is a major structural change and is believed to be a step in the right direction as opined by economists around the world from a long term perspective whatever its impacts in short run

Impact of IoT Adoption on Agility and Flexibility of Healthcare Organization

Samyadip Chakraborty, Vaidik Bhatt, Tulika Chakravorty

Abstract: This study addresses one of the most critical advents and highly sought after the technological breakthrough of today's service sector. Internet of things has been finding relevance in today's service sector as a significant impetus to superior service delivery and advanced service proposition to customers. Healthcare sector is also no exception. This study taking data from the Indian healthcare sector attempts to check the relationship between IoT adoption and proposed service delivery gains experienced by healthcare organizations (if any). The study based on the theoretical premises of cybernetic control theory and technology adoption model by Davis, Hypothesized that IoT adoption must positively influence flexibility and agility and in turn, flexibility positively influence readiness. The empirical evidence supports these hypotheses, and all the findings validate the propositions that healthcare organizations and the players and actors involved in healthcare consider IoT adoption as pivotal. Because the survey outcomes establish path analysis linkages through Structural equation modeling (SEM). SEM results highlight the significant positive impact of IoT adoption on flexibility and agility and in turn, even stronger association and effects of flexibility on readiness in the services offered by healthcare organizations. This study outcomes are very vital for hospital managers and upcoming healthcare practitioners as it establishes empirical evidence supporting IoT adoption as a helpful step and prominent success factor for better flexible patient care delivery and agility.

Key Words: IoT, Healthcare, Agility in Healthcare, Flexibility in healthcare, Technology adoption

I. INTRODUCTION

In the era of information technology and connected world, IoT is a stepping stone. It is a foundation stone in the industry 4.0 where all the things are wirelessly connected and coordinated, due to its capability. IoT has the potential to change its existing business and bring effectiveness in data collection and decision making because of the superior quality of data collection. The technology is used in too many organizations; be it production or services. Mc Kinsey & Company also reported the bright future for IoT and its use. According to the Mc Kinsey & Company report IoT will host the economy with manifolds increase in its investments. Today, many companies are investing in IoT based operations as it is easy to administer with the integrated devices, which will seamlessly and swiftly communicate and share the data.

Vaidik Bhatt, Research Scholar, Department of Operations & IT, ICFAI Business School (IBS), Hyderabad, The ICFAI Foundation for Higher Education (IFHE) (Deemed to be university u/s 3 of the UGC act 1956)

Tulika Chakravorty, Doctoral Scholar, Department of Logistics & Supply Chain (LSCM),

Wearable devices can have a plethora of opportunities which can be served for a business, which can be worn directly or can have loose contact with the human or operator (1) as operators can always see how devices are communicating with each other through mobile of computer application. All the transaction data are stored on the cloud.

Due to IoT's capabilities of effectiveness, security, efficiency, and decision making using free communications between conventional devices, it is recognized as a paradigm-shifting idea. With the help of IoT devices are seamlessly united, interconnected, and communicated across the environments and physical objects (2). With the pervasive interaction, things work simultaneously and reach a common goal with advanced services. (2 & 3). As per (4) Things and network both became more valuable when connected and interacted with each other.

IoT can provide enhanced product and services with the opportunity to create new businesses with its usefulness. On the other side, IoT has many more challenges yet to be addressed such as for reliability, standardization, network alignment, cost issues, etc. (5; 6; 7). Especially in a country like India, where companies and consumers both facing primary network and connectivity issues, adoption of IoT has a most significant challenge to increase the connectivity in the last mile. No matter how the incredible technology is if it fails to be assimilated into the market due to any reason, including consumer education (8). For implementation in India, educating a consumer is also a hurdle.

IoT can be used in service as well as production sectors; in fact, almost all the business can find the opportunities to use IoT (9). IoT is connectable to the digital communication platform, which facilitates a large amount of data to be stored (10). For each company, real-time data can be provided, which can be used for real-time analytics, and operational efficiency can be enhanced or increased (11).

This study broadly gives the idea and check the relationship between the IoT adoption and flexibility of healthcare organization because of IoT adoption and agility of healthcare organization because of IoT adoption. On the other end, the study also checks and confirms the established relationship between flexibility and agility in the context of healthcare organizations and hospitals. Our research explores the following objectives:

Objective 1: To check and establish a relationship of IoT adoption with the flexibility and agility of a healthcare organization

Objective 2: To check the established relationship between flexibility and agility in the context of the healthcare organization in the presence of IoT adoption

Abstract

We investigated the impact of Psychological Capital on the wellbeing of postgraduate management students. The relationship between two second order reflective constructs namely; Psychological Capital (hope, resilience, optimism, self-efficacy); well-being (positive health, distress) was tested by using higher order structural equation modeling with the help of IBM AMOS 20.0. Our study results confirmed positive significant impact of Psychological Capital on the wellbeing of postgraduate management students. We strongly recommend that instructors, counselors, management and administration must work collectively on conceptualizing, planning, and execution of educational and counseling activities/programs that aim cultivate students' sustainable psychological resources like Psychological Capital to facilitate constructive psychological functioning in academics. The study results are based on 109 postgraduate students from a privately owned business school.

Keywords

Psychological Capital, Hope, Resilience, Optimism, Self-Efficacy, Well-Being, Positive Health, Distress, Structural Equation Modeling

1. Introduction

Academic demands vary across educational institutions and success in the endeavors remains aspiration for all the students. In this context, teaching community is always concerned about the academic success optimization of students. Psychological capital facilitates positive student outcomes [1]. According to [2] "Psychological capital is a state-like positive motivational condition that arises from one's endorsement of hope, optimism, resilience and self-efficacy".

Abstract

The objective of this paper is to examine the impact of SMEs green supply chain practice adoption on SMEs firm and environmental performance. This study used data from owners/managers from different Industry Associations and clusters in the SMEs domain in South India and used a two-step approach for data analysis. In the first step, a measurement model was used to assess the validity and reliability of the measures, then in the second step structural model was used to test the proposed hypotheses. The results indicate that green purchasing impacts on SMEs firm performance and environmental performance, and eco design impacts on SMEs firm performance. To author's knowledge, this paper is unique in the terms of finding impacts of green purchasing and Eco design on SMEs firm performance and environmental performance.

Keywords

Green Purchasing, Eco Design, SMEs Firm Performance, Environmental Performance

1. Introduction

Environmental issues and the inclusion of green practices within the supply chain is a topic that has gained importance in academic literature. This interest is mirrored by the growing interest shown by Governments and Enterprises around the world about environment and climate change and the adverse impact arising out of mismanagement resulting in adverse impact [1].

Small- and medium-sized enterprises (SMEs) are responsible for a significant

Impact of terrorism on stock markets across the world and stock returns

An event study of Taj attack in India

Laila Memdani and Guruprasad Shenoy
IBS Hyderabad, ICFAI Foundation for Higher Education, Hyderabad, India

Abstract

Purpose – The purpose of this paper is to study the following: short-run and long-run associations between the terror-affected country's stock market index and other global countries' equity indices and gold; the volatility of stock market indices when one of the countries is affected by a terrorist attack; and the linkages between terrorism and the returns in the selected stock markets.

Design/methodology/approach – To study the impact of the Taj attack on other global indices, the authors selected top five countries' stock market indices, namely, FTSE, DJI, NIKKEI, SSEC and DAX. The short-run and long-run associations are also compared with gold. The authors used the autoregressive distributed lag model, LM test and bounds test for analyzing the short-run and long-run impact; ARCH family models to study the volatility impact; and the MAR model to study the impact on returns.

Findings – The authors found that all the global indices had a short-run association with the terror-affected country's benchmark index, i.e. BSE. Gold moved as expected, with it having a short-run impact on the terror-affected country. All the global indices except DJI have volatility of share price movement either positively or negatively. As the benchmark of the terror-affected country fell, NIKKEI, HSI, IXIC, DAX and CAC also fell; that is, it had a positive influence on the terror-affected country's index. Post the Mumbai attacks, DJI, NIKKEI, SSEC, DAX, BSE and CAC performed well in performance measure returns compared with the pre-attack period. Whereas, FTSE and GOLD performed well in performance measure returns in the pre-attack period compared with the post-attack period. GOLD proved that it is the best avenue to invest in, as it has only a short-term association with the terror-affected country's index.

Research limitations/implications – The authors studied the short-run and long-run associations with only five countries' benchmark indices.

Practical implications – The authors found that all the global indices had long- and short-run associations with the terror-affected country's benchmark index, i.e. BSE. Global indices like DJI, NIKKEI, SSEC, DAX and FTSE had a short-term association with the affected country's index. Gold moved as expected, with it having a short-run impact on the terror-affected country. All the global indices except DJI have volatility of share price movement either positively or negatively. As the benchmark of the terror-affected country fell, NIKKEI, HSI, IXIC, DAX, TSX, BVSP and CAC also fell; i.e., it had a positive influence on the terror-affected country's index. Post the Mumbai attacks, DJI, NIKKEI, SSEC, DAX, BSE and CAC performed well in performance measure returns compared with the pre-attack period. Whereas, FTSE and GOLD performed well in performance measure returns in the pre-attack period compared with the post-attack period. GOLD proved that it is the best avenue to invest in, as it has only a short-term association with the terror-affected country's index. In all the relationships were mixed with respect to terror attacks, and GOLD took the lead run out of all the associations it had in the 16-year time span from 2000 to 2016.

Abstract

Purpose – The purpose of this paper is to propose a theoretical model of business model innovation based on evidences from the past literature. The paper established a link between business model innovation (BMI) strategic flexibility, competitive advantage and firm competence.

Design/methodology/approach – The study was approached from a theoretical perspective using previous literature on BMI from 2000 to 2017, as per the recommendations of Tranfield *et al.* (2003). A total of 104 conceptual and empirical articles on BMI research spanning from 2000 to 2017 were analyzed based on different classification schemes.

Findings – The study proposed a theoretical model of BMI and discussed how the various internal factors, such as organizational culture, organizational structure, organizational inertia, leadership and technology drive BMI. The study highlighted how BMI gives companies sustainable competitive advantage. The study also highlighted that the BMI is an important predictor of firm performance and strategic flexibility. Further, the study found that the firm size and firm inexperience mediate the influence of BMI on firm competence.

Research limitations/implications – The study highlights how BMI can be a source of sustainable competitive advantage and enhance the firm competitiveness and strategic flexibility of a firm.

Originality/value – This study is the first of its kind which has developed a conceptual model on the various internal factors and consequences of BMI. The study highlighted how BMI is an important predictor of firm performance, competitive advantage and strategic flexibility.

Keywords Firm competitiveness, Competitive advantage, Business model innovation, Value creation, Strategic flexibility

Paper type Literature review

Introduction

The research on business models (BMs hereafter) has seen a huge surge over the last decade, primarily with the advent of the dot com bubble in early 1990s. It has become a subject of extreme importance to academicians as well the business practitioners (Casadesus-Masanell and Zhu, 2012; Chesbrough and Rosenbloom, 2002; Reeves and Deimler, 2011; Zott and Amit, 2007). Previous researches on business model innovation (BMI hereafter) has mainly focused on explaining the construct and on what makes it different from other constructs, such as strategy, entrepreneurship and information technology (Baden-Fuller and Morgan, 2010; Sabatier *et al.*, 2010; Teece, 2010; Zott and Amit, 2008). According to Teece (2010), BMI is simply the discovery of new or different mode of value proposition, value capture and value creation. BMI allows both the incumbents and the entrepreneurial firms to reconfigure the value creation mechanisms and increase the performance (Desyllas and Sako, 2013; Hartmann *et al.*, 2013b; Massa and Tucci, 2013). Researchers see BMI as the means of value creation and as a basis of firm's competitive

The authors would like to express their sincere gratitude to the anonymous reviewers and the editorial board for their valuable suggestions which has helped to improve the quality of the paper. This research work required high concentration and the whole hearted support of people from industry and academics without which it would have not been possible to accomplish. The authors therefore express their sincere thanks and gratitude to all the people who have been associated with this research.

Issues and Considerations for Effective Text Data Retrieval

D.Saravanan

Abstract: *Text data retrieval is one of the major domain for extracting knowledge from the stored data sets. Within the text information, the text meaningful numerical codes extracted unstructured process information is to make the free text associated with the unstructured nature of data mining in a different stream. Number of procedure is constructed to Performing this operations most effectively. This paper focuses one of the text retrieval process, experimental results verified proposed methods works well with most of the documents.*

Keywords: *Text Mining, Clusters, Text Clusters, Grouping of words, Text extraction.*

I. INTRODUCTION

The use of computers to handle the day-to-day operations of a wide range of databases and record companies involved from the foundation. Computers and the ability to efficiently store and retrieve data in the field of marketing, finance , operations, sales for costing and many more. From this available stored huge volumes of information it is difficult to analysis the data sets. For reducing the analysis process today everywhere they start using computers. Computers not only used for analysis it also helps to visualize the result in various users need format. Today many tools supports for their analysis and visualize the data sets one of that knowledge extraction or knowledge discovery process. Traditional methods such as data reporting is a necessity for many companies; Etc. In some cases, the information recovery process using these traditional forms that are difficult to recover it. Several clarifications for the long text documents and databases because of the formless structure of the data sets. Text information are collected from various sources so it is difficult to fit those data sets in particular structure or format. User wish to retrieve any content from the stored document based on the content available on the document or based on the presented terms in the structure. Based on the terms user can group the term and formed complete structure. Using this term handler can done the comparison with any relevant information's.

II. OVERLAYING DATA ONTO TEXT CLUSTERS

Analysis this data structure need preprocessing steps. Because of the nature of the data sets. Data sets are collected from multiple place first it need to be arranged in proper format. After this data sets are groped based on the similarities it helps the users to reduce the searching and processing time. Grouping this information reduce most of the users operations effectively. In the proposed technique this grouping described in encrusted procedure. A tree based structure helps solve the problem effectively.

Revised Manuscript Received on November 05, 2019.

D.Saravanan, Faculty of Operations & IT ICFAI Business School (IBS), Hyderabad

In this structure child nodes helps to form a clusters and root node helps to travel the information from the root to the last node in the structure. This travelling mechanism done either top to down or down to top fashion. It helps to transfers the needed information from the lower node to higher node and vice versa. This grouping mechanism helps gets the parental information. This information's gets transferred from parent to the child node effectively. Other than this tree structure this nodes are well distributed in nature instead of hierarchical structure. In this type of distributed separate nodes are done any operation based on his own, Here travelling or transformations are not done. Every node operations are done separately based on the information present on the node. However, with the increase in popularity of such networks, the attacks have also increased proportionally.

III. APPLICATIONS FOR TEXT EXTRACTION

Knowledge extraction or knowledge mining is the process of bringing the unknown fact or rule from the stored data sets. This source of information's it helps the user in various applications. This technology helps the various industrials functions with their available huge traditional data sets. Today this technology helps the industrial users to solve many applications such as predicting the customer behavioral patterns, risk involved in investment during the new startup operations, finding the errors on the operations and more functions through help of rule based functions. All this operations are done through help of the past result or past rule based operation. This analysis tool help the business to find the risk involved in the business. Some of the data mining functions helps the user to drive the business smoothly they are

A. In Survey Research

One of the major application of knowledge discovery in the area of marketing research. In market segmentation this process helps to understand the customer buying behavior, customer interest, market trend and more. It helps the responded to enter their respective thinking or judgment without any pressure on the previous knowledge or any hint.

B. Automatic Text Classification

One more important claim of text mining used in many mail server and creation of word document i.e. spontaneous text organization. This applications used in many mails with help of certain term or key words system automatically sends the mail to the spam folder. It avoids bulk of mails loaded in the user's inbox.

C. Used in Market Research Trends

Today most of the feed backs, customer query, customer complaints, product specification, user manuals, all are comes in the form of text. Applications such as in guarantee declare or any patient medical history record it helps to complete certain information

Maintaining the Quality of Work-Life Among the Employees of Private Banks

Dr. Niraj Kishore Chimote

Assistant Professor - OB and HRM, ICFAI Business School, ICFAI Foundation for Higher Education, Hyderabad Telangana.

Abstract: This empirical study deals with the concept of Quality of Work-Life and factors that are responsible for maintaining the Quality of Work-Life. The literature review highlighted that the employees have different perceptions on the variables that stimulate or hinder their quality of work-life. The variables used are impact of new technologies, flexible working arrangements, new working conditions, family friendly policies, leave arrangements, type of job and basic responsibilities. The research gap found here was the impact of these flexible arrangements on the quality of work-life has not been tested in detail and in totality. A questionnaire survey based on Literature review has been conducted on the private bank employees. The number of responses received for private banks are 388. Factor analysis was conducted to group the variables into factors which were taken ahead for conducting Multiple Regression Analysis. The employees of private banks in Gurgaon have indicated that their quality of work-life is affected by Flexible working procedures, New work conditions, Diverse Job Dimensions, Positive Work Benefits, Basic Responsibilities, Telecommuting, Any Other Schedule Flexibility, Study Leave, Maternity Leave, Prenatal Leave, Emergency Leave, Unpaid Leave, Counseling Services, Health Programs, Exercise Facilities and Any Other Employee Welfare Service.

INTRODUCTION

Private Sector Banks: Banks are one of the important components of financial system and basic instruments of circulating money.Banking plays an indispensable role in modern economy. Banking has changed dramatically over the past few years.Banks offer a wide range of products and services than ever before and deliver them faster and more efficiently. However, the central function of banking remains the same-mobilizing the savings (deposits and investments) of the economy towards investment.The primary activity of a bank is to act as a payment agent and borrow and lend money.It is also referred to as banking company.It consists of the activities undertaken by a bank to carry on its operations including receiving, keeping and lending money to the outsiders.

Private sector banks with their focussed business and service portfolio have a reputation of being niche players in the industry.The strategies of these banks have allowed most of them to deliver superlative levels of personalized services. With RBI allowing these banks to operate their businesses in urban areas, this statutory requirement has translated into lower deposit mobilization costs and higher margins relative to public sector banks.

Banking has made a shift from being traditional to going online. It is now marked by intense competition, narrowing margins, growing customer and regulatory pressure and rapid technological departments which have pressurized the employees to work even harder.

The newly developed facilities provided by banks to the customer are automated teller machine services, plastic money in the form of credit cards and debit cards, telebanking, anywhere banking, internet banking,mobile banking,relationship banking,life and general insurance,mutual funds, demat accounts,etc.

The growing health consciousness among the consumer and increasing awareness about organic food has led numerous opportunities for organic producers. Along with opportunities, there also arise challenges; thus, the main purpose of this study is to explore the marketing challenges faced by the organic and conventional farmers in India. The study also aims to examine the differential association of the marketing challenges on various farm sizes. The sample comprised 400 Indian farmers including both conventional and organic producers. A sequential form of mixed-method design, that is, qualitative–quantitative, was applied. In the first phase, an exploratory study was convened to find out the marketing challenges among organic and conventional farmers. In the second (quantitative) phase, binomial and multinomial logistics regression was applied to ascertain the differential impact of the marketing challenges on the type of farming and different farm sizes. The results of the qualitative analysis revealed six major marketing challenges faced by the farmers, namely, lack of warehousing facility, lack of price information, inadequate demand for crop, costly transportation, market price variations, and lack of government support. The results suggest there are significant differences in the marketing challenges faced by the conventional and organic farmers across farm sizes. This study is among the few to examine the marketing challenges of organic and conventional farmers in a developing country such as India. The findings will help different stakeholders to frame policies and build strategies to promote organic farming, which will lead to sustainable and responsible consumption in India.

1 | INTRODUCTION

"Sustainable consumption" has taken a center stage in the new millennium, as it brings about an array of benefits to consumers. Organic produce is considered to be sustainable as per the International Federation of Organic Agriculture Movement (IFOAM), which defines organic production as "a production system that sustains the health of soils, ecosystems and people ... it also combines tradition, innovation and science to benefit the shared environment and promote fair relationships and good quality of life for all involved" (IFOAM, 2005; 2017). It is important to notify that IFOAM also provided four basic principles of organic farming, which are good for health, sustenance to ecology, fair deal for farmers, and care for the environment that provides a concrete base of organic food; hence, it is considered as sustainable food (Pretty & Ward, 2001). It is a win-win strategy for both farmers as well as consumers (Lampkin, 1999). Also, past studies have found that nonprofit factors such as environmental concern, food quality, and health benefits were the major motives behind the adoption of organic farming (Pivato, Misani, & Tencati, 2008; Seyfang, 2006; Stagl, 2002; Thøgersen, 2010).

Organic production has been linked with the impressions of nutritional value, freshness, simple and healthy meals, local supply, direct associations between farmers and consumers, and the avoidance of synthetic chemicals and preservatives (Wier, Jensen, Andersen, & Millock, 2008). Therefore, the growing health consciousness among the consumers and increasing awareness about organic food has given

Mediating Role of Company Information in the Relationships among Perceived Risks and Purchase Intentions in an Online Retailing Context

Vikas Gautam[a] and Vikram Sharma[b]

[a]Department of Marketing & Strategy, ICFAI Business School, IFHE University, Donthanpalli, Hyderabad, Telangana, India; [b]Department of Marketing, IBS Business School, Gurgaon, India

ABSTRACT

The exponential growth of the online retail sector has attracted the attention of researchers across the globe. Understanding the consumer decision-making process in an online retail context is of vital importance to all online retailers. The objective of this study was to examine the direct and indirect impacts of perceived risks on consumers' purchase intentions in an online shopping context. This study applied structural equation modeling to test the study model with data from 234 samples. We found a significant negative full mediating impact of performance risk, financial risk, physical risk, and psychological risk on consumers' purchase intentions. Moreover, we found a partial mediating impact of social risk on purchase intentions. However, we did not find a mediating impact of time risk on purchase intentions. These empirical results may help online retailers to better understand their consumers, their intentions to purchase, and their level of risk perceptions. Accordingly, online marketers can frame contemporary strategies to attract retail customers, leading to greater profitability of the organization.

KEYWORDS

Company information; confirmatory factor analysis; exploratory factor analysis; mediation analysis; perceived risks; purchase intentions; structural equation modeling

Introduction

The popularization of the Internet has created multifold opportunities for various stakeholders across the globe. Its capability in accessing, organizing, and communicating information in a highly efficient and effective way has changed the direction of relationships between sellers and buyers. Consequently, new business models have emerged. According to Rowley and Slack (2001), the expansion of e-commerce offers great prospects for manufacturers and all channel members, but at the same time, it presents significant challenges to augmenting existing marketing strategies and understanding consumer buying behavior. Donthu (1999) concluded that consumers are accepting Internet shopping for various goods and services.

Mindfulness: an upward spiral process to combat depression

Abstract

Introduction: *Many studies proved detrimental effects of depression at the workplace in terms of reducing employee performance, increased absenteeism and other psychological, physical and mental distress. Organizations are driving specific interventions and training services to reduce potential negative outcomes of depression and one such intervention that needs to be researched is mindfulness. We postulate that a depressed individuals when engage in mindfulness practice, increases positivity and set an upward spiral processes that broaden the potentials that originate in mind and improves coping potential through positive reappraisal.*

Material and methods: *The participants (N = 155) enrolled in 8 week's Mindfulness Based Symptom Management (MBSM) program were contacted to take part in the study, 105 participants volunteered to take part in the study. The study used SPSS Amos to test the model.*

Results and conclusions: *The results indicate that mindfulness change reduces depression and the relation between mindfulness and depression was mediated partially through positive reappraisal. The study also tests competing model with change in rumination, although mindfulness program helped participants in reducing rumination it did not mediate the relationship.*

Psychiatry 2019; 16, 4: 178–184

Key words: *mindfulness, positive reappraisal, rumination, and depression*

Introduction

The turbulent, changing, complex, competing business environment is drowning employees into the death trap of depression. And many studies prove the detrimental effects of depression at the workplace such as reducing employee performance, increased absenteeism and other psychological, physical and mental distress. Globally 350 million people suffer from depression [1–3]. The highest category of people suffering from depression falls under the realm of corporate employees, around 42.5% of them suffer from depression. The reasons for depression are attributed to high competition to save job, low self-confidence, impractical expectations, and nutrient scarce diet as some of them. Personal resources, such as physical health, social closeness, mindfulness, and resilience can be built over a time to overcome depression. It is estimated that people living with depression has increased by 18.5% [3]. On the other hand organizations are driving specific programs, intervention, and training services to reduce the potential negative outcomes of depression [1] and one such intervention that is attracting the interest of researchers and practitioners is mindfulness. Psychological and medical literature has proven record of using mindfulness interventions to reduce distress, pain and negative emotions among the patients [4]. Bear's review [3] encourages researchers to expand the mindfulness-based interventions to organizational context as it has proven efficacious clinically. Mindfulness as defined by [5] is about "paying attention in a particular way; on purpose, in the present moment and non-judgmentally". Mindfulness has its origin from the Buddhist concept of Sati, which syndicates awareness, attention and memory with non-

ABSTRACT

This study attempts to identify the catalytic role of smartphone addiction in driving mobile wallet payment adoption behavior in emerging economies such as India. The research model was tested using a questionnaire-based response collected from 512 young consumers. The findings of structural equation modeling and multi-group analysis helped in understanding the influence and importance of the research constructs of perceived ease of use, perceived usefulness, and subjective norms in the adoption of mobile wallet payments by young people. The results indicated that the moderating effect of smartphone addiction played a substantial role in the adoption of mobile wallet payments. It has also revealed the importance of communication to the right consumer through proper channels and the appropriate age group. The outcome of the study can be utilized by marketers to frame strategies for positioning their services among an appropriate consumer base, thereby enhancing Internet business opportunities.

Introduction

Mobile payment systems have emerged as a game changer in the field of m-commerce and financial services. Within the scope of mobile payments, the concept of digital wallet or mobile wallet payment (MWP) is emerging as an advanced mode of carrying out financial transactions. Mobile wallets are a digitized version of traditional wallets that use space in mobile phones to accommodate digital money as well as digital cards. The benefits of mobile wallets include faster payment, fraud reduction, carrying less cash, saving time and effort, and so on. Since MWP is in its initial stage in India, MWPs accounted for only 4% of the transactions made by mobile payment consumers in 2016[1]. With the sudden increase in the user base of mobile subscribers (approximately one billion), the scope for mobile

Abstract

The objective of this paper is to examine the moderation effect of perceived benefits of loyalty programs on the link between store attributes and customer loyalty. This study uses data from loyalty program members covering different apparel retailers of Northern districts of Karnataka. In the first step variables were identified through literature review and interview method. In the next step, exploratory factor analysis was performed to identify the critical factors which measure customer loyalty in the apparel retailer's context. Finally, moderation analysis was employed using SPSS and results indicate that perceived benefits of loyalty programs significantly moderate the relationship between stores attributes and customer loyalty.

1. Introduction

In retailing, relationship marketing has gained importance in both academics and industrial fields as a strategy to manage, develop, and evaluate the relationship between retailers and customers [1] [2] [3] [4] [5]. Studies have shown that relationship-marketing outcomes are influenced by the relational constructs of trust, commitment, relationship satisfaction, and relationship quality influences buying behaviour [6], increases loyalty [7] [8] [9], and the expectation of continuing interaction and willingness to advice [10]. However, often retail business executives are disappointed with the performance of relationship marketing efforts [11] and customers may not want a relationship with a retailer because they consider it to be a burden [12].

Novelty seeking as driving factor for fashion apparel innovators: A qualitative investigation

Farrah Zeba[a] and Shirshendu Ganguli[b]

[a]Department of Marketing, ICFAI Business School, Hyderabad, India; [b]Department of Marketing, T A Pai Management Institute, Manipal, India

ABSTRACT

The objective of the paper is to comprehend the parsimoniously explored phenomenon of novelty seeking in the fashion apparel consumption through the lived experiences of fashion apparel innovators in the context of adult career women of emerging market. Interpretive phenomenological analysis is used to explicate consumers' everyday lived experiences of fashion apparel consumption. Based on the interpretation of the findings of the qualitative data, we endeavored to conceptualize novelty seeking as a multidimensional second-order construct comprising of four main dimensions of themes with three subdimensions viz. sensory appeal (Fairy tale experience, Stress anecdote, Self-confidence booster), finding the niche (Idiosyncratic attire, Self-expressing through clothing, Red carpet dress), clothes-aholic (Hoarding of the clothes, Ever lacking wardrobe, Impulse clothes purchase), and socially bound (Varied persona, First impression, Balancing effect). The conceptualization encapsulates how novelty seeking is driving innovative behavior in fashion apparel context. Novelty seeking is an interdisciplinary concept. Apart from psychology domain, several studies have been conducted across various industries in the consumer behavior domain, especially in tourism, hi-tech products, and telecom. However, in-depth research on novelty seeking in fashion industry is limited. Value of this article lies in developing a theoretical base of novelty seeking in fashion industry through lived experiences of consumers in emerging market.

Abstract

Online channel has redefined the way businesses were conducted and many e-travel firms were the first to exemplify. The purpose of this paper is to determine the key factors that influence consumers' intention to adopt online channel for train travel. The extended model incorporates the basic ingredients of TAM, TPB and Shim's model along with several external variables such as trust, convenience and involvement. Data were collected from 514 online travel customers. In the first phase, structural equation modeling was employed to determine the significant variables and in the second phase, the neural network model was used to rank the relative importance of the significant predictors identified by SEM. The results indicated that Trust, Perceived Usefulness, Convenience and Website as significant factors. Among significant ones, neural networks suggested "convenience" as the highest importance. The study indicates few marketing approaches that can help travel service providers to formulate optimal marketing strategies.

PREDICTORS OF CUSTOMER LOYALTY: A CASE OF INDIAN MOBILE TELECOMMUNICATION SERVICES SECTOR

Vikas Gautam, Department of Marketing & Strategy, ICFAI Business School Hyderabad

ABSTARCT

The current research investigated the predictors of customer loyalty in Indian Mobile Telecommunication Services Sector. The study model was estimated with the help of structural equation modeling Partial using Least Square (PLS) estimation method. The model was found fit with reference to indicators like; average path coefficient (APC=0.416, p<0.001), Average R Square (ARS=0.609, p<0.001), and Average Variance Inflation Factor (AVIF =2.533, Good if<5). The results of the study highlighted predictors of the customer loyalty with the help of significant path coefficients. Sample size comprised of 411 responses.

Keywords: Service Quality Attributes, Customer Value, Customer Satisfaction, Customer Loyalty, Mobile Telecommunication Services, Structural Equation Modeling.

INTRODUCTION

In order to enhance performance and bring operational efficiency, quality had received a very important place in strategic planning process (Babakus & Boller, 1992; Garvin, 1988; Phillips et al., 1983). The service industry also embraces this aspect of quality assurance. According to Rust & Oliver (1994) quality is instrumental in increasing customer value and satisfaction, which in turn leads to repurchase intentions. Also it ensures high profitability and returns on investments.

Mobile telecommunications market of India is growing at a very high volume. Indian telecommunication service market has grown from 543.20 million subscribers in 2009 to about 951.84 million subscribers in December, 2014, registering surprizing yearly growth rate (Telecom Regulatory Authority of India, 2014).

With reference to service marketing literature, Parasuraman et al. (1985) developed an instrument to assess the service quality and named it as SERVQUAL. Hartline & Jones (1996) developed a study model to investigate the delivery process of service quality. Authors also assessed the impact of service quality delivery process and customer value on behavioural intentions. In service contexts, Behavioural intentions of the customers can be assessed with the help of direct and indirect effects of service quality, customer value and satisfaction (Cronin et al., 2000). Customer satisfaction completely mediates the relationship between quality of services and customer loyalty (Caruana, 2002). Author suggested that customer value and reputation of the firm are important constructs for better understanding of customer loyalty. Therefore, an integrative model comprising service quality, customer value, customer satisfaction, and customer loyalty is required to decipher true relationships among these constructs.

Hence, with this background, this study expands the preceding researches conducted by numerous scholars and contains the model developed by Heskett et al. (1997), popularly known as Service Profit Chain. So, proposed conceptual framework for this study is depicted in Figure 1 below:

ABSTRACT

In this paper, we empirically examine the application of a host of techniques employed to measure price efficiency through long-range dependence using prices of monthly oil contracts. Using a series of methods, we analyse the volatility (daily absolute returns) of WTI and Brent oil prices for nine different contracts with maturity, ranging from 1 to 9 months, during the sample period of 1990-2017. We use bootstrapping to compute the confidence interval of the parameter of long-range dependence. Our results indicate that on an average, there is no long-range dependence in the volatility of oil price contracts at least at the 10-percent level of significance. Moreover, our results of rolling estimates suggest that the normality assumption does not affect the results considerably, and the results are robust to different rolling window sizes. While the results of the efficiency index suggest that the efficiency of oil returns vary with time, the futures contracts for Brent oil are found to be less efficient compared to WTI oil. The long-term futures contracts are more efficient than short-term contracts.

1. Introduction

Proponents of the market efficiency in its weak form argue that all historically available information is already absorbed into current prices, and therefore, one cannot predict future prices based on the past data. However, advocates of the efficient market hypothesis (EMH) have shown that asset returns, and their volatility exhibit long-range dependence (Connor and Rossiter, 2005; Los and Yu, 2008; Sensoy and Hacihasanoglu, 2014). Numerous problems, due to the presence of long-range dependence may emerge, such as, the ideal investment time may become uncertain for investors; the techniques applied for derivatives' valuation may be questionable; or the general tests of valuation based upon CAPM (Capital Asset Pricing Model) and APT (Arbitrage Pricing Theory) do not fit to a time-series with long-range dependence (Sensoy and Hacihasanoglu, 2014).

An extensive range of methods has been proposed to quantify such long-range dependence across asset classes. Rea et al. (2009) provide elaborative detail on the uses and accuracy of these methods, which include wavelets, periodogram, rescale range (R/S) statistics, de-trended fluctuation analysis (DFA) etc. We focus on host of techniques developed to estimate the long-range dependence including wavelets, the periodogram method, the semi-parametric method given by Geweke and Porter-Hudak's (GPH), the rescale-range (R/S) analysis, the De-trended fluctuation analysis (DFA) and modified DFA (MDFA), the quasi maximum likelihood (QML) and the centred moving average (CMA).

In particular, we follow Rea et al. (2009) in terms of gauging long-range dependence and extend it further on the lines of Fernandez (2011) through examining the existence of such dependence in the volatility series of the monthly contracts on WTI and Brent oil prices during 1990-2017. Whether the volatility of crude oil prices exhibit long range dependence is an important issue largely ignored in the literature. We use absolute returns as a proxy of volatility as in Cajueiro and Tabak (2005) and Tabak and Cajueiro (2007). Following Rea et al. (2009) and Fernandez (2011) we make use of bootstrapping re-sampling in our empirical application and extend these studies by constructing an efficiency index based on

Abstract

National Stock Exchange was ranked foremost for trading of individual futures stocks in the year 2007. Since then trading of stock futures has witnessed a tremendous growth in India. Futures and options instruments have not only emerged for trading but also to minimize the risk associated with stock price fluctuations. Index, stock futures and options are based on monthly, bimonthly and quarterly contracts which expire on last Thursday of the month. The scope for studying futures and options has gained prominence with the introduction of weekly option contracts of Bank Nifty and Nifty Index Option at National Stock Exchange. It is believed that longer-dated options are more sensitive to the risk of intertemporal shift in any economic environment while shorter dated options are comparatively less risk sensitive. The factors stated above stress upon the need to explore the impact of maturity date on futures and options. Thus, the present study makes an attempt to present a detailed review of literature in this context. The present paper is of threefold. Firstly, it attempts to draw inferences based on literature review in relation to impact of maturity effect on derivatives market in National Stock Exchange. Secondly, it also makes an attempt to bring out the effect of monthly and weekly futures and options contracts. Towards the end, based on the analysis efforts had been made to draw a meaningful conclusion which may be helpful to academicians as well as investors and also may provide scope for further research.

Abstract

Entrepreneurship ventures are not new to India. They have been instrumental in developing the socio-economic scenario in the country. Many leading business houses today in India were family enterprises in their days of beginning. The latest trend is that India is reaping dividend because of larger percentage of youth in its population, who are venturing into innovative startups. With startups coming up in large numbers, Indian employment scenario is changing very fast. An entrepreneur starts a venture with her own will and might, and thus there are many important factors in such drive. A budding entrepreneur can come from any walk of life. However, a trained technical and/or managerial person may make a difference. Encountered with a challenging situation, a budding entrepreneur often finds himself at cross roads in her journey of life. This paper explores entrepreneurial narratives and classifies them into multi-criterion decision scenario faced at an individual level by an entrepreneur. Following a qualitative-quantitative research (mixed) approach, the paper shows outcome across two stages. Using qualitative research methods (e.g. Focus Group Discussion), a list of factors affecting motivation of someone to start an enterprise (called "startup") is obtained. Subsequently, an analytic hierarchy process (AHP) model has been used under quantitative paradigm. This approach used Decision Analysis Module for Excel (DAME) add-in on MS-Excel to analyze responses obtained on the aforesaid list of factors from subjects with entrepreneurial mindsets. It was found that the risk taking ability depends on situation a youth is facing. However, turbulence in socio-economic environment diminishes the risk appetite. Strategic option such as "Focus" which is one when barriers to entry are higher and very select competitors can get into the spectrum; and it is better coupled with low exit barrier for a fail-safe and fast-exit plan.

Abstract

The paper identifies why there are more non-performing assets (NPAs) in the public sector banks (PSBs) than those in the private sector banks (PVSBs). It evaluates and reviews the policies and practices of scheduled commercial banks (SCBs) in terms of NPA management. It studies the causes of NPAs, such as ownership structure, credit terms, conditions and covenants, nature of loans, kind of borrowers, bank management practices and business cycles. The study suggests that PSBs have adopted liberal and loose credit policies, and have concentrated loans on borrowers and sectors, *i.e.*, huge credit exposures to a few large corporate borrowers and to a few sectors. It also finds that PSBs are subject to weak and mild regulatory and supervisory impacts on their operations and functions as these are owned by the Government of India. The managements of PSBs are indifferent to the success and performance of PSBs as there are no incentives or penalties for their performance and nonperformance. It is suggested that the PSBs should develop both the skills and practices towards credit and credit risk management. The government has to introduce flexible compensation package and incentives to the managements of PSBs linked to the performance so that it will improve profitability and reduce NPAs. The Reserve Bank of India's regulation and supervision should be ownership neutral.

Impact of Consumer Sentiment on Defensive and Aggressive Stock Returns: Indian Evidence

Rama Krishna Yelamanchili*

Department of Finance and Accounting, ICFAI Business School, IFHE-Hyderabad, Hyderabad, Telangana, India.
Email: yrk@ibsindia.org

Received: 25 May 2019 **Accepted:** 09 July 2019 **DOI:** https://doi.org/10.32479/ijefi.8368

ABSTRACT

This paper aims to study predictive ability of consumer sentiment of individual stocks. We consider two proxies for sentiment. One is explicit (Index of Consumer Sentiment [ICS]), second is implicit (Broad Market Indicator, S&PBSE500) and we pick 50 stocks randomly from S&PBSE500 index. We collect monthly data of all the variables. We group stocks into defensive and aggressive based on their beta value. We posit that sentiment indicators have contemporaneous co-movements and significant predictive ability of defensive and aggressive stocks. Results show contemporaneous co-movement exists between implicit sentiment indicator and stocks; contrarily no such relation exists between explicit sentiment indicator and stocks. We find causation from ICS to S&PBSE500. Both the sentiment indicators have causal relation with aggressive stocks but not with defensive stocks. Result show that only ICS has short-term predictive power of aggressive stocks. We find significant negative relation between consumer sentiment and aggressive stock returns in the following month. This implies high consumer optimism in current month results in price shrink of aggressive stocks in following month. We conclude that implicit sentiment indicator has no predictive ability of stocks and explicit sentiment indicator is able to predict only small number of aggressive stocks. We suggest investors not to follow sentiment indicators blindly because these indicators predictive ability is very limited that too with select aggressive stocks. We find aggressive stocks have high volatility and gain investor attention during optimistic and pessimistic market conditions.

Keywords: Retail Investor, Investor Sentiment, Stock Returns, Noise Trade, Predictive Analytics
JEL Classifications: G40, G41, G14, G17

1. INTRODUCTION

Equity stocks investors can be categorized into rational, arbitrageurs, and noise traders. Rational investors expect nominal return that is in excess of risk that they bear. They make investment decision depending on stock return, risk, and their risk appetite. Arbitrageurs search for undervalued or overvalued stocks in the market and buy or sell accordingly. Noise traders trade on noise in the market. Their investment decision depends on optimism and pessimism about the market movements. When market is optimistic, they pump funds into the market to make quick money. Moreover, when market takes down turn, they are the first to quit the market and create panic. In anticipation of abnormal returns, noise traders behave irrationally. Noise traders pay much attention to sentiment rather than fundamentals. Sentiment whether positive or negative may influence by many factors at firm level, macro level or global level.

There are multiple methods to measure investor sentiment. The sentiment measure may be explicit or implicit. In explicit sentiment measures, agencies collect sentiment data from consumers/ investors through surveys and obtain investors' opinion on market conditions. Implicit sentiment measures represent investor sentiment in the form of volume, volatility, advances/declines and overnight prices etc. Extant research use both explicit and implicit sentiment measures to explain market movements and returns.

Corporate Governance and Firm Performance in India: An Empirical Research

T.Sita Ramaiah, N.Akbar Jan, Radha Mohan Chebolu, Thangaraja Arumugam, A.K. Subramani

Abstract— The point of the exploration is to look at the relationship among corporate administration and firm execution. In this examination study board information of S&P BSE-100 listed organizations from 2011-2018 and LSDV board information model, 2SLS model are utilized as instruments for investigation of the information. Where Market to Book worth and Tobin Q are taken as the needy variable while size of the board, freedom with the board; compensation given for the board, advertiser shareholding are considered as autonomous factors. The result of the examination uncovers that great corporate administration practices actualized by organizations are decidedly identified with money related execution. The finding of the examination uncovers that littler sheets are probably going to be progressively proficient in observing execution (Fuerst and Kang 2000; Loderer and Peyer 2002). The present examination affirms that there is a negative relationship among board freedom and execution of the firm and higher level of outside executives negatively affect firm execution (Yermack, 1996; Klein, 1998).

Keywords: Corporate Governance, Firm Performance, Board Independence, Panel data analysis

I. INTRODUCTION

The key principle of a decent corporate administration structure is to expand the commitment of the firm to the whole economy, i.e., which includes all partners. With this definition, corporate administration describes about the relationship among investors, loan bosses, enterprises, budgetary markets, foundations and workers (Classens, 2006). Hereafter it is engaged that great corporate administration expands the consistency and execution of the firm by progressing in the direction of the practical financial advancement (Mallin, 2008). Great corporate administration makes ready for good associations with partners by and large, and hence builds the work relations and furthermore the air for development in social angles like natural security (Bebchuk et al., 2009). In this way, the examination attempted to review the relationship among execution of the firm and corporate administration with regards to developing countries are essential to improve appreciation of the subject. In the previous couple of looks into has been embraced to examine the impact of corporate administration on execution of the firm (Chakrabarthi et al., 2007; Desai and Dharmapala, 2011) and there are uncommon research with respect to Indian setting which investigated endogenous between connections among corporate administration, firm execution, proprietorship and capital structure. From now on, the present research centers around impact of corporate administration on firm execution out of sight of creating nation. The focal point of the exploration is to research the relationship among corporate administration and firm execution of S&P BSE-100 filed organizations and the investigation additionally investigates the between relationship among corporate administration, firm execution, possession, and capital structure.

II. AIM OF THE STUDY

The purpose of the examination is to audit the causal relationship among corporate organization and firm execution for the associations enrolled in Bombay Stock Exchange (S&P BSE-100) and besides to take a gander at the between relationship among corporate organization, capital structure, ownership and execution of the firm.

III. METHODOLOGY

3.1 Data Description

The examination looks at and surveys the relationship among different factors related to corporate management and implementation of the firm at S&P BSE-100 enrolled firms. The information for the examination is accomplished. The board informational collection involves 752 perceptions which spreads time arrangement information from 2011-18 and cross segment units of 94 examples firms of the considerable number of factors. Where the required samples is allocated into two major categories of industry such as manufacturing and service and are grouped in to four sub-industry wise as information technology, financial services, pharma and manufacturing firms, in order find out differences of corporate governance characteristics industry-wise and promote the analysis with findings

Value Co-Creation as a Dialectical Process: Study in Bangladesh and Indian Province of West Bengal

Abstract
The process by which technological innovation is adopted and diffused within an industry persists as a key research interest in the existing literature. Furthermore, the innovation and diffusion of ICT (information and communications technology) in general and smartphones in particular are viewed as a useful resource to support and foster socio-economic wellbeing in developing countries. As such, sustainable design and development of smartphone industry in developing world and their contribution to socio-economic wellbeing has drawn significant research attention. In the current study, we explore and analyse various factors and their inter-relationships that initiate, support and disseminate technological innovation within the smartphone industry in Bangladesh and Indian province of West Bengal who share linguistic, historical and cultural ties. Drawing on the concept of co-creation of value we develop a dialectical perspective toward multi-stakeholder involvement in smartphone industry's creation of value. Through in-depth interviews with senior government and private sector employees, industry experts, researchers, and small and medium enterprise owners, we conclude that the development of ancillary industries, contextually appropriate apps and innovation by small enterprises and inter-industry collaborations contribute to current and future innovation and sustainable development of smartphone industry.

Keywords Dialectic co-creation · Smartphones · ICT for development · Smart technology

1 Introduction

It is argued that the adoption and use of digital technologies can enable consumers in developing countries to improve the quality of their lives (Kapoor et al. 2015; Pick et al. 2014; Heeks and Jagun 2007; Bayes 2001) as Internet and mobile telephony have the potential to contribute to human development and increase market efficiency (Thapa and Sæbø 2014; Donner and Escobari 2010; Rashid and Elder 2009). Thus ICT (information and communication technologies) for development research recommends contextually appropriate design and use for ICT to deliver the benefits of technological innovation to various parties within the socio-economic spheres of developing countries who may have different needs and wants compared to those of the developed world (Thapa and Sæbø 2014; Dey et al. 2018).

Furthermore, it has been acknowledged that innovation requires the visualisation of a range of potentialities that may seemingly be hidden, but now are believed to be accessible (George et al. 2012). Organisations can create new markets utilising these opportunities (Prahalad 2010). With globalisation and advancement of information technology, competition in the global markets has intensified, forcing the organisations to do something better and different, both commercially and socially, to meet the stakeholder needs and maximise their profits in the global value chain (Karnani 2011; Khavul and Bruton 2013; Vogel 2005). This orientation implies the crafting of entirely new business solutions, sometimes in a co-created and co-technological manner, in relation to buying, manufacturing, packaging, marketing, distributing, and

Governance structure and performance of private family firms

Tarun Mukherjee[1] · Vighneshwara Swami[2] · Wei Wang[3]

Published online: 4 January 2019
© Academy of Economics and Finance 2019

Abstract
A debate exists on the issue of whether a governance system is value additive or even necessary for a privately-held firm. One side of the debate suggests that, since agency problems do not exist in a small private firm, it does not need a costly governance system. The other side argues that a private firm indeed faces agency costs in the form of altruism and, therefore, could extract net gains from a governance system. In this paper, we empirically investigate whether a good governance system crates or destroys value of private family firms. We first demonstrate that a multifamily firm encounters larger agency costs stemming from inter-family conflicts, and therefore, has larger incentive than a single-family firm to institute a superior governance system. We then show that a multifamily firm, owing to its better governance system, outperforms its single-family counterpart.

Abstract

This research is an effort to empirically understand the relationship among the three modes of International Technology Transfer (ITT)—1) Foreign direct investment (FDI), 2) joint ventures (JVs) and 3) trade. A common factor as representative of technology stock is derived using a number of scientific journal publications, engineering exports, number of trademark registered and patent filed in India by native as well as foreign applicants. A simple linear regression (using ordinary least square method) is conducted on the technology stock and foreign direct investment, joint ventures and trade indicators. Results represent that FDI, JVs and trade are affecting the domestic technology stock gain. SPSS 17® is used for factor analysis and transformation of indicators. EView6® is used to make data set stationary and run regression analysis.

1. Introduction

Prior to 1990, the restricted capacity of Indian firms was maintained by the quota system. The rational for the quota system commonly known as "License Raj" was socialist agenda of central government. In the early 1990s the Indian markets were opened via liberalization, privatization and globalization. This allowed domestic and foreign firms to get access to Indian market. By mid-1990s the Indian economy was fairly open for firms to enhance capacity, introduce new products and raise funds from market (domestic as well as international). The foreign firms were allowed to enter Indian market. These firms enter Indian market via trade in goods and services, FDI, licensing and joint ventures. It has been a significant time since Indian market was opened for investments foreign firms (with exception of critical sectors like defense, aerospace and nuclear power). During this period, the presence of international firms is expected to have a significant technology transfer (both intended and spillover). India currently is the 2nd fastest growing economy. It is critical for the policymaker to frame and come up with

Special Section: Time in Perspective

Time perspective as an antecedent of trust in a manager and its impact on employee attitudes

Ritu Gupta[1] and Douglas A Hershey[2]

Abstract

A manager's personality has been demonstrated to have an influence on employees' level of trust. However, it has yet to be demonstrated whether trust levels are based, in part, on a manager's time perspective. In this study a between-subjects scenario-based experimental approach was employed, which involved administration of six different scenarios. Each described a hypothetical manager who exhibited one of six time perspectives: past positive, past negative, present hedonistic, present fatalistic, future oriented, and balanced. Participants (N = 630) rated the extent to which the manager could be trusted and what they believed their attitude would be if they were to work for the individual. Findings revealed that managers who exhibited a past positive, future oriented, or balanced time perspective were perceived to be more trustworthy and had higher ratings of trust than supervisors with a past negative or present fatalistic orientation. A path analysis model further demonstrated that employee perceptions of trustworthiness (an antecedent of trust) covary with time perspective, as did employee attitudes (a trust-linked outcome). This research contributes to the development of theory by shedding light on the way interpersonal perceptions shape employee attitudes. From an applied perspective, the findings suggest interpersonal perceptions influence workers' attitudes toward their manager and their job.

Time perspective is a personality trait that not only influences one's behavior, but also shapes one's judgments, decisions, and actions (Gupta et al., 2012; Lewin, 1951; Nuttin and Lens, 1985; Zimbardo and Boyd, 1999). It has also been suggested that there exist different types of time perspectives (Zimbardo and Boyd, 1999), which may differentially shape an employee's perceptions of his or her supervisor, depending on the nature of the trait displayed. Perceptions of time perspective are potentially important in the workplace because employees' trust in a manager is influenced by the supervisor's personality, which in turn, has an influence on employee attitudes and performance (Brower et al., 2000; Politis, 2003; Simons, 2002). Furthermore, because different time perspectives are associated with particular types of behaviors and personal characteristics, it is important, from a theoretical perspective to explore managerial time perspective as a way of extending current theories of leadership efficiency. And from an applied perspective, it is crucial for firms to take into consideration how a manager's time perspective influence employees' perceptions of

Abstract: The objective of the study is to examine the relationship between critical success factors of total quality management implementation and business performance. A survey method of data collection was adopted to collect primary data from small-scale manufacturing organisations in a regional manufacturing cluster. The two-step structural equation modelling approach is followed to examine the relationship between critical success factors of total quality management implementation and business performance. The study identified seven critical success factors such as top management commitment, customer focus, strategic planning, process management, people management,

REDUCING ENTREPRENEURIAL FEAR OF FAILURE THORUGH MINDFULNESS

Raghavendra Sode Kalaa Chenji
ICFAI Business School, Hyderabad India

ABSTRACT

The study inspects mindfulness practices to reduce entrepreneurial fear of failure and further test the mediation effect of positive reappraisal between mindfulness and entrepreneurial fear of failure. Startup entrepreneurs registered with incubators were targeted through email, explaining the concept and importance of mindfulness. The participants were administered mindfulness program short version for 7 days by a trained instructor. Data was collected pre- and post-mindfulness intervention to examine the proposed model. Entrepreneurial fear could be reduced by practicing mindfulness, further, it also proved that positive reappraisal partially mediates the between mindfulness and entrepreneurial fear of failure. The study proved that through practice of mindfulness an entrepreneur can overcome the fear of failure and pursue the entrepreneurial activity to become a successful entrepreneur. The study explored untouched aspect of reducing the fear of failure through mindfulness-based intervention and contributes to the entrepreneurial literature.

Keywords: Entrepreneurial fear of failure, mindfulness, positive reappraisal, mindfulness program

INTRODUCTION

The changing paradigm of business environment is characterized by fluctuating economic growth, rapid technological changes, and recession, lead policymakers, governments across the globe to emphasize on self-employment and entrepreneurship (ILO, 2011). Entrepreneurs are known to recognize and exploit new opportunities. Globally, entrepreneurship is considered as a shared concern (Degeroge, 2016) due to increased entrepreneurial activities, educational programs (Bechard & Gregorie, 2009; Boyles, 2012; Kakouris, 2015) and as a means to create new business and jobs (Boissin, 2013). Failure looms over enterprises and more often a new venture end as a failure (Mitchell, 2011). Inevitably there is increased interest among researchers to examine the aspects of entrepreneurial failure (Baron, 2011; Pretorius, 2011; Cacciotti,2015) over success.

Efficiency

ABSTRACT

This paper reflects an attempt to measure the effect of mergers on efficiency of banks in India. Five major merger cases in India during 2000 to 2005 were examined to measure the pre- and post-merger efficiency to achieve the purpose of this study. Secondary data were obtained from bulletins and reports of the Reserve Bank of India (RBI) and Data Envelopment Analysis (DEA) was employed to calculate efficiency. The study found efficiency gains in four merger cases except the merger of the Oriental Bank of Commerce with the Global Trust Bank. The findings of the study suggest that market driven mergers boost and forced mergers lead to a decline in the efficiency of banks.

Contribution/ Originality
This study compared the post and pre-merger performance of the Indian commercial banks, particularly the analysis is based on five main mergers of banking industry. The results are mixed in the terms of market driven mergers and forced mergers.

Constructive usage of WhatsApp in education sector for strengthening relations

Shiv Ratan Agrawal
IBS Hyderabad, a Constituent of IFHE, Deemed to be University, Hyderabad, India, and
Divya Mittal
Department of Management Studies, Sri Sri University, Cuttack, India

Abstract

Purpose – The purpose of this paper is to explore the key role of WhatsApp as WhatsApp-customer relationship management (w-CRM) for strengthening the relationship in the education sector. The paper is exploratory in nature.
Design/methodology/approach – A self-administered questionnaire was developed with 20 items for four latent constructs. The data were collected from the undergraduate and postgraduate students of Sri Sri University, Cuttack (Odisha), India, based on convenience sampling. The hypotheses were tested through regression and correlation analyzes.
Findings – The findings of the study unveiled that the relationships between students and teaching staff, students and non-teaching staff, and teaching and non-teaching staff can be strengthened by the adoption of w-CRM.
Practical implications – WhatsApp can be an inevitable tool to emerge with traditional CRM system to facilitating the advance implementation of w-CRM in the service industry.
Originality/value – Although the present study is limited to one of the service sectors, i.e. education, it unfolds the scope of implementation of w-CRM in different services. Especially, small and medium enterprises can implement this tool hand to hand to maintain strong relationships with customers.

1. Introduction

Social media has become an essential part of our life, especially among students who known as Generation Next (James and Levin, 2015). As a user of social media, we can share pictures and videos, choose to likes and comments on others' contents and create our own stuff on the same platform (Statista, 2015). Due to the phenomenal growth of social media, the dominance of the social customer relationship management (CRM) system is growing on the traditional CRM system (Malthouse *et al.*, 2013). Nowadays, a study on social media-based CRM practices is one of the most emerging research areas among the scholars and academicians (Ahani *et al.*, 2017). Based on the existing literature, social CRM can be defined as using at least one kind of social media such as Facebook, Hike, Instagram, LINE, Linkedin, Twitter, YouTube, Viber, WeChat, WhatsApp, etc., to build and maintain a long-lasting relationship with customers (Ainin *et al.*, 2015). In fact, many service firms and institutions across the world have been attracted toward social media-based CRM practices for dealing with different business issues (Abedin, 2016). This paradigm shift in business society opens a gate to harvest this opportunity for all of us.

Undoubtedly, education is one of the most key service areas which reap instantaneous benefits from new developments in the information and technology sector (Malhotra and Bansal, 2017). It is crucial to understand that the role of education is "communication" at the right time to the right person in the right place (Barhoumi, 2015). Advanced developments in mobile technology are capable to transform our whole education system in this direction with an inexpensive way. Presently, different smartphone-based instant messaging (IM) apps, and, especially WhatsApp have upgraded our ways of communication (Choudhary *et al.*, 2015). Consequently, WhatsApp has emerged as a major IM app before us (Hashim *et al.*, 2015).

Maram Srikanth[2]
Debashis Acharya[3]

Abstract

The present study is an attempt to assess the 'probability of incurring loss' of manufacturing firms in India during different phases of business cycles. We use data on a sample of 87 manufacturing companies for the period from 2002 to 2014 (comprising 1131 firm years). We use the panel logit model with the dependent variable derived from the return on assets to empirically test the hypothesis. Besides, we use firm-specific variables and macroeconomic variables as independent variables in the model. Firm-specific variables, namely size of the firm and interest coverage ratio and macroeconomic variables namely exchange rate, bank credit, inflation, interest rate and index of industrial production are statistically significant in predicting the probability of incurring loss of the firms during the study period. The results are important for investors, corporate houses, managers, lenders, policymakers and the research community as business cycles have a visible impact on all functional areas of an organization. Our study assumes significance because of the importance of macroeconomic variables in the strategic decision-making of the corporate sector in general and manufacturing firms in particular.

Manufacturing firms, business cycles, panel logit, India

Introduction

Business cycles are very common in the journey of any free market economy. Business cycles affect the macroeconomic environment, which in turn influences firms' sales, profitability and cash flows (Bhattacharjee, Higson, Holly, & Kattuman, 2009; Hol, 2007). Though the macroeconomic environment

Abstract

This paper explores the social inclusiveness of agricultural extension services in India. We estimate the probability and frequency of farmers' access to extension services and resulting changes in crop income across different caste groups. The literature suggests that caste-based social segregation manifests in various spheres of life, and perpetuates economic inequality and oppression. An econometric analysis of nationally-representative data from rural India verifies this with respect to the agricultural sector. Farmers belonging to the socially-marginalized castes are found to have a lower chance of accessing the public extension services, primarily due to their inferior resource-endowment status. Contacting extension agents at least once increased the average annual crop income by about 12 thousand Indian rupees per household, which is equivalent to 36% of the annual crop income of those without access to extension services. There exists significant impact heterogeneity. Farmers from the socially-marginalized castes hardly benefited from accessing the extension services. Based on these observations, we have developed a number of policy recommendations that could improve the social inclusiveness of agricultural development strategies in rural India.

Introduction

The dissemination of improved technologies forms an integral part of agrarian development in the Global South [1]. The speed of technology diffusion is determined by an array of socio-economic and institutional factors, amongst which the human capital of farm households is particularly decisive. Agricultural extension is one of the important means to enhance human capital through the transfer of locally-relevant information from a global knowledge-base [2,1,3]. An examination of the Green Revolution literature indicates that the enhancement of crop productivity and rural livelihoods has been achieved not only through the increased use of material inputs, but also through the dissemination of information on crop production methods and farm management practices [4–7]. The relevance of information as an input to the agricultural production process has continued to increase over time, particularly in the

Rambalak Yadav[2]

Abstract

The case is about EnviGreen Biotech which produces an alternative to plastic bags that is 100 per cent organic, biodegradable and recyclable. The case focuses on how the concept of sustainability is being incorporated into the organization. Currently, the EnviGreen bags are manufactured in India and are being exported to South East Asian and Middle East countries. Along with this, the company has also started manufacturing bags for the organized retailers in India, but still to enter into the retail consumer market. The case ends up with the discussion that whether EnviGreen Biotech should enter into the B2C market in India or not as the products are costlier than plastic bags and price sensitive nature of Indian consumers is a major concern.

Keywords

Biodegradable, eco-friendly, EnviGreen, marketing, plastic bags, sustainability

Introduction

It is a world free from moth and rust and full of color, a world largely built up of synthetic materials made from the most universally distributed substances, a world in which nations are more and more independent of localized naturalized resources, a world in which man, like a magician, makes what he wants for almost every need out of what is beneath and around him. (Yarsley & Couzens, 1945)

Evidence for Life Satisfaction Among Dual-Career Couples: The Interplay of Job, Career, and Family Satisfaction in Relation to Workplace Support

Neha Gahlawat[1], Rina S. Phogat[2], and Subhash C. Kundu[2]

Abstract

Using data from 406 dual-career couple employees in the Indian context, the current study has indicated that favorable perceptions of workplace support variables like work–family balance actions, supervisor support, coworker support, work autonomy, and role clarity lead toward heightened life satisfaction among dual-career couples. However, this relationship is not as simple as it seems. Interestingly, none of the five workplace support initiatives are directly related to the life satisfaction among employees. Bootstrap results via serial mediation model establish that job satisfaction, career satisfaction, and family satisfaction mediate individually and serially the relationships between various workplace support variables and life satisfaction. Being first of its kind, the study has potential to prove beneficial in improving the lives of employees if thorough consideration is given to workplace support in relation to various types of employees' satisfaction.

Estimating Loss-in-Output as a Cost of a Financial Crisis

Vighneswara Swamy

Published: June 2019

The global financial crisis caused a huge loss of economic output, depletion of financial wealth, extended unemployment, psychological consequences and other significant costs. A quantitative exploration of modelling loss-in-output as a cost of financial crisis using macroeconomic indicators is useful in understanding the impact of a crisis. The conservative estimates for India suggest that, over a period of ten years, a financial crisis can cause a cumulative loss-in-output ranging from 48% of GDP to 59% of GDP after discounting at 0.025 and 0.07 respectively. Intermediate values are also explored. Estimating loss-in-output in terms of GDP simplifies estimation of the impact of financial crises. Policymakers and regulators must be more prudent and alert in sensing the early indicators of a financial crisis and act swiftly in containing its perils.

Estimating Loss-in-Output as a Cost of a Financial Crisis

Vighneswara Swamy[*]

Key Points

- The global financial crisis caused a huge loss of economic output, depletion of financial wealth, extended unemployment, psychological consequences and other significant costs.
- A quantitative exploration of modelling loss-in-output as a cost of financial crisis using macroeconomic indicators is useful in understanding the impact of a crisis.
- The conservative estimates for India suggest that, over a period of ten years, a financial crisis can cause a cumulative loss-in-output ranging from 48% of GDP to 59% of GDP after discounting at 0.025 and 0.07 respectively. Intermediate values are also explored.
- Estimating loss-in-output in terms of GDP simplifies estimation of the impact of financial crises. Policymakers and regulators must be more prudent and alert in sensing the early indicators of a financial crisis and act swiftly in containing its perils.

Introduction

There is strong evidence that the destructive effects of a financial crisis, as widely understood, extend to causing loss of output by percolating its viral effects through direct and indirect channels. While the direct effects are clearly visible in all aspects of the production function, its indirect effects are beyond quantification. Primarily, financial crises lower the incentives for investors by shrinking demand for products and services and simultaneously

Exploring the antecedents of co-creation in hospital-supplier relationship: an empirical study on private sector hospitals in India

Samyadip Chakraborty

Department of Operations and IT,
IBS Hyderabad,
IFHE University,
Hyderabad-501203, Telangana, India
Email: samyadip@ibsindia.org

Abstract: Criticality of healthcare has always been a matter of huge concern. With increasing focus towards value-based patient-care service, hospitals are struggling between continuously spiralling cost and providing increased access to quality care-services. Interactions and relationships among the hospital stakeholders have become very crucial, especially in hospital-supplier relationships. Extant literature has thrown light on interaction, systematic orchestration and collaborative ambience as essential needs for achieving value co-creation. The current study analyses the antecedents of co-creation in hospital-supplier relationship context from a service-dominant-logic (SD-logic) perspective. The study is further underpinned with theories like relational-view and relational-coordination-theory. In this empirical research, the relational antecedents of co-creation have been validated. This study further establishes the well-known DART framework (dialogue-access-risk assessment-transparency) linkages with trust, commitment and care-service orchestration (CSO) as antecedents to co-creation activities based on 229 responses from private tertiary-care Indian hospitals using structural equation modelling (SEM).

Keywords: healthcare; co-creation; hospital-supplier relationship; supply chain management; trust; interdependence; DART; care-service orchestration.

Abstract: The objective of the study is to analyse the impact of the asset quality on the financial performance of the Indian microfinance institutions. Using the financial data of 76 'for-profit' Indian MFIs from the microfinance information exchange database for the period 2006 to 2013, we observe that the quality of asset deteriorated significantly during the period of study and it has impacted the performance of the MFIs negatively. The commercialisation of the MFIs resulted in predatory lending and unfair debt collection practices ensuring better repayment rates. These practices, however, resulted in client defaults and an increase in both portfolio-at-risk and write-off ratio. The study, therefore, suggests that the MFIs need to re-examine and realign their operations so that social parameters are given due importance in every aspect of lending activity. This will ensure that MFIs achieve their social objective as well as ensure higher repayment rates.

Keywords: microfinance; financial performance; asset quality; panel regression; India.

Impact of Bank Credit on GDP Growth: An Empirical Evidence from India

Tamma Koti Reddy

I. INTRODUCTION

Indian Banking system has gained much strength after the nationalization of commercial banks in 1969. With the introduction of the Lead Bank scheme, the Commercial Banks started to extend its banking network in the rural areas so as to provide the benefits of banking business to the rural people. The single striking feature of the post nationalization banking scene is the rapidity with which the branch network has multiplied itself. The rate of branch expansion has been unparalleled anywhere else in the world (M Gopalakrishna 1989). Reforms in the banking sector were initiated at a time when public sector commercial banks were facing many problems including lack of transperancy and low profitability. Indian banking industry has been passing through the phase of technological development inorder to improve the efficiency of the financial system (PK Dhar 2015). The factors like Planned economic Growth, Raise in money supply,Nationalization of Banks in 1969&1980, banking sector reforms in 1991, caused for rapid progress in the Indian Banking system.

Credeit is essential for Economic growth,, but to exploit fully the opportunities for improved well-being that growth offers, it needs to be properly managed . Credit provided by the scheduled commercial banks have contributed for growing economic activities in the country since 1969. There was higher growth interms of SCBs Bank credit and Economic Growth particularly during the reform period with yearly fluctuation. The performance of the banking system has been improved during 2018-19 as NPA ratios declined and credit growth accelerated. However, financial flows to the economy remained constrained because of decline in the amount of equity finance raised from capital markets and stress in the NBFC sector(Economic Survey 2018-19). Capital to risk-weighted asset ratio (CRAR) of Scheduled Commercial Banks' increased from 13.8 per cent to 14.0 per cent between March 2018 and December 2018 largely due to improvement of CRAR of Public sector banks (PSBs). Scheduled Commercial Banks' return on assets (RoA) decreased from 0.21 per cent in 2017-18 to 0.03 per cent in 2018-19 while their return on equity (RoE) decreased from 2.41 per cent to 0.4 per cent during the same period(Economic Survey 2018-19).Credit growth has come down from 13.8 per cent in November 2018 to 11.9 per cent in April 2019. Scheduled commercial bank's credit has increased from a mere Rs. 1163 billion in

Price Discovery Behavior of Spot and Futures: Evidence from Pre- and Post-Crisis Periods

VDMV Lakshmi and Medha Joshi***

The study attempts to examine if there is any shift in the price discovery behavior of spot and futures markets between pre-crisis period and post-crisis period. All those stocks which are available for trading in futures segment since the launch of futures trading on November 9, 2001 to December 31, 2018 have been considered for the purpose of the study so as to understand the behavior of the stocks in price discovery process in pre-crisis, crisis and post-crisis periods. To measure the price discovery effects, the study uses Johansen's cointegration and Vector Error Correction Model (VECM), as it helps in investigating which market (spot or futures) leads in discounting the potential value of the information. The study also applies Hasbrouck's information share approach to investigate the proportion of contribution of each market to price discovery. The results indicate that there is evidence of futures market leading spot market during pre-crisis period. However, the leading role of futures disappeared during the crisis period. It may be attributed to the fear of market participants to trade in high levered instruments. Rather, there is evidence of leading of spot market during the crisis period and also after the crisis period. On the whole, it is observed that spot market plays a dominant role in price discovery as against the general premise that futures being low-cost instruments lead in price discovery. This phenomenon may be attributed to relatively low participation of informed institutional investors in Indian futures segment.

Introduction

India's major stock exchanges, National Stock Exchange (NSE) and Bombay Stock Exchange (BSE), launched futures trading in individual stocks in November 2001. The purpose of Securities and Exchange Board of India (SEBI) in introducing future trading is to bring informational efficiency through price discovery mechanism. When a stock is available for trading in both spot market and futures market, market participants are expected to approach

Consumers' Perception toward Private Brands with Reference to Grocery Products

Dwarakanath Siriguppi, Santosh Kumar Alreddy

Abstract: Organized retailing in India has witnessed a massive growth in recent times. Big corporates have entered into this growing sector. The Private brands i.e., the brands promoted by the organized retailers are the major revenue drivers for these retail firms. These organized retailers predominantly having presence in the segments such as apparels, food and grocery, healthcare, personal care, lifestyle products etc. In the majority of the product categories established national brands are doing extremely well.But the private brands are generating revenues for the retailers mainly in the grocery segments. The important demographic variables like income, occupation and lifestyle have a key role in shaping up the perceptions of consumers of private brands. Private brands are a head of national brands with regard to addressing the price sensitive consumers when compared to national brands. The success of private brands is closely associated with the store image. The national brand manufacturers have invested huge capital on packaging innovations to draw the attention of the consumers. The quality savvy consumers prefer national brands over the private brands. The organized retailers are focusing much on value added services to have competitive advantage. This study found that consumers perceive private brands also offer better quality and greater value for money like national brands especially grocery products.

Key Words: Consumers' perception; Private brands; Store loyalty, Value for Money, Store identity

I. INTRODUCTION

The Indian market is experiencing the emergence of the organized retailing. The introduction of private brands in the product assortment of organized retailers has greatly increased within the last few years. Indian Retail market is poised to grow up to 1200 billion in 2021(IBEF September 2019).

Its contribution to the GDP is 10%. India is the largest retail market in the entire world with around 10 million retail shops. This sector is being expanded through different store setups. The Indian governments' FDI policy is highly instrumental in attracting more domestic players and MNC's to foray into organized retail sector. The leading Indian giants like TATAs, Reliance, Aditya Birla group, Bharti group, Future group have already began their operations in to organized retailing business. To sustain in the intense competition the organized retailers are working various strategies.

Development and introducing the private brands are one such strategy adopted by these firms. Private brands account 5 % sales of FMCG product category.

Revised Manuscript Received on November 15, 2019

Dr.Dwarakanath Siriguppi, Assistant Professor, Department-Marketing & Strategy, ICFAI Business School (IBS), Hyderabad,

Dr.Santosh Kumar Alreddy, Assistant Professor, Department-Marketing & Strategy, ICFAI Business School (IBS), Hyderabad

In India, as organized retailing accounts 9% (Amit Gugnani, Gautham Jain, 2018) of the total retail market, private branding strategy is in nascent stage for most of the retailers. Players such as Big Bazaar, Westside and Food World, Reliance, More have come up with private brands in different product categories.

Private brands

A variety of private brands are being launched by the retailers in various product categories. They are mostly seen in the categories such as apparels, food and grocery, healthcare, personal care, lifestyle products etc. The important drive behind introducing private brand is to spawn store loyalty. This can be achieved as the private brand is only available at a particular outlet. This in turn offers these retailers competitive advantage over other rivals.

Branding of Private Brands

Private branding strategy certainly increases the store image and organization's profitability. In order to attract more consumers, retailers are positioning private brands par with national brands. However, consumers consider private brands alternatives and inferior to national brands, Dolekoglu, C. O., (2008). To change the consumer's perception toward private brands the retailers are coming with innovative marketing strategies. For example Shoppers Stop's brands like Vittorio Frattini, Kashish are positioned as premium brands. The firms are creating ample of shelf space for their own brands

II. REVIEW OF LITERATURE

Many researchers have taken up work on the private branding which is the emerging area of research in the organized retailing. It was found that consumers prefer both private brands and national brands.

Frank and Boyd (1965) and Meyers (1967) opined that perception of consumers plays a key role rather than the individual or economic variables. Present trends reveal that the factors such as involvement, experience, and familiarity, and psychographic and demographic influence purchase behaviour of the store brand (Kara et al., 2009). Consumer preferences, cultural background, diverse economic cycles, and variables such as working condition, social class, and family size can also impact purchasing behaviour(Cuneo et al., 2015).Retailer name on product help the customers in greater brand recall and may lead to favourable perception of both retailer and private brand.(Lace Choi & Patricia Huddleston(2013).Perceptions of the private brands are effected by consciousness of the consumers(Kara et al., 2009).Perceived quality, self-perception of the shopper , and perceived risk are the intuitive characteristics of the consumers (Jin and Suh, 2005).Even though, consumers have a better perception of retail store products, but this may lead to the perception of higher

Over-indebtedness and Its Drivers among Microfinance Borrowers in India

SOUGATA RAY, SUSHANTA KUMAR MAHAPATRA, SHYAM NATH

In microfinance markets worldwide, over-indebtedness among borrowers and households has emerged as an important concern. Over-indebtedness, measured in terms of sacrifices made by households, is high in both rural and urban India. Factors statistically significant in explaining over-indebtedness are the borrower's age and financial literacy; the household's entrepreneurial activity, income level, and spatial location; and the proportion of dependent members in a household.

The authors express their sincere thanks to the anonymous referee for constructive comments and suggestions, which helped in improving the quality of the paper significantly. An earlier version of this paper was presented on 19 January 2018 at the Institute for Financial Management and Research, Sri City Campus, Chittoor District, Andhra Pradesh. The authors are grateful to the participants for their valuable comments.

Sougata Ray (*raysougata6@gmail.com*) teaches at the Department of Management, Amrita Vishwa Vidhyapeetham, Amritapuri, Kollam, Kerala. Sushanta Kumar Mahapatra (*sushanta.mahapatra@gmail.com*) teaches at the IBS Hyderabad, Department of Economics, IFHE University, Hyderabad. Shyam Nath (*snathg4@gmail.com*) is a researcher at the Amrita Center for Economics and Governance, Amrita Vishwa Vidhyapeetham, Amritapuri, Kollam, Kerala.

Microfinance or microcredit represents small loans made to the weaker sections of the population to help them improve their livelihood. Microfinance institutions (MFIs) engaged in providing these loans have been able to challenge the traditional banking system by using the concepts of joint liability and group lending. Over the years, microfinance programmes have emerged as an important factor in reducing poverty and bringing about social change.

In India, the movement took shape when the National Bank for Agriculture and Rural Development (NABARD) took up a pilot project, along with some non-governmental organisations (NGOs), of formally linking self-help groups (SHGs) with banks for meeting the credit requirements of poor households in rural India. The high demand for such microcredit propelled many different types of organisations into the sector, including non-banking financial companies (NBFCs). These organisations started with the genuine objective of helping the poor and low-income people but, over time, they started drifting from their social objective and became linked to mainstream finance, and their focus shifted from social goals to other organisational goals such as higher profitability, repayment rates, and market share. It resulted in aggressive lending and undesirable recovery practices in the market, which affected daily livelihood, social networks, and the dignity and self-worth of poor households (Hulme and Maitrot 2014).

The sector was almost paralysed by repayment problems in 2010–11. Default rates and village suicides increased, particularly in Andhra Pradesh. The sector, earlier characterised by high repayment records, suddenly started witnessing high loan defaults, and over-indebtedness among borrowers emerged as the most important concern (Lascelles et al 2014). Over-indebtedness is not only borrowers' inability to repay loans; it is also MFIs' lack of professionalism and their inability to evaluate clients' creditworthiness and manage arrears and recovery practices (Lascelles et al 2014). It is impossible to completely eliminate over-indebtedness, but it can be contained to reasonable levels.

Literature Review

Historically, banks have avoided lending to poor households because "information asymmetry" in credit markets for the poor is high. Banks cannot distinguish between safe and risky borrowers, and tend to charge high interest rates. Poor clients cannot provide any collateral because of non-availability or non-existence of clear property rights. The market mechanism

Motives and consciousness as determinants of sustainable development

by *Raghavendra Sode and Kalaa Chenji*[*]

Abstract

The objective of the study is to develop an original framework of sustainable development to examine the positive effect of sustainable motives on sustainable development dimensions namely environment development, social development, and economic development through partial mediation by sustainable consciousness. The study summarizes the concepts of motives and consciousness leading to sustainable development. A structural equation modeling is applied to verify the research framework. The data was collected from sustainable reporting officer or HR executives involved in sustainability reporting or from environmental protection departments of the companies in India. The target sample reached through social media platform dedicated to HR professionals. The study examines the relationship of sustainable motives and consciousness on three dimensions of sustainable development. The results demonstrated that sustainable motives and consciousness may have a positive and strong relationship with three dimensions of sustainable development.

Further, the study examined mediating effect of consciousness with sustainable development. The study integrates theories of motives and consciousness to develop an integrated conceptual model of sustainable development.

Keywords: Sustainable development, Sustainable motives, Sustainable consciousness, SEM

Introduction

Sustainable development has become an important area for all organizations to gain a competitive advantage. As defined by World Commission on Environmental Development (WCED, 1987) sustainable development "is the development that meets the needs of the current generation without compromising the ability of future generations to meet

Abstract

The case presents the entrepreneurial story of Raghunandan Kamath, Founder CEO of Kamath Ourtimes Ice-Creams Pvt. Ltd., popular as Natural Ice Cream. Kamath's story is that of a tough, determined, and focused individual who faced, withstood, and overcame numerous challenges on the journey toward becoming a successful entrepreneur. Kamath founded his first humble ice cream store amidst the glitz and glamor of Juhu area in Mumbai (the financial capital of India). For Kamath, the beginning was anything but smooth. But he managed to get through the clutter of risk, uncertainty, and hardship, to come up with an innovative product and a successful business model that made Natural stand out. The case presents Kamath's passion toward product and process innovations and continuous improvements at Natural Ice Cream.

Introduction

In the year 2016, India-based Natural Ice Cream (Natural) owned by Kamaths Ourtimes Ice Creams Pvt. Ltd., won the Coca-Cola Golden Spoon Award for India's 'Most Admired Foodservice Chain of the Year' in the 'Desserts and Ice Cream Parlors' category. The awards felicitated food service operators and food and grocery retailers for their outstanding achievements.

Abstract

Zoomcar, the first start-up in India to flag off the self-drive car rental as compared to other initiatives that focused on chauffeur-driven services, was founded by two Americans—Greg Moran (Moran) and David Back—in 2013 in Bengaluru, India. Moran paid his maiden visit to India in the summer of 2011 to gather information about the country as a business destination. He gathered demographic, political and economic facts and statistics and made a reconnaissance of the Indian start-up scenario. Moran was inspired by the opportunities and gaps in India. As a 25-year-old investment banker in the US, Moran grew more and more confident about India as his business destination. Moran came down to India in 2013 to launch Zoomcar. He collaborated with car majors like Tata, Mahindra, Ford, etc. to build a fleet for a car-rental service with the self-driving model. He withstood and successfully overcame the adversities he met in the way of regulations, competition, union bodies, etc. to build Zoomcar. Zoomcar, one of the initial players in cab services, faced stiff competition from imitators and other players. Within a few years of its inception, about 25 start-ups followed Zoomcar's model. These included Myles, Voler, JustRide, and Revv. With Uber and Ola occupying the point-to-point ride hailing segment in India, the going became tough for Zoomcar. The space was getting increasingly crowded. With the growing competition and a variety of business models crowding the car-rental segment, Zoomcar with about $1.47 mn of annual revenues, looked forward to capitalizing upon its niche segment of customers.

Introduction

We definitely believe that we're operating in a unique white space because our competitors are followers who came on after we launched, but they're not into pure play self-drive car companies.

GENDER GAP IN EDUCATION AND ITS IMPACT ON FEMALE WORK PARTICIPATION IN INDIAN ECONOMY

Dr. Swaroop Kumar Kiliveti[1] **Dr. Koti Reddy Tamma**[2]

Abstract

The paper examines the gender gap in education and its impact on female work participation rates in Indian economy using Census Data for the period 1991-2011. Despite very rapid economic growth in India in recent years, the study has observed the declining female labour force participation rates across all age groups, across all education levels, and in both urban and rural areasThe study reveals that the female workers participation rate is much lower as compared to the male workers participation rate. The authors opine that falling rate of women in the workforce was due to dropping out for further education, raising children and family pressure.The study reveals that there is a need to design policies to improve women's work force participation rate so that India can take complete advantage of its upcoming demographic dividend. Hence, changing nature of women's work is essential to ensure the sustainability and inclusiveness of India's growth.

Key words: *Female Work Participation Rate, Structural Change, Econommic growth, Gender Gap,Drop-out rate*

Introduction:

Labour force is considered to be important not only because it is productive but also because it activates other fctors and makes them useful for production purposes.therefore, the size of labour force in a country is of crucial importance for the level of economic activity. Size of labour force in a country is determined by the number of people in the age group 15-59 as generally children below 15 years and old people above 59 years do not participate in productive activity. Hence, the size of labour force depends on all economically active population including the unemployed. The declining labour force participation rates among women with rising household economic status is also consistent with women's labour supply acting as a insurance mechanism for households(Attanasio 2005). The factors impacting women's employment also interact among themselves making it tricky to disentangle their effect. The impact of education, for example, will depend on both economic opportunities available and cultural perceptions that govern women's work norms. This to a certain extent will also be mediated by the economic status of households.

The labour force in India increased by more than two-and-a-half times during the period 1971-2011.In 2011, it was 48.17 crore as against 18.07 crore in 1971.The average rate of increase in labour force in this period was 2.48 per cent per annum which was distinctly higher than the rate of population growth of 2.0 per cent per annum. Moreover, labour force did not increase at a uniform rate during the four decades since 1971.Male workers have always accounted for more than two-thirds of India's labour force. In the four decades period since 1971, annual rate of growth of female workers was 3.61 per cent per annum as against 2.10 per cent per annum of male workers **((V.K.Misra and S.K.Puri 2014).**The growth rate of female workers slowed down during the decades of 1980s and 2000s.

The female labour force participation rate (FLFPR) in India is low and concentrated in rural areas

I. a. Objectives of the study:

1. To study the trends in work participation rates in India since 1901
2. To study the gender gap in terms of education and its impact on female workforce participation
3. To study the programmes implemented by the government to improve the female work participation rate in India
4. To suggest measures for improving the Female work participation rate in India

I. b. Methodology:

The present study is based on secondary data taken from the census of India from 1991, 2001 and 2011 Ministry of Finance, Planning commission, Government of India Agricultural statistics, DISE and Ministry of Human Resource Development and world bank data base. Simple statistical techniques are extensively used.

Exploring the Medical Representatives' Perception towards Motivational Measures Implemented by Selected Pharma Companies, Chennai City

A.K. Subramani[1], N. Akbar Jan[2], Ashok Kumar Goute[3], Thangaraja Arumugam[4]

[1]Associate Professor & Head, Department of Management Studies, St. Peter's College of Engineering and Technology, Avadi, Chennai, Tamil Nadu, India, [2]Assistant Professor, Faculty of HR & OB Department, ICFAI Business School, (IBS), Hyderabad (A Constituent of ICFAI Foundation for Higher Education), Hyderabad, Telangana, India, [3]Associate Professor, Faculty of HR & OB Department, ICFAI Business School, (IBS), Hyderabad (A Constituent of ICFAI Foundation for Higher Education), Hyderabad, Telangana, India, [4]Assistant Professor, VIT Business School, Vellore Institute of Technology, Chennai, Tamil Nadu, India

Abstract

Background: Indian Pharmaceutical industry has significant growth in recent decades and faces hyper competition in the local and international market.

Aim: The primary objective of this research is to explore the medical representatives' perception towards motivational measures implemented by selected pharma companies, Chennai city.

Method and Material: The primary data of the research was collected through the structured questionnaire. The questionnaire was prepared based on Work Motivation Scale. The final sample size of the survey is 227.

Results: The findings of the study indicates that earnings & benefits given to the medical representatives has highest positive effect on work motivation of medical representatives, which is followed by working conditions, success orientation, task orientation, task orientation, mission orientation, coworker relations, managing others, and supervisor relations. The results of confirmatory factor analysis confirms that all the factors of the conceptual model has significant positive effect on work motivation of medical representatives working in selected pharma companies.

Conclusion: The medical representatives in Pharma industries can be motivated through the adoption of appropriate strategies by considering the right blend of above-mentioned factors.

Keywords: *Motivation, Work Motivation Scale, Pharma companies, Medical representative.*

Introduction

India being a developing country, it establishes foot prints in all kind of industries in national and international level. India plays a significant role in the international pharmaceuticals sector. India is the leading manufacturer of generic drugs in the globe. India has talent pool of scientists and engineers who drives the industry in par with international standards. In the year 2018, the pharmaceutical exports from Indiaraisedat US$ 17.27 billion, which includes the exports of bulk drugs, intermediates, drug formulations, biologicals, Ayush & herbal products and surgical. The medical representatives of pharmaceutical industry play an important role in creating awareness and promotion of the various drugs manufactured by their companies among the doctors, chemists, and patients, therefore the sales turnover, growth, and brand image of the company rests on the shoulders of medical representatives. The competition in pharma industry increases challenges of medical representatives in promoting the company products. The motivation of medical representatives is an important driver which drives them to achieve their sales targets. Therefore, the prime goal of this research is to explore the medical representatives' perception towards motivational measures implemented by selected pharma companies, Chennai city.

IT and green practices as enablers of service-oriented capabilities and patient-focused care in healthcare industry

Samyadip Chakraborty and Rajesh Kalepu

Published Online: March 9, 2019 · pp 220-244

ABOUT

Abstract

Concepts like 'Green' has become pivotal in today's world where sustainable service delivery has become the most sought after objective. Application of green-practices (GP) and IT-enabled practices (ITEP) have been gaining importance across industry sectors and healthcare sector happens to be under scanner as one of the most lucrative sectors to investigate such relationships. Practitioner and contemporary academic literature suggest that indeed GP and ITEP applications are the two major enablers of today's healthcare business; boosting the overall service-oriented capabilities of the patient-care service providers; in turn proving itself key towards achieving better patient-focused care delivery and also boosting hospital's performance. This study carries out an empirical investigation to understand the linkages of the aforesaid relationships using data from two sources in Indian healthcare context: hospital-side and patient-side data. The study uses standard statistical techniques including confirmatory factor analysis, and structural equation modelling (SEM) to test the hypothesised path linkages.

Abstract

This study provides a data-rich analysis of the dynamics of government debt and economic growth for a longer period (1960–2009). It spans across different debt regimes and involves a worldwide sample of countries that is more representative than that of studies confined to advanced countries. This study observes a negative relationship between government debt and growth. The point estimates of the range of econometric specifications suggest that a 10-percentage point increase in the debt-to-gross domestic product ratio is associated with 23 basis point reduction in average growth. The results establish the nonlinear relationship between debt and growth. Further, by employing panel vector autoregressions approach, this study decomposes the cause and effect relationship between debt and growth and offers an answer to the question—Does high debt lead to low growth or low growth leads to high debt? The results derived from the impulse–response functions and variance decomposition show the evidence of the long-term effect of debt on economic growth. The results indicate that the effect is not uniform for all countries but depends mostly on the debt regimes and other important macroeconomic variables like inflation, trade openness, general government final consumption expenditure, and foreign direct investment.

1 | INTRODUCTION

Postglobal financial crisis, the debt trajectories in several economies around the world, are felt to be unsustainable. Many countries in the euro zone (and more particularly Greece) are struggling with a combination of high levels of indebtedness, budget deficits, and frail growth. This has necessitated the revival of the academic and policy debate on the impact of rising levels of government debt on economic growth. There is a growing concern among the policy makers, central banks, and international policy organizations to understand the effects of government debt on economic growth. An important policy question in this context has been —"Do sovereign countries with high government debt tend to grow slowly?"

Abstract

Green supply chain management (GSCM), important approach for firms to achieve sustainability in business environment. Two branches have grown parallelly over the past decade, one is GSCM with its multipronged research linking various aspects of SCM, the other evolving theoretical foundation is the concept of co-creation of service-dominant logic theory. Our current research aims at not only logically establishing the relational linkages between green supply chain practices, co-creation activities, and business sustainability, and also attempts at understanding whether level of cross-functional commitment and cooperation has some bearings. This study undertakes an empirical validation, having its theoretical framework grounded with the established theoretical premises of relational view theory, service-dominant logic, and the relational resource-based view. The findings should have implications for the industry professionals as this study highlights the key aspects for businesses to achieve sustainability and levels of cooperation and extent of GSCM practices helps the cause toward achieving sustainability.

The Dual Entertainment Theory In Celebrity Endorsements

The Role of Celebrity Worship And Profession

SUBHADIP ROY
Indian Institute of Management Udaipur
subhadip.roy@iimu.ac.in

ADITYA SHANKAR MISHRA
IBS Hyderabad
aditya.s.mishra@gmail.com

This study builds on entertainment and transportation theories and empirically tests a model that incorporates the effects of entertainment motives and attitudes. It examines endorsement success and the differences in the mentioned effects between celebrity worshippers and nonworshippers, including the role of celebrity profession as a moderating variable. The study's hypotheses were tested empirically and validated with survey data of two nonstudent samples (Study 1), with real brands (Study 2), and in a different nation to ensure generalizability (Study 3). Different entertainment motives were found to influence endorsement success among worshippers and nonworshippers. The moderating role of celebrity profession also was observed.

INTRODUCTION

A celebrity is "known to the public for his accomplishment in areas unrelated to the product class endorsed" (Friedman, Termini, and Washington, 1976, p. 22). Use of celebrity endorsers in marketing communication is not a recent phenomenon[1] and is globally prevalent (Shimp, 2010). A celebrity endorser could affect positively consumers' attitude toward brands, increase advertisement believability and credibility, influence purchase intentions (Amos, Homes, and Strutton, 2008; Atkin and Block, 1983; Erdogan, 1999), and increase brand recall and recognition (Amos *et al.*, 2008; Misra and Beatty, 1990; Roy, Guha, and Biswas, 2015; Roy and Moorthy, 2012). Despite the growing popularity of celebrity endorsements, researchers have struggled to find the right model to predict endorser success. There is thus a global need for a better understanding of the celebrity-endorsement phenomenon, which could aid academicians and marketers alike.

[1] *S. P. Sherman. (1985). "When You Wish upon a Star."* Fortune, *August 19, 1985.*

Management Slant

- Celebrity worshippers and nonworshippers have different motives that influence their attitudes toward endorsements so marketers should employ different strategies with each segment.
- Celebrity profession moderates the influence of entertainment motives on endorsement effectiveness; celebrities should be carefully selected based on professional relevance.
- Celebrity-fantasy-driven brand attitude may not result when established brands use celebrities known only at a national and not global level.
- Celebrity-fantasy-driven brand attitude may not result when established brands use celebrities known only at a national and not global level.

CEO TL and TMT performance: study from GCC

Abubakr Suliman, A. Srinivasa Rao and Tamer Elewa

Abstract

Purpose – *Various research studies have been carried out to study Chief Executive Officers' (CEOs') transformational leadership in driving organizational performance and success. Evidence shows that few studies were carried out on CEO transformational leadership and top management team (TMT) performance in Gulf Cooperation Council (GCC) region. Thus, this study aims to provide a unique contribution and the first of its kind to examine the CEO leadership–TMT performance link across GCC countries.*

Design/methodology/approach – *In this study, the researchers approached 500 employees and 30 CEOs working in 30 different organizations operating in the GCC countries. The firms were selected conveniently from different industries located in the UAE, Saudi Arabia, Kuwait, Oman and Bahrain. The researchers used the PASW (SPSS) program to analyze the data.*

Findings – *The findings show that psychological empowerment has no significant role in moderating the transformational leadership – TMT performance relationship. Internal support for innovation plays a significant role in mediating the relationship between transformational leadership and TMT performance.*

Research limitations/implications – *The present study has not examined the behavioral aspects of CEO followers. Future research may study behavioral characteristics of the entire TMT.*

Originality/value – *This study contributes to body of research that identifies CEO transactional leadership as perceived by the followers was found to be more important in predicting TMT performance than transformational leadership in the context of organizations located in GCC countries. Managerial implications and future research areas are further discussed.*

Keywords *Innovation, Leadership*

Paper type *Research paper*

Tamer Elewa is based at Inspire, Dubai, United Arab Emirates.

Introduction

Various research studies have been carried out to study Chief Executive Officers' (CEOs') transformational leadership in driving organizational performance and success (Ling *et al.*, 2008a, 2008b). Previous research studies have shown effects of transformational leadership as a whole on the team performance and have assumed simply that all the components of transformational leadership influence members of the group in similar ways. Individual-oriented leadership (i.e. differentiated leadership) and group-oriented leadership constitute both sides of the same coin, and all transformational leaders are required to maintain balance between the two (Wu *et al.*, 2010; Wang *et al.*, 2012).

By establishing a clear purpose, managing culture, creating a vision and communicating, CEOs influence their firm's direction, relations with key stakeholders and general reputation (Vera and Crossan, 2004). Because of their job context, personality characteristics of CEOs are reflected in not only behaviors and personal preferences but also the structures, performance and strategies of the organizations which they lead (Schein, 2004). Till date, research has clearly suggested that the top management teams (TMTs) influence various firm-level outcomes and behaviors (Carpenter *et al.*, 2004). Klimoski and Koles (2001) and Peterson *et al.* (2003) observed that the research typically identifies CEOs as members of

Concentration in the Indian Automobile Industry

Neeraj Kumar
Assistant Professor
Dept. of Economics, IBS Hyderabad,
Telangana (India)

Pooja Choudhary
Independent Economics Researcher
Hyderabad, Telengan (India)

Abstract

The Indian automobile industry occupies a prominent place in Indian economy. It passed from different phases, the emergence of indigenous automobile manufactures and self reliance before 1983 to Freedom to Grow after 1991 economic reforms. The present paper analyzed the concentration ratio of each segment Indian automobile industry. It further investigated firm level market shares of each individual firm in their respective segment from 1991-92 to 2013-14. The study found that the economic reforms of 1991 dissolved the entry, exit and FDI restrictions which lead entry of foreign players and competition goes on increasing and the concentration ratio starts declining in Indian automobile industry.

Keywords: Automobile, Structure, Concentration, Reforms

JEL Classification: L620

Introduction

Theoretically one can consider perfect competitive market as the ideal market where two pivot assumptions i) large numbers of seller (buyer) and ii) independently acting seller (buyer) prevailed. With the help of these two assumptions there is no possibility of discrepancy among price and marginal receipts to attain profit maximization. But, the markets of the real world differ mostly in the number of firms and their relative size. The public are concerned about industrial concentration, because they are concerned about its economic and political effects. The economist should, therefore, analyze at least the economic effects and assess their importance (Citovsky 1955). The industrial theory assumes that concentration is an important component of the market structure which further determines the conduct and performance of concerned firm or industry. Thus, it is important to discuss the each and every aspects of concentration.

Concentration defined as the economic position of a firm or industry in which enables the concern to command control over production (possession of considerable share of the total productive capacity, control over raw material and inputs) or market exchange (power to influence the supply) or employment (power to influence the terms and conditions in respect of employment) in respect of any good or service. Thus, concentration treated as a technical concept dealing with concentration ratio giving the shares of the largest few firms in respect of some specific characteristics. Concentration is the capacity to

IP: 193.56.73.246 On: Sat, 23 May 2020 08:28:18
Delivered by Ingenta

Online product reviews (reviews) play an important role in the consumer's purchase decision, which affects sales and assists business firms in improving quality (by receiving feedback). The number of reviews available, even for a product that has mediocre popularity, can reach a few hundred or a thousand. In order to get the most informative review to the customers first, from the plethora of reviews available online, online retailers came up with the 'helpfulness voting' feature. This became a major hit and now almost all websites, as well as academics, search for the most helpful review, according to the number of consumer votes that a review has received. Previous research has acknowledged the importance of 'review helpfulness'. Review helpfulness has been conceptualised and evaluated by researchers, as well as websites, according to their requirements. In this study, we have tried to inspect the evaluation of the review helpfulness construct in the extant literature and have proposed a conceptual framework of a formative index as the measurement instrument of review helpfulness.

Keywords Online reviews, Review helpfulness, Formative measurement, Index development, Marketing

Introduction

Word-of-mouth (WOM) refers to the sources of interpersonal information about people's experiences with products or services on the traditional offline marketspaces, for example, asking a friend for advice about a mobile phone he/she has prior experience with (Bronner & de Hoog, 2011). This WOM communication has long been of prime interest and importance to both practitioners and marketing researchers, since extant literature discovered its significant impact on the consumer's purchase decision, as well as post-purchase product evaluations (Gruen, Osmonbekov, & Czaplewski, 2006;

Abstract

Increasing demand of automotive products and over-consumption of natural resources compel the manufacturers to implement the Extension of Useful Life (EUL) methodology of automotive products through remanufacturing. Remanufacturing is a process in which the original functionality of End-of-Use (EoU) or End-of-Life (EoL) product is restored and the remanufactured product is treated as good as a new product. In spite of these advantages, remanufacturing is still not so popular and organized in developing countries like India. The developing countries encounter several problems in strategic, tactical and operational level of management while implementing the remanufacturing business option

Abstract

Research on entrepreneurship domain and its different dimensions is not new. This paper explores entrepreneurial orientation of Indian millennial and their motivations using open source R/RQDA packages through a qualitative paradigm. The sociological method called "interpretivism" uses qualitative approach which is humanistic as opposed to scientific methods followed by "positivism". This study uses qualitative data generation techniques e.g. participant observation, focus group discussion, and unstructured interviews, with an emphatic understanding of individual accounts. It applies thematic coding and categorization of the participants' narratives on a computer assisted platform for grounding it into a theoretical model. Individuals in Indian millennial cohort, don't just positively react to external positive stimuli to pursue an entrepreneurial career, they possess values e.g. altruism and societal orientation. Narratives from individual accounts manifest different perspectives on singular objective reality as would be broadly construed as social constructionism of Indian milieu. The computing environment of R/RQDA (Source: CRAN) for data coding, aggregation, plotting and theorization on personal narratives drawn from limited accounts in a group setting asserts on the findings that are most appropriate in recent cultural shift witnessing India such as unleashing individual potential or cooperative capitalism toward social change. Identifying a group of budding entrepreneurs currently pursuing business management program and looking for a near future objective realization of an entrepreneurial career was a part of the sampling. Data triangulation is a natural improvement for generalization of the findings to make it a more relevant outcome, and is a limitation of the current study.

DETERMINANTS OF CORPORATE DIVIDEND POLICY IN INDIA: A DYNAMIC PANEL DATA ANALYSIS

Brahmaiah B, ICFAI Business School
Palamalai Srinivasan, Xavier Institute of Management & Entrepreneurship
Sangeetha R, Christ University

ABSTRACT

The present study empirically examines the determinants of dividend policy of National Stock Exchange (NSE) listed firms in India, using dynamic panel data model for the sample of 95 NSE listed firms with continuous dividend payments from 2012/2013 to 2017/2018. The empirical results reveal that profitability, liquidity, leverage, risk, size of the firm and inflation are the major determinants of dividend policy of selected NSE listed firms in India. Findings deduced from empirical evidence bears testimony to the fact that profitability, liquidity, size of the firm and inflation have significant negative impact on dividend policy of the selected NSE firms covered by the study. These findings seem contradictory to the expected outcome contained in the existing literature on the Indian context. The risk variable tends to have negative and significant impact, which is line with the existing literature. Besides, the lagged dividend, investment opportunities, taxation and yield curve do not play significant role in determining the dividend policy.

Keywords: Dividend Policy, Determinants, Dynamic Panel Data Estimation, India.

INTRODUCTION

As evidenced by information and analysis contained in the available financial literature, the behaviour of dividend policy is most debatable issue in the context of developed and emerging markets. In his seminal paper entitled "the Dividend Puzzle", Black (1976) concluded that "the harder we look at the dividend picture, the more it seems like a puzzle, with pieces that just do not fit together". Since then, several research studies have emerged on the factors that influence a firm's decision regarding its dividend policy and whether the dividend policy affects the value of a firm and yet the famous dividend puzzle remain unsolved. It has been argued that dividend payments may results in double taxation of income as it is paid from after-tax profits of the corporate and also shareholders have to pay income tax on dividends. Besides, the dividend payments are considered to be a partial liquidation of the corporate. The enterprise value is negatively associated with the dividend payments. In other words, the enterprise value of a firm would decrease with respect to dividend amount paid by a firm. As Miller & Modigliani (1961) irrelevance theory emphasized that the value of the firm is depends upon its fundamental earning capacity and its investment decision, regardless of how it distributes the income, hence the dividend payment become worthless.

It has been stated that the stock price of the firm would fall equivalently to the dividend amount, paid by the firm over the course of the particular trading day (Campbell & Beranek, 1955; Durand and May, 1960; Elton & Gruber, 1970). Campbell & Beranek (1955) and Durand & May (1960) reported that the size of the average price decrease on the ex-dividend day, relative to the dividend amount. Further, Elton & Gruber (1970) estimated the drop-off ratio

ABSTRACT

We examine the performance of different types of Indian manufacturing firms for the 1999–2004 and the 2004–09 periods, before and after significant trade liberalization took place under the Export-Import (EXIM) policy of 2004–09. Based on firm-level balanced panel data from the Centre for Monitoring Indian Economy (CMIE) Prowess database, we assess the differential impact of this policy on the performance of *food and agro-based* versus *non-food and non-agro based* firms as well as on *large* versus *small* firms, while controlling for firm and industry-specific characteristics. By using a semi-parametric Difference-in-Difference model we find that the EXIM policy had a positive effect on firm-level productivity and profitability in the case of *non-food and non-agro based* firms which experienced significant trade liberalization while *food and agro-based firms*, which remained relatively protected, exhibited stagnant and weak performance. We also find that trade liberalization mainly benefited large as opposed to Small and Medium sized firms. We conclude that continued trade protection has hurt certain Indian manufacturing industries and that alongside trade liberalization, complementary policies that address structural and other constraints faced by certain groups of firms, also need to be implemented.

1. Introduction

Through the 1950s, 1960s and 1970s, many countries erected high tariffs and introduced a range of nontariff barriers as an integral part of their industrialization and development strategy. However, since the late 1970s, many countries have implemented trade reforms. This shift towards trade liberalization has spawned a growing literature which tries to assess the impact of trade reforms on development outcomes and the various channels for this impact, including improved resource allocation; economies of scale and scope; imports of inputs and intermediate goods; transfer of know-how; increased domestic competition and positive externalities in the form of technology transfer and productivity improvements. In recent years, studies on trade reforms have shifted their focus towards microeconomic analysis at the firm level. These studies confirm the presence of the aforementioned benefits from trade liberalization at the firm-level. They also highlight three important issues: first, the need to capture trade protection as accurately as possible, including capturing both tariff and non-tariff barriers (NTBs); second, the need to understand the comparative structure of protection across industries and between final and intermediate goods in determining the overall impact of trade liberalization on firm-level performance; and third, the need to take into account the role of firm-level factors such as size and industry characteristics such as trade orientation in shaping the impact of trade reforms.

This paper attempts to add to this existing body of work on the impact of trade liberalization on Indian manufacturing firms, focusing on performance measures such as profitability and productivity. The country focus is motivated by the fact that India has undertaken significant tariff and non-tariff liberalization since the 1990s but non-uniformly across sectors and that there is a differentiated concentration of large versus Small and Medium (SME) size firms across industries and products which is likely to have influenced the impact trade reforms within and across industries.

The paper has three main objectives. First, it constructs Effective Rates of Protection (ERPs) and NTBs for different product groups in Indian industry over the period 1999–2009, which is a recent phase of India's Export-Import (EXIM) policy.[1] Second, it highlights differences in the degree of tariff and non-tariff liberalization experienced across

ABSTRACT

The purpose of this paper is to examine the effect of competition and regulation on Microfinance Institutions (MFIs) outcomes in India. Using data for 60 MFIs from the MIX Market database for a period of five years from 2008-09 to 2012-13, panel models are estimated for the empirical examinations. In the modeling framework, constructed Lerner's Index as competition proxy and regulate dummy as regulatory intervention proxy are introduced as interest variables along with the MFI specific and Macro specific control variables to examine their effect on MFIs outcomes. The study reveals that competition strengthens the outreach, promotes operating efficiency, deteriorates the loan portfolio quality and adversely affects the MFIs profitability. While the regulatory intervention creates some accommodative space for the MFI borrowers, improves MFIs efficiency partially and dampens loan repayments and portfolio quality and profitability via "roe" in India. Our results have also implications on MFIs, fund provider, regulator, government and policy research practitioners. This study contributes towards filling gap in the literature by extending the analysis of the effect of competition and regulation on MFI outcomes to a cross-section of states in India in a panel data framework.

Revisiting Spectator-Based Sports Team Reputation: Strategic Implications for Team Managers

Anish Yousaf[1] · Makhmoor Bashir[1] · Abhishek Mishra[2]

© Reputation Institute and Springer Nature Limited 2019

Abstract
Prior works on corporate reputation are primarily derived from the fields of marketing, management and sociology, yet, except for Jang et al. (Int J Sports Mark Spons 16(3):52–72, 2015), none of those works examine and measure reputation for sport teams. Even with Jang et al. (2015), a major limitation is that they use a small non-probability convenience sample of students and hence, their scale may have limited generalisability. This work rigorously re-tests the scale for its empirical efficacy to measure reputation of sport teams, in context of the most popular cricket league in the world, the Indian Premier League (IPL). We use a randomly selected pool of 440 and 481 IPL team fans at two different points in time. This work not only revalidates an important scale with a large set of real consumers but also examines the importance of a sport team's reputation for spectator identification and re-engagement intentions as a check for nomological validity. Findings have strategic implications for managers who can evaluate their team's reputation with this framework and use it to create more fan engagement.

Keywords Spectator-based sport team reputation · Sports marketing · Spectator identification · Re-engagement intention · Indian Premier League

Introduction

The sport industry has grown big over decades, becoming more professional and commercial with sport leagues and teams having emerged as key constituents, with multi-billion-dollar evaluations in some cases (Bauer et al. 2005). With big money involved in sport business and resultant increased competition, it is imperative for sport marketers to manage their team, leagues and events as professional brands to build brand equity through on-ground and off-ground performance (Ross 2006). Specially for team managers, it is not only important for managing teams as professional brands but also to identify factors that have the potential to contribute to a team's economic success (Ross 2006; Naik and Gupta 2013). One such factor is the reputation of sport team that can help marketers to develop competitive advantage and brand differentiation from competitors in and outside a specific sport (Hill and Vincent 2006; Jang et al. 2015; Walker and Kent 2009), improve teams financial performance and brand equity (Dowling 2001), gain fan loyalty, trust (Walsh and Beatty 2007; Keh and Xie 2009) and create fan satisfaction and positive word of mouth (Walsh and Beatty 2007; Hong and Yang 2009).

Despite its importance and relevance, the reputation construct has received limited attention in sports context, causing a lack of consensus among practitioners regarding the conceptualisation of reputation of sports teams (Jang et al. 2015; Parent and Foreman 2007; Walker and Kent 2009). Defining reputation as "the overall perception of a sports team based on spectators' reaction to all previous interaction experiences with the sports team's activities" (p. 212), Jang et al. (2015) develop spectator-based sport team reputation (SSTR) scale to measure the overall reputation of a sport team. They argue that previously developed frameworks were established from non-related fields of marketing, management and sociology,

Put–Call Ratio Volume vs. Open Interest in Predicting Market Return: A Frequency Domain Rolling Causality Analysis

Sangram Keshari Jena [1,*], Aviral Kumar Tiwari [2] and Amarnath Mitra [3]

1 Department of Finance, IBS Hyderabad, IFHE University, Hyderabad 501203, India

Received: 22 September 2018; Accepted: 12 March 2019; Published: 25 March 2019

Abstract: This study examined the efficacy of the Put–Call Ratio (PCR), a widely used information ratio measured in terms of volume and open interest, in predicting market return at different time scale. Volume PCR was found to be an efficient predictor of the market return in a short period of 2.5 days and open interest PCR in a long period of 12 days. Thus, traders and portfolio managers should use the appropriate PCR depending upon the time horizon of their trade and investment. The results are robust even after controlling for the information generated from the futures market.

Keywords: Put–Call Ratio; volume; open interest; frequency-domain roiling causality

1. Introduction

Options are a conduit of carrying information into the market, which subsequently leads to stock price changes Grossman (1988). Because informed traders prefer to trade in options market for leverage and low transaction cost Black (1975) and Easley et al. (1998)[1], trading activities of options market measured in terms of volume and open interest are informative to predict the future price of their respective underlying assets. Both options volume and open interest have been used in addition to other factors in modeling early warning system for market crisis Li et al. (2015). Further, as per Jena and Dash (2014), trading volume and open interest represent the strength and potential of price change of the underlying asset, respectively. In addition, traders and technical analysts use open interest data to study the behavior of the underlying asset and design appropriate options strategies. Fodor et al. (2011) found individual call and put open interest have the power to predict future stock return. Most often PCR remains in the news as one of the important and parsimonious information variables used by traders to predict the market return[2]. This ratio is a contrarian indicator of the market by looking at build up options. That means, if there is excessive fall or rise in the market, PCR will move

1 Informational role of derivative markets was discussed by Back (1993), Biais and Hillion (1994), Brennan and Cao (1996) and John et al. (2000) and others who further enriched the linkage among trade, price and private information in derivative market. In addition, few empirical studies support the informational role of derivative markets (e.g., Du et al. (2018), Ryu (2015), Cao and Ye (2016) and Chordia et al. (2018)).

SERVANT LEADERSHIP IN ETHIOPIAN PUBLIC SECTOR ENTERPRISES: RELATIONSHIP BETWEEN HUMAN-SIDE AND ACTION-SIDE

Rama Krishna Yelamanchili

Abstract: *Many studies have examined the servant leadership in Americas, Asia, and Europe. However, there is scant research on servant leadership in African continent. This paper aims to investigate the presence servant leadership among public sector enterprises of Ethiopia and measure causal relationships between the characteristics and competencies of Ethiopian public enterprise leaders. Data were collected from 179 public servants of Ethiopia. They rated their immediate supervisor leadership behavior on 30-item SLS. Confirmatory Factor Analysis was used to validate the SLS. Simple and multiple regression analyses were used to test the hypotheses. The paper found significant positive relationship between characteristics and competencies of public enterprise leaders. Similarly, this paper found similarities between African World-view and servant leadership. This paper is the first to explicitly explore and confirm the validity of Servant Leadership Survey (SLS) in Ethiopia. Our result support the Sousa and Van Dierendonck (2016) categorization of action-side (Accountability, and Empowerment) and humble-side (Humility, and Standing back) dimensions of servant leadership.*

Keywords: servant leadership, Ubuntu, Ethiopian public sector enterprises, African culture, African World-View

I. INTRODUCTION

The concept of servant leadership was coined by Greenleaf (1970, 1977) and at later time was advocated and promoted by Spears (1995, 1998) and Laub (1999). Greenleaf (1977) defined servant leadership as not just a management technique but also a way of life, which instigates with "the natural feeling that one wants to serve, to serve *first*" (p. 7), he believed that servant leadership was an inward lifelong journey. Greenleaf mentioned that servant leadership is unorthodox and would be difficult to operationalize and apply as "it is meant to be neither a scholarly treatise nor a how-to-do-it manual" (Greenleaf 1977, p. 49). During initial years, servant leadership was talked by practicing managers and practiced in organizations. The concept lacked precise definition, theoretical framework, and empirical evidence. Bass (2000) recognized that servant leadership requires extensive research, highlighting that "the strength of the servant leadership movement and its many links to encouraging follower learning, growth, and autonomy, suggests that the untested theory will play a role in the future leadership of the learning organizations" (p. 33).

Store Attribute Factors Inducing Customer Loyalty in the Context of Apparel Retailers

Santosh Kumar Alreddy

Abstract: *The aim of this paper is to explore elements and variables of store attributes impelling customer loyalty. This study uses loyalty program members from apparel stores. Initially the variables were explored through literature and interview with retailers. In the second step, exploratory factor analysis was used to identify factors of store attributes. Multiple regression test the significant effect of extracted factors on customer loyalty intentions. It was evident from the result that, interpersonal communication fail to induce loyalty among members of loyalty program. In future the study would be carried out in different stores.*

Key words: *Store attribute, interpersonal communication, loyalty intention, apparel.*

I. INTRODUCTION

The concept of store attributes covers retail information or background which arouse due to willingness to buy and which include product, service and collection qualities (Kotler, 1973-74). Further, the store characteristics/attributes are interesting for self-perception of buyers and its influence on in-store happiness and intents of support. The consumers happy with service superiority were possible to become and stay loyal (Wong and Sohal, 2003).

Hedrick et al (2005) it was projected that the store background and the outlet atmospherics may sway shopper's opportunities on the store vendor. The research piloted on sales persons and store setting, have found that shoppers insights of a vendor's characteristics and affiliation building conducts' were a significant carters of buyer happiness.

The research proves that the store image basically refers to a collection of concrete and elusive aspects that shoppers think to be present in store outlets (Lindquist; 1974). Further it was found that in selecting a store outlet the shoppers use store appearance as a norm before deciding to buy (Varley, 2005). The store characteristics denotes aspects like merchandise, tangible amenities, facilities, and atmospherics and so on of store image as a primary construct. The term loyalty covers the aspects such as repeat purchasing, and the tendency of buying with a same vendor (Dick and Basu, 1994). The term loyalty program refers to merchant's effort to enhance attitudinal and behavioural obligation to sellers offering (Sharp and Sharp, 1997).

The previous researchers noticed that, in case of department stores the characteristics like post-transaction service, e- mail, personal communication, merchandise, privileged treatment and retail atmosphere were most relevant.

Revised Manuscript Received on November 15, 2019

Dr. Santosh Kumar Alreddy, Department of Marketing & Strategy, IBS Hyderabad (A Constituent of the ICFAI Foundation of Higher Education), Hyderabad, India

A. Objective

To test the degree to what extent the factors related to store attributes are predicting the customer loyalty in organized apparel retailers.

II. METHODOLOGY

For exploratory part of this study, the qualitative research approach followed by quantitative approach was used. In order to devise hypotheses and to recognize variables, qualitative research approach was used. Unstructured interview with members of loyalty program and store managers assisted to explore their perception about store attributes, loyalty program benefits and loyalty. Unstructured interview was conducted with 20 loyalty program members and two store managers, which facilitated in gathering diverse viewpoints on the concepts i.e., store attributes, loyalty program and customer loyalty intentions. This was conducted in Gulbarga which includes Peter England and Levi's store. The structured questionnaire was developed after identifying variables through literature review and interview method. And the pilot study was carried out among 30 members of loyalty program at Peter England and Levi's store to finalize the questionnaire. Only those members who are associated with the store at least for a year were selected, since this is considered to be a satisfactorily long period whereby withdrawing from the program is due to frustration or disappointed. Besides, a year time was considered to be a satisfactory to view members as qualified loyalty program members, a feature that signifies the validation of data (Morais et al., 2004).The ideas discovered in this exploratory study are an input to the descriptive research to test hypotheses and to examine relationships.

B. Questionnaire

A total of seventeen items measures store attributes which consists of store environment, merchandise, interpersonal communication, preferential treatment and post transaction service. The remaining five items are measuring loyalty (purchase intensity & resistance to counter persuasion) covering loyalty program concept.

Section B includes seven questions intended to collect demographic details about the respondents. The demographic details cover name, age, gender, educational qualification, occupation, income and period of membership. For descriptive part of the study survey was conducted among six retailers (three retail companies) which include Levi's, Basics Life store's at Gulbarga and Peter England store's at Gulbarga, Bidar, Raichur and Bellary of Karnataka. A total of 540 samples were collected using self-administered survey method.

The survey of apparel retailers in these districts shown two things firstly, there are no studies has been carried out considering store attributes effect on loyalty and secondly, organized apparel retailing is at a growing stage in this region.

Store love in single brand retailing: the roles of relevant moderators

Abhigyan Sarkar and Juhi Gahlot Sarkar
Institute of Management Technology, Ghaziabad, India, and
Gaurav Bhatt
IBS Hyderabad, Hyderbad, India

Received 11 May 2018
Revised 10 July 2018
28 August 2018
6 September 2018
Accepted 9 September 2018

Abstract

Purpose – The purpose of this paper is to investigate how various retail store atmospheric cues can impact store brand loyalty (SBL) via eliciting store brand love. This paper posits that different store brand experiential cues can predict brand love only when the experience is processed based on perceiving the brand as human-like entity, i.e. brand anthropomorphization. Brand love cannot be strongly elicited without the sense of brand anthropomorphization. Moreover, brand love can impact brand loyalty intention only under the moderating condition of perceived firm's positive relationship marketing orientation.

Design/methodology/approach – Survey was conducted among urban shopping mall consumers, and the data were analyzed using structural equation modeling.

Findings – The findings support that store brand experience elicited by store environmental cues can better predict store brand love when the store is perceived as human, and store brand love can better predict conative SBL when consumer perceives that the store is having a positive relationship orientation.

Originality/value – The value of the paper lies in empirically testing the psychological mechanism through which store atmospheric cues lead to SBL.

Keywords Store brand love, Store brand loyalty, Brand anthropomorphization

Paper type Research paper

1. Introduction

Recent consumer research has focused on the role played by store brand love in enhancing brand loyalty in the highly competitive retail sector. As a result, studies have been conducted to investigate various factors that can stimulate store brand love (e.g. Sreejesh *et al.*, 2017; Koo and Kim, 2013). The retailers are paying special attention toward private label or retail branding to cut through the competition (Ailawadi and Keller, 2004). Single-brand or private-label retailers sell private label brands which are generally the same as the names of the store brands (Jones and Kim, 2011). Ailawadi and Keller (2004) stated, "Retailer brands are typically more multi-sensory in nature than product brands and can rely on rich consumer experiences to impact their equity" (p. 332). Customer experience facilitates the forging of emotional ties between brand and consumer, and these emotional ties are translated into consumer loyalty (Gentile *et al.*, 2007). Customer experience in a retail store is majorly influenced by the retail store environmental elements or store atmospherics (Baker *et al.*, 1992). Customer's store-related emotion is influenced by cognitive evaluations of store environmental cues like in-store music and aroma (Walsh *et al.*, 2011). Kumar and Kim (2014) stated, "For a single brand retailer, the store atmospheric cues, along with the exclusive merchandise, become a major reason for customers to visit the store because it is not available in many other retailers" (p. 686). Hence, single-brand retailers must take the opportunity by focusing on creating unique store atmospherics in order to impact customer experience which would be a major predictor of store emotion.

Recent consumer research has recognized that a consumer can love a brand, and the brand love is a pre-condition for brand loyalty to occur (e.g. Bergkvist and Bech-Larsen, 2010; Batra *et al.*, 2012; Sarkar and Sarkar, 2016; Sarkar *et al.*, 2015). Brand love represents

Technology has become omnipresent in our lives and workplace is no exception. Recent advancements in human resource management (HRM) and organizational behaviour (OB) are predominantly technology driven that require techno-savvy human resource managers (Lengnick-Hall & Lengnick-Hall, 2018). In general, the quest for effective and efficient workforce management has led to embracing digitization (Berber et al., 2018). It does affect the several stages of a typical human resource process which includes stages such as recruitment, selection, performance appraisal, demand forecasting, supply forecasting, job description, job specification, job analysis, job evaluation, training and development, career planning and development, and succession planning among others (Tooranloo, et al., 2017). Technology is a double edged sword with potential to make or break organizations with major consequences for employees and employers.

We are experiencing the impact of Industry 4.0 on HR functions. For example, chat-bots are assisting in screening candidates (Sivathanu & Pillai, 2018), analytics-powered employee demand and supply prediction (Sommers, 1999), and smart offices connected through cloud and social networks (Filos, 2008). Crowdsourcing is on a record spree, with Deloitte forecasting five billion people engaged in crowdsourcing projects by 2020 (Howe, 2006; Grewal-Carr & Bates, 2016), performance appraisal of employees can be done using a mobile app (Samuel et al., 2014), and sophisticated human resource information systems (HRIS) manage all HR processes ranging from the simple ones such as leave management and salary slip generation to more complex processes such as succession planning (Nagendra & Deshpande, 2014). Rapidly developing technology which is available to both employers as well as employees can become a source of sustained competitive advantage or a catalyst of

Competence assessment and development in India

Introduction

To survive and thrive in today's digital age, human resource (HR) managers and/or HR development (HRD) professionals need to keep their workforce engaged (Gupta and Shaheen, 2017, 2018; Gupta *et al.*, 2018) and up to date (Ananthram *et al.*, 2018). However, it requires identifying and bridging the knowledge, skills and abilities (KSAs) gaps for each employee (Bohlouli *et al.*, 2017). With the help of sophisticated technologies, it has become simpler to manage and analyse a large amount of KSA data for employees (Lakshminarayanan *et al.*, 2016; Soja and Soja, 2017). Yet, the importance of collecting quality data remains intact (Molan *et al.*, 2018). This special section seeks to explore the challenges that the HR managers and the HRD professionals face in managing competency-based data.

The special section is expected to answer the following questions: Why do organisations opt for a particular competency mapping technique? What are the challenges that organisations face in implementing and executing competency techniques? How are competency techniques used in the workplace? and What areas for future research are associated with competency mapping?

Objective

The purpose of this special section is two-fold. The first objective is to examine and share the experiences of practitioners in mapping employee competencies. The second objective is to understand the challenges practitioners face in assessing employee competency in the digital age.

Contributions

This special section has two papers. The first paper is "Assessing the relevance of digital competences on business graduates' suitability for a job". The objective of this paper is to compare the digital and generally demanded competence by the job market. For this, the authors telephonically interviewed 992 team and HR managers. The final usable responses were 231. To analyse the data and test the hypotheses, the authors used partial least square modelling. The authors found that out of the five dimensions of digital competence, four including communication, content creation safety and problem solving had a significant impact on the candidate's suitability for the post. The authors emphasised on the need to match the digital competence required by the organisations and the one developed by the training centres.

In the second article in this special section titled "A competency framework for contractual workers of manufacturing sector", the authors developed a competency dictionary and model for contractual workers in the Indian steel manufacturing sector. To accomplish this objective, the authors interviewed 30 supervisors and analysed the data using behavioural events interviews. The findings of their study revealed that the competencies could be categorised into knowledge, skills and attitudes. The authors then used them to develop a competency dictionary with behavioural indicators. It was coupled with a framework to map and evaluate the various competencies. Their paper is expected to help HR practitioners implement competency-based HR processes including recruitment and selection, training and development, and performance management particularly for the contractual workers in the manufacturing sector.

This paper forms part of a special section "Competence assessment and development in India".

Engaging liquid knowledge workers: causes, concerns and consequences

Introduction

To survive in today's highly dynamic marketplace, knowledge-intensive organizations expect their workforce to adapt to ever-changing customer needs (Gupta *et al.*, 2018). For this, organizations are relying on liquid workforce comprising part-timers, freelancers and casual knowledge workers (Naik, 2016). To outperform, some companies – including Accenture, Google and General Electric – have taken a lead to align their existing human resource practices as per the requirements of liquid knowledge workers (Petac and Petac, 2016). A liquid knowledge worker could be a nurse, an accountant, a teacher, a lawyer, an engineer or any other professional whose job description involves acquiring and applying information as a part-timer, a freelancer or a casual worker (DeCenzo *et al.*, 2010; Gupta, 2017). The "liquid" component connotes at least one of the following two things:

(1) absence of job demarcations; or

(2) working as part-timers, freelancers or casual workers.

The main challenge for the managers of liquid knowledge workers is to keep them engaged in their job. They need to have workplace mobility, flexible work times, colleagues with an accommodating nature, a keen attitude to learning and the ability to multitask (Klewes *et al.*, 2017). Managers often struggle to ensure effectiveness and efficiency of their liquid knowledge workers; they are highly sensitive to contextual factors, which is also the foundation of systems theory. It is this distinct nature of liquid knowledge workers from conventional workers that calls for in-depth analyses of the antecedent and consequences of engaging liquid knowledge workers (Gupta and Shaheen, 2017a, 2017b).

Objective

The purpose of this special issue is twofold. The first objective is to understand the motivating factors for engaging liquid knowledge workers. The second objective is to understand the possible individual- and organization-level outcomes of engaging knowledge workers.

Contribution of this special issue

Though there are several recent studies on engaging workforce (Gupta, 2018; Gupta and Shaheen, 2018; Gupta and Shukla, 2018; Gupta *et al.*, 2018; Gupta *et al.*, 2019), this special issue includes studies that have investigated the antecedents and consequences of engagement at work in the case of liquid knowledge workers. The subsequent paragraphs describe each of these in brief.

One of the articles, "Transformational leadership and knowledge sharing behavior in freelancers: a moderated mediation model with employee engagement and social support," explored the relationship of transformational leadership with knowledge-sharing behaviors among freelancers in North India. Work engagement was proposed as a mediator and social support as a moderator of the aforementioned relationship. Using rigorous analytical techniques on survey data from 250 freelancers, the results supported the moderated mediation model, linking transformational leadership with knowledge-collecting and knowledge-donating behaviors. The study identified work engagement as a necessary mechanism via which transformational leadership affected knowledge-sharing behavior and also emphasized on the significance of social support in the process.

ICT in Rural School Education: Impacting on Children Cognition

Vijayudu Gnanamkonda, Chakravarthi Koundinya, Chethana G Krishna

Abstract: Intellectual thinking and analytical skills in school children helps them to achieve new heights. Globally Information and Communication Technology (ICT) started playing a key role in school education. In developing countries, it is premium and also having limited human resource. India is not an exception. If the usage and its importance reach to the nook and corner of the country, one can experience overall development of children. The purpose of the study is to understand the role of ICT tools impacting children cognition across rural high schools. The main objective is to study how teachers perceive the ICT integration in teaching process and its effect on students learning and change of their behaviour. The secondary objective is to study students' opinion on ICT based learning process and its effect on improving knowledge and behaviour. The study has followed the ethnographic research methodology (observation and field research) in fully equipped ICT schools in Telangana and Andhra Pradesh, Telugu States of India. The data collection is through a structured questionnaire as well observations with the selected sample population. The sample is qualified students and trained teachers in the government as well private schools where the ICT tools are implementing and strictly following. There are some interesting findings between teachers' perception and students' perception towards change in learning process and change in behavior. Originality of the paper is the researchers tried to elucidate the facts about the students' and teachers' perception regarding ICT tools in education and their effectiveness in changing the behaviour of the students as well teachers on education.

Key words: Students' Perception, ICT tools, technology driven classrooms, rural India, Rural High Schools

I. INTRODUCTION

The role of Information and Communication Technology (ICT) in school education is enormous. ICT in education can be defined as 'diverse set of technological tools and resources used to communicate, and to create, disseminate, store, and manage the information. These technologies include computers, the internet, broadcasting technologies, and tele communication (ICT Guidelines). ICT is also defined as a Range of electronic technologies which when converged in new configurations are flexible, adaptable, enabling and capable of transforming institution and redefining social relations. The range of technologies is increasing all the time and there is a convergence between the new technologies and conventional media [1]. Online education consists of all structure of electronically support for teaching and learning purpose. It also facilitates individuals who are deprived for geographic, physical, or social conditions have increasingly better educational odds via online. It is able to sustain synchronous and asynchronous communications in a mixture of formats ranging from text, voice and audio [2]. In early 1960s Government of India (GoI) has formed National Educational Commission on 14 July 1964 headed by Daulat Singh Kothari to evolve the general educational system in India. The commission report (1966) [3] mentioned that a poor teaching lead to a bad learning, technical & visual support enhances the learning ability in students. Government of India (GoI) has taken an initiation and integrated the technology in education strongly. Initially, technology was used in education through television, later on computers, and then, internet, animation, etc. ICT is mastering the basic skills alongside reading, writing and numeracy [4] in students. Teachers are also recruited and trained accordingly. The states of India is also implementing similar integration in state operating schools to encourage the school going children, as well creating some new platforms for improving the knowledgeable society. The rapid changes in ICT products/ tools have influenced the development of technology used in the educational field [5]. This made, the teachers should believe in the effectiveness of technology, as well they must have control over technology [6]. It comes through updated ICT tools, teachers' integration in technology usage, and regular maintenance without any interruptions. In rural India, this is a biggest challenge.

ICT provides new educational approaches [7] and it also enhances the international dimension of educational services [8]. After using ICT in their teaching, the innovative teachers stated that the use of ICT is motivating the students as well teachers [9]. ICT integration is required with the subjects and newly developed technologies. Since, ICT leads all processes based on information, teachers and students must be technological competent [10]. ICT increases the flexibility of delivery of education [11]. It influences the way students are taught and how they learn as now the processes are learner driven.

Jimoyiannis and Komis, [12] examined teachers' beliefs and attitudes towards information and communication technologies (ICT) in

This paper forms part of a special section "Competence assessment and development in India".

Abstract

Purpose – *The purpose of this paper is to develop a competency dictionary and model for contractual workers of the steel manufacturing sector of India.*
Design/methodology/approach – *In-depth interviews with 30 supervisors and behavioral events interviews (BEIs) with 40 contractual workers were conducted to identify and validate the competencies of the contractual workers.*
Findings – *The competencies identified are arranged according to the similarity and dissimilarity between it under three broad categories of competencies, i.e., knowledge, skills and attitudes. These categories are used to develop a competency dictionary which has behavioral indicators, and a framework that can be used to map and evaluate the competencies.*
Practical implications – *The competency dictionary and the framework developed in the present study will assist human resource practitioners in implementing competency-based human resource processes such as recruitment and selection, training and development and performance management for the contractual workers in the manufacturing sector.*
Originality/value – *The present study is among the few empirical studies that provide a competency dictionary and a framework of contractual workers in the manufacturing sector of India.*

Keywords *India, Competencies*

Paper type *Research paper*

Introduction

Steel manufacturing industry is one of the major industries of India. India is among the top three producers of steel in the world (IBEF, 2018). By the year 2030, it is expected that India will overtake Japan and will become the second largest producer of steel in the world (IBEF, 2018). It is also likely that steel production will rise to 128.6m tonnes (MT) from 88.4 MT, which will increase the share of India (in the steel production) from 5.4 to 7.7 percent in the world (PTI, 2017). To meet this growing demand, steel manufacturing organizations need efficient and competent workers who can work efficiently to contribute and accelerate the production. Further, to meet these varied needs, it has also been noticed that manufacturing organizations across (the world) are hiring contractual and daily wages workers (Connelly and Gallagher, 2004; Singh *et al.*, 2017). Similar trends are observed in India as reported by Ananthanarayanan (2014). The statistics reported states that in the year 2014 contractual workers accounted for 46 percent of the total workforce in the manufacturing sector of India (Ananthanarayanan, 2014; Jha, 2018).

Apart from these, there are several other reasons behind increase in the hiring of contractual workers in India. The nature of the work in the manufacturing sector is characterized as labor-intensive and the stringent clauses of Indian labor laws such as the different sections of Industrial Dispute Act, 1947 (India Code – digital Repository of Legislations (ICDRL), n.d.; Jha, 2018) and Indian Trade Union Act, 1926 (National Laws on labour, social security and related human rights (NATLEX), n.d.; Jha, 2018) are some of the reasons. Under these stringent laws organizations are not allowed to lay-off permanent workers without a prior intimation and permission from the relevant state government (Ananthanarayanan, 2014; Kapoor, 2015). Roychowdhury (2018) explored the problems associated with the issue of labor flexibility in Indian manufacturing market and suggested two major challenges of this sector – the issue of job

Jan Aushadhi-Taking Medicines to the Masses

<<Previous Page

INTRODUCTION

In 2016, the Medical Council of India (MCI) amended Clause 1.5 of the Indian Medical Council Regulations (Professional Conduct, Etiquette, and Ethics), 2002, making it mandatory for the medical practitioners to prescribe medicines by their generic names. The directive followed the revamping of the Jan Aushadhi Scheme (JAS) launched in November 2008 by the Government of India (GoI) to provide affordable and quality generic medicines to the needy and weaker sections of society.

Even though JAS was launched with the noble cause of providing affordable medicines to the weaker sections of society, the scheme initially faced several challenges such as poor supply chain management, competition from the state governments, quality issues, and lack of awareness among the public about generic medicines.

Sustainable and responsible consumption: Evidences from emerging economies

Welcome to this special issue, which includes nine papers that collectively seek to understand the sustainable and responsible consumption in emerging economies. While the authors have sought to address sustainability from various perspectives, such as organic food, electric vehicles, sustainable commuting, shared clothing, and reconstructed products, they share the prevailing view about the importance of sustainable consumption.

Environmental issues have become a topic of interest at the global level. Researchers and practitioners in the field of business management have recently paid increased attention to the concept of sustainability. However, the best way to enhance sustainability in society is to encourage individuals to adopt eco-friendly activities in their day-to-day life (Prothero et al., 2011). An individual's consumption patterns affect the environment, the functioning of the ecosystem, and the availability of resources (Connolly & Prothero, 2003). It is, therefore, believed that sustainability and environmental consciousness should be incorporated into an individual's consumer behavior. Sustainable and responsible consumption will also contribute to economic development. While several studies have focused on sustainable consumption in developed countries, only very few studies have investigated it in emerging economies (Khare, 2015). According to Yadav, Kumar Dokania, and Swaroop Pathak (2016), about 90% of studies in the area of socially conscious consumerism is limited to developed regions of Europe and North America. Although a large proportion of the global population resides in emerging economies, environmental consciousness among the people living in these parts of the world is limited (Scott & Vigar-Ellis, 2014). Emerging economies tend to take initiatives to respond to the environmental problems and to enhance sustainability (Vergragt, Akenji, & DeWick, 2014; Yadav & Pathak, 2017); however, very limited emphasis has been placed on individuals' commitment to adopting sustainability and their sustainability practices in their consumption behaviors (Yadav, Dokania, & Pathak, 2016). Considering this, the special issue emphasizes sustainable and responsible consumption in the context of emerging economies.

The first paper, "Motivators and barriers to sustainable food consumption: Qualitative inquiry about organic food consumers in a developing nation" by Rambalak Yadav, Pankaj Kumar Singh, Ankur Srivastava, and Anees Ahmad, identifies the motivators and barriers of organic food consumption in the Indian context. A grounded theory approach demonstrated the motivators that trigger the purchase of organic food, namely, health consciousness, environmental consciousness, social identity, consumer ethnocentrism, and concern for farmers. Moreover, the factors, namely, high prices of organic food, unavailability, trust issues, and limited marketing communications by the firms, are ascertained as the barriers to the consumption of organic food.

The second paper titled "Marketing Challenges and Organic Farming in India—Does Farm Size Matter?" by Sikandar Azam, Musarrat Shaheen, and Sonali Narbariya highlights the marketing challenges of farmers who are involved in organic farming in India. Organic food is sustainable food, and organic farming encourages responsible consumption. The authors explore various marketing challenges that influence the intentions to adopt organic farming. They investigate the challenges according to different farm sizes. The findings are useful in addressing the challenges the farmers face in organic farming in an emerging economy like India.

The third paper titled "A Theories of Practice Perspective in Understanding Barriers to Sustainable Commuting: The Case of UAE" authored by Shilpa Iyanna, Carmela Bosangit, Jordon Lazell, and Marylyn Carrigan investigates a range of elements that collectively shape the practices of daily commuting. The authors have used a qualitative approach to understand sustainable commuting among residents in the UAE. The research also showed insights into barriers to sustainable commuting and outlines viable opportunities to provide sustainable commuting.

The fourth paper titled "Factors explaining shared clothes consumption in China: Individual benefits or planet concern" authored by Jashim Khan and Sharyn Rundle-Thiele is aimed at expanding the understanding of the consumption of shared clothes with the underpinnings of attitude-intention behavior theory. A total of 250 responses from current users and 232 responses from potential users was gathered using surveys. The findings showed that environmental concerns are higher among current users than potential users of the shared clothing platform. The results also demonstrate that personal considerations, such as economic benefits outweigh environmental considerations when it comes to the consumption of shared clothing.

The next paper is by Jighyasu Gaur, Ritu Gupta, Pratyush Banerjee, and Mehdi Amini, entitled "Influence of cultural divergence on consumers' perception towards reconstructed products: A qualitative inquiry." The paper is aimed at understanding whether consumers from different cultures have varied perceptions of reconstructed products. The authors took theoretical support from the cultural divergence concept and collected data from the consumers of two culturally diverse societies: India and the USA. The grounded theory approach was used for interviews and data analysis. Culture, being one of the critical findings of the study, plays a decisive role in shaping

 © 2019 John Wiley & Sons, Ltd.

consumers' perceptions of reconstructed products. However, other factors, that is, product/process-related factors, brand/store-related factors, and individual factors, also influence these perceptions.

The next paper authored by Amit Shankar and Puja Kumari attempted to investigate the enablers and inhibitors of electric vehicles (EV) adoption intention from the sellers' perspective using a dual-factor model. The researchers have used an extended theory of planned behavior framework to explore the enablers, whereas the status quo bias theory has been used to explore the inhibitors of EV adoption. The results indicate that attitude, subjective norm, perceived behavioral control, environmental concern, and perceived CSR obligations have a significant positive impact on the intention to adopt EVs. However, regret avoidance, inertia, perceived threat, and perceived value have significant impacts on the resistance to adopt EVs. This study enriches the literature on green technology adoption and provides several suggestions to marketers for increasing the pace of EV adoption.

The next paper in the issue is "Modelling the Predictors of Young Consumers' Sustainable Consumption Intention" authored by Yatish Joshi, Deepak Sangroya, Anugamini Priya Srivastava, and Mayank Yadav. This research paper attempts to explore the various determinants of sustainable consumption intentions. Based on the theory of planned behavior and the theory of reciprocal determinism, the findings show that past sustainable experience and environmental responsibility affect consumers' sustainable intentions. The study offers a different approach to develop consumers' sustainable consumption behaviors and provides an applicable model to determine sustainable consumption intention.

The next paper titled "What drives organic food consumption in Lebanon?" was authored by Malak Tlies, Roberta Callieris, Lina Al Bitar, Rocco Roma, and John Thøgersen. Hierarchal value maps constructed from the laddering interviews showed that "quality of life," "pleasure," and "peace of mind" are the main values driving organic food consumption in Lebanon. Frequent organic consumers displayed higher concerns for their family's health and for environment, whereas occasional organic consumers cared more for their own pleasure and were more likely to perceive organic food as a traditional and nostalgic product.

The final paper in the special issue titled "Answering Key Questions on Green Consumption: A Qualitative Study among Indian Youth" by Manish Gupta and Anitha Acharya is aimed at comprehending the meaning of green consumption, identifying the products that are considered green by Indian youth, exploring the reasons behind green product consumption, and deciphering the possible implications of consuming green. The authors' core argument is that the past literature does not provide a comprehensive and clear definition of green consumption and that very few studies cover this concept in the context of Indian youth. The authors conducted a qualitative study by interviewing information-rich cases. Based on the responses, they developed thematic maps and identified three significant themes, namely, (a) personal factors, (b) social factors, and (c) environmental factors. Based on the thematic analysis, they also propose a model of green consumption.

Finally, the guest editors would like to sincerely thank all the reviewers who helped us with reviewing and re-reviewing manuscripts. We would also like to appreciate the continuous guidance and support from Jane Hudson, the editor in chief of *International Journal of Nonprofit and Voluntary Sector Marketing*, for this special issue.

Abstract

Religion's impact on society cannot be overestimated. In the multireligious country of India, it is prevalent in the micro-level interactions and practices of commoners and the macro-level strategies and policies of political parties. Religion thus holds power to make or break societal structures and practices. This article investigates the role of religion in the lives of widows living in Vrindavan, India, by analyzing 37 narratives. Religion was found to have a dual role. Through the sociological lens, it is among the major reasons for these widows' marginalized and dejected condition, having been abandoned by their families and society. The sociological themes comprise interpreting the doctrine of karma to rationalize widowhood, the formation of negative attitudes toward widows, and religion as a source of exclusion. Conversely, through the psychological lens, religion provides them with the necessary psychological resources to cope with several hardships in their daily lives. The psychological themes comprise seeing misery as an instrument of God, developing a personal connection with God, surrendering to God, using religious rituals as distractions from misery, helping others, and conceptualizing Vrindavan as a place of Krishna and enabler of spiritual retreat. The linkages to theory and a model for religion in the lives of Vrindavan widows are also discussed. (PsycInfo Database Record (c) 2020 APA, all rights reserved)

disciplines. Skills improvement is the main motivation for medical and pharmacy students to attend guest lectures. Attitude improvement is a key reason for management, medical, and pharmacy students to attend guest lectures. This study helps academics to understand the relative importance of knowledge, skills, and attitude in conducting guest lectures for students in management, pharmacy, and engineering. The study is the first of its kind within the context of higher education to examine the factors that determine the motivation levels of students to attend guest lectures. Its findings are likely to assist the administration of Indian higher education institutions in formulating and designing their pedagogy around guest lectures and to ensure the success of those lectures.

Keywords: Guest Lectures, Students, Higher Education, Knowledge, Skills, Attitude, India, Mixed Method, Teaching Pedagogy

Introduction

In the past decade, higher education has undergone a tremendous change, with the emergence of new disciplines, market-oriented curriculum design, and the use of innovative teaching pedagogies (Rogers 2000). There has been a paradigm shift towards student-centered teaching, which allows students to be actively involved in the classroom and remain interested in their courses (Baepler et al. 2014; Van Teijlingen et al. 2018). Though there are many methods of teaching, such as case studies, project-based methods, simulation exercises, and role playing, lecturing remains the most popular or widely used method of imparting knowledge in a classroom setting (Stappenbelt and Rowles 2009; Wallace et al. 2014). The lecture is solely driven by the speaker, who provides information on a given topic using chalkboards or audio-visual aids to cover the topics outlined in the course design (Gilboy et al. 2015). Studies conducted in the past have indicated boredom and lack of engagement among students during lectures due to the lack of opportunity for participation and the relatively passive nature of the classroom (Wilson and Korn 2007; Hockings et al. 2008; Mann and Robinson 2009; Kochenderfer 2015). Nevertheless, past studies have noted that guest lectures are effective mechanisms for subverting the boredom, by exposing students to real world examples and allowing them to interact with the speakers, generally industry experts and professionals who

possess ample knowledge and expertise on their given topic (Taraban et al. 2007; Roehl et al. 2013). In higher education disciplines such as management, pharmacy, and engineering, guest lectures are considered a useful method to update students with recent developments, convey the applicability of theories to practice, and foster students' involvement in class (Kember et al. 2008; Oskvarek et al. 2016).

However, students of these three academic disciplines may attach different importance to guest lectures, depending on the relevance of the topic (Dannels 2002; Aithal and Kumar 2015). In this regard, it is likely that students in management, pharmacy, and engineering may perceive the usefulness of guest lectures differently, which in turn may shape their varied expectations for guest speakers. To provide students with optimal guest lecture experiences, it is essential to gain insights into the students' expectations and the factors that motivate them to attend guest lectures (Paechter et al. 2010; Porras 2016). The present study, therefore, attempts to explore students' expectations of and motivation to attend guest lectures across three popular higher education disciplines in India: engineering, pharmacy, and management. The findings of the study could help universities to design more successful and effective guest lecture series that attract students in those disciplines and meet their expectations.

Literature Review

The guest lecture is one of the most popular methods used in higher education to impart practical relevance of the subject in the classroom and to engage students (Grasha 1994; Gauci et al.

Information Retrieval Using Image Attribute Possessions

D. Saravanan

Abstract Extracting defined information from the huge data set really challenging task for many researchers, especially this data set like image data's process is too complex. As image data consist of motion, time, text, audio, pixel difference and more. From this complex data set, extracting the domain knowledge takes more time. This process differs from traditional text mining, because the nature of the data sets. Extracting information from image data, user needs additional knowledge; i.e., users required domain knowledge. This attracts many users concentrate on this field. Currently, many research works carried on this particular domain. Advancement of technology more and more image data is created and uses, for this urgent attention required in the field of image mining. This paper focuses on image mining help of clustering technique. First video data are grouped into frames, from the cleaned frameset process are done client- and server-side operations. The proposed technique works well, and experimental results also verified this.

Keywords Video data mining · Key frame analysis · Clustering technique
Image mining · Frame comparison · Knowledge extraction

1 Introduction

Technology brings image-based extraction so simple and easy to the users. This process brings the output with greater accuracy. Today most of the applications which are used in this process effectively some of them are in traffic control, criminal analysis, weather forecasting, finance, marketing, operations and more. In the above domain, vast amount of images are collected and constructed image data based.

INSIDER OR OUTSIDER CEO: CHOOSING WISELY IN DIFFERENT CIRCUMSTANCES

Naseem Ahamed and Nitya Nand Tripathi

ABSTRACT

Change of leadership is a big and important incident in the life of a company. As important as it is for the company, it is equally a difficult decision to make for the board of directors. Most of the big companies have a committee dedicated toward laying out a succession plan of the existing chief executive officer (CEO). The big dilemma, however, is whether to appoint someone from within the company and let him or her lead as he or she has been associated with the company and knows the internal dynamics better or to induct some outsider and take advantage of his or her expertise/reputation in the market. The balance appears lopsided when the result of this chapter is perused. Companies on an average seem to reap more benefits if an existing executive is promoted to the office of CEO rather than hiring an outsider. The benefits which are talked here from promoting insiders are indirect ones and do not have a direct bearing with the finances of the company. As shown by the results that insiders are more likely to continue with the company for a longer duration as the CEO as well as not as the CEO which defers the hiring and firing costs (screening candidates, conducting

Nexus Between International Trade and Economic Growth

Laila Memdani

Abstract Trade is considered by many economists as an engine of economic growth. Trade openness accelerates economic development is believed by many economists. The main objective of this paper is to study the link between economic growth and trade and also to study how the link varies according to the level of income of the countries. There are allegations by poor and middle income countries that trade is not promoting growth for them but it helps the rich countries to become richer. The data for all the countries of the world is collected from the official website of World Bank from 1990 to 2014. The countries are divided into high income countries, middle income countries and low income countries. VECM is used to study the long–run- and short-run causality between trade and growth.

Keywords Trade · Development · FDI · Exports · Imports · Panel data analysis

JEL Classification F2 · F14 · F15 · F63

1 Introduction

Trade is considered by many economists as an engine of economic growth. Many economists believe that trade openness accelerates economic development. The swift growth may be a transitional effect so that it is reasonable to consider trade openness to be accelerating economic growth, rather than just leading to a, one-time adjustment in real income (Dollar and Kraay 2004). When India slowly opened its economy, there were fears that imports will shoot up and there may also be capital flight. But many others are also skeptical about it. Competition will increase and domestic industries will be killed, i.e., the phenomenon of big fish eats the smaller

Robust Command And Control System For Military Weapons

Authors Akella Amarendra Babu, Siva Prasad Nadakuduru

Description Military Weapons Operate In Harsh Battlefield Noisy Environment And The Voice Command And Control Need Robust Man Machine Interface (Mmi). In This Paper, We Present Two Methods To Achieve Robustness. Firstly, Incorporate Error Tolerance Techniques And Secondly, Adapt Pronunciation Of The Speaker. Phonemic Distance Measurement Algorithms Are Used For Measuring The Phonetic Distance Between Various Commands And Their Pronunciation Variations. The Algorithms Are Implemented Using Java And The Data Sets Are Taken From Timit Database And Cmu Pronunciation Dictionary. The Performance Of The New System Is More Robust When Compared With Existing Systems.

Non-Performing Assets (NPAs) and its Resolution in Indian Banks

A. Sager Reddy

INTRODUCTION

The profitability, performance and efficiency of banking firms depend upon the efficient credit function of banks. Banking institutions do financial intermediation by undertaking asset liability transformation, size transformation, maturity transformation and risk transformation (Brahmaiah, 2018). Because of these transformations, the banking business is a risky business. Credit and credit risk managements are important functions of the banks. Credit risk is a major source of NPAs. The efficient credit function reduces the complexities of credit risk management. The nature of ownership, size of the assets, terms of credit, credit exposure to the different sectors and kinds of borrowers, the nature of collaterals and security provided by the borrowers, style of management, practices of banking business, and business cycles are determining the size of NPAs in commercial banks in India. The core business of banking institution is to manage different risks associated with the banking business and provide a return on investment to the shareholders. The Indian banking structure comprises 84 Scheduled commercial banks (SCBs) consisting of 19 public sector banks (PSBs), 18 private sector banks (PVBs) and 47 foreign banks (FBs). In view of these developments and not many studies are carried out on the subject of NPAs relating to overall banking institutions in the Indian context, this study is undertaken. The data relating to the banks have been collected from secondary sources for the period 2008 to 2018. The rest of the paper is organized as follows. Section 2 reviews the literature; Section 3 analyses the banks' performance and NPAs of banks, Section 4 discusses the recovery process and resolution mechanisms. The last Section concludes the paper.

LITERATURE REVIEW

There are plenty of studies on determinants of NPAs with respect to international and Indian banking industry. Researchers investigated the determinants of NPAs and find banks' profitability and efficiency have negatively associated with NPAs. Researchers investigated credit growth and its effect on non-performing assets, and find evidence that higher loan growth leads to higher NPAs. Earlier studies find a bank, which capitalizes

Predicting Hotel Book Intention: The Influential Role of Helpfulness and Advocacy of Online Reviews

Tathagata Ghosh

ICFAI Business School, IFHE University, Hyderabad, India

Contact: Tathagata Ghosh, 208, Wing C, ICFAI Business School, IFHE University, Donthanapally, Shankarapalle Road, District: Ranga Reddy, Hyderabad, India. E-mail: tghosh@insindia.org

Downloaded by [Australian Catholic University] at 05:24 24 August 2017

ABSTRACT

This article empirically examines and validates a research framework that gives key insights into the influential role played by salient characteristics of online reviews, namely helpfulness (how helpful a review is) and advocacy (whether the review explicitly approves or rejects the brand), on consumers' attitude toward the review and the hotel about which the review is written. The subsequent effects of these attitudinal reactions are then examined on hotel booking intention in the presence of destination specific emotion as a moderator. Data collected from a sample of 362 individuals are analyzed using ANOVA and linear regression. Results reveal that review helpfulness and review advocacy have differential effects on consumers' attitude toward the review and brand. Also, attitude toward the review positively affects brand attitude which subsequently effects consumers' intention to book a hotel. Finally, destination emotion is found to affect the relationship between brand attitude and hotel booking intention positively.

Keywords: Review helpfulness, review advocacy, attitude toward review, brand attitude, hotel booking intention, destination emotion

Prioritising of banking firms in India using entropy-TOPSIS method

Santosh Kumar Yadav and M. Dharani

Published Online: October 24, 2019 · pp 554-570

ABOUT

Abstract

India Brand Equity Foundation (IBEF) reveals that the banking industry contributes about 7.7% of the country's gross domestic product (GDP) in India. It shows that the banking industry is the backbone of the Indian economic development. The study examines the performance of the banking companies based on the financial ratio and ranking them using the TOPSIS method for the period between 2010 to 2015. Entropy method was used to get criteria weight value while TOPSIS method used the entropy weight value to assign a final ranking of the banking firms. The results show the ranking of all banking firms based on relative closeness value under TOPSIS method during the study period. It will be helpful for decision-makers, who want to analyse the performance of banking companies.

Prioritising post sales service quality items in light commercial vehicles using TOPSIS method

Santosh Kumar Yadav

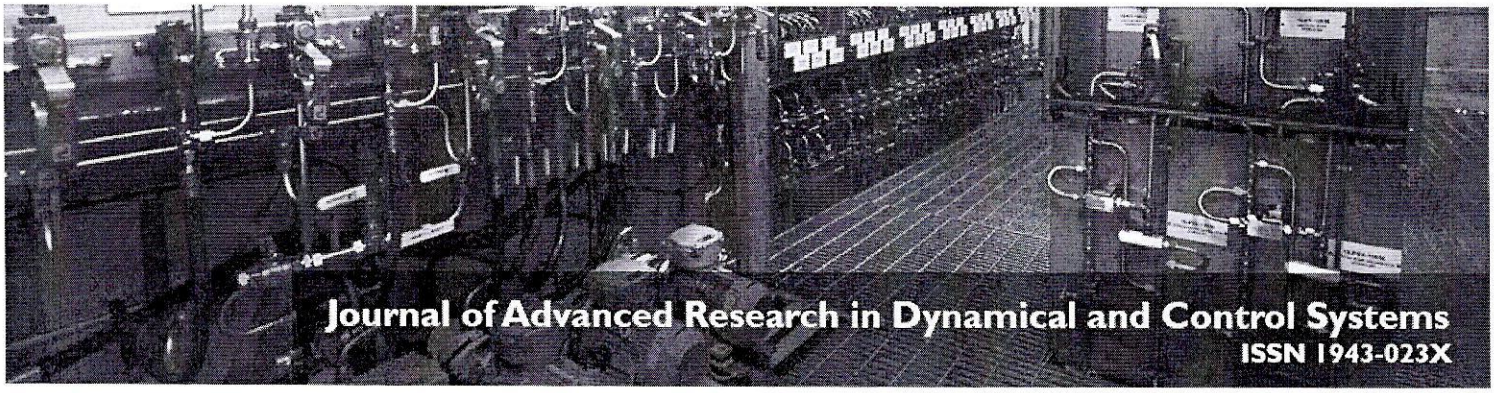
Published Online: February 8, 2019 · pp 119-138

Abstract

Post sales service quality is the most essential viewpoint to measure customer satisfaction in light commercial vehicles. A post sales service is required after the sale of a vehicle. Customer satisfaction checks whether, after getting services, customers feel happy or not. This research paper attempts to identify post sales service quality items that lead to customer satisfaction or dissatisfaction. A questionnaire was developed about post sales service quality in which the customer was asked to rate the importance of these items. The technique for order of preference by similarity to ideal solution (TOPSIS) method was applied to rank the post sales service quality items based on their importance in light commercial vehicles. From the results, it is found that having a consistent standard for accepting and returning vehicles for service and promptness of service were the two most important post sales service quality items. The accessibility to the service station and the availability of advanced facilities in the service station were also found to be of significant importance. Service station managers may give these items priority in order to increase post sales service quality.

Keywords

post sales service quality, light commercial vehicle, technique for order of preference by similarity to ideal solution, TOPSIS



Secure Transaction through Image Password Generation Technique

D. Saravanan, Dennis Joseph , N. Sivaprasad

Abstract:

Increasing demand of technology has considerably increased the need for proper authentication in the present digital world. Users can use different techniques for securing their data sets. Traditionally, a text based authentication system was used for protecting our data. This technique brings about various problems to the user community, as it can be easily tracked by hackers and it is easy to judge and break a generated password. To overcome these problems, researchers have come up with many techniques. Graphics based password generation is one of the advanced techniques. An important usability goal for knowledge-based Authentication systems is to support users in selecting passwords of higher security, in the sense of being from an expanded effective security space. We use persuasion to influence user choice in click-based graphical passwords, encouraging users to select more random, and hence more difficult to guess, click-points. We developed a framework for developers, researchers, professionals, and users to identify and compare the user-centered features that may be supported by authentication schemes. We also performed empirical studies on two novel authentication schemes. We demonstrate that our text-based password scheme, Persuasive Text Passwords, can influence users to create more secure passwords that are memorable.

Abstract

The study analyzed the persistence of shocks to the seasonal time series of the price indices of selected agricultural commodities in India. The seasonal unit root test procedure proposed by Hylleberg et al. (1990) and Beaulieu and Miron (1992) were used for 10 major price indices of agricultural commodities. The study covered the period January 2000 to January 2013. Overall results provide significant and robust evidence rejecting the presence of unit roots at all seasonal frequencies for cereals; condiments and spices; eggs, meat, and fish; pulses; and vegetables. For the rest of the commodities studied, evidence indicates that the seasonality present is partly deterministic and partly stationary stochastic. These findings have important policy implications for policymakers and research analysts.

Subject(s)

The Impact of Information Technology and Analytics on the Performance of a Hospital: Scale Development in Indian Context

Vaidik Bhatt, P Sashikala, Samyadip Chakraborty

Abstract: ***Today, in the era of analytics and Information Technology, analysing every form of data is possible. Be it manufacturing, Supply Chain, Retail, Service, Product, Sales Marketing or be it Pharmaceuticals and Healthcare. In recent times hospitals are facing the issue of over-crowding and medical staff is not able to deliver the healthcare properly. With the help of the Information Technology System used in hospitals for routine work, high quality and high amount of data can be generated. With the capabilities to analyse the data accurately for the internal operations, planning, and forecasting for the benefits of the patients in deciding the nature of the treatment, medicines used or the probable adverse drug reaction pharmacologically, the performance of the healthcare organization increases. The study concentrates on the scale development for the constructs which can improve the operational performance by using the information technology and the care analytics.***

Key Words: Healthcare Analytics, Information Technology, Hospital Performance

I. INTRODUCTION

Healthcare is one of the critical sectors in every country; on the other hand, it is an essential factor for the growth of the country also. The increase in the cost for the healthcare sector for the individual as well as the government has contributed to making healthcare as an essential area of research. In the country like India, though the death rate for the various diseases decreased over the period, the healthcare cost has also increased [40]. On the other end, during the time of disasters and communicable diseases, it has been observed that hospitals are overcrowded, and the patient is not able to get best treatment because of the congestion of the patients in the hospitals.

With the disorders like diabetes, cardiac arrest or high blood pressure, it has also been observed that the patient does not have full information on their disorder type, like the patient does not know which medicine they are taking. For deciding the nature of treatment for such kind of complex diseases, it is crucial to know about the previous medication, other diseases and allergy towards the molecule [43].

There are studies on the Information technology in healthcare set up, which mostly concentrated towards the areas like, institutional and market factors [11], strategies to adopt IT on different levels [18], information technology for the purpose of medication safety [35], Electronic Health Record adoption for the performance [2]; [12].

Revised Manuscript Received on September 15, 2019

Vaidik Bhatt, Research Scholar, Department of Operations & IT, ICFAI Business School (IBS), Hyderabad, The ICFAI Foundation for Higher Education (IFHE) (Deemed to be university u/s 3 of the UGC act 1956)

P Sashikala, Professor, Department of Operations & IT, ICFAI Business School (IBS), Hyderabad, The ICFAI Foundation for Higher Education (IFHE) (Deemed to be university u/s 3 of the UGC act 1956)

Samyadip Chakraborty, Associate Professor, Department of Operations & IT, ICFAI Business School (IBS), Hyderabad, The ICFAI Foundation for Higher Education (IFHE) (Deemed to be university u/s 3 of the UGC act 1956)

However, Information technology includes many more systems which includes EHR but not limited to, as information systems and technology can also include ERP [1],[16], SCMS [30] and several other systems.

On the other side, healthcare analytics is a separate discipline. There are many models developed. With the different data mining techniques it is possible to observe and analyse different kinds of diseases under the different type of situations. With or without prominent data inclusion, there are several models which have been made available to predict the various types of conditions. However, data needs to be in the analysable format to get the insights.

IT is essential to use analytics and get the job done correctly with the right accuracy and precision. With the sophisticated instrumentation in IT, it is possible to create the coordination and integration among the departments and with the accurate, adequate, timely and credible data it is possible to run real-time analytics to improve the efficiency and performance in terms of patients' care for the healthcare organization.

II. LITERATURE REVIEW

A. Theoretical Underpinnings:

a. *Resource Based View (RBV)*

A resource-based view [6] suggests that for creating a competitive advantage for the firm, a resource should be Valuable, Rare, Inimitable and Organizational Specific. A resource should increase the capability or decrease the delay in time and process to be as a valuable and it should be copied by the competitors. At least the overall impact of the resource should be organizational specific and embedded in routine to create the complementarity between the other resources. With the RBV, the firm should also focus on building internal capability or enhancing it instead of looking for opportunities outside. IT as a resource improves the speed, coordination, integration and decreases the inefficiency in the process, and the overall impact cannot be copied as it is learning method and relationship between IT and the business person also impacts, which is unique and inimitable.

b. Dynamic Capability

Dynamic capability can be defined as an extent to which firm can integrate, built and reconfigure internal and external competencies to respond to the fast-changing dynamic environment [49]. Dynamic capability is more towards the outside orientation of an organization, as organizations must be agile enough to change according to the market requirement and fulfil the demand generated by the market.

Apple's Battle with the FBI: Privacy Versus National Security

— Manish Agarwal and D Satish

Apple Inc. (Apple), the world's biggest tech company, updated its privacy policy and security features during the launch of the iOS 8 in 2014. In order to protect its customer's data privacy, Apple refused to provide information to FBI from a phone used by a terrorist involved in San Bernardino terrorist attack in December 2015. However, FBI accessed data from the terrorist's iPhone with the help of professional hackers. This news brought new challenges for Cook and his team to find and fix the flaw that had allowed hackers to crack the passcode and protect the customers' privacy. The case provides information for not only discussing the future of Apple's privacy strategy but also the ethical issues behind Apple's decision.

The objective of this study is to determine the attitude of young Indians towards snacking and munching habits. Data was collected from 200 respondents through a structured questionnaire, and the sampling method used was random sampling. The data was processed and analyzed using the statistical techniques available. On the basis of the data analysis, the results have been interpreted and conclusions drawn.

Factors Driving 'Life Satisfaction' of the India Population: Evidence from an Ordered Probit Regression Analysi

P. Azad & M.A. Lagee

INTRODUCTION

Happiness economics has received much attention among the economists, after the publi of a broad review of research on subjective well-being by Wilson (1967). But the subject received more attention with the publication of the seminal paper by Easterlin's (1974). He by examining the available evidence on income and happiness, concluded that higher level income or economic growth does not necessarily make people much happier (Easterlin 1974, 1995, 2001), which is known as *Easterlin paradox*. Since then, a large body of literature has emerged studying happiness within various disciplines including economics and psychology and self-reported happiness is considered as unique measurement of happiness and subjective well-being of the people (to name a few are Diener 1995a; Diener, 2009; Easterlin 2001; Frey and Stutzer, 2000; Frey and Stutzer, 2002; Kahneman and Krueger 2006; Tella and MacCulloch 2008; Stevenson and Wolfer 2008).

Happiness of the people has major implications to the development of an economy (Boada 2018). Happy people are more likely to be healthier and live longer, to have better social relationships, and to be more productive at work (Proto, 2016). The developing economies are doing their best to maximize well-being of the society. However, majority of people still report feeling unhappy even though they have more comfortable material lives. India, one of the fastest growing economies in the world is finding herself in a lower position in terms of happiness (Helliwell et al, 2012). This study will therefore address the research question i.e. what are the factors driving the subjective well-being/life-satisfaction of the people in India?

The rest of this paper is structured as follows: In Section 2 review the existing literature on the determinants of life satisfaction by putting them into two categories such as literature which tested the validity of Easterlin Puzzle and the literature which considered income and non-income factors. In Section 3 we describe the data, variables and methodology used in the study. Section 5 discusses findings from the empirical analysis. Section 6 provides summary and conclusion of the findings and limitations of the study.

REVIEW OF LITERATURE

The literature on the issue of the determinants of life satisfaction is galore and it can be classified into two categories such as the studies which examined income and life satisfaction/happiness relationship and the studies which focused on the non-income determinants of happiness.

HAPPINESS AND INCOME

A large body of literature focused the discussion on happiness and income. It is a general belief that the rich are happier than the poor and that happiness will increase with increase in income.

Easterlin (1974) observed that, on an average, a rise in income raises happiness at a point in time, but over time happiness does not increase with increases in income. Further, in spite of the fact that there are unfathomable and glaring income gaps among countries, extent of happiness remains more or less uninfluenced (Stevenson and Wolfers, 2008). It is also evident that individual happiness not only depends on the individual's own income but also on the income of a reference group. The reference group can include all members of a society or only a subgroup, such as individuals living in the same neighbourhood or having the same education level, age, employment etc (Clark and Oswald, 1996; McBride, 2001).

As an extension to reference group, another body of literature maintained that people garner utility from enjoying a higher ranked position within an income distribution rather than from either absolute income or their position relative to a reference income (Smith et al, 1989).

Boyce and Gordon (2010) found that the general life satisfaction is vividly influenced by the ranked position of an individual's income, whereas absolute income and reference income have trivial role at all. Further, individuals weight 'upward comparisons' more heavily than 'downward comparisons'. They further argued that income and utility are indirectly related and hence people can increase their utility from an increase in income only if his/her ranked position also increased and this will necessarily leads to a decline in the others who lost their higher rank. Finally, there are some studies which observed that it is the 'perception of financial status' more powerful than the actual income in subjective well-being of the people (Haller and Hadler, 2006)

NON-INCOME DETERMINANTS OF HAPPINESS

Apart from income, there are many other socio-economic demographic factors having significant bearing on happiness of the people. They are employment status, inequalities, social trust etc. It is observed that unemployment is inversely correlated with happiness and life satisfaction. One of the phenomenal findings from literature is that life satisfaction and unemployment are inextricably mixed up and that working status and social esteem are also influenced by the availability and accessibility of employment. (Winkelmann, 2009; Helliwell and Huang, 2014). There is bidirectional causality between job satisfaction and life satisfaction and mixed evidence of causation between life satisfaction and different facets of job satisfaction (Mishra et al, 2014).

Scanned by CamScanner

The positive relationship between trust and happiness has been corroborated by literature. In general trusty people are happier than mistrust people. Several Studies found that trust more than income or even health is the biggest factor in determining hap (Wenzel, 2008). It is not just about trusting people but also the feeling of being trusted contributes to our happiness. Helliwell and Putnam (2004) and Helliwell (2007), ba World Values Survey data show that happiness is positively related to trust level, alt the direction of relation is somewhat ambiguous. Moreover, even trust in public institu such as government, police, and legal system is also positively associated with highe satisfaction. There is also mounting evidence that institutions are also strongly correla across countries, with happiness. The deepness of democracy and the extent of politi economic, and personal freedom correlate strongly with reported happiness across coun (Frey and Stutzer, 2002). A multitude of studies also support that greater life satisfac is related to religiousness. This relation between subjective wellbeing and religion is fo irrespective of their confession (Helliwell, 2007; Heliwell and Putnam, 2004).

There is much covenance regarding the relationship between education and happi Some studies show positive effect with increasing life satisfaction in higher education gr (Ferrante, 2009, Bukenya et al. 2003) argue that effect of education is correlated to inco and health and therefore the latter variables should be controlled in order to verify the effe of education. In many studies health has been found to be one of the mightiest drivers overall life satisfaction. Life satisfaction is greater among people who are in good physi and mental health. Inversely, happy people are less likely to fall ill and die than unhap people (Deaton, 2008; Steptoe et al, 2015). Marriage or other affairs usually are associa with happiness of the people. Many studies find positive relation between being in clo relation and happiness (Helliwell, 2006). Divorce or Widow according to literature, caus the lowest level of happiness. Some explanations are that marriage provides additio sources of self-esteem, support and companionship (Frey and Stutzer, 2002). Regardi age, the general belief is that older people are less happy than younger people. Howeve recent studies suggest a U-shaped curve relation between age and life satisfaction. Young and older age group respondents tend to be happier than middle aged respondents (Carbon and Gowdy, 2007). Other studies come across a divergent relation (Baird et al, 2010). Ul et al (2013) reviewed the relationship between age and life satisfaction and suggest th there are different methodologies, data sets and samples for comparison among disciplines and hence studies is difficult. However, extant studies do show either a U-shaped, inverse U-shaped or linear relation between ageing and life satisfaction.

There is no consensus among the scholars whether gender is an important variable in happiness studies. While study of Alesina et al (2004) found some relationship regarding gender and happiness, others argue that relation is not significant (Louis and Zhao, 2002). Studies found that impact of having children may vary depending on other factors. Stu some studies find a positive relation between having children and life satisfaction (Angeles, 2010). Tendency towards lower crimes are associated with higher levels of subjective well-being, but the relationship is weaker and as yet not well studied. Brown et al (2012), Ja

Scanned by CamScanner

and Smith (2016) pointed out that victimisation does have a significant impact, although the size of the coefficient is small. They may reflect the fact that the impact of victimisation on life satisfaction diminishes over time. The data used in their analysis is victimisation over the last 12 months. There are studies which highlighted the importance of relationships with family, friends, and others in the community on life satisfaction. For instance, Healy (2005) discovered having strong social connection through close friends, personal touch, and mutual trust were strong covariates of happiness and life satisfaction.

The above research discussions were primarily conducted in wealthy nations. With the rapid growth of the world economy, scholars are increasingly harping on developing countries. But India as developing economy, studies in economics of happiness is rare and very few comprehensive and authoritative studies have been made so far in this direction viz., Lakshmanasami (2010), Majundar and Gupta (2015).

Lakshmanaswami (2010) validate the *Easterlin Paradox* by using the data of 315 respondents from two divisions of Chennai Corporation: Chepauk and Triplicane. This study found that the absolute and relative income have a positive and significant impact on the happiness of the households. The study, however, also observed that beyond a certain level of income people are more bothered about status and position in the society than money. Further, this study found that school educated is happier than the higher degree holders, professionals are happier than the lower grade workers and retired people are happier than their working counterparts.

Majundar and Gupta (2015) found that the households who are employed, main wage earners, married, healthy, educated are happier than their counterparts in the opposite category. They also found that the lower income group and minority religion group are equally happy like their counterparts in the higher categories. The study also confirms the presence of *Easterlin Paradox* in the Indian context.

Overall, from the above review, it is observed that the evidences are mostly from the advanced economies and there are only a few studies from the developing economies in this direction. The few studies on the Indian economy, however, are based on the data collected from a specific region, small sample size and descriptive statistical analysis and hence it is insufficient to provide a lucid picture of subjective-well-being (happiness/ life satisfaction) of the Indian citizens. The present study makes an attempt to bridge this gap by empirically investigating the self-assessed determinants of happiness of the Indian citizens using the official Sixth World Value Survey (2014) data and ordered probit regression model. Studies having cross-sectional evidence of happiness of Indian respondents are rare. Further, in our best knowledge no studies have examined determinants of life-satisfaction/happiness using econometric method 'ordered probit regression' and a large sample size in the Indian context.

DATA AND METHODOLOGY

Data

The two major sources of secondary data on life satisfaction at country level are UN World Happiness Report (by United Nations Sustainable Development Solutions Network) and the

Scanned by CamScanner

World Value Survey prepared by a non-profit World Values Survey Association in Stockholm. The present study use data retrieved from the World Value Survey (WVS) as the household level data is not directly available at the United Nations Sustainable Development Solutions Network.

To monitor the changes in what people want out of life and what they believe in, World Values Survey (WVS) in collaboration with the European Values Study (EVS) have conducted six waves of surveys from 1981 to 2014. Representative national samples of each society's public are interviewed, using a standardized questionnaire that records changing values concerning religion, gender roles, work motivations, democracy, governance, social capital, political participation, tolerance of other groups, environmental protection and life satisfaction (www.worldvaluessurvey.org/). The WVS covers more than 100 countries which contain almost 90 percent of the world's population. The survey is currently including interviews with more than 500,000 respondents. Moreover the WVS is the only academic study encapsulating the full range of global variations, from very poor to very rich countries, in all of the world's major cultural zones. India entered in the world value survey since 1990 (second wave onwards).

The dependent variable of this study i.e. 'life satisfaction' was provided as a ten point scale in World value Survey. However, the author found no significant difference between a few categories of the dependent variable. Hence, the insignificant categories were merged and hence the recoded dependent variable has only four categories viz. 'Not satisfied', 'Not very satisfied', 'Pretty satisfied' and 'Very satisfied'.

Along with the happiness indicators mentioned above the WVS also provides the self-assessed socio-economic and demographic information of the respondent. This information is utilized in the present study to understand the factors contributing to the life satisfaction of the Indian population. A detailed description of the socio-economic and demographic independent variables used in this study is provided in the Appendix 1.

The present study is based on the 6th wave of WVS (2014) which actually contains 4078 respondents. However, after accounting for the missing values the final sample of present study comprises of 1682 respondent.

METHODOLOGY

The dependent variable of this study is an ordinal variable and it has 4 categories. We cannot apply a linear regression to the ordinal dependent variable as it violates one of the assumptions of the linear regression that the distances between the categories are equal. Therefore the present study used the ordered probit regression method to empirically test the hypothesis. The econometric specification of the ordered probit regression used in the present study takes the following form:

$$y_i^* = x_i'\beta + u_i \qquad \text{where } u_i \sim N(0,1)$$

Scanned by CamScanner

where is a vector of unknown parameters. is a vector of independent variables. is the observable variable that captures the satisfaction level of the ith individual. is related to the observable ordinal variable of as follows:

$y_i = 1$ [Not satisfied at all] if $-\infty < y_i^* > \theta_0$

$y_i = 2$ [Not very satisfied] if $\theta_0 < y_i^* > \theta_1$

$y_i = 3$ [Pretty satisfied] if $\theta_1 < y_i^* > \theta_2$

$y_i = 4$ [Very satisfied] if $\theta_2 < y_i^* > +\infty$

Where stand for the threshold value of the ordinal variable at which the outcome variable changes and it is determined by the software.

RESULT AND DISCUSSION

Table 1 reports frequency distribution of the categorical/ordinal variable used in this study. The first variable, 'life satisfaction' (measured in a 4 point scale) is the dependent variable of this study indicates that 70% of the sample is pretty or highly satisfied with their life. 47% of the sample is female households indicating the gender balance in the sample. Age is measured in a 3 point scale i.e. age equal to or below 29 year respondents are assigned 1, respondent falls between the age group 30 to 49 are assigned 2 and the 3rd group comprises people with 50 or greater than 50 years age. From the table it can be seen that 54% of the respondents are middle aged people. 92% of the respondents are married. 93% of the respondents are having 4 or less than 4 number of children. 70% of the respondent mentioned that their health status is good or very good. 75% of the respondents have completed secondary school (technical/vocational type) education. 93% of the respondents said religion is very important or rather important in their life. Also 96% of the respondent said they believe in God.

The income scale is measured as 1 to 10 points where 1 indicates the lowest income group and 10 the highest income group. 68% of the respondents fall in the 5 or below 5 income scale which stands for average or low income group. The variable 'financial status' is measured as the financial situation of the household in a scale of 1 to 10 where 1 indicates the 'complete dissatisfaction' and 10 the 'complete satisfaction'. 57% of the households are satisfied or highly satisfied with their financial situation. 81% of the respondents said the work is very important to them. Only 34 % said leisure is very important to them.65% of the respondent state that they are worried about loss of Job. 94% of the respondent said they have no crime history. 42% of the respondents are very interested or somewhat interested in politics. When asked whether they belong to the working class, the middle class, or the upper or lower class, 42 % of the respondent said they belong to lower middle class.

Table 1

Frequency table for the dependent and the independent variables

Variable	Category code	Frequency	Percent	Cumulative (%)
Life-satisfaction	1	74	4.4	4.4
	2	439	26.1	30.5
	3	847	50.4	80.9
	4	322	19.1	100

Scanned by CamScanner

... no specific pattern emerging from the work and leisure relationship with the life ... The result shows that those who find 'the work and leisure are very important' ... likely to be happy. However, those who find work and leisure are not at all important ... are found more likely to be happy. Those who worry a lot about losing their job are ... happy with their life. The people who are more interested in politics are found ... to be satisfied with their life. The people with no crime history are found more ... satisfied with their life. The variable 'social class' is also a self-assessed variable ... was derived by asking whether they belong to the Upper class, Upper middle class, ... middle class, Working class and Lower class. The result indicates that being in any ... class doesn't make them more/less happy.

SUMMARY AND CONCLUSION

... this work we analysed the important determinants of the life-satisfaction of the Indian ... population using the world value survey (2014) data and with the help of the econometric ... technique 'ordered probit regression'. We have used self-assessed 'life-satisfaction' with ... categories as the dependent variable and self-assessed socio-economic and demographic ... characteristics of the households are as the independent variables in the model. All the ... independent variables are categorical and are included in the model as a series of indicator ... variables which allows the model to capture the non-linear relationship of these variables ... with the dependent variable.

The empirical analysis of the present study revealed that the self-assessed socio-economic ... indicators such as income status, health, education, crime history, and worries about loss ... of job are the significant determinants of the life-satisfaction of the Indian population. ... Therefore to have a happy, healthy and productive labor force, the policy makers should ... target these indicators while framing policies. Further, the positive relationship between ... the income and happiness of the people (rejection of *Easterlin Paradox*) can be attributed ... to the low per-capita income of the Indian population. Hence, they are happier when their ... absolute income increases.

Finally, this study is subject to certain limitations. An obvious limitation of this study ... is that it focus on the cross sectional behaviour of the subjective wellbeing. It would be ... interesting to understand how the time-varying characteristics especially the macroeconomic ... variables influence the wellbeing of the Indian citizen. However, currently there are no data ... source which provide the wellbeing data of the Indian population over a long period of time.

Factors Driving 'Life Satisfaction' of the India Population: Evidence from an Ordered Probit Regression Analysis

P. Azad & M.A. Lateef

INTRODUCTION

Happiness economics has received much attention among the economists, after the publicatio of a broad review of research on subjective well-being by Wilson (1967). But the subject received more attention with the publication of the seminal paper by Easterlin's (1974). He by examining the available evidence on income and happiness, concluded that higher level income or economic growth does not necessarily make people much happier (Easterlin 1974 1995, 2001), which is known as *Easterlin paradox*. Since then, a large body of literature has emerged studying happiness within various disciplines including economics and psychology and self-reported happiness is considered as unique measurement of happiness and subjective well-being of the people (to name a few are Diener 1995a; Diener, 2009; Easterlin 200 Frey and Stutzer, 2000; Frey and Stutzer, 2002; Kahneman and Krueger 2006; Tella and MacCulloch 2008; Stevenson and Wolfer 2008).

Happiness of the people has major implications to the development of an economy (Bradt 2018). Happy people are more likely to be healthier and live longer, to have better social relationships, and to be more productive at work (Proto, 2016). The developing economies are doing their best to maximize well-being of the society. However, majority of people still report feeling unhappy even though they have more comfortable material lives. India, being one of the fastest growing economies in the world is finding herself in a lower position in terms of happiness (Helliwell et al, 2012). This study will therefore address the research question i.e. what are the factors driving the subjective well-being/life-satisfaction of the people in India?

The rest of this paper is structured as follows: In Section 2 review the existing literature on the determinants of life satisfaction by putting them into two categories such as literature which tested the validity of Easterlin Puzzle and the literature which considered income and non-income factors. In Section 3 we describe the data, variables and methodology used in the study. Section 5 discusses findings from the empirical analysis. Section 6 provides summary and conclusion of the findings and limitations of the study.

Antecedents to Employee Attrition Behavior in Indian IT/ITES Sector

Sashikala Parimi, Samyadip Chakraborty

Abstract: Attrition is the biggest challenges being faced by the HR managers in today's competitive environment especially with IT/ITES sectors. The study identifies clarity, career growth and advancement, personal priorities and organizational environment as the vital antecedent factors which impacts employee attrition. Further through multi-group analysis the paper studies the impact of agile environment on the said relationships in low and high agile environment. The study uses exploratory factor analysis, confirmatory factor analysis and structural equation modeling for obatinig path linkages. In high agile group all the path linkages were highly significant and the path coefficients were stronger

Keywords : Agility, Attrition, Attrition behavior, multi group analysis, structural equation modeling

I. INTRODUCTION

Attrition is the reduction in number of employees. It is defined as the how much is shrinkage in number. The greatest challenge for Human Resources is retaining the employees in the highly competitive environment. Human resource management is a recent term for the classic word personnel management. However, the terminology has not changed. An HR professional is in charge of the undertakings associated with manpower in the organization (Stahl, et al, 2006). The management of attrition has become crucial in IT industry as it is developing.

The reasons attributed to this are poaching of employees, burn out and high stress environment. When HR personnel of an IT company is met the main problem which they face is neither technology, timelines or cost but attrition (Ferrat, et. al., 2005). This leads to heavy loss to the company, both by manpower and in financial aspects. The organizations approach towards employees need to be fair and favorable so that the employees feel loyal and committed (Pooja, 2011).

Though IT/ITES is considered to be one of the top industry in employment generation the main task is employee satisfaction (Horwitz, et. al., 2003). Women employees constitute to 30-35% of the total which leads to the amount of attrition huge (Punita, 2002).The major issues they face are role overload, maintaining proper health, poor time management and lack of adequate support networks.

The HR managers and executives are constantly in the pursuit for finding out ways of retaining the employees and employee attrition management and employee turnover ratios are recent buzzwords in the human resources management realm. Several extant studies have been indicating the need for detailed antecedent consequence relationships between antecedent factors and attrition behavior (Reina et al. 2017; Zeng and Honig, 2017).There exist studies which highlights the prominent factors affecting employee attrition in case of traditional industry sectors (Cheidu et al. 2017). Studies do exist where IT sector has been considered as a part of multi-sector study (Nahar et al. 2017). However dedicated exploration in the context of highly stressful IT and ITES sectors, have been largely missing in the Indian context. This study becomes more needed and important in the Indian context, because India happens to be one of the foremost IT and ITES solution providing nations and also one of the choicest destinations for outsourced IT and ITES jobs. In this backdrop a detailed study highlighting the factors and their importance in the context of differing levels of agile work environment in the Indian IT and ITES sector becomes an obvious need and natural choice.

The study aims at addressing three vital objectives: first, establishing the factors and validating them as antecedents to the employee attrition behavior; second, studying the path linkages between the antecedent enablers of attrition; third, studying the impact of level of agility in the organization on the aforesaid path linkages. To investigate the linkage between Clarity, Career Growth, Personal Priorities & Organization environment as antecedents to employee attrition behavior which were identified built from the literature. It further investigates whether same linkages behave differently in agile and traditional IT/ITES project environments in India.

The study is divided into certain key segments. *First* segment, of this article deals with the background and introduction; *second* segment, discusses about the problem-statement, study-gap and motivation of the study; *third* segment, highlights the literature, theoretical underpinning and hypotheses development; *fourth*, the methodology and results section discussing the detailed techniques followed; *fifth*, discussion and analyses of results; *sixth*, conclusion and managerial implications; lastly limitations and future scope of study.

II. LITERATURE REVIEW

Theoretical Underpinning

This study conceptualization has its roots ingrained in the backdrop of Denison's (1990) distinct organizational culture standpoints. The study talked about four distinct standpoints name: Consistency, Mission, Involvement/participation and adaptability. Consistency emphasizes that shared beliefs, common perspectives and communal values among peers and participants in organization promotes internal coordination, sense of identification and meaning to individuals.

ABSTRACT

We examine the causal relation between oil prices, exchange rate and stock prices in the Indian context using the Hiemstra and Jones (1994) nonlinear Granger causality and nonlinear ARDL tests. The results of Hiemstra and Jones (1994) causality show a strong evidence of bidirectional nonlinear relation between oil and exchange rate, and between oil and stock price. The results further reveal significant unidirectional nonlinear causality from exchange rate to stock prices. The results of the NARDL test reveal that previous month positive and negative shocks in oil prices have positive (negative) significant impact on exchange rate (stock prices). In both the cases, the positive previous month shock has more pronounced effect than the negative shocks, confirming the asymmetric impact of oil prices on exchange rates and stock prices. To account for the persistence in the variance of oil, exchange rate and stock prices, we consider residuals obtained from GARCH (1,1) filtered model and conclude that our findings are consistently robust.

1. Introduction

The relationship between oil prices, exchange rates and stock prices has received considerable attention from academicians and practitioners globally. It is widely accepted that oil is an important part of the economic developments of all countries across the globe, especially the emerging economies which account for more than a half of world total oil consumption (Pershin, Molero, & de Gracia, 2016). In particular, oil is considered as a leading indicator of exchange rate movements since an increase in oil prices reduces the wealth of oil-importing nations by transferring their income to oil-exporting nations through trade balance (Turhan, Sensoy, & Hacihasanoglu, 2014). Such disequilibrium in the trade balance causes fluctuations in the exchange rates. The evidence of relationship between oil prices and exchange rates is, however, mixed and inconclusive. For instance, some studies like Benhmad (2012), Chen and Chen (2007), Lizardo and Mollick (2010) and Tiwari, Dar, and Bhanja (2013) find that oil prices Granger cause exchange rate fluctuation; while others (Sadorsky, 2000; Zhang & Wei, 2010; and Reboredo, 2012) have shown that exchange rate movements may granger cause change in oil prices.

Similarly, the impact of oil prices on stock prices have become a prominent issue in recent times (Chang & Yu, 2013). Examining the oil-stock market relationship is important for asset allocation and portfolio risk management since investors' decisions are based not only on the available fundamental information in the stock markets but also on the information prevailing in the oil markets (Mensi, Hammoudeh, Shahzad, & Shahbaz, 2017). The notion that increase in oil prices leads to decrease in stock prices has been widely accepted and seems to be virtually axiomatic (Aloui & Aïssa, 2016). The commodity (particularly oil) traders eye both commodity and stock market movements concurrently since stock markets provide a mechanism for substitution between commodity and stock markets (Jain & Biswal, 2016), thanks to the financialization of commodity markets. The rise in oil prices is believed to lead to decline in exchange rates, thereby increasing inflation which negatively affects the stock prices. Therefore, we attempt to uncover the dynamics of the relationships between oil prices, exchange rates and stock prices in an emerging market, India.

Despite such a large number of studies, the dynamic relationship between these streams of literature mainly concentrates on the United States or the European countries and has not been dealt in detail, particularly for an emerging market. We therefore, analyze this relationship in the Indian context which has been an important player in the world oil market for many reasons. For instance, in

Effective Text Data extraction using Hierarchical Clustering Technique

D.Saravanan

ABSTRACT--- In the digital era, text plays an important role it has come forward in a variety of data mining applications. In text mining, information are extracted and clustered from an unstructured data-set. For efficient retrieval many procedures are involved. Text mining is used in a variety of data mining approaches such as market research, survey research, statistical process and more. The objective of this paper is to analyze the relevant data that leads to a novel multidimensional data mining package. The method is based on the use of text mining. Data collection and analysis of data related to the text of a real-world test are also presented

Index Terms -Text Mining, Clusters, Text Clusters, Segmentation, Text Retrieval, Hierarchical cluster.

1. INTRODUCTION

Technology makes the operations of a company more efficient. With the help of technology, mangers are able to perform their day to day operations and decision making more quickly. Today the available data sets are not easy to operate as they are more complex and various different structures are available. From this complex datasets deriving any decision is not an easy task. It requires additional knowledge on the domain and additional efforts are needed . Because of these complex data sets users are diverted to specialized tools such as machine learning, artificial intelligence, data mining, and knowledge extraction is required. Creating and storing of any data types are easy now, the same gives more burden to the user community, because of this unstructured data set user first motivated to data preprocessing steps, because of the impurity in the data sets extract the relevant data sets are not an easy task. Extracting the relevant information required some preprocessing operations, in text retrieval necessary to create stop words, index terms to retrieve the relevant documents. For that many documents today creates a clusters of words to extract any in formations more effectively [3,4]. These words are to help the user to extract similar content or similar words or paragraphs.

Text data mining process is based on a single word or single sentence or a whole document. Extracting such relevant documents in formations is properly indexed and creates index terms for easy access . Before creating the index terms, the user first creates a document matrix that is create a mass of the text document. This task complete with help of collected all related documents it may be any format such as text, doc, pdf, XML any format. Once this collection process was done next immediate steps convert the unstructured information into structured information i.e. different formats are converted into a single format for easy processing. This simple form information's are stored separately for further operations. Next step to create a document matrix here columns are represents the various available documents and rows are frequent terms. This initial process are required for any text data mining further this operations combined with other tools such as mathematical or algebraic technique used to retrieve the need knowledge.

2. APPLICATIONS OF TEXT MINING

Data mining is the process of extracting the concealed information from the available huge data sets. This tool today is used by most of the researchers and many companies drive a new rule or new procedure for their day to day operations. This tool helps in the day to day performance of the company in terms of doing market analysis, predicting customer behavior, trend analysis, market segmentation and more. This helps the business to forecast upcoming events to run the effective business operations and make effective decisions based on the formations derived. This tool helps to derive any decision based on the past proceedings with that helps to derive new decision making operations. It also helps to solve the business queries quickly which usually is more time consuming, without using this tool. Many of the businesses today run with huge integrated data sets which come in a variety of patterns and structures. Not only business operations apart from academic research, customers' feedback, medical observations, medical history all are stored in the form of text. These tools are highly support without changing of its nature and perform the operation in terms of additionally without disturbing it functions.

2.1 Investigation study

In investigation study ex customer buying patterns done with help of preparing a variety of open ended question to the particular problem or which need to find solution. It helps the people to find the interesting relationship or finding new ideas or their view based on the available information source. This helps the authority to make conclusions on the particular domain.

2.2 INVOLUNTARY Text categorization

The most important operation of text mining was involuntary text categorization. One of the best examples for this application performs the sort our inbox and mechanically pushes certain mail contents in our spam folder based on the users mailing pattern or certain terms or language that are not likely to come into view in rightful

Abstract: *Video Content is always huge by itself with abundant information. Extracting explicit semantic information has been extensively investigated such as object detection, structure analysis and event detection. However, little work has been devoted on the problem of discovering global or inexplicit information from the huge video stream. The video is a particular media embedding visual, motion, audio and textual information. The indexing process must be automated in order to build a dictionary of images region. This process is carried out in various steps. One such important step is Clustering, which is data mining is the process of discovering groups in a dataset. In this paper, we attempt to give a comparative study of existing algorithms suitable for video data mining.*

Keywords: *Hierarchical Clustering, Video data mining, Image Processing, Chameleon Algorithm*

I. Introduction

Techniques to understand digital video content becomes a hot research topic in recent years. Their main focus is on structure analysis [1], event detection [2], highlight summary [3], et al. As video contents normally take a long period of time to play and occupy a large volume of bytes to store, mining useful statistical information from the whole video content to help users have a better understanding of it is a relatively difficult task and has not been fully explored yet. Compared with object-, structure- or event-based video semantic information, statistical mining information is hard to be acquired by human labeling. Data mining is the process of finding useful patterns or extracting previously unknown knowledge from a massive set of data [4]. Different from textual information which has been studied for a long time, video contents have special characteristics: they are continuous sequences with temporal relations among them, and each video segment normally contains abundant information itself. Due to the semantic gap between human perception and computer-centered low-level features, many video understanding techniques such as shot boundary detection and event extraction remain open problems. Thus investigation on video mining is at its early stage as mining solutions normally need the extracted semantic information. In fact, the current status of video mining is still at the pre-processing stage, such as video clustering [5]. The main motivation of video mining is to find undiscovered knowledge from the stream based on visual and audio cues. The knowledge may typically include structure information within a video clip or association information among various clips, as well as trend information based on the analysis for a massive size of video set[7][8][9]. Clustering is an unsupervised machine learning process that creates clusters such that data points inside a cluster are close to each other, and also far apart from data points in other clusters. Clustering in data mining [SADC93, CHY96] is a discovery process that groups a set of data such that the intracluster similarity is maximized and the intercluster similarity is minimized [JD88, KR90, PAS96, CHY96]. Clustering is used in many applications, as a stand-alone tool to get insight into data distribution and as a preprocessing step for other algorithms. Specifically it is used in Pattern Recognition, Spatial Data Analysis, Image Processing, Economic Science, document classification etc. [10]

II. Categories of clustering algorithms

There are four main categories of clustering algorithms: partitioning, density-based, grid-based, and hierarchical.

A. Clustering Approaches

B. Partitioning algorithms

Construct various partitions and then evaluate them by some criterion (k-means, k-medoids)

C. Hierarchical algorithms

Create a hierarchical decomposition of the set of data (or objects) using some criterion (AGNES, DIANA)

D.Density-based

Based on connectivity and density functions – grow a cluster as long as density in the neighborhood exceeds a threshold (DBSCAN, CLIQUE)

E.Grid-based

Impact of Transformational Leadership on Employees' Extra Effort and Leader's Effectiveness: Moderating Role of Organization Type

Debajani Sahoo
Associate Professor, IBS Hyderabad, IFHE University, India
debajani@ibsindia.org
Manish Gupta
Assistant Professor, IBS Hyderabad, IFHE University, India

Abstract

Purpose: This paper is based primarily on the theory of transformational leadership. Transformational leaders encourage the employees to put-in extra efforts in their work and believe that their leadership is effective. Prior research also suggests that organization type (public vs. private) could have a key role in affecting these relationships. The objective of this paper is two-fold. One is to understand the moderating role of organization type between transformational leadership and employees' extra effort. The other objective is to examine the moderating role of organization type between transformational leadership and the employees' perception of their leader's effectiveness.

Design/methodology/approach: The target population was the public and private sector organizations from the power industry. A sample comprising of 610 employees were surveyed that resulted in a usable sample of 364 employees. Step-wise regression analysis was carried out to test the hypotheses.

Findings: Results suggested that transformational leadership has a positive relationship with both the employees' extra effort and the leader's effectiveness. Also, it was discovered that organization type moderated the relationship between transformational leadership and the employees' extra effort as well as between transformational leadership and the leader's effectiveness.

Research limitations/implications: Transformational leadership plays an important role in affecting both leader's effectiveness and extra efforts. Whether the organization is private or public affects these relationships. Therefore, scholars need to take organization type as an important variable while predicting the relationships.

Practical Implications: The managers of the power industry in the public sector are encouraged to employ transformational leaders and train the employees on transformational leadership. It would help employees perceive that their leader is effective and would motivate them to put-in extra efforts at work.

Originality/value: To the best of researchers' knowledge, this study is one of its kinds to understand the moderating role of organization type in the relationships between transformational leadership and extra effort as well as between transformational leadership and effectiveness.

Keywords: *Transformational leadership, Organization type, Effectiveness, Employees' perception of leader*

Enablers of co-creation in hospital-supplier relationships: empirical study in Indian healthcare context

Samyadip Chakraborty

Dept. of Operations & IT, IBS Hyderabad, IFHE University, ICFAI Foundation for Higher Education, Hyderabad, INDIA

ABSTRACT

One of the biggest challenges in healthcare is cost containment. In the face of continuously spiralling cost hospitals are facing steep competition to provide increased access to high quality services. In this backdrop, network relationship become vital and offers extensive opportunities to explore hospital-supplier relationships. Past literature highlights interaction and collaborative ambience as pre-requisite to value co-creation. This study focuses on co-creation aspect in the hospital-supplier relationship context (medical-surgical suppliers) and uses a Service-Dominant-Logic lens besides drawing support from Relational-View and Relational-Coordination-Theory. This study aims at empirically exploring the relational antecedents of co-creation and establishing the DART (Dialogue-Access-Risk-Assessment-Transparency) framework proposed by Prahalad and Ramaswamy in the year 2004, trust and commitment as antecedents to co-creation. Data were collected from 229 private tertiary-care hospitals in and around four major urban areas in India. The relationships proposed in the research model were tested using structural equation modelling. Results indicate that DART parameters and relational variables (trust, commitment) act as antecedents to co-creation and have significant and positive relationships, thereby enhancing co-creation activities. Study also explored the impact of interdependence between hospital and suppliers on DART-parameters, trust and commitment besides exploring trust to DART linkages. Structural model outcomes indicate significant and positive relationship for the linkages.

Introduction

The healthcare industry is an aggregation of sectors of which the hospital activities constitute the lion's share. Healthcare costs are continuously spiralling up and hospitals are facing steep competition to provide increased access to high quality services (Zheng, Roehrich, and Lewis 2008; Dobrzykowski 2012). In this backdrop the importance of studies investigating relationships and inter-partner linkages have started gaining extra focus and attention (Beirão et al. 2017; McColl-Kennedy et al. 2017; Ranjan and Read 2016). One of the biggest challenges that healthcare service sector is facing worldwide, is cost containment as costs are continuously spiralling up and hospitals are facing steep competition to provide increased access to high quality services (Zheng, Roehrich, and Lewis 2008; Dobrzykowski 2012). Such cost accelerations are due to various factors, but one of the most prominent areas are supply-related cost which accounts for 25% of total hospital-cost(Byrnes 2004). Several inefficiencies affect performance in healthcare supply chains which is concerning, given that approximately. Amidst this turbulence, concepts like supply chain relationships, collaborative environment, value creation activities with network partners, etc have received enhanced importance with respect to healthcare providers. While supply chain management (SCM) has proven effective in other industries, healthcare has found its adoption challenging (McKone-Sweet, Hamilton, and Willis 2005; Meijboom, Schmidt-Bakx, and Westert 2011). Schneller and Smeltzer (2006) highlighted that significant opportunities exist for collaboration in healthcare in key areas linked to purchasing which is one of the largest cost components (second only to labor). Purchasing decisions and network relationships are gaining attention as healthcare leaders are finding it difficult to provide quality care, in the face of rising uncertainty and spiralling cost (Zheng, Roehrich, and Lewis 2008); thereby making every purchasing decision critical(HFMA,Dec,2012, p.2). Reliable and complete information plays critical role in managerial decision making as the success of decision depends largely on the reliability and appropriateness of data. Various sectors have niche difficulties and problems fetching most reliable data; healthcare procurement happens to be no exception. Thus reliable information despite being a pre-requisite in many decision making processes, access to such information has often proved

ABSTRACT

Substantial rise in internet penetration is revolutionising online retailing in emerging markets in general and India in particular. Realizing this, retailers of traditional store formats are venturing into e-retailing. The Indian online retail industry is estimated at USD 38.5 billion in 2017 and is growing at a rate of 45 to 48 per cent CAGR. This is a trickle compared to the Indian retail market of USD 672 billion in 2016 with a CAGR of over 15 per cent. Online retailing in India is poised to grow by leaps and bounds. The challenge before the companies and marketing professionals is to understand what drives online-shopping? What factors influence online-shopping buying behaviour? Considering that the growth rate for online-shopping is high for food (80%), ticketing (26%), jewellery (25%) and perfumes (18%) categories, women consumers play a significant role and their buying behaviour is important. This study focuses on factors that influence female online-shopping behaviour. The factors that motivate the female buyers to shop-online and their attitudes towards online-shopping are studied. Insights are provided into female shoppers' expectations with respect to online-shopping. The findings of this paper benefit online retailers, marketing managers, policymakers and academicians.

INTRODUCTION

Factors Affecting Female Consumers' Online Buying Behaviour

Internet is redefining the shopping behaviour of people across the globe. It has become a hotbed of advertising, shopping and commercial activity (Rowley, 1998). People's daily life is influenced by internet more so as compared to past (Hsieh et al., 2013). Consumers are getting used to virtual experience from physical experience, adapting to online purchases. According to Lee and Zhang (2002) after e-mail usage, instant messaging and web browsing, online shopping is the third most popular internet activity. The process a customer takes to purchase a service or

Abstract

The most precious metals is Gold for long and its value has been used as the standard for many currencies also known as gold standard. The consumption of gold has increased drastically with strong economic growth and promising movements in gold prices in 1990s during liberalization of gold import policy. The gold prices in India are continuously increasing due to domestic demand based on security, liquidity and diversified portfolio. There would be various factors that influence the prices of the gold. This study aims at understanding and analyzing the various factors which influence the gold prices in the Indian context.

Keywords

Gold Prices, S & P 500, Crude Oil, Indian Rupee Rate, BSE, Nifty, Multiple Regression

1. Introduction

The most precious metals is Gold for long and its value has been used as the standard for many currencies also known as gold standard. It has been used as a symbol of purity, value, royalty and pool of these properties. The consumption of gold has increased drastically with strong economic growth and promising movements in gold prices in 1990s during liberalization of gold import policy. Gold is used as an alternative for dollar since its downfall [1]. Due to its importance in both investment and consumer world, Gold is one of the most widely debated metal and continues to have strong impact on the value of currency of developed countries. Moreover, there exists a strong correlation between the value of the gold and the strength of currencies trading on foreign exchanges. Gold has been observed as a safe haven, especially during periods of financial

Abstract: The paper presents the results of a study conducted in India that assesses the impact of marketing mix elements on overall quality perception of customers about water purifiers. The results of confirmatory factor analysis confirmed the factor structure of marketing mix elements (product, price, promotion and place). Moreover, multiple regression results showed that barring place, all other marketing mix elements viz. product, price, and promotion have positive significant impact on overall quality perception of customers. The sample comprised of 253 respondents.

Consumer dispositions toward global brands

Ankur Srivastava
IBS Hyderabad, IFHE University, Hyderabad, India, and
M.S. Balaji
University of Nottingham, Ningbo, China

Received 17 November 2017
Revised 31 January 2018
7 March 2018
24 March 2018
Accepted 24 March 2018

Abstract

Purpose – Despite the increasing attention on consumers in emerging markets, there is limited research on the emerging market consumers' evaluation of global brands. The purpose of this paper is to address this research gap by examining the role of consumer dispositions – cosmopolitanism, need for uniqueness and materialism in attitude and purchase intentions toward global brands from emerging vs developed markets.
Design/methodology/approach – A mall intercept method was used to collect responses from shoppers in four major cities in India. The intercept method produced a usable sample of 613 respondents. Each respondent was asked to mark his or her response concerning two global brands – one each from developed and emerging markets separately.
Findings – The findings show that cosmopolitanism and need for uniqueness determine emerging market consumers' attitude toward global brands. Specifically, the authors find that while cosmopolitanism has a higher positive impact on global brands from the developed market, need for uniqueness has a negative impact on global brands from emerging market.
Research limitations/implications – The study findings show that need for uniqueness negatively affects attitude toward global brands from emerging markets. This presents a significant challenge for global brands from emerging market when competing with the counterparts from developed markets.
Practical implications – The findings show that managers of global brands in emerging markets should develop unique brand positioning that differentiates from international brands. By carefully managing their marketing mix elements (e.g. price, design, distribution), they can induce counter-conformity among consumers for brands that originate in emerging markets.
Originality/value – While prior studies suggest that emerging market consumers prefer foreign brands than domestic brands, little attention was focused on the antecedents for such preference. This study considers consumer dispositions, which were not examined in prior research in addressing this research gap.

Keywords Materialism, Cosmopolitanism, Global brands, Customer attitudes, Emerging markets, Need for uniqueness

Paper type Research paper

Introduction

Marketing literature emphasizes the role of global brands in shaping consumer attitudes and behaviors in emerging markets. Global brands share the same name across multiple countries that use centrally coordinated marketing strategies (Steenkamp *et al.*, 2003). Global brands exert considerable influence on economic, cultural, and psychological fronts (Mitchell, 2000). On the psychological front in particular, they provide consumers with a sense of identity, belongingness, and accomplishment. By transferring their values and ideals to a consumer's self-concept, global brands can play a key role in shaping consumer identities (Bartsch *et al.*, 2016).

Consumers in emerging markets such as India prefer global brands for their globalness and derive self-expressive and status benefits from consumption (Batra *et al.*, 2000). Globalness perception functions as a distinct brand attribute providing emerging market consumers with the opportunity to show their participation in an aspired-to global consumer culture. This has created significant opportunities for domestic firms to develop global brands. These developments have made it imperative for foreign brands to succeed in emerging markets as well as foreign markets. Thus, consumers in emerging markets face a choice between global brands originating in foreign markets and domestic markets.

Customer helping behavior

ABSTRACT

The purpose of this study is to examine the differential impact of service quality, service fairness and service convenience on customer engagement behaviors. The study also examines the moderating role of service convenience on the relationship of service quality, service fairness and different forms of customer engagement behaviors (CEBs). The proposed research model was tested using partial least square path modelling on survey data collected from users of retail banking and mobile services. Results show that service convenience and perceived service fairness affects different forms of CEB positively. Results also show the negative moderation effect of service convenience on the relationship between service fairness and CEBs. The study provides useful insights for both researchers and practitioners on the role of service convenience, service fairness, and service quality in eliciting customers' engagement behaviors. Our first contribution pertains to examining the role of service convenience in eliciting CEBs. We also contribute to the existing CEB literature by examining the extent to which traditional firm-based antecedents (e.g., service quality and service fairness) are effective in eliciting all forms of CEBs (word-of-mouth, customer helping company and customer helping customers).

1. Introduction

Customer engagement behaviors (hereafter, CEBs) are becoming increasingly important to enhance firm profitability (Carlson et al., 2017; Roy et al., 2018). More and more firms are beginning to pay attention to CEBs as a strategic imperative that leads to sustainable competitive advantage (Ostrom et al., 2015). According to a report (Forrester, 2016) the majority of participating firms are in the process (52%) of connecting various engagement points across the entire customer journey. However, while research shows that engaged customers (compared to disengaged customers) are less price sensitive, resist switching to competition, actively participate in service development, and advocate the firm to others (Dasteel, 2014), many firms are struggling to manage customer engagement throughout the customer journey (Forrester, 2016). It may be that while firms' investments are surging to elicit CEBs from customers, in turn, firms demand engaged customers' voluntary investment of scarce non-monetary resources (namely time and effort) to help firms and other customers (Hollebeek et al., 2016; Verleye et al., 2014).

As a consequence, numerous studies have focused on identifying the drivers of CEBs (Jaakkola and Alexander, 2014). These studies assume that all customers are equally willing to elicit CEBs given their favorable perception of these drivers. We argue that the relationship between CEBs and their drivers cannot be generalized as customers need to spend considerable amount of resources for eliciting CEBs. For example, Dong (2015) state that customer invest physical labor while acting as partners in co-creating service which influences their value perceptions. Since customers are treated as partial employees by service firms, we argue that they need to incur significant time and energy while eliciting CEBs pertaining to their interactions with employees and other customers. Consistent with existing literature this study examines three forms of CEBs which are positive word-of-mouth, customers helping other customers and customer helping company (Verleye et al., 2014). Customers show their engagement with service firms by spreading positive word-of-mouth and recommending them to their peers (Roy

Abstract

The present study has investigated the day of the week and weekend effect on index returns and it's volatility in the Indian stock market using GARCH (1, 1) for Nifty 50, Nifty midcap 50 and Nifty smallcap 50 indices. The study period starts from 1st April, 2005 to 29th June, 2018. This study found a strong evidence of a positive weekend effect as well as a negative Tuesday effect across all the 3 indices. It is observed that the returns on Tuesday are lower than the returns on Monday. The study also found a positive weekend effect (except Nifty 50) as well as a negative Tuesday effect on return volatility for all these 3 indices. Like return, it is also observed that market is less volatile in Tuesday than Monday. In addition to this, the present study also revealed a negative Thursday effect on return (except Nifty 50) as well as a negative Friday effect on return for Nifty smallcap index only. It is concluded that Monday is a high risk and high return day whereas, Tuesday is a low risk and low return day in comparison to Monday. If traders can take higher risk they can earn higher return on Monday. The overall findings of the study suggest that the Indian market is not efficient and market can be predictable based on historical series. The findings of this study is valuable to both academicians as well as the market participants.

Gulping the Poison: How Webcare Attributes Reduce Damages to Brands Caused by Negative Reviews

Ghosh Tathagata[a] and Raju G. Amar[b]

[a]Department of Marketing, T.A. Pai Management Institute, Manipal, Karnataka, India;
[b]Department of Marketing and Strategy, ICFAI Business School, Hyderabad, Telangana, India

ABSTRACT

Negative reviews written by unsatisfied consumers can significantly erode the image of a brand. Therefore, marketers regularly respond to these reviews through written messages posted on online channels: a practice known as webcare. The present article seeks to explore whether selected webcare attributes, such as strength, sidedness, and ownership, have any effects on consumers' forgiveness of the service failures caused by transgressing firms. Furthermore, the effects of consumer forgiveness on satisfaction with webcare, brand attitudes, and purchase intentions are also investigated. The article examines these relationships in the context of a fine dining restaurant (Study 1) and a hotel (Study 2). The results reveal that webcare attributes play a salient role in achieving consumer forgiveness. Furthermore, the studies also reveal that consumer forgiveness leads to satisfaction with webcare and improved brand attitudes and purchase intentions.

KEYWORDS

Consumer forgiveness; negative reviews; webcare; webcare attribute; webcare ownership; webcare sidedness; webcare strength

Introduction

The ingenious exploitation of the Internet has empowered consumers to share their negative experiences with products and services through a wide array of online channels, such as microblogging websites (e.g., www.twitter.com), company websites (e.g., www.canon.com), third-party websites (e.g., www.mouthshut.com), and product-/industry-specific review sites (e.g., www.zomato.com; Ward and Ostrom 2006). This opportunity for consumers to spread negative word of mouth (NWOM) through online reviews is a serious threat to marketers (Hennig-Thurau et al. 2010) because negative reviews possess potent harm-inflicting characteristics that negatively affect consumers' attitudes toward brands (Purnawirawan et al. 2015), purchase intentions (Lee and Youn 2009), product trials (Huang and Korfiatis 2015), and sales (Cui, Lui, and Guo 2012) and that eventually diminish a company's brand image in the marketplace (Lee and Youn 2009).

Like it but do not comment: manipulating the engagement of sports fans in social media

Anand Agrawal, Anil Gupta and Anish Yousaf

Published Online: July 27, 2018 · pp 340-356

Abstract

Marketers have embraced social media to connect with their customers and fans, but due to lack of sufficient research in this area, they are struggling to manipulate customers' responses and their engagement levels. We categorised the recent Facebook posts of the four most popular teams in a popular cricket league in India into different types of updates, forms of messages, and message orientations using interaction process analysis (IPA), to study their impact on different levels of engagement, in terms of likes (low engagement), shares (medium engagement) and comments (high engagement). Result revealed that different combinations of these variables generate significantly different growth in numbers of likes, shares and comments. Insights from this study are useful for practitioners in devising a method to analyse and design social media messages to manipulate the levels of customer engagement in social media.

MUTUAL FUNDS PERFORMANCE EVALUATION: A META ANALYSIS

Sagar Reddy Adavelli*

Abstract: *The purpose of this paper is to summarize various strands on mutual fund performance around the globe since 1965. Various studies conducted by different authors showing their results that performance differs from country to country. To summarize the mutual fund performance in different countries, 93 research papers considered for the study. Some researchers reported that mutual fund schemes provide returns higher than market return, whereas, other studies reported mutual funds underperform the market index. There is another school of thought that say international funds outperform the domestic funds and vice-versa due to selectivity and market timing ability of fund managers as proved by Chen & Jang (1994). A Meta analysis has conducted in this paper, which summarizes different models and tools used by researchers on mutual fund performance in different countries of origin theoretically.*

Keywords: *Mutual Fund Performance, Meta Analysis, Market Index, International Funds.*

INTRODUCTION

Mutual funds boast that they yield abnormal returns and outperform market indices. Investors trust the statements made by mutual funds and park their money with them. Investors also opine that mutual funds fetch them more returns than their naïve investment strategies or buy and hold strategy. However, in recent years, there was phenomenal growth in mutual fund industry in emerging markets. A close observation reveals that investment flows into equity mutual funds are volatile. It is observed that when broad market conditions are positive, and with Bull run in stock markets, equity mutual funds attracted more investments. In contrast, when the sentiments are low, equity mutual funds witnessed withdrawals or shrink in their assets under management. Overall, mutual funds in some nations outperforming and in other markets underperforming the equity market indices during same period. This raises an inquiry to conduct an in-depth research in understanding the performance and dynamics of equity funds. An understanding of equity mutual funds by performing a rigorous and meticulous research is very essential. In this regard, the researcher conducted an extensive review on earlier studies on mutual funds performance in different markets.

ARGUMENTS IN FAVOUR OF MUTUAL FUNDS PERFORMANCE

Gallo, Apilado, & Kolari (1996) examined the mutual fund activities of 47 Bank Holding Companies (BHCs) and their impact on profitability and risk for a period from 1987 to 1994.

Myntra- An Online E-Commerce Retailer to a Mobile Commerce Player

Dr. Souvik Roy & Dr. Achyut Telang

Department of Marketing IBS Hyderabad, India.
E-mail ID: souvikroy@ibsindia.org achyutktelang@ibsindia.org

Abstract

The revolution of mobile phone innovations has opened the doors for companies to gain purchasers through downloadable smart phone applications. These applications expand the usefulness of the advanced mobile phones and empower shoppers to perform different tasks easily. These applications have also produced significant interest due to high client engagement. The greatest example of this was recently evidenced by the decision of the online fashion retailer Myntra to operate through apps only by closing down its e-commerce website entirely. This qualitative study discusses in detail the pros and cons of Myntra's motive of taking such a bold step and what is the future of this decision in the backdrop of the Indian market where a slow transition is taking place from e-commerce to m-commerce platform.

Keywords: Myntra; E-commerce; Mobile commerce.

INTRODUCTION

By the start of 2015, there were more than 300 Million internet users in India with a 32% year on year growth (IAMAI, January 2015). As the costs of Wi-Fi access and buying a cell phone with 3G and 4G data choices decreased, Indian mobile users became an important set of customers.

The changing technology scenario was a wonderful opportunity for retail brands to personalize and customize the experience for users. From the perspective of a brand, after the download of an application by the customer, the application would be logged in always. Thus the brand would be able to gather user data like length of browsing time, repeat buying, information sharing platforms used etc. Organizations would also start having their own data analytics to better serve the users as well as to supporting their marketing activities[1]. One such company was Myntra.

In May 2015, Myntra shut its website to become a mobile app-based retailer enabling clients to just purchase through smart phones. The move came after Myntra asserted that 95 percent of the Internet traffic came through mobiles and 70 percent deals were created through smart phones.

The move to only-application business saw 10% decrease in sales at first which brought up a few issues on the success of having business through mobile applications only. There was an outrage from the people after this move and the mobile app page of Myntra on the Play Store received a lot of one-star ratings. Competitors like Snapdeal and Jabong put out statements that they were not going to follow this move and would continue to sell through websites. Even experts were divided over this move[2].

E-commerce industry in India

India's e-trade business sector was worth about $3.8 billion in 2009, and it went up to $12.6 billion in 2013[3].In 2013, the e-retail fragment was worth US$2.3 billion. Around 70% of India's e-trade business sector was travel related[4].As indicated by Google India, there were 35 million online customers in India in 2014 Q1 and was estimated to cross 100 million imprint by end of year 2016[5].The major players in e-trade industry were Flipkart, HomeShop18, Snapdeal, Indiatimes shopping and Makemytrip, Jabong and Zomato.

Mobile- application industry in India

The mobile applications industry in India was growing. As indicated by the Mobile Marketing Association (2014), Indian organizations spent 3 billion rupees ($49.9 million) on mobile advertisements in 2013, and the business sector was anticipated to extend 43 percent in 2014 (Varnali and Toker, 2010). India's M-Commerce (mobile commerce) business size was assessed to be approx. $2.5 billion in 2014[6]. As per the 2013 Brand Z report, out of the 100 most important worldwide brands, 89 of them outlined and dispatched an application all over the world. As per App Annie Index (2013), India was in the third position in terms of the quantity of downloads from Google Play and Apple App Store[7].The application downloads in India was prone to increment from 1.56 billion in 2012 to 9 billion by 2015 and the incomes produced by means of these applications

PERFORMANCE PERSISTENCE OF EQUITY STOCKS: AN EVENT STUDY

Adavelli Sagar Reddy*[1] and V. V. Krishna Reddy[2]

[1] *ICFAI Business School, IBS, IFHE, Hyderabad, India (*Corresponding author)*
[2] *Amity Global Business School, Hyderabad, India*

Abstract: This paper examines the performance persistence of stocks during the period of 2014 to 2017 by considering two parts of the study based on stock split as an event. A final sample of 16 stock splits that were split in the year 2015 considered to study the persistence in the performance of stocks. The study results reveal the positive performance immediately after the stock splits. We also tested statistically the persistence in the performance of stocks during the pre-split and post-split period.

Keywords: Stock split, Equity stocks, persistence, t-test

INTRODUCTION

Stock market in India has been reporting incessant growth year on year since two decades as more of investments made by individuals and institutions in post industrialization scenario. Whereas, not all the stocks listed with stock exchanges and trading have been ending optimistically. There exists a liquidity problem for some stocks during the operational activities. Companies, which are listed with stock exchanges, involve stock splits as one of the events to overcome the problem of liquidity in short run and even in long run. Companies initiate the process of stock splits as an event to increase the liquidity by retaining the existing shareholders through realigning the share price and number of shares. Stocks involve with split as an event they end up the trading day positively anticipating favourable situation for the availability of liquidity. Performance of firms involve with stock split reports positive results immediately in the year of split, but they report negative financial performance in near years after split.

Indian stock market evident that the stock price positive movement appeared during the stock split and bonus issues by companies listed with stock exchanges. However, there is no evidence of the continuity in the positive performance in long run. The present study intends to focus on performance persistence of stocks, which are split into small units after the stock split announcement during the year 2015. Further, this section, we reviewed the literature in section II, Methodology of the study in section III, Results and discussion in section IV, and Conclusion and future scope stated in final section.

REVIEW OF LITERATURE

Liping, Xiaoqi, & Philip (2013) conducted a research to study market reaction for the stock split announcements by considering 120 splits in United States over a period from 2000 to 2009. They employed single factor market model and found encouraging Cumulative Average Abnormal Returns even though the liquidity positively moved. They further observed that smaller stocks tend to have more benefits from stock splits. Their research also stated that firm size and abnormal returns were inversely related. Barber & Lyon (1997) analyzed the power of test statistics of various event studies, stock splits as one of the events considering 1,798,509 monthly returns of firms during 1963 to 1994. They calculated continuous compounded returns, cumulative abnormal returns and buy-and-hold abnormal returns

Reforms in Institutional Finance for Inclusive Growth in India

Vighneswara Swamy[a]

Abstract: *This paper analyses the need, significance and the advantages of 'reforms in institutional finance for inclusive growth' in the context of Indian economy and offers some practical suggestions from the functional perspective. India's rural financial architecture (RFA) is subject to systemic policy issues and pervasive institutional weaknesses. Lack of autonomy and weak governance and 'unseen' accountability have affected the sustainability of rural financial institutions (RFI) and resulted in constrained outreach. The importance of access to institutional finance for the poor arises from the problem of financial exclusion of nearly 3 billion people from the formal financial services across the world. With only 34% of the population engaged in formal banking, this paper finds that the reforms in institutional finance coupled with governance reforms in India's RFA would greatly benefit the economy in making available the much-needed financial services to the poor and the neglected sections of the society, and facilitate efforts towards achieving inclusive growth.*

1. Introduction

Studies note that efficient, broad-based and deepened financial markets can lead to increased economic growth by improving allocation and utilisation of savings in the economy (Beck, Georgiadis, & Straub, 2014; Cournède & Denk, 2015). Better functioning financial systems ease external financing constraints that impede firm and industrial expansion and establish strong, positive link between the functioning of the financial system and long-term economic growth.

Three dimensions of effective financial systems are first, an institutional dimension which includes the regulatory and judicial framework and the quality of institutions. Second, the market dimension which includes the traditional measures of size and access to finance; financial innovation; and residents' access to finance. The third dimension is market performance that

Tourism and Economic Growth in India: An Empirical Analysis

Aruna Kumar Dash[*]
Aviral Kumar Tiwari[**]
Pradeep Kumar Singh[***]

Abstract

Recently, researchers have been interested in the relationship between tourism and economic growth. The main goal of this study is to investigate the effect of tourism on the economic growth of India over the period of 1973-2013 by using Auto Regressive Distributed Lag (ARDL) model. The results show that, tourists have a positive impact on the economic growth of India in both short-run and long-run. In addition, physical and human capital has positive effects on economic growth, while depreciation of the exchange rate will promote economic growth only in short-run but not in long-run. Our study supports the tourism led growth hypothesis so far as India is concerned. Therefore, there is a need of policy intervention, where government should frame the tourism policy in such a way that it would attract progressive tourist arrival to India that in turn would impact economic growth in a sustainable manner.

Keywords: Tourism, Economic Growth, ARDL Model, India.

JEL Classification: C32; L83; O40.

1. Introduction

Tourism is a rapidly evolving industry that has become increasingly competitive in the global arena. Day by day tourism is gaining universal acceptance as a potent engine for inclusive socio economic progress because of the jobs created and infrastructure developed. It has the potential to stimulate other economic factors through it's forward and backward linkages

TOURISTS' MOTIVATIONS TO TRAVEL: A THEORETICAL PERSPECTIVE ON THE EXISTING LITERATURE

Anish Yousaf
Insha Amin
Jose Antonio C. Santos

Review
Received 10 May 2017
Revised 4 July 2017
28 March 2018
Accepted 13 April 2018
https://doi.org/10.20867/thm.24.1.8

Abstract
Purpose – Current study is an attempt to look into the various theoretical concepts/ theories that help to understand what motivates individuals, especially young people, to travel and which are the practical implications of the analysed theories. In particular, we chose Maslow's Theory of Needs to analyse youth travel motivations.
Research Design – The study draws its base from two streams of literature, one being associated with motivations and the other dealing with the question of how motivations can influence travelling patterns of an individual. The literature review was done extensively and articles published in the domain of tourist motivations and related areas were traced and reviewed.
Findings – Our analysis of youth tourism centred on Maslow's hierarchy of needs and confirmed its validity as an explanation of the most important youth travellers' motivations. The results also indicate that, due to recent technological developments affecting societies and young tourists' behaviours – especially those of Millennials – new needs have emerged, which are discussed in detail.
Research Limitations – The research has been carried out in light of the available literature and it fails to address empirical evidence. Also, the analysis of youth tourism needs to be extended to other motivation theories as those which are presented in this work.
Keywords tourism, motivation, tourist, pull factor, push factor, destination.

RESEARCH BACKGROUND

Tourism is currently one of the most dynamic phenomena worldwide. The travel and tourism industry has grown by leaps and bounds over the years, with international tourist arrivals recorded as 1,235 million for 2016, thereby accounting for 3.9% of global economic growth for that year (United Nations World Tourism Organisation [UNWTO], 2016). Tourism as an activity must contend with a wide range of tourist behaviours and the internal or external forces that significantly influence these behaviours. This industry is regarded as particularly vibrant, and it includes travelling for the purposes of pleasure, relaxation, visits to friends and family, pilgrimages and other related activities.

Li and Zhang (2013) and Simkova and Holzner (2014) report that individuals' travel patterns are closely related to psychological patterns, which can be used to examine the factors that motivate people to travel. Hill (1965) early on explored vacationers' motives as a response to psychosomatic exhaustion. They seek to replenish and restore their sense

ORIGINAL PAPER

The tipping point of financial development? – evidence from OECD countries

Vighneswara Swamy[1] · Dharani M[1]

Published online: 10 August 2018
© Springer-Verlag GmbH Germany, part of Springer Nature 2018

Abstract
This study estimates the tipping points of financial development in the finance – growth dynamics in the case of OECD countries as they experience considerably higher levels of financial development. Using a unique balanced panel data set of 31 years from 1983 to 2013 for 27 OECD countries, we provide new evidence on the presence of nonlinearity as there is an inverted U-shaped relationship between finance and growth in the long run. The results show that there exists a tipping point of the finance-growth relationship estimated at 141.6% of GDP. We find that surpassing the threshold level results in deceleration of economic growth as excess finance is undesirable. Based on the panel Granger causality test results, we show that financial development should be associated with optimal growth performance. Our findings for OECD countries provide some useful inferences to the emerging and developing economies in designing their financial development strategies.

Abstract

This study models the impact of new capital regulations proposed under Basel III framework on bank profitability in India by constructing a stylized representative bank's financial statement. It shows that, with an increase in the capital ratio in the context of new capital regulations, the banks tend to experience a rise in interest income. The results indicate that in the case of scheduled commercial banks, assuming that RWAs are unchanged, for 1-percentage point increase in capital ratio, interest income would rise by 17 percentage points and would go up to an extent of 62 percentage points for six-percentage-point increase assuming that the risk-weighted assets are unchanged. It also provides the estimations for different groups of banks and the scenarios of changes in the risk-weighted assets, and changes in the capital ratios.

1 | INTRODUCTION

A growing strand of bank capital regulation literature in favor of the Basel III framework for bank capital regulations, argues that there are significant macroeconomic benefits of raising bank equity. However, there have been debates about the desirability and the impact of new capital regulations on the profitability of banks. Higher capital requirements lower leverage and the risk of bank bankruptcies (Admati, DeMarzo, Hellwig, & Pfleiderer, 2010). On the other hand, there is another strand of literature, which argues that there could be significant costs of implementing a regime with higher capital requirements (Angelini et al., 2011, and Bank of International Settlements, 2010). The impact of Basel III regulations on the banks is extensive and affects the bank's day-to-day decision-making in lending, funding, treasury, capital, liquidity, and operations. All these areas are closely interconnected, and directly affect the bank's profitability.

Though literature is rich with studies on bank regulation and its impact (Cohen & Scatigna, 2016; Dermine, 2015; Dietrich, Hess, & Wanzenried, 2014; Lee & Hsieh, 2013; Pessarossi & Weill, 2015), very few studies are reported on the modeling of the impact of capital and liquidity requirements on bank profitability except the one by Michael (2010). There is a need to conduct country-specific studies for estimate the impact of new capital regulations under Basel III proposals on the profitability of banks. This would provide the much-needed logic and rational approach toward ascertaining these impacts to policymakers as well as build a body of literature capturing the uniqueness of country specific features (particularly of emerging market economies such as that of India) in this direction.

Abstract: Maintenance is inevitable and each machine requires maintenance after certain interval of time. There are several maintenance policies catering to maintenance needs of manufacturing organisations. The bottom line is that, several issues together govern the selection of a particular maintenance policy. So, in order to understand the factors responsible for selection of particular maintenance policy an empirical study is carried out. In this research paper thirty six issues in maintenance are identified using available literatures and questionnaire survey conducted on industry practitioners and is analysed using t-test, factor analysis and Friedman's test. Factor analysis is carried out to summarise the large number variable into set of few comprehensible factors and then Friedman's test is performed to rank those factors according to the various identified maintenance policy in order to identify the critical factors playing important role in selection of a particular maintenance policy. The study is carried out in the Indian manufacturing sector.

The factors behind working in virtual community

Anitha Acharya
Department of Marketing and Strategy, ICFAI Business School (IBS), Hyderabad and The ICFAI Foundation for Higher Education (IFHE) (Deemed to be University u/s 3 of the UGC Act 1956), Hyderabad, India

Received 1 March 2018
Revised 10 July 2018
Accepted 6 August 2018

Abstract

Purpose – In this paper, the prior research on virtual teams was reviewed to assess the state of the literature. The purpose of this paper is to determine why individuals prefer working in virtual teams (also termed liquid workers and part-time workers). Previous researchers have focussed on the benefits that organizations receive if they hire liquid workers, but to date, no research has been conducted to determine the perspective of these liquid workers. The various definitions of virtual teams are discussed and an integrative definition is proposed that suggests all teams may be defined in terms of their extent of virtualness.

Design/methodology approach – A systematic review of the literature on virtual teams was conducted. The data were collected from 12 informants. A thematic analysis was used to analyse the data.

Findings – Six main themes were identified, namely, pliability, opportunities, increased earnings, vigour, family and transportation.

Research limitations/implications – This study was conducted in a three-metropolitan city in India and warrants being extended to rural and international settings to gain additional insights and confirmation of the research findings.

Practical implications – It is suggested that organizations who recruit liquid workers will be in a position for substantial cost savings; this is because organizations usually make payment of liquid workers' wages on an hourly basis. This will help the organizations to schedule the number of working hours depending on their needs.

Originality/value – The current study is novel as there is a paucity of research in identifying the factors behind working in the virtual community in India. This study presents the first research of its kind to the best knowledge of the author, and the findings will be valuable for companies who are looking for cost savings.

Keywords Qualitative, Thematic analysis, Virtual team, Depth interview, Liquid workers

Paper type Research paper

Introduction

There is an increasing need to react quickly to customers' needs and competition, customization and reengineered product life cycles are some of the trends that are driving organizational change (Miles and Snow, 1992). Activities in the corporate world are becoming more global, and corporations are facing increased competion from the domestic and international market (Townsend *et al.*, 1998). In addition, there is a shift from production to knowledge/service-based work environments. Additionally, the present progress in communications has aided speedier changes (compared to the past) and has created jobs that are more dynamic and complex. To compete with these changes, organizations have changed their existing systems to become more flexible and adaptive. Organizational structures, which are horizontial in nature and based on team work, are becoming more widespread due to technology. Successful organizations use information technology as a primary enabler and these organizations adapt very quickly to ever-changing competitive landscapes and customer requirements (Jarvenpaa and Ives, 1994). The building blocks of

Structural changes and trade competitiveness in the Indian pharmaceutical industry in product patent regime

Varun Mahajan
Department of Economics, ICFAI Business School (IBS), Hyderabad, India

Received 14 December 2016
Revised 12 May 2018
22 May 2018
Accepted 31 October 2018

Abstract

Purpose – This paper aims to present structural changes and trade competitiveness in Indian pharmaceutical industry in pre and post product patent regime. The study shows the impact of product patent on market structure, ownership, trade, revealed comparative advantage, R&D and mergers and acquisitions.

Design/methodology/approach – The study is based on secondary data and extensive relevant conceptual and empirical literature review.

Findings – The study finds that this oligopoly Indian dominant pharmaceutical industry has many challenges ahead such as in R&D expenditure, patent expiration of many major drugs manufactured in Ireland, growing competition in generic global market, bulk drugs dependence on China, rise in the number of M&As, rising costs of new drug discovery and tightening safety and efficacy testing requirements. The smaller firms are likely to act as the contract manufacturers for medium and bigger companies at a lower value chain. The Normalised Revealed Comparative Advantage (NRCA) index was calculated for top exporters of pharmaceutical. It was found that NRCA index of IPI has shown deterioration from 1996 to 2005 and thereafter, improvement except in the year 2009. Switzerland, Belgium and Ireland are the top three countries in NRCA index, which are followed by Germany, the UK and France.

Originality/value – It attempts to capture recent trends in market structure, comparative advantage indices, R&D, trade, M&A and ownership, especially in new IPR regime. There is a dearth of studies providing detailed analyses of India's comparative advantage *vis-a-vis* other leading exporters of pharmaceutical products in the world. The paper would be of value to practitioners and scholars interested in structural changes of IPI, especially in product patent regime. The findings have significant implications for managers and government for future policymaking.

Keywords Pharmaceutical industry, Revealed comparative advantage, MNCs, Trade, Merger and acquisition, R&D, Patent

Paper type Research paper

1. Introduction

The Indian pharmaceutical industry (IPI) is considered to be one of the most dynamic and vibrant industries of the developing world. In terms of quality, technology and range of medicines, it is positioned very high in the developing countries and is ranked third in terms of manufacturing pharmaceutical products by volume. Over the past 35 years, this industry estimated to have grown to be of the worth of US$22bn in 2013 and growing at about 8-9 per cent annually.

The author's sincere gratitude towards Dr D.K.Nauriyal, Vice-Chancellor (Kumaun University, Uttarakhand) and Dr S.P. Singh (IIT Roorkee) for their invaluable guidance and sincere advice.

Manish Gupta[1]
Sindhu Ravindranath[1]

Abstract

This case is about Nisheeth's Microsign Products (Microsign), a manufacturer of electronical, electronics, and automobile components. Since its inception in 1979, the company underwent several HR related changes. The biggest decision in this regard was to employ as many differently abled people as many possible. The firm could sustain financially because of the modifications done in the HR practices to adapt to the differently abled workforce. In 2017, the company felt the pinch of increased competition and demand for better quality products. Therefore, the CEO, Nisheeth, decided to embrace advanced German machines. However, he knew that embracement of technology is not easy and this move could potentially change the existing HR practices. He wondered what he and other organizations that employ differently abled people could do to sustain in this turbulent time.

Keywords

Microsign, Physically Challenged, human resource management, India

In the year 2017, Nisheeth P. Mehta (Mehta), the chief executive officer (CEO) of Microsign Products, India, met his old friend Subhash with a few researchers who were from different places. During the ensuing discussion, Mehta recalled how the decision of employing physically challenged workers resulted in positive consequences for the firm and the stakeholders. Indeed, it required both Mehta and the organization to adopt a different approach to managing human resources (HRs) altogether. He was proud of not only employing a relatively discarded section of the society but also running the business successfully for 30 years with almost 60 per cent differently abled employees in the workforce.

He discussed about how during one of his visits to an event in Singapore, he came to know about the latest German machines which would improve the production process and quality of the products.

Disclaimer: This case is written for classroom discussion and is not intended to illustrate either effective or ineffective handling of an administrative situation, or to represent successful or unsuccessful managerial decision-making, or endorse the views of the management.

ABSTRACT

Copeland (1976) and Shalen (1993) state that the causal relationship between trading activity variables, such as volume, open interest and volatility, the three most important factors for traders and portfolio managers, extends beyond one day. However, the literature on causality thus far concerns a one-day horizon. In this study, we provide a more powerful causality test by measuring the strength of the causal relationship over a multiple horizon. The robustness of the results is analysed by splitting the sample into two period pre and post 2008 crisis. Our findings may impact the designing of trading strategies.

1. Introduction

Trading activities, such as volume and open interest, are measures of demand for speculation and hedging of futures contracts according to Bessembinder and Seguin (1993), Lucia and Pardo (2010). Furthermore, open interest and volume are indicators of the potential and strength for price changes in the derivatives market, respectively, and are critical for trading according to Jena and Dash (2014). The study of causality between trading activity and volatility is centred on the fact that both volume and open interest are measures of liquidity, which is important in the pricing of assets because it involves the cost of transforming cash into financial assets and vice versa, (Chordia et al., 2002). Additionally, trading activity is explained by the momentum, i.e., price trend, (Brzeszczynski & Melvin, 2006). Again, trading activity depends on the direction of the market, Chordia et al. (2000). The trading volume of a derivative contract refers to the number of contracts traded, whereas open interest represents the number of contracts outstanding, i.e., initiated but not closed at the end of the trading day. Examining the nature of the relationship between volatility and trading activity, Fung and Patterson (1999) observed a strong volatility reversal effect from trading volume and market depth (open interest as a proxy), and volatility has a one-day-ahead (i.e., one-day horizon) predictive power for trading volume but not for open interest. Since volatility is an important determinant of volume, (Bessembinder et al., 1996), it impacts the traders' decision to trade in the futures market. In addition, trading activities of traders in the futures market are affected by market depth proxies for open interest, which reflects the change in market liquidity. Theories have been propounded on the relationship among volatility, volume and open interest, which are based on how information arrives in the market and how it is interpreted by traders. The theory

Abstract

The paper aims to investigate the impact of Agricultural inputs on Agricultural Gross Domestic Product in Indian Economy using A Simple Regression Analysis for the period 1980-1981 to 2015-2016. Agricultural GDP is taken as the dependent variable and independent variables are taken as fertilizers, net irrigated area, pesticides, electricity, rainfall and usage of HYV seeds. The study reveals that the variables like fertilizers and net irrigated area are not statistically significant, which means they do not have a significant impact on agricultural GDP during the time period 1980-1981 to 2015-2016. The study further reveals that the variables like pesticides, electricity, rainfall and seeds are statistically significant and it is inferred that these variables have a significant impact on agricultural GDP during the aforementioned data period. The authors opine that the government can intervene in the working of the agricultural sector both from input side as well as from output side. The study highlights that the Reviving public sector investment is critical due to its multiplier effect on the overall GCF in the sector. Thus, there is a need to formulate a long-term perspective plan for rural infrastructure that focuses on infrastructural projects that have the highest total impact and strongest linkages.

Keywords

Net Irrigated Area, Fertilizers, Electricity, Rainfall, Agricultural GDP, Public Investment

1. Introduction

Indian Economy is mainly agrarian in nature and economy is rural centric. Being the largest industry in the country, in 1972-1973 nearly 73.9 percent of working population was engaged in agriculture and allied activities, and this percentage fell to 64.8 percent in 1993-1994 and 48.9 percent in 2011-2012 [1].

Role of CSR in the consumer decision making process – The case of India

Sudeepta Pradhan

Sudeepta Pradhan is Assistant Professor at the Department of Marketing and Strategy, ICFAI Foundation for Higher Education, Hyderabad, India.

Abstract

Purpose – *The purpose of this study is to capture the decision-making process of one of the major stakeholders, i.e. consumers, while purchasing from socially responsible firms.*

Design/methodology/approach – *This study uses an exploratory approach to have an understanding of consumers' evaluation of their perceptions of a company's CSR during the purchasing process. A total of 60 respondents were interviewed, and their responses were transcribed. These messages were then analysed using content analysis.*

Findings – *The evaluation of CSR initiatives is an intricate, logical and structured process where consumers consider factors that are valued by them. The findings support the concept of legitimacy theory, as most respondents believed it was the duty of a firm to give back to the society.*

Research limitations/implications – *This study suffers from an inherent limitation faced by qualitative studies, namely, the results cannot be generalized. Hence, quantitative methods can be designed in future research in the field. A cross-cultural study would also provide deeper insights and interesting avenues in future investigation to identify different factors.*

Practical implications – *Managers have the option of ignoring consumers' approach towards CSR, and/or focus on CSR positioning and use it in their marketing communications. The Companies Bill, 2013, mandated Indian firms to spend and report their CSR expenditures. Hence, they should use it strategically and advertise their CSR initiatives effectively to influence a large number of consumers. It is also essential for managers to make CSR information easily available and clarify the connection of the company to CSR initiatives. They should also identify the proper channels that would get desired results.*

Social implications – *The study investigates the intricate process that explicates the reasons why CSR affects the consumer decision-making process. The research provides a better understanding into intention-behavior gap, investigates the reasons for such discrepancy and identifies a large number of factors.*

Originality/value – *The study intends to contribute to the field of marketing by capturing stakeholder (consumer) engagement (by exploring consumers' beliefs of CSR, their perceptions and the role of such perceptions) in decision-making. It also intends to add to the existing studies in legitimacy theory.*

Keywords *CSR, Consumer perception, Content analysis, Qualitative analysis, Interview method*

Paper type *Research paper*

Introduction

Firms are generally considered as commercial business paradigms that focus on economic measures of success. They provide products and services, create jobs and make monetary profits in return. However, the past few decades have witnessed a sea change in the business functions. It is no longer an entity that focuses on profit-making, but an institution concerned with every aspect of the business environment and the society at large. Today, stakeholders play a major role in re-defining and evaluating the role of a firm towards the society. It is now time for *responsible business* rather than *profitable business*. Hence, the concept of socially responsible business or corporate social responsibility (CSR) is no more a passing trend, but a crucial part of the business. CSR is now a globally debated phenomenon that provides firms with numerous benefits. Moreover, consumers are highly

Optimization of postponement process for a two stage modular manufacturer

Shantanu Shankar Bagchi and Jighyasu Gaur
Department of Operations and IT, ICFAI Foundation for Higher Education, Hyderabad, India

Received 21 March 2017
Accepted 30 May 2017

Abstract

Purpose – Firms have increasingly been using postponement as one of the supply chain strategies to respond to rapid changes in customers' demands. The purpose of this study is to identify the optimum level of postponement in the context of two-stage modular manufacturing setting, given the information about trade-off between level of postponement and associated cost is known.

Design/methodology/approach – A critical ratio for the manufacturer to determine whether postponement process is to be continued or not is identified. An algebraic formula for the critical ratio is obtained using which managers can identify the optimal level of postponement using differential calculus.

Findings – The authors have analytically arrived at the solution which gives the manager the optimum level of postponement. Here, they identify the optimum level of postponement in the context of manufacturing, given the trade-off between level of postponement and associated cost. They calculate the expected total profit with different demand scenarios. The parametric analysis in this study shows that if price of the product decreases, then optimal amount of postponement also decreases.

Research limitations/implications – It is important for a manager to identify the optimum level of postponement. In practice, managers usually take this decision on the basis of their judgment and trivial analysis of trade-off between costs and benefits of postponement.

Originality/value – In this study, the authors find an optimum amount of postponement for a firm to find an optimal balance between the cost and the benefit garnered by the postponement process.

Keywords Scheduling, Profit maximization, Postponement, Mathematical modeling, Modular manufacturing

Paper type Research paper

1. Introduction

In today's competitive market, there is a rapid change in customers' demands every day. Moreover, they demand quick response and speedy deliveries of products and services (Feitzinger and Lee, 1997; Li and Liu, 2008). It is extremely challenging for the firms to respond to such rapid changes in the customers' demands and yet deliver the product or services within stipulated time. To deal with such issues, firms have increasingly been using postponement as one of the supply chain strategies (Yang and Burns, 2003; Saghiri and Hill, 2014). Postponement may be defined as delaying activities in the supply chain until better information about the market is available. Hewlett–Packard (HP) has been mass-customizing effectively by postponing the task of differentiating a product for a specific customer until the latest possible point in the supply chain network (Feitzinger and Lee, 1997). As a result, HP could save 25 per cent on total manufacturing, shipping and inventory costs. Other successful examples of postponement include General Motors (GM), Honda, Embraer, Dade Behring, Reebok, Polaroid and McGraw Hill (Rietze, 2006).

Market timing and pseudo market timing: an empirical examination of IPOs in India

Kavita Wadhwa
Department of Accounting and Finance, IBS Hyderabad, Hyderabad, India, and
Sudhakara Reddy Syamala
Finance and Control Group, Indian Institute of Management Calcutta, Kolkata, India

Received 10 January 2017
Revised 31 July 2017
8 September 2017
24 September 2017
Accepted 3 October 2017

Abstract

Purpose – The purpose of this paper is to examine the impact of market timing and pseudo market timing on equity issuance decisions of IPOs in an emerging economy – India. Indian new issues market provides a perfect setting to test market timing against pseudo market timing due to two reasons. First, the US literature shows that most underpriced IPOs are highly overvalued and in India, the authors have the evidence of underpricing of IPOs. But whether Indian IPOs are overvalued or not it is yet to be tested. Second, majority of IPOs were issued in India only after the 1991 economic reforms which may signal the evidence for pseudo market timing hypothesis.

Design/methodology/approach – The authors use direct test to examine the impact of market timing and pseudo market timing variables on the IPO activity. The direct tests of market timing and pseudo market timing hypotheses are based on the positive relation of market timing variables and market conditions variables with IPO activity. The authors examine the long-run performance of IPOs by using the calendar-time regression approach to test market timing against pseudo market timing. This serves as indirect test of market timing and pseudo market timing. Evidence of market timing using indirect test shows that there is a decline in the long-run stock performance of IPOs.

Findings – The results show that in India, firms issue equity not just due to market conditions but they also issue equity in order to time the market. The results of market timing are also supported by the calendar-time approach results. However, the authors find that the evidence of market timing is stronger for hot issue markets as compared to cold issue markets.

Originality/value – This is the first study to comprehensively examine market timing and pseudo market timing using direct and indirect tests for an emerging market context.

Keywords Market timing, IPOs, Emerging market, Pseudo market timing

Paper type Research paper

1. Introduction

Market timing refers to selling equity when it is overvalued and repurchasing equity when it is undervalued. The objective is to take advantage of temporary fluctuations in the value of the equity until the price converges to its fundamental value (intrinsic value). According to the theory of market timing, there are two reasons why firms go for market timing: first, they look for opportunities and issue equity when the market valuations are high; second, managers behave opportunistically and sell equity at high prices to investors who are overly optimistic about the future prospects of the company. However, this view is not popular among those investors who believe that capital markets are efficient. They believe that managers neither possess market timing ability nor can sell overvalued equity to irrational or uninformed investors by using insider information. Accordingly, firms issue equity when the economy is expanding, markets are rising and there is a higher demand for capital because of greater growth opportunities. They refer to this phenomenon as the market conditions hypothesis or pseudo market timing hypothesis (Schultz, 2003). The literature on IPOs has not been able to establish clear evidence on whether equity issuance decisions are driven by market timing or market conditions. Our paper provides further evidence on this issue.

THE CONTAGION EFFECTS OF EUROPEAN UNION MACROECONOMIC INSTABILITY IN EMERGING MARKETS: EVIDENCE FROM INDIA

ABSTRACT

This paper examines the European Union (EU) macroeconomic instability and its contagion effects on emerging market economies. Given the large economic weight of the EU in the world, the contagion of the crisis and its potentially devastating effects are necessitating a renewed attention from the researchers and international financial institutions in analyzing the nature and implications of sovereign debt on the political economy of developing and emerging economies in general, particularly India. Though the crisis is epicentered in the EU, its knock-on effects are felt all across the globe. The emerging and developing economies (EDEs) have posted lower growth on account of the worsening external environment and a weakening internal demand during the period of the Eurozone debt crisis. While presenting the contemporary literature on the topic, this paper analyses the causes of the sovereign debt crisis presents implications for sovereign debt crises and draws lessons particularly for emerging markets such as India.

Key Words: sovereign debt crisis, credit risk, endogenous default, banking crisis

DETERMINANTS OF CORPORATE DIVIDEND POLICY IN INDIA: A DYNAMIC PANEL DATA ANALYSIS

Brahmaiah B, ICFAI Business School
Palamalai Srinivasan, Xavier Institute of Management & Entrepreneurship
Sangeetha R, Christ University

ABSTRACT

The present study empirically examines the determinants of dividend policy of National Stock Exchange (NSE) listed firms in India, using dynamic panel data model for the sample of 95 NSE listed firms with continuous dividend payments from 2012/2013 to 2017/2018. The empirical results reveal that profitability, liquidity, leverage, risk, size of the firm and inflation are the major determinants of dividend policy of selected NSE listed firms in India. Findings deduced from empirical evidence bears testimony to the fact that profitability, liquidity, size of the firm and inflation have significant negative impact on dividend policy of the selected NSE firms covered by the study. These findings seem contradictory to the expected outcome contained in the existing literature on the Indian context. The risk variable tends to have negative and significant impact, which is line with the existing literature. Besides, the lagged dividend, investment opportunities, taxation and yield curve do not play significant role in determining the dividend policy.

Keywords: Dividend Policy, Determinants, Dynamic Panel Data Estimation, India.

INTRODUCTION

As evidenced by information and analysis contained in the available financial literature, the behaviour of dividend policy is most debatable issue in the context of developed and emerging markets. In his seminal paper entitled "the Dividend Puzzle", Black (1976) concluded that "the harder we look at the dividend picture, the more it seems like a puzzle, with pieces that just do not fit together". Since then, several research studies have emerged on the factors that influence a firm's decision regarding its dividend policy and whether the dividend policy affects the value of a firm and yet the famous dividend puzzle remain unsolved. It has been argued that dividend payments may results in double taxation of income as it is paid from after-tax profits of the corporate and also shareholders have to pay income tax on dividends. Besides, the dividend payments are considered to be a partial liquidation of the corporate. The enterprise value is negatively associated with the dividend payments. In other words, the enterprise value of a firm would decrease with respect to dividend amount paid by a firm. As Miller & Modigliani (1961) irrelevance theory emphasized that the value of the firm is depends upon its fundamental earning capacity and its investment decision, regardless of how it distributes the income, hence the dividend payment become worthless.

It has been stated that the stock price of the firm would fall equivalently to the dividend amount, paid by the firm over the course of the particular trading day (Campbell & Beranek, 1955; Durand and May, 1960; Elton & Gruber, 1970). Campbell & Beranek (1955) and Durand & May (1960) reported that the size of the average price decrease on the ex-dividend day, relative to the dividend amount. Further, Elton & Gruber (1970) estimated the drop-off ratio

Abstract

In this study, we investigate whether Indian Spot Electricity Price Series exhibit Inverse-Leverage effect by modeling Indian spot electricity price using ARIMA-EGARCH model using data given by Indian Energy Exchange from January 1st 2014 to 31st December 2015 accounting for 730 days and 17,520 hourly spot prices for all the five regions of Indian electricity market. Conditional mean and conditional variance equations are estimated. The results of the study provide crucial insights for power market participants/open access consumers whose numbers have surpassed 3530 in Indian Energy Exchange to strategically plan their exposure in Indian spot electricity market.

Keywords

Spot Electricity, Indian Energy Exchange, Inverse-Leverage Effect, ARIMA-EGARCH Model

1. Introduction

Indian Energy Exchange and Power Exchange India Limited are the two energy/power exchanges which are currently functional in India and are regulated under the provisions made in Power Market Regulations 2010 issued by the Central Electricity Regulatory Commission. Very akin to electricity industry restructuring by enactment of Energy Policy Act 1992 and following it up by Federal Energy Regulatory Commission Order 888 in USA, in India, the Indian Electricity Act 2003 has cemented way for electricity industry restructuring particularly promoting competition in generation, distribution and power trading and ably ushered by power market regulations. Electricity as a commodity being man-made is unrivaled since it is beyond the bounds of possibility to be stored cost-

Abstract

The objective of this paper is to investigate the impact of General government expenditure on GDP growth in India for the period 1980-81 to 2015-16 by using Simple Regression Analysis. FDI Growth Rate and two dummy variables *i.e.*, one for financial crisis 2008 and another one for reform period 1991 have been used. All the explanatory variables are positively and significantly affecting the GDP growth rate except FDI Growth rate. The crisis period dummy shows that in post 2008 there was a negative and significant impact of general government expenditure on GDP growth rate. The reform period dummy shows that in post 1991 there was a positive and significant impact of general government expenditure on GDP growth rate. We have tested the multicollinearity test, which indicates presence of no serial correlation among the explanatory variables. We have also tested the autocorrelation, using the Breutch Pagan test, the results of which indicate the presence of no autocorrelation. The study further reveals that Non-development expenditures continue to be a large proportion of the general government expenditure. Expenditure management has to lay more emphasis on the design of the programme and the exploration of the alternatives. The authors suggest that there is a need to raise the development expenditure on infrastructure to achieve more economic growth. The study highlights that in addition to fiscal correction and consolidation, fiscal reform at the state level should focus on fixing ceilings on guarantees, taking into account the default and development probability, nature of guarantees issued, pricing of services rendered by the project for which guarantees are extended.

Collaborative model for a two-echelon supply chain with uncertain demand under carbon tax policy

ARINDAM GHOSH[1,2,*], S P SARMAH[2] and J K JHA[2]

Abstract. Consideration of carbon policies while optimizing supply chain operations has become imperative as governments and regulatory bodies throughout the world have implemented different carbon policies to reduce emissions of greenhouse gasses, especially CO_2. "Carbon tax" is one of the major carbon policies, initiated by several governments to curtail emissions. In this study, we have considered this policy to optimize the total expected cost (*TEC*) of a two-echelon integrated supply chain with stochastic demand, where both backorders and lost sales are permitted. An unconstrained mixed integer non-linear programming (MINLP) problem is formulated and further solved to find the optimal production rate, order quantity, number of shipments and reorder point while minimizing the *TEC*. Emissions from all the major sources such as production, inventory and transportation have been taken into consideration. It is assumed that the emission from production is a function of production rate, and emission from transportation depends on payload and vehicle type. This study will help organizations to reduce cost and emissions, and regulatory bodies to decide proper tax rate on carbon emission.

Keywords. Supply chain; carbon emission; carbon tax; random demand; variable production rate.

1. Introduction

Global warming is a major concern in recent times among the common people in general and research community in particular. Scientists have revealed that over the past 130 years, the average temperature of the earth has raised by 0.85°C. It is anticipated that between the years 2030 and 2050 nearly 250000 deaths will take place annually due to a drastic change in weather. Melting of glaciers, rising of sea levels and extreme weather conditions are the result of global warming [1]. Emission of anthropogenic greenhouse gasses, especially CO_2, is the main cause of global warming and air pollution [2]. Human activities are responsible for global warming and pollution, which have driven governments and different regulatory bodies to take initiatives and set realistic targets to curb carbon emission. The Kyoto protocol, a part of the United Nations Framework Convention on Climate Change (UNFCCC), is targeted to reduce emissions by 8% from 1990 levels by the year 2012. Scientists have suggested an even more aggressive target of reduction of 25% emission from 1990 levels by 2020 [3]. Various governments have imposed different carbon policies to materialize this target.

The most common carbon policies are carbon tax, carbon cap and carbon cap-and-trade [2, 4]. The biggest international scheme for the trading of greenhouse gasses is European Union Trading Systems (EU-ETS), which was initiated in 2005, follows the "cap-and-trade" concept, where companies get an upper limit on emissions and beyond this limit, companies are penalized. If companies emit less than the specified limit, they can sell it off or keep as unused allowance [5]. On the other hand, United States has imposed a revenue-neutral carbon tax, where every tonne of carbon dioxide is chargeable [6]. Compared with other policies, the carbon tax mechanism is simple and easy to implement. The carbon tax mechanism bids stable carbon prices; hence, organizations can make investment planning without any concern of fluctuating regulatory costs [7]. In the case of strict carbon cap policy, the regulatory bodies set a carbon emission cap on an organization and penalty for exceeding the cap is infinitely large [8]. Hence, organizations are bound to emit within the given level under strict carbon cap policy. Apart from stringent laws, organizations are striving to bring sustainable practices into their operations due to customer

Abstract

The paper examines compliances of the margin trading rules and regulations of the Stock Exchange by trading members while serving their clients in the securities market in India. The paper applies case study approach to study the trading practices of trading members on Indian Stock Exchange systems and identifies the nature of securities market's misuses and abuses. The paper identifies how trading members are violating and avoiding the regulatory compliances. The paper provides inputs for the development of appropriate regulatory framework for prevention of violations of rules and regulations in Indian securities market, prevention of capital market abuses and enables the investor protection. The limitation in a case study approach, the research findings and results may lack generalizability. The results may be generalized in the emerging markets. Hence, researchers are encouraged to study results further in other developed countries. The results provide critical perspectives on regulatory challenges and encourage the regulatory authorities to issue relevant guidelines to stock brokers to prevent from non-compliances of margin trading rules.

1. Introduction

Northern Investments, an investor aggrieved by the Arbitral Award passed by a Panel of three Arbitrators filed an application to the Appellate Panel Arbitrators of the Stock Exchange, Hyderabad for a claim of INR 74.56 million from Punjab Brokers Pvt Ltd., (Punjab), India [1] . Appellant claimed that the panel of arbitrators passed an award on the basis of doctrine of Estoppel principle and ignored margin trading guidelines. The impugned award lacked the merit and could not attempt to do justice on the principles of natural justice. Northern Investments, a Hyderabad based partnership firm (Appellant), got registered as a client for trading with the Punjab Brokers Pvt Ltd. (Respondent) and had been trading through the Respondent. The Respondent had been extending credit regularly to Appellant and Appellant had been regularizing the position and paying interest on the credit extended to it. Respondent, Punjab Brokers Pvt Ltd., (PB), incorporated under Indian Companies Act, 1956, is a trading member of the Stock Exchange, Mumbai. It is one of the leading stock broking companies in India. The range of services includes broking, investment banking, corporate advisory, and portfolio management services.

Influence of Gender and Academic Qualification on Entrepreneurial Intentions among Students

Kalaa Chenji, S. Raghavendra, Laila Memdani

ICFAI Business School (IBS), Hyderabad, The ICFAI Foundation for Higher Education (IFHE) (Deemed to be university u/s 3 of the UGC Act 1956) Hyderabad-India

Abstract

The purpose of this paper is to study the impact of gender and academic qualifications on entrepreneurial intentions of students as a career choice. The data was collected from 257 students at undergraduate and postgraduate levels in a leading business school in India. Chi square test and t-test were used to examine the influence of gender and academic qualification on intentions of entrepreneurship of students. The results reveal three key outcomes, firstly, it establishes that substantial minority of graduates consistently hold entrepreneurship intentions. Secondly, despite the considerable effort put in by authorities in minimizing gender gap, bias amongst men and women in intentions of entrepreneurship continues to exist. Women seem to lag behind in their efforts

An Empirical Clarification on the Assessment of Engagement at Work

Advances in Developing Human Resources
2018, Vol. 20(1) 44–57

Manish Gupta[1] and Keerti Shukla[1]

Abstract

The Problem.

The attachment of a person's "self" to "role" has been studied from a variety of perspectives by numerous social scientists since 1990. However, scholars are divided on the issues of definition and measurement of engagement. Also, the incremental validity of one engagement measure over the other in predicting performance has not been examined. Therefore, this study attempts to review, test, and examine the incremental validity of different operational definitions of engagement in light of the self and role theory.

The Solution.

ANOVA conducted using 317 knowledge workers from different companies in India indicates that personal engagement, work engagement, and job engagement differ significantly from each other. Next, the results of step-wise regression indicate incremental validity of work engagement over other types of engagements in predicting task performance. However, personal engagement remains the strongest predictor of task performance.

The Stakeholders.

The results of this study are expected to help human resource development (HRD) scholars make more informed decision while choosing a particular engagement measure. The results also encourage practitioners to use work engagement scale to explain their employees' performance, at least in the Indian context.

Keywords

engagement at work, India, performance, self and role theory

Musarrat Shaheen[1], Farrah Zeba[1], and Pankaj Kumar Mohanty[1]

Abstract

The Problem.

Although there have been a plethora of studies on the determinants of customer delight in marketing literature, less attention has been given to understand the role of employees' work engagement and psychological capital (PsyCap) in satisfying and delighting customers. The objective of the present study is threefold—the first is to examine how engaged employees are positive and efficacious; the second is to investigate how engaged, positive, and efficacious employees delight patients specifically in the health care sector; and the third is to examine how the relationship between employees' positive PsyCap and customer delight is mediated by beneficiary contact, which is the perception of employees about the meaningful impact of their efforts on their patients.

The Solution.

Previous studies have shown that employees who are absorbed, dedicated, and immersed in their work are more confident and positive at their workplace. Engaged, positive, and confident employees not only keep themselves but also their customers happy and positive through their optimistic outlook and efficacious work behavior. Responses are collected from 200 employees and their 200 patients from different hospitals of India. Hierarchical regression analysis shows a significant and positive relationship between work engagement, PsyCap, and customer delight. Work engagement is found to predict PsyCap and customer delight. Beneficiary contact is found to mediate between the relationship of PsyCap and customer delight. The originality of the article lies in its interdisciplinary approach to understand how engaged and dedicated employees keep themselves and their patients positive and delighted.

Job characteristics affect shared leadership

The moderating effect of psychological safety and perceived self-efficacy

Swati Hans
Department of Human Resource Management, IBS Hyderabad, IFHE University, Hyderabad, India, and
Ritu Gupta
Human Resource Management Department, T A Pai Management Institute, Manipal, India

Abstract

Purpose – Shared leadership is characterized by exercising lateral leadership influence depending upon the task and the adroitness required for the task. The purpose of this paper is to examine the effects of job characteristics on shared leadership and explore the moderating effects of perceived self-efficacy, and psychological safety on the relationship between job characteristics and shared leadership.
Design/methodology/approach – The authors applied hierarchical regression and social network analysis using a sample of 23 teams consisting 219 employees from an Indian-based multinational BPO.
Findings – Results indicate that skill variety, task significance, autonomy and feedback are significant precursors for shared leadership, and psychological safety and perceived self-efficacy act as moderators.
Research limitations/implications – The study extends the literature associated with job characteristics in relation to shared leadership. Managers can encourage shared leadership using job design and by creating a psychologically safe environment to enhance performance of the team. The cross-sectional nature of the study and data from a single organization question the generalizability of the results.
Originality/value – The authors provide an initial understanding of the impact of job characteristics in a team for the development of shared leadership, which has not been studied so far. Also, psychological safety and self-efficacy of individuals in teams have not been explored in the past, moderating the job characteristics and shared leadership relationship.

Keywords India, Self-efficacy, Psychological safety, Job characteristics, Shared Leadership, Sociograms
Paper type Research paper

Introduction

Organizations are increasing their reliance on team-based work due to its high potential to demonstrate quality results in less time. Teams bring diverse perspectives and experience to ensure richness in the workplace decision making and functioning (Torrente *et al.*, 2012). The importance of structuring work around teams stems from emerging trends such as increase in global competition, emphasis on knowledge-work, innovation and flatter organizational structure. These trends inevitably make an external leader incapable to execute the leadership functions for his/her team (Lawler *et al.*, 2002).

Furthermore, employees in current forms of team possess strong desire to participate and influence the underlying team functions, processes and decisions (Day *et al.*, 2004; DeNisi *et al.*, 2003). To address these issues, team members require leadership properties to originate within teams rather than those elevated by formal hierarchy (Carson *et al.*, 2007). Here, distributed leadership becomes important, as it requires team members to take part in activities and functions with responsibility (Feng *et al.*, 2017). Conventional models of leadership centralize the leadership power to a single individual and ignore the importance of funneling the leadership functions to middle- and lower-level managers (Lambert, 2002; Ensley *et al.*, 2006; Fransen *et al.*, 2018). However, the concept of shared leadership rests on the idea that

Integration
Indian electricity market
Spot prices
Panel granger causality
Panel unit root

ABSTRACT

This paper investigates the spot electricity price discovery that exists among the five regions of Indian electricity market using hourly spot electricity price data from 1st January 2014 to 31st December 2015. Using Augmented Dickey-Fuller (1981) and Narayan and Popp (2010) unit root tests, we find that the spot electricity prices for both peak and off-peak hours across all the regions are stationary at level. Then by applying Granger causality test for a reduced VAR model at level, the results show that there hardly any causality exists between these electricity markets barring few regions. Though we did not find any causality between peak price and off-peak price for all individual region, but we formed two panels by using peak and off-peak price data of all five regions. Our results showed short-run and long-run panel Granger causality between peak price and off-peak price. The results of the study suggests that though India as a nation has all the regions inter-connected with single frequency of Power grid operation since 2008, however, these markets are not highly integrated in comparison to electricity markets of developed nations around the world.

1. Introduction

The Indian electricity market is broadly divided into five regions namely the southern region, north-eastern region, eastern region, western region and northern region [16]. The Ministry of Power (MoP) of the Indian Government oversees policy formulation, planning and has been entrusted with the responsibility of effective implementation and administration of IEA 2003 which introduced competition and has completely reorganized the power sector. In India, Power/Electricity is the responsibility of both Central Government and the respective State Governments who are the stakeholders. Central Electricity Authority (CEA) has been entrusted with statutory functions including overseeing the technical coordination and supervising implementation of various programs and schemes of the Government [5]. The Central Electricity Regulatory Commission (CERC) is the independent regulator for power sector in India along with State Electricity Regulatory Commissions (SERCs) for each of the state. National Load Dispatch Centre (NLDC) which was constituted in the year 2005; is the apex body in India for ensuring integrated operation of the national power system [35]. NLDC is entrusted with supervising the functioning of other Regional Load Dispatch Centers (RLDCs). NLDC and RLDCs together overlook scheduling, dispatch of power/electricity both intra as well as inter-regional links, maintaining grid security and proper monitoring of system operations. Transmission in India is entrusted with Central transmission utilities, State transmission utilities and transmission licensees. Power sector companies should get license and prior approval from the Central Electricity Regulatory Commission for commencing operations. Appellate tribunal is responsible for hearing appeals against any of the orders of adjudicating officer or any Commission under the IEA 2003.

India currently has two energy/power exchanges namely the Indian Energy Exchange (IEX) and the Power Exchange India Limited (PXIL) which are regulated under the provisions made in Power Market Regulations 2010 which was issued by the Central Electricity Regulatory Commission. Similar to electricity industry restructuring by enactment of Energy Policy Act 1992 and following it up by Federal Energy Regulatory Commission (FERC) Order 888 in USA, in India, the Indian Electricity Act (IEA) 2003 paved way for electricity industry restructuring particularly encouraging competition in Generation, Distribution and Power trading which was followed up by Power market regulations in 2010 issued by the Central Electricity Regulatory Commission (CERC) of India. Electricity as a commodity (man-made) is matchless since it is highly unlikely to be stored cost-effectively due to its physical properties as well as meeting the demand which usually tends to illustrate strong seasonality [22,40]. Previously vertically integrated electric utilities have now been deregulated into competitive markets with introduction of competition world-wide (Li et. al, 2007;

Manish Gupta[1]

Abstract

The Problem.

The engagement literature suffers not only from inconsistent construct conceptualizations but also from the paucity of research in India, a country whose employment conditions differ substantially from those of the Western nations. Therefore, there is a need to have clarity on the contribution of the engagement construct to the field of human resource development (HRD) and examine the significance of engaging employees in India.

The Solution.

To address the aforementioned research gaps, the objectives of this issue are to derive a clear understanding of the engagement construct and to gain fresh insights into the antecedents and consequences of engagement at work, particularly in the context of India.

The Stakeholders.

This issue is expected to benefit researchers, HRD professionals, and organizations by identifying the strongest engagement predictor of employee performance, suggesting several ways of engaging workforce in India, and providing fresh insights into the nomological network of engagement at work.

Keywords

customer delight, employee performance, engagement at work, flexible human resource management, happiness, human resource development practices, India, knowledge workers, psychological capital

Engaged employees add considerable value to their organizations (Kim & Kang, 2016). Such employees attach themselves cognitively, emotionally, and physically

Moderating Effects of Age and Experience on the Factors Influencing the Actual Usage of Cloud Computing

Shailja Tripathi
IBS Hyderabad, IFHE University
shailja.tripathi@gmail.com

ABSTRACT

Cloud computing technology (CCT) has attracted extensive attention of organizations to enhance their agility, flexibility and competitive advantage. Successful implementation of CCT depends on its acceptance and use by senior IT managers in the organizations. This study proposes an extended technology acceptance model (TAM) to predict actual CCT usage by the managers. A questionnaire is used to collect data. Exploratory and confirmatory factor analyses are performed to analyze the factor structure and measurement model. Structural equation modeling is used to analyze the structural model. The results supported all the hypotheses of the model. The moderating effect of experience and age is also tested through multi-group analysis. Based on findings of the study, implications for CCT usage in the organizations are discussed.

KEYWORDS: Cloud computing technology; TAM, Actual usage; Multi-group analysis

INTRODUCTION

Cloud computing is an emerging technology and many organizations are embracing it to meet their computing requirements economically with less maintenance efforts. Cloud technology includes cloud computing and mobile cloud computing. Cloud computing is a technology that extends its services to the users through internet. According to Marston et al. (2011), cloud computing technology (CCT) as a service based technology that assimilates both hardware and software dispersed through a network on demand irrespective of time and location. It provides a flexible and highly scalable platform for business operations by outsourcing fractional or full information technology (IT) operations (Armbrust et al., 2010). By emphasizing the implication of cloud computing for practitioner and academics, Wang et al. (2011) considered cloud computing as a low-cost commodity which can be retrieved by many businesses and individual customers. CCT comes with

A Study on Exploring the Factors Influencing Celebrity Endorsement Credibility

Ramendra Pratap Singh[1] and Neelotpaul Banerjee[2]

Abstract

This study tries to explore the factors contributing to the source credibility of celebrities as brand endorsers and, subsequently, develops a conceptually integrated scale for the same in Indian perspective. To conduct an empirical investigation, a survey is conducted consisting of 432 participants. In this study, exploratory factor analysis (EFA) followed by confirmatory factor analysis (CFA) has been con-ducted. Exploratory factor analysis resulted in three factors or dimensions. All the indicators are strongly loaded into their respective construct. The Cronbach's alpha, composite factor reliability and variance extracted measure for validity checks are found to be satisfactory. All pairs of inter-construct correlation are found to be positive and significant. The issue of multicollinearity did not bear a serious threat to the data. Common method effect of Harmen's one-factor post hoc test result indicates that multidimensional three-factor model fits the data well than the one-factor model. These results are also invariant across different demographic profiles, namely, gender, educational qualification and age.

Keywords

Celebrity, confirmatory factor analysis, scale development, source credibility, validity

Introduction

A celebrity spokesperson is characterized as a recognizable individual who uses this acknowledgment to promote consumer goods through an advertisement (Rifon, Jiang, & Kim, 2016). Brand endorsement by celebrities is a way to improve communication ability by cutting through the clutter that exists in the marketplace and gets the brand noticed. Advertisements are designed to draw and hold attention of the audience for as much time as possible (Banerjee & Siddhanta, 2015). Marketing and advertising practitioners share the impression that a communicator's character incorporates the preponderant effect on the strength of the message. The role of famous personalities in advertising as brand endorsers has become a prevalent marketing communication strategy (Erdogan, 1999) among marketers to develop favourable brand image among consumers (Erdogan, Baker, & Tagg, 2001). Past research has uncovered that by and large an advertising source thought to be profoundly credible is more convincing than a less valid source in drawing consideration and augmenting recall (Pornpitakpan, 2004). At present, celebrity endorsement has evolved

Testing the Purchasing Power Parity Hypothesis in India: A Non-linear Cointegration Approach

Aviral Kumar Tiwari

Montpellier Business School, France

Mothkuri Aruna and Aruna Kumar Dash

IBS Hyderabad, IFHE University

Abstract: This paper attempts to test whether Purchasing Power Parity (PPP) hypothesis hold good for the Rupee-Dollar, Rupee-Pound, Rupee-Yen and Rupee-Euro exchange rates. This study employs Breitung's (2002) rank tests for nonlinear cointegration by using monthly data from 1993:M3 to 2011:M3. Results indicate the presence of cointegrating relationship only in Japan indicating that PPP hypothesis hold only between the Indian Rupee and Japanese Yen.

Keywords: PPP Hypothesis, Exchange Rate Determination, Non-linear Cointegration, India

JEL Classification Number: F31, F15

1. Introduction

The initiation of economic reforms in India during 1990-91 witnessed a paradigm shift in the international trade with an open door policy. This has paved Indian economy to embrace managed floating market determined exchange rate system in 1993. This change reflected shifts in the trade policy with certain external shocks. Though there is a plethora of empirical studies pertaining to exchange rate determination, there is a need to investigate the impact of time varying parameters in the determination of the exchange rate with the non-linear cointegration approach.

Purchasing Power Parity (PPP) asserts that the nominal exchange rate between two currencies should be equal to the ratio of aggregate price levels between the two countries, so that a unit of currency of one country will have the same purchasing power in a foreign country. Cassel in his paper 1918 entitled as "Abnormal Deviations in International Exchanges", explains "although the term PPP was coined close to 100 years ago, it has a much longer history in economics". Rogoff, in his paper 1996 entitled "The Purchasing Power Parity Puzzle", explains while very few contemporary economists would hold that PPP holds continuously in the real world, "most instinctively believe in some variant of PPP as an anchor for long-run real exchange rates" and indeed the implication or assumption of much reasoning in international macroeconomics is that some form of PPP

ABSTRACT

This paper examines the effect of bank-appointed directors on corporate cash holdings for Indian firms. We build on, and extend, the role of bank-appointed directors as a better monitor to mitigate agency problems, thereby alleviating the financial constraints of the firm. Our results indicate that firms with bank-appointed directors hold less cash compared to firms without bank-appointed directors. Nevertheless, we find greater reduction in cash holdings, because of bank-appointed directors, in firms that are not dependent on bank financing. We show that the above relationship is driven by bankers' ability to alleviate the financial constraints of the firm by improving access to bank and non-banking financial institution loans. We next document that these benefits of a banker's presence on a corporate board are true only for standalone firms, not for firms affiliated with business groups.

1. Introduction

Corporate cash policy plays an imperative role in corporate finance. From precautionary and transaction motive perspectives, firms accumulate cash to meet their unforeseen needs, particularly when external financing is costly (Habib & Hasan, 2017; Han & Qiu, 2007; Opler, Pinkowitz, Stulz, & Williamson, 1999). Various empirical studies document several determinants of corporate cash holdings (Harford, Mansi, & Maxwell, 2012; Kim, Mauer, & Sherman, 1998; Lin, Chan, Chien, & Li, 2017; Opler et al., 1999; Yung & Nafar, 2014). Nevertheless, there is limited research that examines the consequence of financial intermediary on corporate cash holdings. In this study, we analyze the effect of banks' monitoring through board representation on corporate cash holdings for Indian firms wherein, on average, 99% of the total debt is borrowed from banks and financial institutions.

We posit two contradictory hypotheses regarding the consequence of bank-appointed directors on corporate cash holdings. First, we develop the monitoring hypothesis from literature on relationship banking which examines the monitoring role of banks. Banks invest in acquiring proprietary information for the borrowing firms and therefore, mitigate information asymmetry and improve bank monitoring (Boot, 2000). These benefits may be further strengthened if a banker acquires a seat on a corporate board since bank-appointed directors can access information over and above what is conveyed by a firm's financial statements (Kroszner & Strahan, 2001). Depending on the extent to which bank-appointed directors can access proprietary information, the bank monitoring would become more effective. This consequently reduces the cost of monitoring (Fama, 1985), which in turn lowers the cost of funds (James, 1987). The bank monitoring

Abstract: Technique for order preference by similarity to an ideal solution (TOPSIS) is a multi-attribute decision making technique, used to evaluate alternatives and find an ideal solution. Practically, it has been successfully applied to identify the best alternative for decision making process from a finite set of alternatives in different industries. It can be used for evaluation of the performance of different entities like suppliers/processes/designs/locations/standards and many others. In view of the significance of TOPSIS in several industries to prioritise the alternatives, this paper is intended to highlight various important industrial applications with the help of detailed review of literature. The application areas covered include automobile, mobile, information technology, manufacturing, biological and behavioural. A hypothetical example with six alternatives and five criteria is presented to detail the step-wise derivation of solution by TOPSIS method.

The mediating role of customer related performance outcomes on the relationship between customer integration and firm performance

An empirical investigation in Indian context

Nikhat Afshan
Department of Operations and Information Technology, ICFAI Business School, Hyderabad, India, and
Jaideep Motwani
Department of Management, Seidman College of Business, Grand Rapids, Michigan, USA

Abstract

Purpose – Even though supply chain integration (SCI) has been considered as a vital contributor to business performance, the research shows inconsistency in its finding. Accounting for these inconsistencies, researchers (Fabbe-Costes and Jahre, 2007; Van der Vaart and van Donk, 2008) have highlighted the need to relate the level of integration in a single relationship to the performance outcomes of that relationship. The purpose of this paper is to make an effort in this direction and investigate the impact of customer integration (an important dimension of SCI) on customer-related performance outcome (CRPO) and financial performance of the firm.
Design/methodology/approach – Based on an extensive literature review, a research model has been developed hypothesizing the relationships between customer integration, CRPO and financial performance. The research model is then tested using data collected from 214 Indian manufacturing companies. Structural equation modeling was used to test the hypothesized relationship between constructs of interest.
Findings – The result showed that there is no direct effect of customer integration on financial performance instead the relationship is fully mediated through CRPO.
Originality/value – This study conceptualizes and develops scale for the specific performance outcome resulting from a high level of integration between manufacturer and key customers and labels it as CRPOs. It further investigates the mediating role of this immediate performance outcome on the relationship between customer integration and firm performance.

Keywords Financial performance, Supply chain integration, Customer integration, Customer-related performance outcome
Paper type Research paper

1. Introduction

In the past few decades, there has been growing consensus concerning the strategic importance of integrating manufacturers, suppliers and customers (Bowersox and Morash, 1989; Barrat, 2004; Rosenzweig *et al.*, 2003; Danese and Bortolotti, 2014; Kim and Chai, 2016; Yuen and Thai, 2016, 2017a, b). The rapidly changing technology, increased globalization, shorter product life cycles, a focus on efficiency and increasing customer expectations are some of the reasons for integration and building close relationships with supply chain partners (Soosay and Hyland, 2015). The most successful manufacturers seem to be those that have carefully linked their internal processes to external suppliers and customers in unique supply chains. In short, for the new millennium upstream and downstream integration with suppliers and customers has emerged as an important element of manufacturing strategy. Efficient supply chain integration

Keywords:
Price discovery
Lead–lag relation
Currency market
Error correction model
Cost-of-carry model

ABSTRACT

We examine the lead-lag relation between spot and futures prices in the leading emerging foreign exchange markets from September 2008 to April 2018. Using the daily data for Indian rupee, Brazilian real and South African rand against the US dollar, we find the evidence of price discovery in these currency markets. The spot market consistently leads the futures market for the Indian rupee and South African rand, however, the futures market leads the spot market for Brazilian real during the sample period. Our results further show that the cost-of-carry error correction model is the best forecasting model and a trading strategy based on this model outperforms the market even after allowing for transaction costs.

1. Introduction

The lead–lag relation between the price movements in the futures market and its underlying spot market illustrates how fast one market reacts relative to another. In an efficient market, the movements in the prices in the two markets are contemporaneously related which means both the markets react to the same information simultaneously. However, if one market reacts faster to new information, a lead–lag relation between spot and futures market is detected. The greatest advantage of futures market is its ability to discover prices since it transmits information to uninformed traders through informed traders (Grossman, 1989). Price discovery is the process through which closely related markets reach an equilibrium price (Cabrera et al., 2009).

While detecting price discovery, the movement of prices in futures market should possess important information for its underlying spot market. It could be either due to less restrictive regulations or lower transaction costs which lead to greater liquidity in the futures market and might move these markets before the spot market. Moreover, with the arrival of new information, futures can be traded instantaneously with modest cash outflow since futures are levered instruments. In fact, Chen and Gau (2010) show that after news announcements, the contribution of futures rates to price discovery is greater than the spot rates. Therefore, such a transaction preference might explain the speed of price discovery in futures market and lead the spot market.

Many studies report that futures markets have relatively more information than spot market because large and informed traders participate in futures markets. For instance, see, Min and Najand (1999); Frino et al. (2000); So and Tse (2004); Kang et al. (2006); Bohl et al. (2011) among others. On the other hand, there are studies which report that the underlying spot market leads the futures market. For example, see, Bohl et al. (2009); Cabrera et al. (2009); Chen and Gau (2009), and Yang et al. (2012). Some studies reveal a bidirectional relation between the two markets (Hasan, 2005; Kavussanos and Nomikos, 2003), while others support the efficiency of information and show that there is no lead–lag relationship between one market and the other (Finnerty and Park, 1987; Wahab and Lashgari, 1993; and Kung and Carverhill, 2005). Table 1 shows the studies that report mixed findings for the lead–lag relation

Virtual Cloud Cluster with Moodle Framework

Ashok Verma[1], Sumangla Rathore[2], Santosh Vishwakarma[3], Prateek Shrivastava[4], Shubham Goswami[5]

Abstract— **In Moodle LMS there is a need to saturate the over centralized data load to multiple clusters instead of a single cluster to overcome the existing implementations of Moodle LMS.To defeat the issue that Moodle stack tends to be immersed on a single server, it ought to be considered todispense the over-brought together load to a few different servers. In different words, a cluster should be developed.The physical clusters have weaknesses, for example, misuse of resources. In this paper, Moodle Virtual cluster is composed and developed through virtualization in cloud computing to consistently oversee and progressively allocate computing resources. Through simultaneous access weight test, the outcomes demonstrate thatMoodle Virtual Cluster can make strides exchange ability of the framework and decrease response time.**

Keywords-Moodle;Virtualization;Virtual Cluster;Cloud Computing

I. INTRODUCTION

Moodle LMS is a standard open-source learningadministration framework generally because of its straightforward and clear activity and additionally adaptable space growing ability. The run of the mill working condition is a server with LAMP,short for Linux activity framework, Apache server, Mysql database and PHP. This could upgrade Moodle and makes it steadier andmore secure [5].

In 2010, Moodle was configured on HP Proliant-DL180G6, server with LAMP structure in Gyan Ganga Institute of Technology & Sciences campus. For a single server, 1GB memory could usually be used up by around 50 concurrent users and 250 browsing users at most [8]. As HP Proliant-DL180G6 server has a 4GB memory, it's evaluated to supply around 200 simultaneous clients and 1000 perusing clients at most. At the point when Moodle was first configured on the server in campus, it could fundamentally take care of the demand of students and instructors. In any case, as the framework was acquainted with Gyan Ganga campus and clients turned out to be more, single server failedto deal with the expanding load.Subsequently, server cluster is needed to be constructed under such condition.

II. MOODLE PHYSICAL CLUSTER

A Moodle installation comprises the Moodle code executing in a Apache web server; a database managed by MySQL, and a file store for uploaded and generated files (the moodledata folder). Moodle data folder store files created or uploaded by users such as course content uploaded by instructors, and assignments submitted by students, usually in large quantities. Current user data in the campus is up to 156 GB. To allot the load of single server, they can be separated with many load-balanced web-servers, a database cluster, and a file-server:. Web server cluster is developed through clustering, with numerous web hubs to share services. At that point a load balancer is introduced at the front end to react to get to demands at customer side by dispatching related web hubs. Servers in web server cluster could get to information in a similar network storage and inquiry a similar database server.

Physical group could address the issue of over-incorporated load for much of the time went to sites on single server of Moodle, however experiences the accompanying:Misuse of assets: Multiple free gadgetsare expected to develop the previously mentioned cluster. Research has been directed in the campus by utilizingtwo Web servers, one database server, one load balancing server and storage. Just systemcapacity could impart to different applications in the campus, and others are only utilized by Moodle. Test outcomes demonstrate that such group could fulfill the request of students and instructors on campus. Be that as it may, a few assets are sitting without moving and not completely used now and again. Cluster structure isn't adaptable: Traditional physical cluster depends on set number of physical machines, so new gadgets should be added to extend new hubs in the cluster.

In this paper, a Moodle Virtual Cluster is built through virtualization in cloud computing to spread unreasonable load in single server of Moodle and stay away from previously mentioned weaknesses in physical cluster. Virtual cluster can progressively allot assets on requests. in this way using assets productively and building a versatile figuring design.

III. VIRTUALIZATION INCLOUD COMPUTING ENVIRONMENT

A. Cloud Computing

Cloud computing is a relatively new business model in the computing world. According to the official NIST definitioncloud computing is a model forenabling ubiquitous,convenient, on-demand network access to a shared pool of configurable computing resources (e.g., networks, servers, storage,applications and services) that can be rapidly provisioned and released with minimal management effort or service provider interaction [3].

Abstract

The paper investigates the unauthorized trading indulged in client's accounts by the trading members of the stock exchanges. Trading systems, misuses and abuses of the securities market by trading members have been identified and analyzed. It finds how some trading members violate trading rules, misinterpret regulatory compliances and indulge unauthorized trading. The findings and conclusions provide inputs for the development of appropriate regulatory framework for the securities market. However, the results may be generalized in the emerging markets environment. Hence, researchers are advised to study trading practices, stock market operations, appreciate the dynamics of stock market and apply the same in their future research in India and abroad.

Abstract

In this paper, we examine the determinants of bilateral export demand function of India during 1993:Q1-2015:Q1. The starting point of our study is 1993:Q1 by keeping into consideration that RBI implemented market determined managed floating flexible exchange rate system during that period. We have employed Auto Regressive Distributed Lag (ARDL) model by using the macroeconomic variables such as real exports, foreign income, nominal exchange rate (Rupee-Dollar) and relative price. We found there exists a long run equilibrium relationship between real exports, foreign income, exchange rate and relative price. In our empirical analysis, we found that in the long run and short run, real exports are influenced more by foreign income followed by relative price. Foreign income carries a positive sign and is statistically significant, which implies that 1% increase in foreign income will increase real export by 1.63% in the long run. Likewise, relative price carries a negative sign and is statistically significant which implies 1% decrease in relative prices that will increase real exports by 0.22% in the long run. The nominal exchange rate carries a negative sign and is statistically significant (in both short run and long run), which suggests that depreciation of nominal exchange rate would not stimulate the volume of export during our study period. Hence, for policy point of view if any policy makers want to promote exports by depreciating, the rupee will not give fruitful results.

The Impact of Work-Life Balance Practices on Women Employees in the IT Sector

K V L Manasa and M Showry***

The growing emphasis on performance, pressure for productivity, the lure of lucrative salaries and a promise of ambitious careers in the IT sector compounds the work-life balance problems further as it results in a grueling work schedule of 24/7. This paper investigates the relationship between work-life balance coping strategies or practices in the IT firms and work-life balance among the women employees working in the IT industry in Hyderabad. The study reveals the extent to which work-life balance policies and practices contribute to work-life balance. The study found that organizational practices have a significant influence on work-life balance among women IT employees. It also shows that leadership plays an important role in implementing work-life balance practices. The study also shows that welfare programs, role conflict and job sharing are found to have higher level of satisfaction among the employees and underlines the importance of work-life balance for employees and organizations.

Introduction

The contemporary business world, driven by unprecedented competition, pressure for efficiency and sophisticated technology, is marked by the entry of a massive number of women employees, especially into the IT sector. Women have not only witnessed sparkling performance at work but also are rising to leadership roles. As the women take an active role in professional life, they have to juggle between career, family and children, leading to pressures of work-life balance (WLB). Against the popularly held belief that technology would lessen the work and bring leisure to the employees, it has left them with scarce free time for the family. In fact, technology has blurred the line between office and home, and the employees are expected to be available for office work round the clock. Such imbalance in work-life is creating numerous challenges and problems to the employees, the organizations and the society. Work and family are the two most important spheres in a person's life and the conflict between the two has been a matter of significant concern for employees, managers, researchers and organizations. Sturges and Guest (2004) recognized a need to balance and integrate family

Mediating role of innovativeness between risk taking and performance in Indian universities

Impact of this nexus on brand image

Manish Gupta and Anitha Acharya
IBS, IFHE, Hyderabad, India

Received 24 September 2016
Revised 8 May 2017
12 August 2017
15 October 2017
3 December 2017
Accepted 23 December 2017

Abstract

Purpose – With increased globalization, Indian universities are struggling to attract and retain talented academics and are exploring the ways to enhance their service performance and brand image (BI). However, there is a paucity of studies that view universities through the corporate lens. Therefore, the purpose of this paper is to examine the mediating role of innovativeness in the relationships of creativity, risk taking (RT), and performance in service delivery (PSD). Another objective is to find out how this nexus affects universities' BI.
Design/methodology/approach – Responses were collected from 280 academics working for different Indian universities. Structural analysis was performed to examine the relationships under investigation.
Findings – The results indicate that innovativeness fully mediates the positive RT – PSD relationship and that PSD positively influences BI.
Research limitations/implications – The findings of this study mainly augment the theory of BI by empirically linking BI and its antecedents in the context of Indian universities.
Practical implications – For enhancing a university's BI, management is encouraged to promote RT work culture along with innovative and creative teaching methods.
Originality/value – This study is one of the few studies in India that see academia through the corporate lens. Also, it provides evidence for the importance innovativeness in enhancing BI of a university.

Keywords Brand image, Universities, Innovativeness, Risk taking, Performance in service delivery
Paper type Research paper

To survive in this era of reduced financial assistance from governments and widespread changes in academia, higher educational institutions (HEIs) are increasingly relying on establishing themselves as brands (Hemsley-Brown and Goonawardana, 2007; Stephenson and Yerger, 2014; Wilkins *et al.*, 2015; Frisancho and Krishna, 2016). Recent reports indicate that in the past few years HEIs all over the world have seen an increase in their marketing and branding budget (Chapleo, 2014). Since there is a lot of scrutiny happening to check on the return on investment, researchers argue that branding may help HEIs communicate their value proposition to the students (Balaji *et al.*, 2016). Branding helps in conveying a favorable image by communicating signals of trust and quality (Casidy, 2013). Conceivably, an imperative benefit of branding in academia is its ability to turn students into university ambassadors by offering a sense of belongingness with the institute (Mael and Ashforth, 1992; Wilkins *et al.*, 2015). Such practices adopted by the HEIs to build or enhance their brand image (BI) in academia are akin to that of "for-profit" organizations and are collectively referred to as "academic capitalism" (Findlow and Hayes, 2016).

The motivation for this research comes from a recent report according to which none of the Indian universities could make it to the "Times Higher Education 2015 University Ranking" (Sinha, 2015). Scholars including Dhawan *et al.* (2017) wrote about the performance of the Indian universities. They found that "top universities differ significantly in their qualitative and quantitative performance in research. The study also found that progression in quantity of research in universities over time does not result in a corresponding progression in quality of research. Thus publishing more, and more often,

Modeling the impact of Basel III regulations on loan demand

Vighneswara Swamy
Department of Economics, ICFAI Business School, Hyderabad, India

Received 21 June 2017
Accepted 13 December 2017

Abstract

Purpose – The purpose of this study is to provide an econometric modeling of demand for bank credit and not only offer useful insights to the decision-makers in the public and private sector but also support researchers and analysts in recognizing the determinants of lending in a major dynamic economic context.

Design/methodology/approach – This study addresses the "supply-versus-demand-puzzle" by using a demand relationship and model loan demand as a function of interest rates and economic activity that may also capture supply effects. Loan demand modeled as a function of interest rates and economic activity not only represents a demand relationship but also captures supply effects. Using the generalized methods of moments estimation, the estimations are made robust to heteroskedasticity and/or autocorrelation of unknown form. GMM–Time series (HAC) option extends the robustness by using the weighting matrix that is robust to the contemporaneous correlation of unknown form to the autocorrelation of unknown form.

Findings – In a bank-dominated financial system like India, lending rates play a significant role in the transmission of monetary policy, as well as triggering and controlling loan demand and thereby exercising a pervasive effect on the output in the economy. The estimates indicate that the elasticity of loan demand is largely determined by the lending rate (0.6) and the economic activity (0.688). For one percentage point increase in capital ratio, the loan spread would rise by 31.4 basis points, which in turn would cause an increase of 18.8 basis points in loan demand assuming that risk-weighted assets are unchanged.

Originality/value – This is the first of its kind studying a banking system dominated emerging economy. Second, this study is based on a rich data set covering the period from 1979 to 2012, than other papers did, to capture the long-run association involving credit booms and busts and, thus, helps in avoiding the problem of estimation spanning the dominance of either boom or the bust alone. With a newer approach for quantification of the impacts of new regulatory standards, this study offers novel insights for the estimation of lending spreads.

Keywords Monetary policy, Emerging markets, Banks, Credit, Bank credit, Capital, Econometric modeling, Loan demand, Credit to the private sector

Paper type Research paper

1. Introduction

We analyze the loan demand from the view that money supply is "credit-driven" and "demand determined". In case the loan demand is relatively inelastic, then the central bank has to set relatively higher change in interest rate to trigger the spending level in the economy. To achieve the desired monetary objective, understanding the elasticity of loan demand facilitates the central bank to decide about the magnitude of interest rate change.

Bank loans constitute an important source of financing the economic activity. Thus, loan growth in an economy offers useful information for analyzing and forecasting the economic activity, prices and other monetary developments. Loan growth analysis has received the relatively little focus of the researchers so far, and despite the vast literature on the

Identifying dimensions of job search strategy: A validation of measurement scale

Chetna Priyadarshini[1] · Pratyush Banerjee[2] · Prerna Chhetri[1]

© Springer Science+Business Media, LLC, part of Springer Nature 2018

Abstract
This paper validates the scale on job search strategy by Crossley and Highhouse in the Indian context. Exploratory factor analysis followed by a confirmatory factor analysis was conducted on the responses elicited from a sample of 504 graduating students in a large business school in India. Reliability and validity scores were also calculated to ensure the psychometric stability of the scale.14items out of the original 16 items were retained for the study. Three distinct factors, namely; Focused Search Strategy (FSS), Exploratory Search Strategy (ESS), and Haphazard Search Strategy (HSS) emerged from the study, which is in sync with the extant factors reported by Crossley and Highhouse. This study highlights the importance of focused job search strategy for university students entering the job market in India. This should help final year higher education students to be better oriented towards their job search process in order to get a job in their preferred professions. This is the first study to focus on the psychometric stability of the measures for job search strategy when applied to the job seekers in emerging economies, like India. This research provides evidence that, with a few exceptions, the job search strategy scale is a valid and reliable measure amongst entry-level job seekers in India. Given the evidence, universities and career counselors in India can focus on guiding the students and job-seekers to use a focused or exploratory strategy when searching for a job.

Keywords Job search behavior · Job search strategy · Scale validation · Exploratory factor analysis · Confirmatory factor analysis

Introduction

Job search is one of the critical processes one gets involved in for finding (re)employment. However, with the rapid change in the job market scenario and development of economies across the globe, individuals are facing the wrath of unemployment, layoffs, and retrenchment due to lack of employability and/or mismatch between skills and requirements of jobs across different industries. A report by the Asia Business Council Forum (2014) highlighted that in recent times, the Asian job market has been boosted by the 'demographic dividend' factor. The two major economic powerhouses- India and China are producing young graduates in huge numbers every year. The majority of developing nations including Japan are faced with the ageing population conundrum: this has opened up new avenues of labor supply. However, strangely, Asian countries are yet to leverage on this opportunity thereby leading to a wide-spread skill gap observed in some of the most populous Asian nations such as India, China, Pakistan and Bangladesh (S4YE 2015; Kilimani 2017). Population projection reports predict sustained increase in youth population across most Asian countries, including sub-Saharan Africa (Cleland and Machiyama 2016). In stark contrast, the number of jobs created to employ this huge employable youth workforce is lagging far behind. As a result, there is huge underutilization of labor resources and gross unemployment in some of the major developed and developing economies of Asia such as India, China, Vietnam, Philippines and Indonesia (Asia Business Forum Report 2014). In a Mckinsey Global Survey (Gratton 2011), it was prominent that there is a difference between what educational institutions are teaching to the students and what the industry demands of fresh graduates. Asian nations have started some process to address this skill gap deficit problem and a few programs such as the Kosen schools in Japan and the National Skill Development Center (NSDC) of India aims at

IFHE University,
Hyderabad, 501203, India
Email: jpvijai@ibsindia.org

Abstract: Measuring and understanding the success of knowledge management system within an organisation has been identified as one of the key challenges for information system managers. The success, typically, is measured at user-level in terms of user satisfaction that mainly depends on system quality and knowledge quality. The objective is to examine the strength and significance of relationship between system quality, knowledge quality and user satisfaction. Halawi et al. (2007) scale was used to operationalise system quality, knowledge quality and user satisfaction. A self-administered questionnaire survey was conducted in a selected knowledge-based organisation's employees who were working in the domain of banking and financial services. Factor analysis, correlation analysis and regression analysis were used to examine the underlying study model. The findings, interestingly, had provided positive but moderate relationship between system quality, knowledge quality and user satisfaction. Managerial implications, limitations and scope for further research are also discussed.

Keywords: knowledge management system; user satisfaction; system quality; knowledge quality; factor analysis; regression analysis.

Abstract: Resilience has been an important dynamic capability for manufacturers and service providers. The study extends the notion of resilience from manufacturing to e-retailer. The study contends that e-retailers need resilience to sustain their operations in event of IT or technological failure. Our study conceptualised perceived resilience construct for e-retailer and explored its antecedents and consequents. Partial least squares (PLS) was used as the statistical tool for testing the proposed hypotheses in this study. Based on 309 completed responses, our study undersigned perceived information quality and perceived system quality as dominant enablers of perceived e-retailer's resilience. Further, perceived e-retailer's resilience was found to positively influence customer satisfaction and engagement; both of them in turn enhance customer loyalty. The study is the foremost to develop e-retailer's resilience construct and with empirical validation. Further, the study also developed a comprehensive model for perceived e-retailer's resilience based on its enablers and outcomes. Implications for business firm's managers and practitioners are also provided.

Keywords: e-retailer; customer engagement; customer satisfaction; customer loyalty; information quality; resilience.

Technical efficiency of coal-based thermal power plants in India: a stochastic frontier analysis

J. Prince Vijai

Department of Operations and Information Technology,
ICFAI Business School,
IFHE University,
Hyderabad – 501203, India
Email: prince.vijai.j@gmail.com
Email: jpvijai@ibsindia.org

Abstract: We analysed the technical efficiency of coal-based thermal power plants in India by employing the stochastic frontier production function methodology for the period of 2007–2008 using annual data. We had employed, further, the Frontier 4.1 statistical package for both ordinary least square (OLS) and maximum likelihood (MLE) estimations. We found that the technical efficiency varies across plants – ranges from 61.05% to 99.53% – and is a time-invariant. However, about 50% of the plants were operated under the mean technical efficiency of 88.20% which had warranted policy makers to take appropriate steps by either increasing the plant output level by 11.80% with existing resources and technology or reducing the existing input level by 11.80% to produce the given level of output. We concluded that the new policy implementations of Government of India had improved the technical efficiency of coal-based thermal power plant operations and also suggested further scope for research. [Received: February 4, 2016; Accepted: August 13, 2016]

Keywords: technical efficiency; production function; stochastic frontier analysis; coal-based thermal power plants; India.

Reference to this paper should be made as follows: Vijai, J.P. (2018) 'Technical efficiency of coal-based thermal power plants in India: a stochastic frontier analysis', *Int. J. Oil, Gas and Coal Technology*, Vol. 17, No. 4, pp.472–485.

Voicing concerns for greater engagement

Does a supervisor's job insecurity and organizational culture matter?

Manish Gupta and Sindhu Ravindranath
Department of Human Resources, IBS, IFHE Hyderabad, Hyderabad, India, and
Y.L.N. Kumar
Department of Human Resources, NMIMS Hyderabad, Hyderabad, India

Received 31 December 2016
Revised 6 May 2017
Accepted 9 June 2017

Abstract

Purpose – Scholars argue that supervisor's job insecurity may affect subordinates' work engagement. Moreover, this relationship may be mediated by subordinates' pro-social voice and the relationship between the supervisor's job insecurity and subordinates' pro-social voice may be moderated by organizational culture. Therefore, the purpose of this paper is twofold. First, to examine the mediating role of the subordinate's pro-social voice between supervisor's job insecurity and subordinates' work engagement. Second, to test the moderating role of organizational culture between supervisor's job insecurity and the subordinates' pro-social voice.

Design/methodology/approach – Data were gathered from employees of a large hospital in India using face-to-face data cross-sectional survey method. To test the proposed hypotheses, ordinary least squares regression analysis was performed on the data obtained.

Findings – The results indicated support for the proposed model in two ways. First, the subordinate's pro-social voice mediated the relationship between supervisor's job insecurity and the subordinate's work engagement. Second, organizational culture acted as a moderator between supervisor's job insecurity and the subordinate's pro-social voice.

Research limitations/implications – The results augment social exchange theory by identifying the crucial role that voicing concerns plays in reducing the negative impact of supervisor's job insecurity on the subordinates' work engagement.

Practical implications – The study findings encourage managers to create an organizational culture that allows the subordinates to challenge their supervisor's decisions.

Originality/value – To the best of the researchers' knowledge, this is the first study to test job insecurity of the supervisors instead of the same respondents as a predictor of pro-social voice.

Keywords Job insecurity, Work engagement, Organizational culture, Employee voice

Paper type Research paper

1. Introduction

Engaged employees are assets for any organization primarily because they are vigorous, dedicated, and fully absorbed in their work role (Van De Voorde *et al.*, 2016). Therefore, the efforts put in by scholars in the direction of exploring the factors affecting employee engagement are of paramount importance (Akhtar *et al.*, 2015). A sizable literature provides evidence that supervisors' positive behavior and other related organizational factors have a strong effect on the level of employee engagement (e.g. Hsieh and Wang, 2015; Pohl and Galletta, 2017; Van Dierendonck, 2015; Zhong *et al.*, 2015).

Most studies examine the extent to which positive "motivational" factors enhance work engagement levels of the employees (e.g. Barrick *et al.*, 2015; Yadav and Rangnekar, 2015; Joo and Lee, 2017). However, the role of negative factors cannot be completely written off (Ivtzan *et al.*, 2015). Factors such as supervisor's job insecurity may reduce employees' attachment with their work (Wrape, 2015) because insecure supervisors perceive subordinates as a threat and tend to create hurdles to ensure that they do not perform (Scharff, 2014).

C.S. Shylajan
Department of Economics, IBS Hyderabad, A Constituent of IFHE (Deemed to be) University, Hyderabad, India

Abstract

Purpose – According to the 70th round of the National Sample Survey published by the Government of India in 2014, the incidence of indebtedness among households in the rural areas of Telangana state, India, is twice that of rural all-India. Around 59 per cent of rural households are indebted in Telangana as against 31 per cent all-India. The purpose of this paper is to examine the extent and magnitude of indebtedness among rural households in the Medak district of Telangana state. Further, the authors wanted to identify the sources of credit to these households and for what purpose the loans were utilised.

Design/methodology/approach – To achieve the objective, the authors conducted a primary-level household survey in one of the distressed districts in newly formed state. The authors applied the Bayesian and the Lasso regression methods to identify the factors that impact indebtedness of a household.

Findings – The OLS results based on the Lasso regression results show that among all the explanatory variables, principal occupation, use of modern technology, the rate of interest, household medical expenditure and source of loan are significant, indicating that these variables significantly affect the loan taken by the farmers in the study area. The study shows that alternative sources of non-farm income and promotion of modern technology in agriculture can reduce the incidence of farmers' indebtedness in India.

Originality/value – The paper contains significant information with regard to indebtedness. It focusses on the issue troubling the authorities the most. It provides the ground realities of the incidence of indebtedness in Medak, one of the most distressed districts of Telangana, a Southern Indian state. There have been very few similar studies done in the newly formed state. The paper has employed an advanced statistical technique, i.e. Heckman's selection regression technique, to study farmers' indebtedness in India. It provides a means of correcting for non-randomly selected samples, which otherwise can lead to erroneous conclusions and poor policy.

Keywords Rural areas, Microcredit, Loans, Farmers' indebtedness

Paper type Research paper

1. Introduction

The agricultural growth rate in India in recent years has not been at a satisfactory level despite a significant acceleration in the growth of the economy. The sector, which engages about 50 per cent of the workforce of the country, grew at only 1.1 per cent in 2014-2015. Even during 2012-2017, the rate of growth in agriculture was about 2 per cent per annum against a target of at least 4 per cent. This is an alarming situation for the government. The slowdown in the agriculture sector is also reflected in its share in the national product which fell from 53 per cent during 1950-1951 to 13.9 per cent during 2012-2013. Even after 65 years of planning in India, the agriculture sector continues to be beset with problems such as low

ABSTRACT

Structure and degree of oil price impact on sectoral indices are examined using Quantile Regression Analysis (QRA). Nine sectors are found to provide diversification opportunities during a bull market (i.e. 90th quantile of the return distribution) and three sectors during a bear market (10th quantile) to hedge oil price risk. Further, the contagion effect and interdependency between oil price and sectoral equity are assessed through frequency domain causality. The causality from oil price in the long run determined that there is interdependence between three sectors and oil price changes. The direction of causality from oil price is mixed in both the short run (high frequency) and long run (low frequency) for nine sectors. Overall, the carbon sector is the only sector that is immune to oil price risk, thereby providing investment and hedging opportunities for portfolio managers.

1. Introduction

The world economic outlook has changed following the 2008 financial crisis and the fall in commodity prices. In this context, India is emerging as a contender to surpass China, and is expected to grow at a compounded annual growth rate (CAGR) of 6.5% over the next 25 years, which is higher than the 5.0% estimated for China.[1] This will drive the demand for crude [redacted]n order to support economic growth. According to IEA data, demand for oil is expect to grow 4.0% annually in India over the next 25 years, compared with the 1.2% annual growth in demand in China. Further, since India is transitioning itself from service-dominated to energy-intensive economic growth driven by the manufacturing sector (i.e. the 'Make in India' campaign[2]), it is expected to become the biggest consumer of oil in the emerging market group.

Furthermore, since India depends on imports to meet 80% of its crude oil needs, it spends INR 9126 crore (USD 1.36 billion) more annually for every USD 1 increase in crude oil prices. This will put pressure on India's fiscal situation, and cause inflation. Given the current economic situation of weak growth and lower fund flows from sovereign wealth funds, a strong outlook for crude oil prices may also prevent the central bank from cutting interest rates aggressively, as any spike in oil prices has the potential to exert upward pressure on inflation.[3] Therefore, any change in oil prices would affect economic activity, which in turn, affects stock markets. However, the change in oil prices may not have a homogenous effect across all sectors of the economy, which is normally masked in studies on the relationship between oil prices and stock market indices as a whole. As such, the association between oil price changes and sectoral stock index returns could be studied from the perspectives of financial markets dynamics, risk management, and portfolio diversification.

There are numerous studies on the relationship between oil prices and economic activities. Further, since the stock market is an indicator of economic performance, most studies examine the relationship between oil prices and the stock market as a whole.[4] Therefore, characterisation of the impact of oil price changes on sectoral equity is relevant for potential

Exploring the Influence of Celebrity Credibility on Brand Attitude, Advertisement Attitude and Purchase Intention

Ramendra Pratap Singh[1,2] and Neelotpaul Banerjee[3]

Abstract

The celebrity credibility scale developed by Singh and Banerjee [Singh, R. P., & Banerjee, N. (2018). A study on exploring the factors influencing celebrity endorsement credibility. Global Business Review, 19(2), 494–509.] which is validated in the Indian context with the addition of some items based on Indian culture and psychometric properties is further tested. The scale items are earlier tested in general terms without any reference to a celebrity. For this study, four major two-wheeler brands in India, which are endorsed by celebrities, are considered. The present study consists of 380 participants. This study tries to explore the influence of celebrity credibility on consumers' brand attitude and advertisement attitude. Subsequently, the influence of brand attitude and advertisement attitude on consumers' purchase intention is studied. The study reveals celebrity credibility has a significant influence on consumers' attitude towards the brand and advertisement, also in the case of purchase intention; both brand attitude and advertisement attitude built on celebrity credibility has positive significant influence. The present study supports the celebrity credibility scale items of Singh and Banerjee (2018). The overall effect of celebrity credibility is positively significant with other constructs; this proves that the scale items are robust and relevant in clarifying celebrity credibility properly.

Introduction

Advertisers consistently seek strategies intended to attract consideration regarding their correspondence and to differentiate their brand from contending brands. There is commonly a deferral between advertisement presentation and the actual purchase, so the promotion-evoked outlook must withstand over time if they are to impact a buyer's purchase conduct (Banerjee & Siddhanta, 2015). The elaboration likelihood model (Petty & Cacioppo, 1984; Petty, Cacioppo, & Schuman, 1983) places two courses through which a stimulus can impact customers—a higher contribution, focal route and a lower association, peripheral route. Earlier research has demonstrated that celebrity publicizing can influence customer by means of either route. This is the reason why so many brands are using celebrities as their brand endorser. In this regard, a high rate of

Anusha Sreeram,
Assistant Professor,
Department of Operations & IT,
IBS Hyderabad, India

ABSTRACT

The consumption of fish by humans worldwide is 77%. The demand and consumption of fresh fish has significantly grown during recent years. The future growth is from aquaculture as the global demand for fish continuous to increase. The supply chain of fish is a network which consists of the fishermen, middlemen, distributors, transporters, storage facilities, suppliers, retailers, delivery and selling the product to the consumer. It is necessary to maintain the quality and safety of fish/fish products till the time of consumption by the consumer. The quality and safety of the fish/ fish products may deteriorate due to variations in temperature, distribution channel, transportation, packaging and grading. The purpose of this paper is to understand the impact of these factors on the quality and safety of the fish/fish products and to propose the implementation of the concept of agility into these factors so that the quality and safety of these products is ensured with minimum losses and wastage.

Keywords: *Supply chain management, fisheries, temperature, distribution channel, transportation, packaging and grading, quality, safety, agility.*

Introduction:

The human consumption of world fish production was more than 110 million tonnes i.e 77% in 2006. Fish is considered to be the handiest food which can be used in number of ways and forms. The distribution of fish is mostly as live, fresh, chilled, frozen, fermented, dried, smoked, salted and canned and so on. The quality of fish used in any form deteriorates in quality due to varied temperatures in developing countries. This occurs due to insufficient use of ice, long supply chains, no proper access to roads and electricity. There is also insufficient infrastructure and services in the markets where the fish is sold. The difficulty in the facilities and the market infrastructure for marketing perishable goods are getting limited and overfilled. Because of this though the utilization of live fish which was 60.1 percent of fish destined for human consumption in 2006) or processed by smoking or fermentation (10.0 percent in 2006), there is an increase in the share of frozen products in developing countries with 19 percent in 2006, up 7.3 percent since 1996 and a more substantial increase in prepared or preserved forms (11.1 percent in 2006, up 41 percent since 1996). There is a significant change in the utilization and processing of fish production in the last two decades. The changes include developments in the capability in storage and processing along with key innovations in refrigeration, ice-making and food packaging and fish processing equipment. The Containers with these improved facilities helped in distribution of more live fish for long duration. The fish processing is evolving in many developing countries driven by the demand in the domestic retail industry (FAO, 2008)

Though, in the production of food, India is the second largest producer of fruits and vegetables, second in the production of milk, fifth in the production of eggs and sixth in fish it is not in the top 10 countries in the export of food. This may be because of the uneven supply chain and lack of cold storage infrastructure and an accommodating food processing industry. Due to these reasons the wastage of food is about 20 percent of the foods produced with 4 percent of fish (Viswanadham, 2008).

The food industry is huge and diversified. It is categorized into different segments such as fresh food, organic, processed food and livestock. The strategies of supply chain required for each of these segments is different. The require various procurement and sourcing, inventory management, warehouse

The impact of faculty member's communication behaviours on student satisfaction: the role of cognitive and affective learning and student's motivation

Smita Kulkarni, Nikhat Afshan and Jaideep Motwani

Published Online: November 14, 2018 · pp 444-458

PDF Tools Share

Abstract

Although the benefits of faculty member's communication behaviours have been examined and discussed in earlier studies, they have been mostly done in the context of traditional classrooms or online learning. This study examines the effect of faculty member's communication behaviours on student's motivation which further impacts students' affective and cognitive learning. Further, this study also investigates the relationship between student's learning (affective learning and cognitive learning) and students' satisfaction in the case study method of teaching. The hypothesised relationships were tested using a sample of 265 post-graduate management students from the Business School of India. The results indicated that faculty member's communication behaviours had a positive effect on student's motivation and student's motivation had a positive effect on the affective and cognitive learning. Further, cognitive learning and affective learning were found to have significant positive impact on student's satisfaction.

Suicide ideation and stresses among the working professionals in India

Raghavendra Sode, Kala Chenji, Laila Memdani

Summary

There were more than 800000 suicides per year throughout the globe and it is second leading cause of death among the age group of 15-25. National Crime Record Bureau (NCRB, 2014) reported that on an average more than one tenth of a million commit suicides per annum that indicate 15 suicides per hour, pushing India to the top position in the world. Suicide had emerged as one of the leading causes of deaths in India and around the world (WHO, 2012). Suicide was mainly linked to mental disorders but recent evidence indicates that normal people take their life due to impulsiveness and easy access to means to end life (WHO, 2012). Even though it is one of leading cause of death in India it is not considered as a serious public health (WHO, 2012) issue. The first objective of the study was to find the reasons for stress among working professionals leading to suicide ideation, which can comprehend to factors leading to suicides and second objective was to establish the relation between suicide stresses and ideation. Suicidal behavior proposed similar model whereby suicidal behavior is associated with socio-cultural, developmental, psychiatric, psychological and family factors. Bonner & Rich (1987) also found similar results as the current study which indicates that Social stress, Economical, Health and Family stress have the significant and positive relationship with suicide ideation and the model predicts 83% of the variance.

suicide ideation, suicides, social stress, economical stress, health and family stress

INTRODUCTION

The World Health Organization reported in 2012 that, there are more than 800,000 suicides per year globally and suicide is a second leading cause of death among the 15-25 age group (WHO 2012)[1]. In India, the, National Crime Record Bureau reported that on an average more than 100,000 people die by suicides every year, the equivalent of a 15 suicides per hour, pushing India to the top position in the world (NCRB, 2014)[2]. Suicide has emerged as one of the leading causes of death both in India and around the world (WHO, 2012)[1]. Gupta et al.,[3] found that 75% of suicides occur in low – income and middle-income countries such as India. Suicide is a result of an imbalance between the individual's needs and means, and a suicide attempt and suicide completion differ in their intention to end one's life. WHO[1] defines suicide as an act of deliberately killing oneself. The NCRB [2] defines it as deliberate termination of life. Suicide has three major essential ingredients – death should be of un-natural causes; individuals inheritable desire to die and one should have a reason to end one's life. As our daily lives are becoming more and more stressful, it is important for the young generation who are entering

Significance of time and cost dimensions in pharmaceutical projects and prioritisation of project phases

Nasina Jigeesh and Nallam Sai Nandeswara Rao

Published Online: 1 Jun 2018

PDF Abstract & Keywords Tools Share

Abstract

The success of any project depends upon different dimensions like time, cost, quality and customer satisfaction. Of all these, time and cost have been treated as the most common and major tangible measures from the perspective of both developer and user. Each project phase has a unique set of activities and its successful completion will be influenced by such factors. This paper aims to examine the emphasis attributed to time and cost in handling different phases of pharmaceutical projects. From a survey around four big Indian pharmaceutical companies, useful feedback was collected. After weighing the importance of both time and cost dimensions, analytic hierarchy process (AHP) was used to prioritise different phases of pharmaceutical projects. Results top ranked 'execution' phase followed by 'monitoring and control' phase. The findings are helpful to pharmaceutical project people in successfully completing different phases of projects on the basis of time and cost dimensions.

An Empirical Examination of Risk Premiums in the Indian Currency Futures Market

https://doi.org/10.1515/apjri-2016-0031

Abstract: In this paper, we examine whether risk premiums are significant in explaining the deviations from the uncovered interest rate parity (UIP) condition in an emerging Indian currency futures market. In particular, we explore the unbiasedness of futures quotes as a predictor of the future spot exchange rate to understand the forward premium anomaly condition. We report huge deviations from the UIP condition for all currencies considered and show that these deviations are explained by the risk premium. The realized risk premiums for all currencies are found to be negative and significantly different from zero, which suggests that investors are awarded for taking short positions in the foreign currency. The realized risk premiums in turn are found to be negatively related to the current spot rate returns and positively to the futures premium, conditional variance of spot rate returns, and the dividend yield.

Keywords: currency futures markets, risk premium, uncovered interest rate parity, unbiasedness
JEL Classification: F31, G13, G15

1 Introduction

The relationship between exchange rate changes and interest rate differentials has long been the central issue in the international finance literature. According to uncovered interest rate parity (UIP), high-interest rate currency should depreciate relative to a currency with a lower interest rate (Aysun and Lee 2014). In an efficient market, the futures rate would be an unbiased predictor of the future spot rate by virtue of UIP (Engel 2016). In other words, the long-run futures price (forward premium) should not be significantly different from the corresponding future spot prices (future change in the spot rate). UIP, under the assumption of rational expectations, leads to the forward rate unbiasedness hypothesis (FRUH), which states that the slope coefficient in the regression of

Performance Evaluation of Adtree, Functional Tree and LMT Classifiers with CFS Subset Evaluator for Intelligent Heart Disease Prediction

Lakshmi Devasena C

Department of IT and Operations, IBS Hyderabad, IFHE University, Hyderabad

ABSTRACT

Healthcare analytics an emerging research area, which analyses existing clinical data, provide better support for clinical practices and decision making. In healthcare analytics, medical data mining an important research field which provide support for healthcare practitioners and working as a third umpire for senior specialist, who gets confused in complex medical cases. Medical data mining (MDM) used to predict numerous diseases in which Heart disease is the chief cause of increasing mortality rate worldwide and is estimated to be the crucial cause of death globally by 2030[1]. Predicting the heart disease in early stage with some demographic and clinical data before going for Angiography and direct high level treatment will reduce the expense of the patient. However, the diagnosis of heart disease and its severity might be difficult for practicing medical doctors, who are not specialized in cardiovascular diseases. There are many papers in literature which can compare the existing algorithms in heart disease prediction[2-36], but none of the papers discussed tree based classifiers with correlation based feature subset selection evaluator, which may improve the prediction rate. Therefore, this research work would be helpful to establish the improvement in accuracy, which might be appreciated by the medical practitioners. In this research work, different tree based classifiers like ADTree, Functional Tree (FT), and Logistic Model Tree (LMT) Classifiers were examined and compared with and without applying Correlation-based Feature Selection (CFS) subset evaluation and the results are analyzed. For this research work, the heart disease data set [37] is taken for analysis. Various measures are used for comparison. After comparison, it is revealed that all the classifiers with CFS attribute selection evaluator has better or equal accuracy as compared without CFS attribute selection evaluator (CFSAE).

Keywords: *Heart Disease Prediction, Medical Data Mining, Performance Analysis, Tree-based classifiers, CFS Evaluator*

INTRODUCTION

MDM an exploring field of data mining (DM), in which various data classification and mining techniques are used to foresee the diseases based on the existing medical data. Medical industries store enormous data of patients and could be used for this purpose. Even the severe diseases like 'Heart Attack' have some common indications which are used to foretell the disease. Based on the historic data if a classification model could be prepared, and then it is easy for the doctor to predict the disease using basic medical data and start the treatment without waiting for other medical modality results. Medical decision support systems use data mining approach to support diagnosing process. Predominantly classification algorithms perform an important role here. The correctness of the classification result will be based on the accurate and enough training data availability. Ranges of classification algorithms exist to foresee the diseases and Computer Science researchers have a chance to scrutinize the algorithms and recommend the best algorithm for MDM.

Plentiful research works are undergoing for better heart disease prediction. Researchers show interest in this area to find the better algorithms which gives superior accuracy by analyzing different algorithms and comparing them using various measures. The algorithms like neuro-fuzzy integrated approach, collective techniques of Maximal Frequent Item set Algorithm with C4.5 and K-means algorithm, Artificial Neural Network (ANN) with Feature Subset Selection (FSS) and Principal component Analysis (PCA) are analyzed for heart disease prediction in Sequential Pattern

Abstract

This study compared the static model (Hendry's and SBS model) and dynamic model (DBS) of brand switching for predicting the future market shares ; also, it ascertained the consumer behavior of brand switching with regard to different demographic factors, identified the factors for brand switching among the different brands of packaged tea that are available in the market, and examined the relative importance of the factors on an overall satisfaction level of consumers and their repurchase intention. The methodologies used for the study are : chi square, exploratory factor analysis, and structural equation modeling. The research work found static nature of market for packaged tea, where DBS model was found to be the best for predicting the future market share. Functional benefit, brand reputation, and marketing efforts emerged as factors which positively influenced satisfaction ; whereas, heightened satisfaction level increased repurchase intention for the brands.

Using the World Bank's Bank Data to Assess Changes in Financial Regulation and Supervision since the Global Financial Crisis

Vighneswara Swamy[*]

Key Points

- The World Bank's Bank Regulation and Supervision Survey (BRSS) data can be used to gain insights into bank regulatory/supervisory styles across countries.
- The data illustrate the differences in regulation/supervision among crisis, non-crisis and BRICS countries, and highlight changes in regulation and supervision during the crisis period.
- The results indicate that the crisis countries had weaker regulatory and supervisory frameworks than those in emerging countries during the crisis.
- As a distinct block BRICS countries demonstrated uniqueness in their regulatory/supervisory styles, which are similar neither to those in the crisis countries nor to those in the non-crisis countries.

Introduction

The global financial crisis has revealed the role of financial crises in exposing the weaknesses in financial policy reform including the liberalization of the financial system and the strengthening of prudential regulation. Indeed, banking regulation has been the topic of global debate owing to the

Abstract: Smartwatches these days have gained popularity under wearable device category. Consumers of smartwatches consider several factors while choosing smartwatches. On this premise, the current research is undertaken to identify the determinants of the smartwatch adoption. In order to arrive at this objective, the study has employed unified theory of acceptance and use of technology 2 (UTAUT2) model as a means and underpinning framework. To suit context, the present study has extended UTAUT2 model by incorporating self-efficacy (SEF), personal innovativeness (PINNO), social media influence (SMI), social image (SIMG), aesthetics (AES) and external social influence (ESI). To validate and check the explanatory power of the extended UTAUT2 model the study has considered Structural equation modelling using Smart PLS 2.0.The results arrived in this study has concluded that the extended UTAUT2 model has a better explanatory power on behavioural intention towards smartwatch adoption. Effect size (f^2) and predictive relevance (Q^2) for the extended UTAUT2 model are also discussed.

Keywords: unified theory of acceptance and use of technology; UTAUT2; smartwatch; social image; self-efficacy; SEF; personal innovativeness; PINNO; social media influence; SMI; SIMG; aesthetics; AES; external social influence; ESI; wearable device.

Firm Value and its Non - Linear Relationship with Endogenous Promoter Ownership in India

** D. Satish*
*** S. V. Satyanarayana*

Abstract

In India, promoters own a significant portion of the shares of the listed firms. The investors also swear by the names of the promoters behind the firms. In this context, the paper studied the relationship between promoter ownership and firm performance among NSE listed companies by first testing for endogeneity of the promoter ownership variable. The paper also studied the impact of deferential promoters' holding on performance of these firms. The paper used 2SLS model to study the relationship while taking Tobin Q as a proxy for firm performance. The results showed the existence of a strong relationship between promoter ownership and firm performance, while the non linear study showed a slight U shaped relationship, indicating a slight reduction in performance of the firm to a certain point with an increase in promoter ownership and then a gradual increase in firm performance with an increase in promoter ownership after that point. The results of the non linear study were significant as it showed that the performance of the firms was maximum when the promoter holding in the firms was the highest. This goes against the theory of promoter entrenchment and justifies the craze of Indian investors for promoter led firms with substantial holdings. The research also recommended regulators not to further reduce the maximum promoter holdings which was brought down to 75% for private listed firms in the year 2013 by SEBI.

Key words : endogeneity, promoter ownership, firm value, regulations, corporate governance, boards, Tobin Q, 2SLS, polynomial, non - linear model, Durban - Wu - Hausman (DWH) Test

JEL Classification : G320, G100, G180, G380

Paper Submission Date : January 29, 2018 ; Paper sent back for Revision : May 12, 2018 ; Paper Acceptance Date : May 20, 2018

Despite a growing number of firms being run by professional managers, a large number of them across the world are still owned and run by promoters. Many of the world's largest multinational firms, including Samsung, BMW, and Walmart are controlled by promoters and their families. Promoters have large voting rights, clout, and also control the board which takes key decisions, including the selection of CEOs. In India, promoters, on an average, own more than 50% of the shares of the listed firms and have a control on the board and on the daily workings of the firms. The promoters like Ambani, Adani, Wadia, Tata, and Birla are very popular both among the big institutional investors as well as among the retail investors. They hold various amounts of stakes in many of their group firms. They own majority stake in most of the firms and play a crucial role in the firms' decision making.

Investors and researchers across the world have been working on understanding the relationship between ownership structure and firm performance. Would the performance of the firm with diffused ownership vary from

Abstract: The study attempts to examine the impact of listing selected stocks on futures and options (F&O) segment of NSE on the spot market liquidity using illiquidity ratio (Amihud, 2002) and volume as measures of liquidity. The study investigates the long-term and short-term liquidity effects in the event of both listing announcement day and actual listing day. An effort is also made to test if there is improvement in post futures liquidity of those stocks which are illiquid during pre-futures period and vice versa. Results indicate significant increase in long-term liquidity of majority of the stocks. However, there is no evidence of such significant change in the short-term liquidity. There is a clear evidence of significant improvement in long run liquidity of the stocks in the first two quartiles indicating that the stocks which are illiquid before futures became liquid after futures. However, there is a marginal decrease in the long run liquidity of already liquid stocks. The results of short run liquidity also are almost in support of this. The results for announcement day and listing day are also almost the same. Mixed results are observed in case of single stock options.

Keywords: single stock futures; SSFs; single stock options; SSOs; illiquidity ratio; F&O segment; long-term liquidity; short-term liquidity; liquidity effects; trading volume; dollar trading volume; spot market; derivatives market.

Organizational Virtuousness and Work Engagement: Mediating Role of Happiness in India

Sharda Singh[1], Rajasekhar David[1], and Sitamma Mikkilineni[1]

Abstract

The Problem.

The positive psychology movement has led to an increased attention in organizational virtuousness, engagement, and happiness. Though attention has been devoted to studying the relationship between organizational virtuousness and performance, there is limited research that explores the relationship between employees' perception of organizational virtuousness and work engagement.

The Solution.

A cross-sectional survey was carried out on a sample of knowledge workers from diverse Indian industries. The findings of the study showed that the employees' perception of organizational virtuousness predicts work engagement not only directly but also indirectly through happiness.

The Stakeholders.

Managers can nurture organizational virtuousness in organizations to enhance employee happiness and promote a more engaged workforce. Considering the findings of the study, Human Resource Development (HRD) professionals should make the best use of their human capital by fostering positive psychological states such as work engagement.

Keywords

happiness, India, organizational virtuousness, work engagement

Asha Binu Raj[1]

Abstract

Internal branding is considered as an Human Resource (HR) construct for creating, implementing and measuring the employee-based brand image in organizations. The purpose of this study was to empirically analyse the influence of internal branding initiatives on overall workplace well-being in which every stakeholder feels included, valued and respected. A study conducted on a sample of 443 respondents across four different Indian services sector examined how internal branding strategies help in psychological, physical, spiritual, financial and social well-being of employees. A conceptual framework based on the hypotheses was tested to establish correlations among internal branding, employee well-being and employee-based brand outcomes at individual and organizational levels. It shows that internal branding is an integral part of overall well-being programme and supports individual and organizational outcomes. Organizations can use this framework to improve their well-being strategies based on their internal brand creation process and also benefit from the increased organizational effectiveness.

Keywords

Introduction

Internal Branding: A Paradigm Shift in Branding Perspective

Branding most frequently focuses on external stakeholders, like customers. There has been a growing interest in the internal component, namely, internal marketing, employer branding and internal branding (Aurand, Gorchels & Bishop, 2005). Building an internal brand is the most significant aspect of any organization in the era of global competition. The importance of employees in the corporate branding

Santanu Mandal[2,3]

Abstract

Website usability has received decent empirical attention in recent academic literature. However, there are various website characteristics that might still influence the usability of websites. In this empirical exploration, we propose three such characteristics: speed with which websites respond to customer requests (i.e., website agility); the capability of websites to restore its operations in the face of a disruption (i.e., website resilience) and the capability of websites to retain the interests of customers and keep them engaged interactively (i.e., website attractiveness) as enablers of website usability based on dynamic capability extension of resource-based view. Further, we argue that website usability will influence electronic word of mouth (e-WOM) for those websites. We also explore if there is any influence of website agility and resilience on website attractiveness. Using customers as target respondents who have used websites mainly for travel and tourism purposes, we test for the proposed relationships through collecting survey data based on face-to-face interview. Partial least squares analysis of 285 survey responses suggests website agility attractiveness and resilience to be dominant enablers for website usability and website usability positively influences e-WOM.

Keywords

Website usability, dynamic capability, e-WOM, agility, resilience, attractiveness

Introduction

Creating usable websites is crucial for e-business accomplishment since online shoppers touch, feel, enquire and experience items (or services) essentially through websites (Cyr, Head, Larios, & Pan, 2009;

Developing a causal model to evaluate the critical issues in reverse supply chain implementation

Received 2 December 2016
Revised 30 March 2017
Accepted 1 April 2017

Kaustov Chakraborty
Department of Operations and IT, ICFAI Business School (IBS) Hyderabad, ICFAI Foundation of Higher Education (IFHE) University, Hyderabad, India

Abstract

Purpose – Approximately, 800m tons of e-waste is generated per year in India. Reverse supply chain (RSC) is the probable strategy to cope up with the issue. Setting up a RSC process is not popular in the Indian sector. There are several factors that basically control the profitability of such kind of business. Hence, the purpose of this paper is to develop a causal model among the identified issues and sub-issues for setting up a RSC in an Indian semiconductor manufacturing industry and then evaluate the critical issues based on the causal relations.
Design/methodology/approach – Decision-making trial and evaluation laboratory (DEMATEL) method along fuzzy set theory is used to develop the causal framework among the identified strategical and tactical issues. According to the causal relations from DEMATEL, analytical network process is then used to identify the weights of the sub-issues.
Findings – The cause–effect interactions among the main issues show that legislations and regulations, market-related issues and organizational issue are the most significant strategic issues. Uncertainty in the acquisition time is the most significant tactical issue because it has a crucial impact on the quality and quantity of the used products. Based on the obtained causal relations of the main issues, it is identified that the reduction of waste, creation of new opportunity, market competition, cost reduction, change in technology and location, capacity and number of recovery facility are the major sub-issues in RSC implementation.
Practical implications – This study is conducted on the basis of the experts' opinion from a semiconductor manufacturing industry, situated in the southern part of India. Therefore, this proves its practical implications.
Originality/value – The paper provides the detail illustration of the issues in the RSC process, and the prioritization of the issues based on the cause–effect relationships also provides some meaningful managerial insights.

Keywords Sustainability, DEMATEL, ANP, Reverse supply chain, Fuzzy set theory
Paper type Research paper

1. Introduction

The rapid increase in e-waste generation around the world in the last two–three decades has become a major concern to the electronic industry. The waste generated from the electronic items such as computer, television, cellphone after their end of life (EOL) or end of use is known as e-waste. According to WEEE directive, the amount of e-waste generated in the European Union (EU) was 9 million tons (MT) in 2005 and it is expected to reach nearly 12 MT by the end of 2020. To mitigate the increasing amount of e-waste, developed countries have already adopted some strict legislative laws, like the EU Commission adopted two legislative laws. The first one is on the waste generation from electrical and electronic equipment and the second one is on the curtailment of using some toxic materials in electronic and electrical products (WEEE directive). The growth of e-waste is mainly due to the rapid change in

Do global financial crises validate assertions of fractal market hypothesis?

Arif Billah Dar[1] · **Niyati Bhanja**[2] · **Aviral Kumar Tiwari**[3]

Published online: 21 November 2015
© Springer-Verlag Berlin Heidelberg 2015

Abstract The frequent occurrence of crises in recent decades has triggered a debate between the proponents of Efficient market hypothesis and Fractal market hypothesis. While, the proponents of Efficient market hypothesis view crises as non-existent and highly improbable, the advocates of Fractal market hypothesis view crises as the dominance of certain investment horizons. We test whether the assertion of Fractal Market hypothesis regarding the dominance of certain frequencies during financial crises hold for the global stock markets. Following Kristoufek (Sci Rep 3:2857, 2013) the wavelet power spectra based on continuous wavelet framework are used to test the said hypothesis. It is shown that stock markets around the globe indicate the dominance of higher frequencies during the crises periods, hence, validate the assertions of Fractal market hypothesis. The results drawn are robust to the use of different countries as well as different crises.

Does international tourism affect international trade and economic growth? The Indian experience

K. G. Suresh[1] · Aviral Kumar Tiwari[2]

Received: 27 May 2014 / Accepted: 19 December 2016 / Published online: 31 March 2017
© Springer-Verlag Berlin Heidelberg 2017

Abstract This study attempts to investigate the relationship between international tourism, trade, and economic growth in India over the period from April 1991 to July 2012. To account for potential asymmetries in the relationship, we make use of new asymmetric Granger-causality tests and frequency analysis. We show that there is bidirectional Granger-causality between trade and tourism in positive components, whereas unidirectional Granger-causality runs from tourism to trade for negative components. Moreover, we find evidence of bidirectional Granger-causality between economic growth and tourism in positive components, but unidirectional Granger-causality running from economic growth to tourism for negative components. On the other hand, the results from frequency analysis provide evidence of Granger-causality between trade and tourism, and also between economic growth and tourism, at different frequency bands.

Abstract

The primary objective of this study is to examine the impact of working capital management efficiency on the financial health/well-being of a company measured in terms of firm value in the context of a rapidly emerging economy. This study applies a multivariate ordinary least square regression analysis on industry adjusted performance variable of 1532 Indian firms listed on the National Stock Exchange (NSE) for a period of 18 years (from 1999-2017). Not all of the 1532 firms selected for this study were listed during the whole period of study. Only 610 firms were listed at the beginning and gradually more and more companies started to get listed until eventually 922 more companies got listed to the initial tally of 610 listed firms making the total number of listed companies to be 1532 by the end of the study period. A total of 19862 firm year observations correspond to listed firms and 9246 firm year observations for unlisted firms making it a total of 29108 firm year observations. The findings of this study indicate that an efficient working capital management (proxied by Cash conversion cycle and components thereof) leads to better firm performance when adjusted for industry differences. It also shows that the relationship follows a curvilinear trajectory instead of a linear one as a change in sign in the coefficient of working capital management proxy (Cash Conversion Cycle) occurs and its square term and both are manifesting itself as significant in the listed companies. This is a co-relational study investigating the association between working capital management efficiency and firm performance. The findings of this study is based in an economy that is unique in its own right. Indian corporate landscape is replete with business groups and they dominate the market in terms of asset holding and market capitalization coupled with the existence of institutional gaps and weak legal enforcement mechanisms. All of which makes the Indian corporate landscape totally different from its more developed counterparts thus rendering the results not generalizable. The relationship between these variables should be verified in other economies taking their unique characteristics into account. This study to the best of the author's knowledge is the first one to investigate the relationship between working capital management and firm performance on such a comprehensive dataset having 62 different industries in an emerging economy. The findings of the study are intended to be of use to financial managers, investors, financial management consultants, and other stakeholders.

Keywords: Working Capital Management, Board Size, Board Independence, Industry Adjusted Firm Performance, India

1. INTRODUCTION

Efficient management of working capital is an essential component of corporate decision making. The management of working capital is fundamentally the management of current assets that the company owns and of current liabilities that it owes. Working capital further can be dissected

Energy saving behaviour among individuals in two different contexts: analysing the individuals' energy saving behaviour at home and workplace

Rambalak Yadav, Vikas Chauhan and Ankur Srivastava

Published Online: July 27, 2018 · pp 347-363

ABOUT

Abstract

The present research attempts to study the energy saving behaviour among individuals in two different contexts: at home and at the workplace. The study proposed and tested a model in which, value orientation, environmental concern, perceived consumer effectiveness (PCE) and personal norm to have an influence on the energy saving behaviour. A total of 359 usable responses was collected via an online survey in India. The data were analysed using structural equation modelling. The findings reported that the altruistic value positively influences the environmental concern, PCE and personal norm which further influences the energy saving behaviour at home (SBH). However, PCE was not found to have any significant impact on individuals' energy saving behaviour in the workplace. Further, a significant difference between individual energy saving behaviour at two different contexts was also reported. Based on the findings of the study, implications for energy savings are also discussed.

Abstract

The study estimates the Basel-III capital requirement for Indian banks employing the methodology incorporating the reported tier-1, tier-2 capital, total capital and risk-weighted assets (RWAs) sourced from the Basel disclosures made by the banks on their websites. In order to understand the strategy and the response of different bank groups based on their ownership styles, this study, groups the banks into scheduled commercial banks, public sector banks group, and private banks and considers the data for the period 2002 -2011. The results suggest that with an assumed growth of RWAs at 10%, banks in India would require additional minimum tier-1 capital of INR 2.51 trillion. With an assumed RWAs growth at 12% and 15%, the requirement would be in the order of INR 3.36 trillion and INR 4.74 trillion respectively.

Examining the relationship between system quality, knowledge quality and user satisfaction in the success of knowledge management system: an empirical study

J. Prince Vijai

Department of Operations and Information Technology,
ICFAI Business School,
IFHE University,
Hyderabad, 501203, India
Email: jpvijai@ibsindia.org

Abstract: Measuring and understanding the success of knowledge management system within an organisation has been identified as one of the key challenges for information system managers. The success, typically, is measured at user-level in terms of user satisfaction that mainly depends on system quality and knowledge quality. The objective is to examine the strength and significance of relationship between system quality, knowledge quality and user satisfaction. Halawi et al. (2007) scale was used to operationalise system quality, knowledge quality and user satisfaction. A self-administered questionnaire survey was conducted in a selected knowledge-based organisation's employees who were working in the domain of banking and financial services. Factor analysis, correlation analysis and regression analysis were used to examine the underlying study model. The findings, interestingly, had provided positive but moderate relationship between system quality, knowledge quality and user satisfaction. Managerial implications, limitations and scope for further research are also discussed.

Keywords: knowledge management system; user satisfaction; system quality; knowledge quality; factor analysis; regression analysis.

IMPACT OF ROLE DESCRIPTION ISSUES ON WORK-LEISURE CONFLICT

Dr. Niraj Kishore Chimote

INTRODUCTION

IT Companies: The Information Technology industry has brought a kind of revolution in the field of business and contributing to the economy of the country.Its the most lucrative sector as far as employment is concerned. The IT companies are majorly found in cities like Delhi (NCR),Mumbai,Bangalore,Chennai and Hyderabad.Some examples of"Indian IT Services Providers" are Tata Consultancy Services, Infosys, Cognizant, Wipro and HCL Technologies.

The IT companies are expected toprovide an enjoyable work-life environment.Though these companies are experimenting with five day work format but the real test for their commitment will manifest in a down turn economy.The signs of work burn-outs are evident in the large number of young IT professionals who are bitter that the personal leisure is snatched away due to work pressures.Some companies are investing in recreational and sports facilities on worksites where people prefer to stay for longer hours owing to the ambience of work environment which cannot be a substitute to the home and family. IT companies support and strengthen work-life balance vision by providing principles, policies and programs to support its employees. It offers flexible leave options and flexible work arrangements that are subject to management approval and business needs.There is an option of study leave, sick leave, maternity leave, compassionate leave, marriage leave, etc in many IT companies. There is also provision for flexible work arrangements like part-time work, flexible work week and flexible tele-commuting.Employment opportunities have become massive because of existence of IT sector companies. It has a great contribution in the global outsourcing sector as well.

Work-Life Balance: Importance of Work-Life balance (WLB) in Human Resource Management is well established. The antecedents and consequences of WLB are the driving forces behind the success or failure to maintain work-life balance. Though this perspective is widely acclaimed and utilized to explain the importance of WLB, it is sparsely incorporated in Human Resource Management. Academic literature on WLB provides information on the individual effects of various WLB policies on the employees of diverse organizations. However, it does not provide the combined effect of these policies on the mental and physical balance and economic well being of the employees. Work–life balance is a concept including proper prioritizing between "work" (career and ambition) and "lifestyle" (health, pleasure, leisure, family and spiritual development/meditation).There can be two ways through which the

Investors overconfidence behaviour at Bombay Stock Exchange

Venkata Narasimha Chary Mushinada
Department of Finance and Accounting, ICFAI Business School, ICFAI Foundation for Higher Education, Hyderabad, India, and
Venkata Subrahmanya Sarma Veluri
University College of Commerce and Business Management, Kakatiya University, Warangal, India

Received 16 May 2017
Revised 16 March 2018
Accepted 21 March 2018

Abstract

Purpose – The purpose of the paper is to empirically test the overconfidence hypothesis at Bombay Stock Exchange (BSE).

Design/methodology/approach – The study applies bivariate vector autoregression to perform the impulse-response analysis and EGARCH models to understand whether there is self-attribution bias and overconfidence behavior among the investors.

Findings – The study shows the empirical evidence in support of overconfidence hypothesis. The results show that the overconfident investors overreact to private information and underreact to the public information. Based on EGARCH specifications, it is observed that self-attribution bias, conditioned by right forecasts, increases investors' overconfidence and the trading volume. Finally, the analysis of the relation between return volatility and trading volume shows that the excessive trading of overconfident investors makes a contribution to the observed excessive volatility.

Research limitations/implications – The study focused on self-attribution and overconfidence biases using monthly data. Further studies can be encouraged to test the proposed hypotheses on daily data and also other behavioral biases.

Practical implications – Insights from the study suggest that the investors should perform a post-analysis of each investment so that they become aware of past behavioral mistakes and stop continuing the same. This might help investors to minimize the negative impact of self-attribution and overconfidence on their expected utility.

Originality/value – To the best of the authors' knowledge, this is the first study to examine the investors' overconfidence behavior at market-level data in BSE, India.

Keywords Overconfidence, Behavioural finance, Excessive volatility, Over/Underreaction, Self-Attribution bias

Paper type Research paper

1. Introduction

The conventional asset-pricing models rest on an important assumption that agents behave rationally. However, many empirical literatures consistently demonstrate that those models fail to explain the stylized facts observed in securities markets[1]. A growing number of researchers argue that one critical reason for the failure of the conventional asset-pricing model is primarily due to the inappropriateness of rationality assumption. By relaxing this seemingly unrealistic assumption, some models are developed basing on special trading strategies taken by irrational investors to explain the observed anomalies while others are derived based on investors' cognitive bias to solve the difficulties encountered by the traditional finance paradigm[2].

Recently, several behavioral finance models have been motivated by offering a unified explanation of short-run underreaction and long-run overreaction. For example, Daniel *et al.* (1998) argued that if investors are overconfident, they overweight their own private information at the expense of ignoring publicly available information. As a result of overconfidence, investors overreact to private information and underreact to public information. They showed that this asymmetric response of overconfident investors to

ABSTRACT

Objectives Although urbanisation is generally associated with poverty reduction in low-income and middle-income countries, it also results in increased socioeconomic segregation of the poor. Cities with higher levels of socioeconomic segregation tend to have higher mortality rates, although the evidence is based on ecological associations. The paper examines whether socioeconomic segregation of the poor is associated with higher under-60 years ('premature') mortality risk in Indian cities and whether this association is confounded by contextual and compositional sociodemographic and socioeconomic factors.

Setting and participants A population representative sample of over one million from 39 427 households living in 1876 urban wards within 59 Indian districts (cities) from the third (2008) District Level Household Survey (DLHS-3).

Primary outcome and other measures The outcome was any death under the age of 60 reported by households in the preceding 4years of the DLHS-3. Socioeconomic segregation, estimated at the district (city) level, was measured using an isolation index of the poor and the index of dissimilarity.

Results Poor households living in cities where the poor were more isolated had higher probabilities of premature mortality than poor households living in cities where the poor were less isolated. In contrast, it did not matter whether rich households lived in more or less socioeconomically segregated cities. A 1 SD increase in the isolation index was associated with an absolute increase of 1.1% in the probability of premature mortality for the poorest households.

Conclusion Increasing segregation of the poor may result in higher premature mortality. As low-income and middle-income countries become increasingly urbanised, there is a risk that this may lead to increased segregation of the poor as well as increased premature mortality.

Strengths and limitations of this study

- The study examines how residential socioeconomic segregation is related to premature mortality.
- This is an important topic because urbanisation in low-income and middle-income countries is accompanied by an increasing spatial concentration of poverty in cities.
- For poor households, the increased risk of premature mortality associated with urban socioeconomic segregation remains even after taking into account household and city level socioeconomic and sociodemographic confounders.
- This is a cross-sectional study so we were unable to account for unobserved factors that could cause the association between socioeconomic segregation and higher premature mortality.
- We have not estimated any lagged effects of socioeconomic segregation on premature mortality.

INTRODUCTION

Urbanisation in low-income and middle-income countries is accompanied by increasing spatial concentration of poverty in cities. Although urbanisation can play a positive role in overall poverty reduction, an increase in the socioeconomic segregation of poor people living in cities may have adverse outcomes in terms of their chances for good health and life opportunities. While levels of urbanisation in India are relatively low at around 31% in 2011, the process of urbanisation is among the fastest in the world. As a result of urbanisation, India contains the highest number of urban slum dwellers, accounting for 17% of the world's slum dwellers.[1]

The association between poverty and ill health is well documented. The risk of premature mortality and disease as a result of living in poor areas such as slums with inadequate housing, lack of access to safe water and adequate sanitation is well known. Furthermore, there are now a multitude of studies showing associations between

Abstract

The objective of the current study was to examine the direct and indirect impacts of materialism on use innovativeness in case of fashion products among Indian consumers. An empirical study was conducted to test these relationships with 282 respondents comprised of 59 percent males and 41 percent of females. Proposed conceptual study model was tested with the help of higher order structural equation modeling by using IBM AMOS 21.0. We confirmed full mediation of fashion involvement in the relationship between materialism and use innovativeness. Furthermore, our study results found full mediation of fashion innovativeness in the relationship between materialism and use innovativeness. On the other hand, materialism had a direct significant negative impact on use innovativeness in case of fashion products. We strongly recommend to the fashion product marketers to highlight the concept of use innovativeness in the entire marketing mix for better business prospects.

What drives the capital flows into BRICS economies?

Vighneswara Swamy | **Vijayakumar Narayanamurthy**

IBS-Hyderabad, Finance, IFHE University, Hyderabad, India

1 | INTRODUCTION

What drives the capital flows into the countries? This is an important question that lies at the centre of a long-standing debate in international economic policy and research. The significance of capital flows and the relationship with economic growth have been the subject of numerous empirical studies. Foreign direct investment flows as primary capital flows among other capital sources are of substantial interest in the developing countries in view of their magnitude and less variance (Acharyya, 2009; Oztürk, 2007). Of late, there has been a renewed interest in the spatial aspects of capital flows, and how they consequently impact the expansion of multinational enterprises into foreign markets. The interest in location aspects of capital flows stems from the fact that most countries compete with each other to attract higher capital inflows. Therefore, changes made by the host countries are important for attracting significant capital flows. In this context, though the importance of capital flows has been appreciated and emphasised over time, nevertheless there exists a gap in understanding the growing capital flows into BRICS countries in the recent years.

The BRICS[1] (Brazil, Russia, India, China and South Africa) countries received substantial capital flows during the recent past. During the last two decades, BRICS countries have participated in international trade of goods and services to drive their incredible growth rates. As these economies become more and more open to trade, they also expose their domestic markets to the economic outcomes of the rest of the world. In recent years, BRICS economies have received increasing scholarly attention as well (Bhar & Nikolova, 2009; Ghorbel & Boujelbene, 2013; Gilenko & Fedorova, 2014; Mensi, Hammoudeh, Reboredo, & Nguyen, 2014). These countries are able to exert great influence on the governance of the global economy.

BRICS countries demonstrate some distinguishing features in terms of GDP growth, GDP per capital growth, trade openness and foreign direct investment inflows (see Table 1). It is worth noting that the financial crisis had no strong effect on the BRICS countries and it is evolving as fast-growing emerging markets group owing to increased input of factors, enormous scales of the

[1]BRICS brings together five major emerging economies, comprising 43% of the world population, having 30% of the world GDP and 17% share in the world trade in 2016. In 2001, Jim O'Neill coined the acronym "the BRIC countries" in his paper entitled "Building Better Global Economics BRICs." In 2003, the research paper "Dreaming with the BRICs: the Path to 2050" by Wilson and Purushothaman from Goldman Sachs Investment Bank drew a lot of attention from academicians and practitioners as they identified the BRIC group as the new economic growth force in the world. Later in 2011, the BRIC was expanded with the joining of South Africa to form BRICS.

Does HDI Promotes Economic Growth – An Evidence From Indian Economy

Tamma Koti Reddy and I R S Sarma

INTRODUCTION

Economic growth is essential for human development, but to exploit fully the opportunities for improved well-being that growth offers, it needs to be properly managed (HDR 1990). Development process needs to continuously strive for broad based improvement in the standard of living and quality of life of the people through an inclusive development strategy that focuses on both income and non-income dimensions. Making growth and development percolate to the marginalized and disadvantaged sections of the society remains the official policy of inclusive growth for the economy (Planning Commission 2007-12). Unless societies recognize that their real wealth is their people, an excessive obsession with creating material wealth can obscure the goal of enriching human life (Haq). In low human development economies a determined effort to expand human capabilities through improved education, health and nutrition can help transform the prospects for human growth (HDR 1996).

Since 1980s the unemployment rate continues to rise with increase in labour force due to overcrowding of agricultural sector and deterioration in the growth of manufacturing sector. Efficiency of human resources in any economy facilitates to improve national wealth, raise in productivity, improving the quality of life and proper exploitation of natural endowments. Distribution of income is one of the important components that determine the impact of economic growth on human development in any economy. Economic growth contributes most to poverty reduction when it expands the employment, productivity and wages of poor people and when public resources are channeled to promoting human development. A vicious cycle of economic growth and human development raises when growth is labour using and employment generating and when human skills and health improve rapidly (UNDP, HDR 1997). The expenditure on social services as a proportion of GDP was 6 per cent during the period 2012-13 to 2014-15 then marginally declined to 5.8 per cent in 2015-16 and again raised to 6.6 per cent in 2017-18 (Economic Survey 2017-18). The general Government expenditure on education which was 3.1 per cent of GDP in 2012-13 gradually declined to less than 3 per cent of GDP in 2017-18. Expenditure on the health sector has risen from 1.2 per cent of the GDP in 2013-14 to 1.4 per cent in 2017-18 (Economic Survey 2017-18).

Tourism, trade, and economic growth in India: a frequency-domain analysis of causality

K. G. Suresh[a], Aviral Kumar Tiwari[b], Gazi Salah Uddin[c] and Ali Ahmed[c]

[a]IBS-Hyderabad, IFHE University, Hyderabad, India; [b]Montpellier Business School, Montpellier, France; [c]Department of Management and Engineering, Linköping University, Linköping, Sweden

Downloaded by [Florida State University] at 17:26 03 December 2017

ABSTRACT

We examine causal relationships among the macroeconomic entities tourism and output dynamics in India, using the frequency–domain causality approach. Our results show that there is a bidirectional causality between openness and tourism as well as between output and tourism, at various frequency bands. Hence, this study suggests a multiplier effect of tourism on the Indian economy.

Introduction

Demand for international tourism keeps growing each year. The number of international tourist arrivals exceeded 1.2 billion in 2016, and this number has grown at a pace of 4% for the past seven years according to the UN World Tourism Organization (2016). According to the World Travel and Tourism Council (2017), the direct share of tourism to GDP in India was almost 5,000 billion rupees, or over 3% of GDP, in 2016 and it is predicted to increase by roughly 7% in 2017. This trend is expected to rise by 7% annually during the period of 2017–2027. Furthermore, visitor exports resulted in over 1500 billion rupees, or over 5% of total exports, in 2016 and is expected to increase by roughly 6% per year during the period of 2017–2027.

Tourism development is a part of the overall development strategy for many countries like India, in order to earn foreign exchange receipts, generate employment opportunities, and facilitate economic growth. This has raised interest among economics scholars to study the relationships of tourism with economic growth, international trade and other macroeconomic variables. Four hypotheses have in particular been put forward and tested in the previous research as regards the relationships between tourism and other macroeconomic variables: the Tourism-Led Growth (ToLG) hypothesis (Katircioglu, 2009; Surugiu & Surugiu, 2013), the Growth-Led Tourism (GLTo) hypothesis (Tang & Tan, 2013), the Tourism-Led Trade (ToLT) hypothesis (Goh & Law, 2003), and the Trade-Led Tourism (TLTo) hypothesis. Previous studies have applied various econometric approaches to examine the ToLG, GLTo, ToLT, and TLTo hypotheses. However, these hypotheses have not yet been tested in a frequency–domain framework. In this study, we are testing these hypotheses by utilizing a frequency–domain Granger-causality approach.

From a broad theoretical perspective, four different hypotheses can be tested when studying the relationship between tourism and output growth. First, the growth hypothesis, which is supported when tourism is Granger-causing economic growth. This suggests that historical information on

DICGC – Insurance of Bank Deposits

D Sreenivasa Chary and B Amarender Reddy

DICGC is a wholly owned undertaking of RBI. It insures bank deposits. Deposit insurance is mandatory for all commercial, cooperative and regional rural banks in India. DICGC assures the depositors of the registered banks safety of the balance in their accounts subject to a maximum of ₹100,000 per depositor per bank, in the event of failure of such banks. The insured banks are required to pay half-yearly deposit insurance premium to DICGC. Deposit insurance gives a sense of security to the public to deal with banks confidently. This article focuses on the role of DICGC.

DICGC is a wholly owned undertaking of the RBI. It came into existence in July 1978, following the amalgamation of Deposit Insurance Corporation Bill 1961 and Credit Guarantee Corporation of India Ltd 1971. It was formed to provide protection to depositors against the failure of registered insured banks, and guarantee the banks against possible loan losses of priority sector advances. However, presently, banks are availing deposit insurance and have opted out of credit guarantee, as several other guarantee schemes like CGTMSE, CGSEL, NCGTC, MUDRA schemes, etc. came into existence.

Insured Banks in India

Deposit Insurance is mandatory for all commercial banks in India, including the branches of foreign banks, Regional Rural Banks (RRBs), Local Area Banks (LABs) and Cooperative Banks. However, primary cooperative societies are not covered. No bank can opt out of the scheme. De-registration is possible only on takeover/merger or closure of a bank. The total insured banks as on March 31, 2018 are 2,109, which includes 101 commercial banks, 56 RRBs, 3 LABs and 1949 cooperative banks. The details of the insured banks are furnished in Figure 1.

Deposits Insured by DICGC

DICGC insures all the bank deposits like savings deposits, current accounts, recurring deposits and term deposits. However, institutional deposits like deposits of foreign governments, central/state governments, state land developments, state cooperative banks, inter-

Does FDI Promote Growth?

Evidence from Indian Manufacturing Sector

Special Articles (/special-articles)

Vol. 53, Issue No. 36, 08 Sep, 2018 (/journal/2018/36)

Updated on 7 September 2018

Suresh K G (/author/suresh-k-g), V Nagi Reddy (/author/v-nagi-reddy)

The spillover effects of foreign direct investment in the Indian manufacturing sector are examined by analysing the financial performance of foreign firms with domestic business group firms and stand-alone firms for selected sub-periods during 2001–15. The study shows that the sales efficiency of foreign firms is not significantly different from that of the domestic firms in all the sub-periods studied, except during 2008–09. The operational efficiency of foreign firms is better than that of the domestic firms till 2009 and, for the later period, there is no significant difference in operational efficiency of domestic and foreign firms.

Capital movements across countries in the form of foreign direct investment (FDI) have been one of the prime features of global economic integration. Home countries, mostly developed economies, promote FDI to get higher returns for their capital. Host countries, mostly developing economies, welcome FDI as part of their outward-oriented development strategy. FDI, mostly contributed by multinational companies (MNCs), is

The case captures the entrepreneurial initiatives, inventions and growth story of Kevin Plank, who, in 1996, founded the firm Under Armour, a sports apparels firm which went on to take on the bigwigs like Nike and Adidas. The case is about the genesis of Under Armour and the various entrepreneurial aspects like product innovation, product branding, marketing, communications, etc. Under Armour's Sweat Wicking Cleats were placed not as mere sports apparel, but promoted as a performance enhancer—which struck the right chord with the target audience. The branding and positioning strategies ranged from sponsoring tournaments, sporting in movies, viral marketing, etc. The case captures the various marketing and branding strategies that Plank adopted to promote Under Armour's brand and its products. The competition in the sports apparel industry was fierce and had immense potential to affect Under Armour. The case also captures the challenges Under Armour faced, viz., competition, lack of continuous innovation, lack of patenting, etc.

I was always smart enough to be naive enough to not know what I can't accomplish.1

When we think about our competition we aren't worried about the next shoe that someone is going to build, we are thinking about the competition that doesn't exist yet and we are thinking about it from a digital perspective.2

–Kevin Plank,
Founder and CEO – Under Armour

Introduction

In 2010, Forbes had adjudged Kevin Plank (Plank), founder and CEO of the US-based sports apparel maker Under Armour (UA), as one of the 15 most powerful American chief executives aged under 40. Plank was also ranked 14 in the 40 under 40 list of Fortune.3 Plank, a footballer by passion and businessman by profession, had founded UA in 1996 with the groundbreaking idea of a sweat-wicking T-shirt that shook the sports apparel industry. The uniqueness of the product and the charisma of Plank earned UA early success.

Through strategic growth drivers, viz., the R&D, innovation, aggressive marketing, and strategic alliances, UA under Plank's leadership, created a robust brand out of nowhere in 15 years. In 2005, UA made a sensational debut on the NYSE, as its stock appreciated by at least 100% during its very first day of trading. The shares opened at $31, which was more than double its $13 price. UA raised $157 mn through the IPO.

Despite its remarkable success with its maiden product the sweat-wicking T-shirt, UA was still not immune to threats from the competition for various reasons. Factors like imitable product, lack of patents, limited target segment, unrelated diversification, and product failures still kept UA struggle to grab a pie in the market share from the giants like Nike and Adidas. Moreover, the daunting competition from sports apparel majors like Nike, Adidas, and Lululemon kept UA on its toes.

The Beginning

Plank, born in 1972, grew up with four older brothers who, right from childhood, compelled him to constantly struggle to secure his interests. Plank was not great at academics. During his high school days, Georgetown Preparatory School rusticated him for poor academic performance. As a result, Plank joined Fork Union Military Academy, where he started playing football with the aspiration of becoming a professional football player.

Toward the end of college, Plank had a job offer in hand from Prudential Life Insurance. Plank, whose inclination for sports had grown immensely during the schooling phase, was not interested in taking up a

ABSTRACT

The paper examines the factors influencing the profitability of Indian commercial banks considering increased globalization, intensified competition, and enhanced concentration. The sample is a balanced panel dataset of 89 banks operating in India for the period 2005 to 2015. We consider the return on assets (ROA) and the return on equity (ROE) as proxy for measurement of banks' profitability. The results indicate that profitability of banks in India is affected by both internal and external factors. Strength of equity capital, operational efficiency, ratio of banking sector deposits to the gross domestic product (GDP), had significantly positive effect on profitability of banks and credit risk, cost of funds, non-performing assets (NPA) ratio and consumer price index (CPI) inflation have significantly negative influence on banks' profitability while bank size and ratio of priority loans to total loans do not have any influence on the profitability. The GDP growth and inflation have significantly negative relation with ROA and inflation has positive influence on ROE.

Banks Profitability, Internal Factors, External Factors

1. Introduction

During the last three decades, major banking reforms have been introduced by the Reserve Bank of India (RBI) to improve the strength, health, performance and profitability of the banking industry. These reforms and changes were aimed to improve the quality of regulation, create healthy competition, and efficient functioning of banking industry. Reforms and liberalization in financial and banking sectors created fierce competition, technology improvement, global integration and

Abstract

This study examines the Gross Domestic product purchasing power parity per capita (GDP PPP per capita) and its determinants using the panel data method to test for unit roots in Brazil, Russia, India, China, and South Africa (BRICS). The main dependent variable in our study is GDP PPP per capita while the independent variables are real exchange rate, real interest rate, consumer price index (CPI), and money supply. We find strong evidence of a long-run relationship among the chosen variables. The co-integration equation reveals positive relationship between GDP PPP per capita and the real exchange rate, real interest rate, and money supply and a negative relationship between GDP PPP and CPI. Based on the VEC Granger Causality/Block Erogeneity Wald Tests, the study finds that the GDP PPP per capita is influenced by the exchange rate and CPI. However, based on the overall Chi-square test, the study shows strong evidence of an influence of all variables on GDP PPP per capita. We hope this study would help the policy makers to come up with appropriate policies to bring about homogeneity among the BRICS nations.

1. Introduction

The Purchasing Power Parity (PPP) Theory otherwise known as "Law of One Price" has remained an inconclusive debate in the academic and policy circles since it was coined by Cassel, G. [1]. The PPP is an economic theory that states residents of one country should be able to purchase the goods and services at the same price as residents of any other country over time. This theory has a linkage to goods and financial markets and the absence of PPP ignites the arbitrage op-

Applying structural equation model to study the critical risks in business intelligence and analytical system implementation in Indian retail

[redacted] Rajesh and D. Saravanan

Published Online: June 18, 2018 · pp 190-218

ABOUT

Abstract

In order to reduce the failure rate of business intelligence and analytical system (BIAS) projects in Indian retail, project managers need to analyse and understand the impact of a risk factor on BIAS implementation. The main objective of this paper is to identify the key risk factors solely or primarily for the Indian retail sector. A theoretical model is developed that explains the risk factors which may impact the success of BIAS implementation. Using the SEM, it is found that [redacted]0% of the variations in BIAS implementation success can be explained with the help of the model suggested in the research study. The findings from this paper can provide a greater understanding of BIAS implementations. Researchers, practicing managers, and those seeking to implement BIAS in the retail organisation can also use the findings of this study as a vehicle for improving BIAS implementation success in the retail sector.

Characterizing Empirical Regularities of the Post Reform Business Cycles in India

Lagesh Aravalath

Department of Economics, ICFAI Business School
Hyderabad, India

Email:lagesheco@gmail.com

Abstract: This study attempts to characterize the stylized facts of the post-reform business cycles in India using 25 years of quarterly data, from 1990Q1 to 2014Q3 of eleven key macro variables. All the variables are deseasonalized using X12-ARIMA method and de-trended using Hodrick and Prescott (1980) and Baxter and King (1999) filters. The stylized facts are characterized for two periods: the whole period under the study (1990Q1-2014Q3) and for the recent decade of post-reforms (2000Q1-2014Q3). The empirical analysis reveals that the recent reform period has witnessed a fast transitioning Indian economy.

Keywords: Business cycles; stylised facts; de-trending methods; post-reform India

JEL Classification Number: E32; B41

1. Introduction

A 'stylized fact' (empirical regularities) is a simplified presentation of an empirical finding. According to Kydland and Prescott (1982), when modelling a country's business cycle, one should first characterize the empirical regularities of co-movement between the cyclical component of various economic aggregates with those of the real output. This methodology of business cycle analysis received enormous attention from academicians leading to a renewed interest in the business cycle research during the early 1980's.

There are ample of studies which attempted to characterize the stylized facts of the business cycles of industrial economies. A few most cited among them are Keydlyard and Prescort (1982), Blackburn and Ravn (1992), Bjornland (1999) and Agresti and Mojon (2001). Business cycles of developing/emerging economies received enormous interest in recent time (Alper (1998), Rand and Tarp (2002), Agénor et al. (2000), Boz et al (2008), Male (2010)).

However, in India, the studies on business cycles are largely related to developing leading and coincident indicators to help forecast booms and recessions as well as dating cycles (Chitre (1986), Gangppadhyay and Wadhwa (1997), Mall (1999), Dua and Banerji (1999), Ahamed and Kamia (2010), and Mohanty et al (2003)). Further, on reviewing literature, it is observed that there are only two studies, viz., Hatekar (1994) and Ghate et al. (2013), which exclusively analysed the stylized facts of business cycles in the Indian context.

Supply Chain Practices of Reliance Dairy

In 2009, Reliance Dairy Foods Ltd (Reliance Dairy), a subsidiary of Reliance Retail , forayed in the Indian branded dairy market, offering products such as packaged milk, curd, sweeteners, a skimmed milk powder. Reliance Dairy operated a pan-India dairy procurement, processing, a distribution platform under the Dairy Life and Dairy Pure brands. Its backend operations were stro as it procured milk at the grass-root level from farmers in remote villages. It offered higher margi to retailers and 10% extra milk to customers.[1] With its strong supply chain and branding strategy, t company tried to capture the market. However, sustaining itself in the dairy business was difficult the market was highly competitive and flooded with several brands such as Amul[b], Mother Dair and Nestlé.[d] In April 2017, Reliance Diary was acquired by Hyderabad-based dairy compa Heritage Foods Limited[e] (Heritage). Heritage planned to achieve breakeven in Reliance's da business by closing down milk procurement on loss making routes and shifting the processing a packaging of milk from third party facilities to Heritage's own facilities, said analysts.

BACKGROUND NOTE

Reliance Industries Limited (RIL) was founded by Dhirajlal Hirachand Ambani, popularly known Dhirubhai, in 1977. The company went in for an initial public offering (IPO) in 1977, issuing 2 million shares of Rs10 each. The issue was oversubscribed seven times, strengthening Reliance growth ambitions. RIL was technically formed in 1985 when Reliance Textiles Industries Pvt. Ltd. w renamed as Reliance Industries Limited with the aim of expanding to other industries. Thereafter, R established its presence in petrochemicals, textiles, natural resources, retail, and telecommunicatio Some of the company's well-known brands were Reliance Fresh[f], Reliance Footprint[g], Reliance Ti Out[h], Reliance Digital[i], Reliance Wellness, Reliance Trends[j], Reliance Super, Reliance Mart, Relian Home Kitchens[k], Reliance Market(Cash n Carry), and Reliance Jewels.

The Dual Entertainment Theory In Celebrity Endorsements

The Role of Celebrity Worship And Profession

SUBHADIP ROY
Indian Institute of Management Udaipur
subhadip.roy@iimu.ac.in

ADITYA SHANKAR MISHRA
IBS Hyderabad
aditya.s.mishra@gmail.com

This study builds on entertainment and transportation theories and empirically tests a model that incorporates the effects of entertainment motives and attitudes. It examines endorsement success and the differences in the mentioned effects between celebrity worshippers and nonworshippers, including the role of celebrity profession as a moderating variable. The study's hypotheses were tested empirically and validated with survey data of two nonstudent samples (Study 1), with real brands (Study 2), and in a different nation to ensure generalizability (Study 3). Different entertainment motives were found to influence endorsement success among worshippers and nonworshippers. The moderating role of celebrity profession also was observed.

INTRODUCTION

A celebrity is "known to the public for his accomplishment in areas unrelated to the product class endorsed" (Friedman, Termini, and Washington, 1976, p. 22). Use of celebrity endorsers in marketing communication is not a recent phenomenon[1] and is globally prevalent (Shimp, 2010). A celebrity endorser could affect positively consumers' attitude toward brands, increase advertisement believability and credibility, influence purchase intentions (Amos, Homes, and Strutton, 2008; Atkin and Block, 1983; Erdogan, 1999), and increase brand recall and recognition (Amos *et al.*, 2008; Misra and Beatty, 1990; Roy, Guha, and Biswas, 2015; Roy and Moorthy, 2012). Despite the growing popularity of celebrity endorsements, researchers have struggled to find the right model to predict endorser success. There is thus a global need for a better understanding of the celebrity-endorsement phenomenon, which could aid academicians and marketers alike.

[1] *S. P. Sherman. (1985). "When You Wish upon a Star."* Fortune, *August 19, 1985.*

Management Slant

- Celebrity worshippers and nonworshippers have different motives that influence their attitudes toward endorsements so marketers should employ different strategies with each segment.
- Celebrity profession moderates the influence of entertainment motives on endorsement effectiveness; celebrities should be carefully selected based on professional relevance.
- Celebrity-fantasy-driven brand attitude may not result when established brands use celebrities known only at a national and not global level.
- Celebrity-fantasy-driven brand attitude may not result when established brands use celebrities known only at a national and not global level.

Impact of Student Engagement on Affective Learning: Evidence from a Large Indian University

Manish Gupta[1] · **Jatin Pandey**[2]

Published online: 29 October 2016
© Springer Science+Business Media New York 2016

Abstract This study has two objectives. The first objective is to examine the mediating role of intellectual engagement in the relationship between online engagement and affective learning. The second objective is to investigate the mediating role of academic engagement in the relationship between intellectual engagement and affective learning as well as between online engagement and affective learning. The study sample comprises of undergraduate students studying in a large private Indian university. The results of structural analysis using 280 responses collected from the undergraduate students support the hypotheses that academic and intellectual engagement constructs mediate the relationship between online engagement and affective learning. Moreover, it was found that compared to intellectual engagement, the role of online engagement is statistically more central to enhancing academic engagement and in turn affective learning. The findings encourage educators to provide academic settings backed by online resources instead of depending only on online resources.

Keywords Academic engagement · Affective learning · Intellectual engagement · Online engagement · Student engagement

Rapid globalization by means of technological advancement has made universities devise new pedagogy and methods to impart learning in a flexible and creative manner. Indian Universities particularly are increasingly using internet as a creative way of imparting knowledge to the students (Thien and Razak 2013). However, installation of modern facilities requires capital investment that is ultimately reflected in the increased education fee charged from students (Tilak 2014). This could be a reason for the low enrollment rate of 17.9 % in higher education (estimated for 2011–12) compared with 26 % in China and 36 % in Brazil (British Council 2014). The government of India has set an ambitious goal to take this rate to 30 % by 2020–2021 (Planning Commission 2013) and learning through internet based e-learning (Pathak and Pandey 2012) can be a way to achieve this target without compromising on the quality of education (University Grants Commisison 2012).

Given the worrisome figures relating to the Indian higher education and the high initial cost of arranging resources necessary for technology aided learning such as online learning, it is important to ascertain the effectiveness with which such initiatives can improve student learning. To the best of authors' knowledge, this is the first study that examines the relationship between online engagement and affective learning in the context of Indian higher education as studies to date were done either in the Western Countries or in the few developing nations such as China (Ma et al. 2015). Therefore, the main research objective of the current study is to explore and test the mechanism through which the student-internet attachment called 'online engagement' (OE) can help them in enhancing affective learning in the Indian higher education.

Technical efficiency of coal-based thermal power plants in India: a stochastic frontier analysis

J. Prince Vijai

Published Online: April 12, 2018 · pp 472-485

Abstract

We analysed the technical efficiency of coal-based thermal power plants in India by employing the stochastic frontier production function methodology for the period of 2007-2008 using annual data. We had employed, further, the Frontier 4.1 statistical package for both ordinary least square (OLS) and maximum likelihood (MLE) estimations. We found that the technical efficiency varies across plants - ranges from 61.05% to 99.53% - and is a time-invariant. However, about 50% of the plants were operated under the mean technical efficiency of 88.20% which had warranted policy makers to take appropriate steps by either increasing the plant output level by 11.80% with existing resources and technology or reducing the existing input level by 11.80% to produce the given level of output. We concluded that the new policy implementations of Government of India had improved the technical efficiency of coal-based thermal power plant operations and also suggested further scope for research. [Received: February 4, 2016; Accepted: August 13, 2016]

Abstract

The effects of government debt on economic growth has become of immense importance in the backdrop of the Eurozone sovereign debt crisis and Reinhart & Rogoffâ€™s related research. This study is based on a sizeable dataset which extends the horizon of analysis to country groupings and makes it inclusive of economic, political, and regional diversities. The study overcomes issues related to data adequacy, coverage of countries, heterogeneity, endogeneity, and non-linear relationships by conducting a battery of robustness tests. An increase in the debt-to-GDP ratio is found to be associated with a reduction in average growth, but the relationship is nonlinear.

Does skewness help in better investment decision making?

Satish Kumar
Department of Finance, Indian Institute of Management Amritsar, Amritsar, India

Received 3 April 2017
Revised 24 October 2017
Accepted 1 December 2017

Abstract

Purpose – The purpose of this paper is to examine the significance of skewness in maximizing the investor utility using the daily data for eight sectors listed on the National Stock Exchange of India.

Design/methodology/approach – The analysis is carried out in three different steps. In the first part, the author analyzes the monthly stock returns and the important financial ratios – price-to-book (PB) ratio, price-earnings (PE) ratio and dividend yield (DY). Second, the author tests the sector-wise return predictability using Westerlund and Narayan (2012) flexible generalized least squares estimator. Third, the author compares the mean–variance–skewness (MVS) utility function with the mean–variance (MV) utility function.

Findings – The author forecasts the sectoral stock returns using three financial ratios – PB ratio, PE ratio and DY – as predictors. The results indicate that sectoral stock returns are significantly predicted by these financial ratios. The author then formulates trading strategies by including skewness in the utility function and finds that the investor utility is high when the utility function includes skewness as opposed to when the skewness is excluded.

Originality/value – The author extends the MV utility function to the MVS utility function and shows that the Indian stock market is more profitable when the investor uses a MVS utility function which highlights the main contribution to the literature.

Keywords Investor, Returns, Utility, Skewness

Paper type Research paper

1. Introduction

Asset pricing has been the vanguard of research in the area of financial economics, of which returns predictability is a popular sub-area. There is voluminous literature on the use of financial ratios as predictors of stock returns (see e.g. Lamont, 1998; Welch and Goyal, 2008; Rapach *et al.*, 2010; Gupta *et al.*, 2014; Narayan and Bannigidadmath, 2015; Phan *et al.*, 2015; Bannigidadmath and Narayan, 2016). In this paper, we focus on the stock returns predictability by examining whether financial ratios predict sectoral stock returns on the Indian stock exchange. There are two main elements of research that are leading in this area of literature. First is the advancement of econometric methodologies for testing returns predictability (see e.g. Campbell and Yogo, 2006; Westerlund and Narayan, 2012, 2015). The second aspect is derived from the first in that after the evidence of return predictability, the economic significance of such predictability has to be understood. Ideally, the economic significance analysis involves the development of trading strategies. Among them, the most accepted trading strategy involves the mean–variance (MV) utility function.

In this paper, we focus on the second aspect, that is, economic significance of the stock return predictability. We argue that the utility function used to estimate the investor utility mostly considers only the first (mean) and second (variance) moments of the stock returns. We seek to include the third moment (skewness) of returns and see whether its inclusion will improve the investor utility. By doing so, we intend to extend the utility function to mean–variance–skewness (MVS) investor. Although several studies have considered the importance of skewness in financial economics (for instance, see, Kraus and Litzenberger, 1976; Golec and Tamarkin, 1998; Garrett and Sobel, 1999; Bhattacharya and Garrett, 2008; Patton, 2004; Prakash *et al.*, 2003; Jondeau and Rockinger, 2006; Mitton and Vorkink, 2007); however, only a few researchers have accounted for the role of skewness in financial decision making to understand its economic significance. For instance, Jiang *et al.* (2016) examined

Legal Analysis of Feminization of Labor in the Unorganized Sector in India

Sanu Rani Paul[*]

Feminization of labor has intensified with the advent of economic liberalization. Though it has improved the economic status of women in the society, their rights are least respected especially in the unorganized sector. This is a gross violation of the rights which are being guaranteed to women under various human rights documents and under the Constitution of India. Protection of rights of women in the unorganized sector is the last priority for the employers in the unorganized sector and this is due to the ineffective implementation of labor laws. The situation needs immediate revamping and the paper introspects about the flaws in the laws and the implementation of the same.

Introduction

Feminization of labor is a common phenomenon after the opening up of the Indian economy to liberalization, globalization and privatization in 1991. It has merits as well as demerits. The merit is empowerment of women; the income generation due to the employment of women transformed the status of the women in the society, be it a woman from the village or from an urban area, no matter if she is socially disadvantaged or not; so, to some extent, there is an inclusiveness in the pattern of growth. The demerit is the exploitation of the vulnerable plight of women. The more she is empowered economically, the more she succumbs to the gender inequality at the workplace, be it a woman who works as a sweeper in a shopping mall or a contract lecturer or an IT employee in a private institution/organization; thus, the exploitation is also inclusive. So the common feature here is empowerment at the cost of exploitation, and what is found to be lacking in the present situation is: legal protective measures which are guaranteed to everyone especially to women under the Constitution of India under Articles 14, 15 and 16. In India, there are laws encompassing all aspects of human activity, but there is no effective implementation of laws.

In the case of women working in the informal sector, the existing laws are Factories Act, 1948, Contract Labour Workers Act, 1970, Industrial Disputes Act, 1947, Employees State Insurance Act, 1948. Though these Acts specifically do not touch the issue of feminization of labor or gender inequality in the context of globalization, they guarantee certain rights, taking into account the specific needs of women. But after 1991, the scenario has completely changed with a liberal democratic setup wherein the state is

79. The Role of Conflicts in Top Management Teams

Dr.Goparaju Purna Sudhakar, Faculty Member, The ICFAI University Group, Hyderabad, India, 500082

Abstract

The purpose of this paper is to find out the role of conflicts and conflict management in Top Management Teams (TMTs). Based on the secondary research and literature review a conceptual model for conflict management in TMTs is proposed. 66 reasons for conflicts and 55 conflict resolution techniques are identified for TMTs from literature review. They are ranked based on reference count in the literature. TMT processes interaction is shown pictorially. Top 5 reasons for conflicts in TMTs identified are *value differences, resources, attitudes, structures* and *trust*. Top 6 conflict resolution techniques identified in TMTs are *avoidance, compromise, withdrawal, collaboration, confrontation* and *integration*. Further empirical research can be done based on the identified top reasons for conflicts and conflict resolution techniques. Also impact of countries and culture can be further be researched. Based on the findings executive teams can manage the conflicts effectively in organizations. This research is useful for the society in proper management of organizations.

Keywords: Top Management Teams, TMT, Executive Teams, C-Level Executives, CEO, Conflict Management, Conflict Resolution, Conflicts, Teams, Senior Management Teams

INTRODUCTION

"The employment relationship is a mixture of conflict and cooperation".

--- Osisioma et al. (2012)

TMTs (Top Management Teams) are required to solve complex and dynamic problems (Edmondson et al., 2003; Zaccaro et al., 2001). They face ambiguous unstructured problems (Edmondson et al., 2003). TMTs make better decisions when more information is required and the problem is more ambiguous, unique and complex (Tompson, 1997). TMT consists of the top two tiers in the organization including Chairman, CEO, CFO, COO, and the next highest management tier (Carpenter, 2002). TMT includes from inside board members till the Vice Presidents (Lohrke et al., 2004). Ensley et al. (2002) in their study consider TMT members as founders, who has stake of at least 10% or someone who plays active role in strategic decision making. Top Management teams play major role in strategy formulation, sales growth and organizational performance (Haleblian and Finkelstein, 1993). The strategies and actions of CEO and his direct reports can make or break the company (Albrecht et al., 2004; Vey et al., 2005). TMT members manage from broad of directors, to governmental officials, shareholders, analysts and partners (Edmondson et al., 2003). Decision making in TMTs is of multiparty and multi-motive negotiations

A CRITIQUE ON THE MATERNITY BENEFIT (AMENDMENT) BILL, 2016

Abstract

By-Priti[1]

The council of states, Rajya Sabha passed the Maternity Benefit (Amendment) Bill 2016, which aims to make amendments in the Maternity Benefit Act, 1961 which aims to increase the paid maternity leave from 12 weeks to 26 weeks.

With this move, India is all set to join 42 countries in the world that have paid leave of more than 18 weeks for mothers-to-be and will be the third country in the world in terms of the number of weeks allowed for maternity leave to working women only behind Canada (50) and Norway(44).

With the proposed amendment in the existing Act, several changes have been proposed by the Amendment Bill 2016, like extending the maternity leave for mothers to- be from 12 to 26 weeks, directing organization employing more than 50 employees to mandatorily have crèche facilities, provisions for work from home for women after the expiration of maternity leave etc.

But there are several areas which have been left undefended and the Amendment Bill fails to take account of some very pertinent issues like the necessity for paternity leaves or that the bill aims to cater to only those women working in the organized sector or the problems in the implementation of the new legislation.

The author through this legislative comment seeks to raise these issues highlighting the grey areas in the Amendment Bill and provide solutions to address the same.

Key words- maternity leave, mandatory crèche, organized sector.

ICFAI FOUNDATION FOR HIGHER EDUCATION

REGISTRAR
THE ICFAI FOUNDATION FOR HIGHER EDUCATION

[1] Asst. Professor, ICFAI Law School, IFHE, Hyderabad

The employer will have to allow the mother to have four visits to the crèche which will include the interval of rest allowed to women employees.

- Nursing mothers may be allowed to work from home beyond the 26 week maternity leave period. However, this depends on the organization she works for and the understanding between the employer and employee.
- The Bill introduces a provision which requires every establishment to intimate a woman at the time of her appointment of the maternity benefits available to her. Such communication must be in writing and electronically.

Though the idea behind the amendment is very noble and well-intended but there are several issues concerning the bill and this comment proposes to address the same.

No provision for paternity leave-

The bill is receiving a lot of flak from people all around, because it fails to provide any relief to fathers-to-be. The maternity leave for working women has been proposed to increase from the current 12 weeks to 26 weeks but has no mention for paternity leave. This leaves us pondering that is bringing up a child the duty of a mother solely? The bill assumes that only the mother is a caregiver and the father is an employee bereft of an active responsibility in childcare. It's a step back for gender neutrality in country like India where women have been demanding equality in status and opportunity since independence.

The ratio of women dropping out of the work force after becoming mothers is quiet startling too. Our country is one of the most rapidly growing economies in the world, but women represent only 24 per cent of the paid labour force, as against the global average of 40 per cent.[3] In the 15-59 years age group, women's participation is only 21 per cent in urban areas as against 81 per cent for men.

The bill does not address and propagates the lack of sustenance to men who have the desire to parent well. If they aren't given paternity leave, how will they develop a bond with their child,

[3] McKinsey Global Institute report, as quoted in Livemint.com, (Sep. 26 2016) available at, http://www.livemint.com/Politics/FhSn2BzO7e2DBwNRoUrEaI/Women-could-boost-GDP-by-700-bn-report.html

Moreover, it is a step back for equal pay for equal work[6] which is one of the directive principles of state policy under part IV of the Indian constitution. Mothers with appropriate jobs may be permitted to work from their homes. Thus in order to work around this provision and to make good on revenue spent on the salaries, the "nature of job" will be so molded that the employers will pay the women (working from home) far lesser as compared to their male counterparts thereby violating gender equality norms in the workplace. Provisions like these will certainly cause employers to view these measures as an undue burden. The amendment in the long run may perpetuate and sustain the gender gap in employment and in pay scales.

Mandatory crèche facility to be established by the organizations-

The Bill also makes it mandatory for organizations which have a workforce of more than 50 to establish a crèche either individually or with other companies within such distance as may be prescribed by rules and also to allow four visits to the crèche by the woman daily, including the interval for rest allowed to her, implying that establishments which do not have working mothers will be exempt from the obligation to maintain a crèche.

Another important matter of concern is that the conditions to be maintained at the crèche must be suitable and it must employ people only after careful background check for taking care of the children. With the growing crime against children as young as 3 months, it's important to do a careful scrutiny so as to protect children from physical and sexual abuses at the hands of crèche employees.

Only for women working in the organized sector-

Enactment of Maternity benefit bill 2016 is a great support for females who are working in organizations. Due to an escalation in nuclear families the social and family support for young parents is declining day by day. Due to this several young mothers are forced to leave their careers and tend to motherhood fully.

Implementation of the law

One of the major fallacies of any legislation is the inability or lose implementation of it. Irrespective of whether the legislation is beautifully drafted and aims to benefit a major chunk of people, if it's not implemented in its true spirit all the efforts go in vain.

For instance, under the new Factory Act, any establishment with more than 30 workers is supposed to maintain a crèche for which the designated labor inspectors are required to hold regular checks and see whether the law is being implemented or not.

"In reality, these crèche, do not keep more than 15 children and many of them also refuse to keep children aged below one year. These are unwritten restrictions.[8]" Women are often sacked or asked to leave during their pregnancy or after childbirth in contravention of the Act.

Conclusion

To ensure legitimate parity in employment, security of maternity, and encouragement of childcare, Lok Sabha members should make sure that the Bill extends maternity benefits uniformly and unconditionally to all women who parent a child. The employers should be under an obligation to provide standard crèche facilities and work-from-home options to all parents and not just to working mothers as childcare is a shared responsibility. Lastly, a non-discrimination clause should be added that no person should be discriminated against in employment for having availed any parental benefits under the law. The right decision will help in carving down gender discrimination and improving social outcomes. These provisions are implemented then women will not have to view career versus motherhood. The two can definitely mutually coexist.

CORPORATE GOVERNANCE IN INSURANCE COMPANIES: CRITICAL ANALYSIS OF *IRDA* ROLE

Dr. Veena *

Abstract

Effective and efficient corporate governance is the need of the day for companies and for financial stability and sustainable development. The protection of shareholders and stakeholders interest is prime concern of the corporate governance as they play as spinal-cord of the company governance. The insurance business is one of the most crucial elements of the financial sector and need to be governed with utmost care and caution for efficient financial results. The policy holders and shareholders are focal points for the insurance business. The insurance companies need to undertake efficient corporate governance systems for sustainable growth of the industry which forms the significant sources for the government. The Board of Directors of every insurance company is responsible for the effective governance and the Insurance Regulatory and Development Authority of India (IRDAI) is the supervisor or the regulator of the insurance business in India. The International Association of Insurance Supervisors have formulated the insurance core principles and laid down the standards for conducting the insurance business. The Insurance Core Principle 7 has set the standards and guidelines to the insurance companies and the insurance supervisors. The IRDAI has issued guidelines relating to corporate governance in 2009. It has notified the revised guidelines on corporate governance on May 18, 2016. This article has made critical analysis of the role of IRDA and provisions of the Insurance law and regulations concerning to the corporate governance in insurance industry in India.

Keywords *Policy Holders, Stakeholders, Mismanagement, Corporate Governance, Insurance Core Principle, Risk Assessment, IRDA, Whistle Bowler Policy*

I Introduction

Insurance business and services forms a major chunk of financial services and contributor to the economic development of our country. There is a close interaction between insurance and economic growth. 'As economy grows the living standards of the people increase, as a consequence, demand for life insurance business increases. As the assets of people and business enterprises increase in growth process... widening of the economy demand for new types of insurance products emerges.[1]" The above statement of Sri C Rangarajan, former Governor of Reserve Bank of India and well known economist, enlightens the key role of the insurance in the economic growth of a country. Insurance plays multifaceted role in the society as it provides protection against vulnerabilities like health problems, accidents, disasters and many other losses caused to the assets and people on happening of uncertain events. It promotes economic efficiency by risk transformation, risk pooling and risk sharing techniques. It aids economic development through its financial intermediation function by providing low cost and long term funds to the government for development activities. In precise, the insurance business helps to increase the public savings and deployment of funds as investments, for development under cooperative system. It mobilizes resources, accelerates and stabilizes the economic growth of a country.

A well-developed and constant evolution of insurance sector is a boon for economic development of a nation since it provides long-term funds for infrastructure development of that particular nation and at the same time strengthens the risk-taking ability by the citizens of the country.

OPPORTUNITIES AND PROSPECTS FOR FDI IN INDIAN INDUSTRIES

[1]Dr.K.Durga Prasad, [2]Dr.Banda Rajani, [3]Dr. Soofi Asra Mubeen
[1] Associate Professor, Centre for Management Studies, ICFAI, Law School, Hyderabad

ABSTRACT
Economy policy reforms have played vital role in the performance of the Indian economy since 1991. Among other things, the reforms have involved opening up the economy, making it more competitive, getting the Government out of the regulations, empowering the States to take more responsibility for economic management, and thereby creating a kind of competition among them for Foreign Investment. Foreign Direct Investment (FDI) in India has grown substantially in the last decade following the liberalization of Indian economy in 1991. FDI gives opportunities to Indian Industry for technological up-gradation, gaining access to global managerial skills and practices, optimizing utilization of human, and natural resources and competing internationally with higher efficiency. Most importantly, FDI is central for India's integration into global production chains, as it brings several advantages like new capital, technology, managerial expertise, and access to foreign markets, involving production by multinational corporations spread across location all over the world. India has one of the most liberal economy policy frameworks for FDI and foreign technology transfer. FDI up to 100 percent is permitted under the automatic route in most of the sectors.

Key Words: Opportunities, challenges,Prospects, Indian Industries, Sectrol Anlysis.

1. INTRODUCTION

Retailing is one among the most important sectors of Indian economy. The unorganized retail sector in India occupies 97% of the retail business and therefore the rest 3% is contributed by the organized sector.The unorganized retail sector contributes about 13% to the GDP and absorbs 6% of our labour force. On 20th September, 2012 the Government of India has approved 51% FDI in Multiband retail and 100% (revised) in Single Brand retail sector through Government Route with some riders. FDI within the retail sector in India will cause economic process and creation of latest jobs along side rural infrastructure development. But the opposite view point is that mass scale job loss will happen particularly in manufacturing sector with the entry of the large MNCs like Wal-Mart and Carrefour, Metro PLC and IKEA etc. (K. R. Kaushi and Dr. Kapil Kumar Bansal, 2012).To form capital for economic activities there's a need of stable financial sector and within financial sector banking sector play crucial role. Due to liberalization, globalization, deregulation, competitive disintermediation and economic intensification competition has grown and each country want to become independent and independent and thus demand for financial resources grown to several fold(Maathi K. Mathiyazhagan, 2005).To cater the economic demand, socio-political competition, economic complexities, increasing population, unpredictable challenges and to capitalize the macroeconomic environmental opportunities at optimal level Government of India (GOI) adopted cataclysmic structural and continuous reforms in Indian macroeconomic system. It started playing a parental role by stoking the engine of economic growth through garnering the internal and external resource in money supply and introduced policy of tectonic economic liberalization, globalization, digitalization and deregulation with metamorphic liberalized policy in financial sector which in result brought drastic change and supreme revolution in Indian financial sector and transformed conservative financial sector into global at par and led to the emergence for brand spanking new financial windows, non debt financial capital FDI, new banks, new instruments, new financial institutions and motivated foreign investors to invest in diversified industrial and manufacturing sector(Sayed Mohammad Tariq Zafar, Waleed Hmedat,SyedAshfaq Ahmed, 2017).

The present paper has been devoted to study and aimed at present the sectoral analysis of actual inflows of FDI as to find out the top sectors, which attract major portion of inflows of FDI and evaluate the sector-wise Prospects and Opportunities of Foreign Direct Investment in India.

The Human Rights Act, 1993: A Cratological Critique

Irfan Rasool[*]

The last 25 years have witnessed the emergence of a new human right actor, the National Institution for the Promotion and Protection of Human Rights—a brainchild of the Conference held in Paris in 1991—an independent body to look into the specific purpose of protecting and expanding human rights. The intention was to adopt a variety of functions for the protection and promotion of human rights depending on the domestic context. Accordingly the National Commission on Human Rights was established in India under the Human Rights Act, 1993. The said Act provided for the composition, functions and powers of the Commission. Against this backdrop, the paper makes an attempt to cratologically analyze the provisions of the Human Rights Act in the light of the controlling Constitution.

Introduction

The concept of democracy[1] lacks within itself any guarantee of basic human rights.[2] It was for this reason that Aristotle envisioned Polity or Constitutional government[3] so that regardless of members, everyone would receive the benefits of the guarantees of

[1] 'Democracy' is a noun, but should be an adjective. Because it is a noun, we tend to think that there is a thing—a particular system of government—which it refers to, and that all existing states can be put into some order of merit according to the degree they approximate to true democracy ... The word 'democracy' and its derivatives apply to the decision-procedures. In its original Greek sense, a decision is democratically taken if the answer to the question *who takes it?* is 'More or less everybody' in contrast to decisions taken only by those best qualified to take them, as a meritocracy, or those taken by one man, as in a autocracy or monarchy. The word 'democratic' has secondly come to specify the way in which a decision is reached; it is an adverb, answering the question *How is the decision taken?* A decision is taken democratically if it is reached by discussion, criticism and compromise. And thirdly, the word is used to characterize the spirit in which a decision is taken, as being concerned with the interests of all, instead of only a faction or a party. *See* J R Lucas (1976), *Democracy and Participation*, pp. 9, 10, Penguin Books.

[2] *See* contra, Ishwar Bhat (2004), *Fundamental Rights: A Study of Their Interrelationship*, p. 6, Eastern Law House.
A common perspective could be discerned in the political belief structures of Socrates, Plato and Aristotle. They were essentially aristocratic conservatives who spoke and defended the values, ways of life and attitudes of an aristocracy ... Plato equated democratization with moral corruption and degradation ... the incompetence and ignorance of politicians for that gave rise to factionalism, extreme violence, and partisan politics, which were the causes of political instability. Moreover, democracy did not tolerate highly gifted persons, a view that was reinforced by the execution of Socrates. Subrata Mukherjee and Sushila Ramaswamy (2004), *A History of Political Thought: Plato to Marx*, pp. 54, 55, PHI Learning Pvt. Ltd.

[3] Aristotle described four kinds of democracy which followed a progression from a moderate democracy, putting property qualifications, to an extreme democracy, where all restraints were removed, being totally lawless with full rights to demagogues.

Securitization of Financial Assets: A Boon or Bane Under SARFAESI Act, 2002?

Ravi Salaka[*]

In India, after Nationalization, the banks, most of them in the public sector, became an important tool for the socioeconomic revolution in the society, resulting in substantial changes to the commercial banking industry. As innovation supported by technology is constantly changing the face of the world of finance, it is today more a world of transactions than a world of relations. Most relations have been transactionalized. The overdue advances of banks in India were found to be mounting and in consequence the Non-Performing Assets (NPAs) in their portfolio are on the rise affecting badly on the banks viability. The Securitization and Reconstruction of Financial Assets and Enforcement of Security Interest Act, 2002 (SARFAESI) has been enacted with an intention to strengthen the creditors' rights through foreclosure and enforcement of securities by the banks and financial institutions without substantial involvement of the courts of law. This paper is an attempt to analyze the legal framework for securitization of financial assets and suggests some recommendations for improving the financial sector.

> *Just as the electronics industry was formed when the vacuum tubes were replaced by transistors, and transistors were then replaced by integrated circuits, the financial services industry is being transformed now that securitized credit is beginning to replace traditional lending. Like other technological transformations, this one will take place over the years, not overnight. We estimate it will take 10 to 15 years for structured securitized credit to replace, to displace completely the classical lending system—not a long time, considering that the fundamentals of banking have remained essentially unchanged since the Middle Ages.*
>
> **– Lowell L Bryan**

Introduction

Today, it is more a world of transactions than a world of relations. Most relations have been transactionalized. Given that, the legislation on security interests has been a very significant one. This significance has only increased over the years with increasing preponderance of credit and security. The Indian growth story is now a global theme. In this new era of resurgence, Non-Performing Assets (NPAs) have come down

INTERNATIONAL COMMERCIAL ARBITRATION: GLOBAL JURISDICTIONAL ILLUMINATION

Dr. M. Madhuri Irene[*]

"Every human benefit and enjoyment, every virtue, and every prudent act, is founded on compromise and barter. We balance inconvenience, we give and take, we remit some rights that we may enjoy others; and we chose to be happy citizens rather than subtle disputants".

Edmund Burke (Speech on Conciliation with America, 22 March 1775)

Abstract

When law runs with laity and levity, justice will be a freely purchased product on the streets. Law and Justice are not two distinct facets of fact but a unified amalgamation of truth and service. Their emergence is concomitant and coterminous and their existence is interdependent. Law is meant to yield justice and justice is to exemplify the nobility of law. This minimum and legitimate expectation of the ultimate consumer of justice system is universally applauded and acknowledged. The modes and means of justice delivery process may be different and various depending upon the nature, need and content of the issue or problem i.e. conventional, progressive or inventive. From Afghanistan to Vatican, the common thing in existence is Dispute and the perpetual quest is not for settlement but for 'resolution'. Resolution is achieved through Arbitration. Settlement subside the differences but resolution through arbitration annihilates the differences and disputes. To-day, human relations are not regional but global. Global village yearns for human bondage with peace and prosperity. The nucleus of global human bondage through fair and just trade relations is always entrenched by International Commercial Arbitration

Keywords *International Commercial Arbitration, Dispute Resolution, UNCITRAL, International Trade*

I Neo Light for Resolution

Business is fragile for buyer and audacious for seller. Despite the agreed atrociousness of the commerce world, the business dealings are moving swiftly and with buoyancy even in the modern global economy. It is natural that business implies controversies and disputes. Dispute is coterminous with business operations. The tradition of settlement of disputes through a neutral third party appointed by the parties has strong origin in India. There are arbitration tribunals recognized even in the ancient legal texts and digests. This third party's dispensation of justice is not only a symbol of moral and ethics disposition but also an authoritative legal settlement.

II Commercial Arbitration - A Legal Penumbra

In the present globalized era, International Commercial Arbitration has established itself as the best method of determining complex commercial disputes all over the world due to which States have modernised their laws of arbitration to facilitate this new need. International Commercial arbitration is a private method of dispute resolution, which is chosen by the parties themselves as an effective way of putting an end to disputes between them, without recourse to the courts of law. It is conducted in different countries and against different legal and cultural backgrounds, with a striking lack of formality in which there are no national flags or other symbols of State authority.[1]

WOMAN AS A KARTA OF HUF- ISSUES AND CHALLENGES

Priti
Assistant Professor,
Department of Law,
I.C.F.A.I. University, Hyderabad, India.

ABSTRACT

Hindu society has grown tremendously and has progressed in line with the fortitude of the contemporary times and so has the status of women changed radically not only in the legal domain but socially too. A female was a part of the Hindu joint family, even prior to The Hindu Succession Amendment Act, 2005. A Hindu joint family consists of a common ancestor and all his lineal male descendants up to any generation along with their wives (or widows), and unmarried daughters of the common ancestor and of the lineal male descendant[1]. The Hindu Succession (Amendment) Act, 2005 made a daughter a coparcener in the ancestral property of her father and she was conferred with the same rights and duties as a son. It appears that with the inclusion of daughters of a coparcener with equal rights as those of sons, the ascension of a daughter as karta or manager cannot be ruled out.[2] This however would be dependent upon several factors like the presence of other senior males in the joint family or her interest in the position of the karta.

This Paper Shall Discuss Woman as a Karta of Huf-Issues and Challenges.

Key Words: Woman, Karta, Challenges, Ancestral, Property, Coparcener.

The Hindu society has grown tremendously and has progressed in line with the fortitude of the contemporary times and so has the status of women changed radically not only in the legal domain but socially too. A female was a part of the Hindu joint family, even prior to The Hindu Succession Amendment Act, 2005. A Hindu joint family consists of a common ancestor and all his lineal male descendants up to any generation along with their wives (or widows), and unmarried daughters of the common ancestor and of the lineal male descendant[3].

The joint family property is managed by the karta who is also known as the manager, he occupies a pivotal position in the joint family. A karta has certain unique powers and rights over the joint family property and as a head of the family he acts on behalf of other members. He is the master and cannot be questioned or held accountable except on the account of misappropriation, fraud or conversion.[4]

Who could be a karta?

Ordinarily, the senior most male member is the karta in the joint family[5]. He does not owe his position to an agreement o the consent of the other copaceners, he is entitled to that position because it is the eldest in the joint family. So long as he is alive, may be aged, infirm or ailing, he is entitled to kartaship[6].

Devolution of coparcenary property of a daughter- Issues and challenges in the light of Hindu Succession (Amendment) Act, 2005.

*Priti**

Introduction

A Coparcenary may be defined as a "unity of title, possession and interest". A Hindu Coparcenary is a much narrower body than a Hindu joint family; it includes only those persons who acquire by birth an interest in the coparcenary property. The constitution of the coparcenary differed depending on the customs and practices of the region. The multiplicity of customs led to the broad classification of customs related to property in two Schools, *viz.*, the Mitakshara and the Dayabhaga. According to the Mitakshara School, the foundation of coparcenary is first laid on the birth of a son. Whereas according to the Dayabhaga School, the foundation of a coparcenary is laid on the death of the father. So long as the father is alive, there is no coparcenary in its strict sense of the word between him and his male issue. Prior to 2005, the Mitakshara coparcenary consisted of the sons, grandsons, great grandsons of the holder of the property for the time being. Feminists had been demanding this amendment for some time now. They had severely challenged the "male- stream" thinking ways and heavily criticized the male dominant structure in the realm of succession and inheritance laws.

This research paper is solely focused and limited to the incidents of Mitakshara coparcenary and tends to highlight the major shortcomings in the Hindu Succession (Amendment) 2005, Act. The researcher has discussed the Hindu Succession Act with respect to women's inheritance rights and further discusses the socio-legal consequences of the 2005 Amendment Act on the modern Hindu family.

ABSTRACT

We never realized when Siri, Alexa and Google have become our best friends and it would not be too wrong to say that these are the names that we reach out to when we open our eyes in the morning. When the whole world is going e-way, converting itself into an e-world and the social networking sites and blogs has entered the veins and arteries of each profession, legal profession has also not remained untouched by this. With this outbreak of Covid19, it has become imperative for us to adjust to the new normal. Globalization is the consequence of the interdependence amongst nations in the context of economicdependence.Law is a profession, which is literally unable to exercise its work without the use of adequate information. Information is indispensable for the effective practice of law.The Internet serves as a powerful mechanism for the collaboration, communication and interaction between individuals regardless of their geographic location.New communication technologies through the Internet offer opportunities for law students, faculty and practicing lawyers to support the learning process.

COMMUNITY SANITARY LATRINES IN INSANITARY CONDITION: REQUIRES AMENDMENTS IN MANUAL SCAVENGERS ACT

Dr. S. Kannan
Assistant Professor
ICFAI School of Law
IFHE (Deemed University), Hyderabad – 501203
Email:kannan.soul@gmail.com

Abstract

The Prohibition of Employment as Manual Scavengers and their Rehabilitation Act, 2013 provided provision for survey of insanitary latrines (Sec 4[1]a) and also given provision to demolish the insanitary latrine or convert into sanitary latrine (Sec 4[1]b). Further, in the said Act, provision also given to construct community sanitary latrines and to take care of its hygienic condition at all times (Sec 4 [3]). In this context, many of the government constructed community sanitary toilets for public use are not in sanitary condition. Due to this, possibility of open defection within the toilet complex and also in the surrounding areas lead to the requirement of manual scavenging. How this situation is handled by the local authorities is the question mark. Against this background, to study the availability of community sanitary toilet facility, its condition and its maintenance, empirical exercise will be carry out in Chevella revenue division and its four Mandal headquarters of Rangareddy district in Telangana. Further the study also analyses, the working condition of sanitary workers and chances for any other form of prevalence of manual scavenging practices in the study area. The study will also suggest amendments regarding the maintenance of community sanitary toilets.

Key Words: Scavenging, Sanitary Toilets, Mandal, Authority, Maintenance

Article History

1. Introduction

Manual scavenging is the most demeaning, defiling, unhygienic and hazardous work that one can never think of. The problems of manual scavenging persist both in the urban as well as in rural areas, but the nature of problems is different. In rural areas, the existence of dry latrine and women engaged as manual scavengers, cleaning, carrying and disposing the human excreta. According to the Census of India, 2011[1], there are more than 2.6 million dry latrines in the country. There are 13, 14,652 toilets where human excreta is flushed in open drains, 7, 94,390 dry latrines where the human excreta is cleaned manually. Seventy three percent of these are in rural areas and 27 percent are in urban areas.In the case of urban, some places reported dry latrines (27%), but major issue of Women scavengers is with cleaning of open defection sites, gutters and drains and male scavengers asked to do more physically demanding work of sewer or manhole blockage removing, septic tank cleaning, etc.

Book Review - FinTech, BigTech and Banks : Digitalisation and its Impact on Banking Business Models

B. Hari Krishna [1]
A. Arun Kumar [2]

Abstract

This is a book review of *Fintech, BigTech and Banks : Digitalisation and its Impact on Banking Business Models* by Alessandra Tanda and Cristiana - Maria Schena. Both the authors' effort in framing the title itself attracts the attention of the readers. The book highlights the important phase of digitalization of financial markets and services, thereby converting them into the digital economy. The book highlights micro to macro level of discussion about both the fintech and bigtech firms. Further, it elaborates on the operational and regulatory challenges faced by the financial institutions while adapting themselves to the new technologies with a sole aim to meet the customers' expectations in terms of varied innovative products and services. It explains the strategic approach of the large banks by investing and partnering with fintech and bigtech firms with a motto of enhanced customer services by offering innovative financial products and services. The challenges faced by small banks in the competitive market are also discussed, and finally, the book synthesizes about the regulatory framework and the digitalization of financial products and services.

The Surrogacy Regulation (2019) Bill of India: A Critique

By Astha Srivastava[1]

Abstract

Assisted Reproductive technologies (ARTs) like In Vitro Fertilization (IVF) and surrogacy have made aspirations of parenthood come true for many. With quality medical services, low costs and an indifferent regulatory regime, the surrogacy industry, particularly of the commercial and trans-border variety, has boomed in India so much so that India had once been termed as the 'baby factory' of the world. Through successive administrative measures the government of India has tried to regulate surrogacy with a view to prevent exploitation of women. At least two comprehensive bills to regulate various aspects of surrogacy arrangements have been tabled in the Parliament, viz: The Assisted Reproductive Technologies Bill -2008 and the Surrogacy Regulation (2016) Bill, both of which did not see light of the day. The Government's initiative to table a new bill on this subject is a welcome move. The Surrogacy Regulation (2019) Bill brings clarity on the rights of stakeholders in surrogacy arrangements and seeks to protect the vulnerable. This is an opportune time for a comprehensive discussion on all aspects related to surrogacy arrangements in India so that the legislation becomes an effective tool for social progress. In particular, considerable thought is needed on pressing issues arising out of the provisions of this bill, such as the possibility of a flourishing grey market in cases where commercial surrogacy is completely banned and the possibility of soft coercion of women by relatives, against their own choices, for altruistic surrogacy by matrimonial families. The rights of the child in cases of arrangements in contravention with the proposed law also need deliberation. This paper discusses the lacunae in the bill on the above aspects taking into consideration the Indian experience and that of the world and attempts to propose possible alternatives that may be adopted for a more meaningful and just legislation.

Keywords: Assisted Reproductive Technology (ART), Commercial surrogacy, Altruistic surrogacy, Surrogate, Surrogacy Regulation (2019) Bill.

Introduction

Black's Law Dictionary defines "surrogacy" as the process of carrying and delivering a child for another person (Garner, 2009). This arrangement is often referred to as 'renting of the womb'. There are multiple emotional, legal, medical and ethical dilemmas and complex possible scenarios involved in this arrangement. On the one hand, are the hopes and desires of commissioning parents which can be fulfilled by using technology; on the other, there are chances

THE INDIAN LEGAL REGIME REGULATING INTER- COUNTRY ADOPTIONS

Dr. Ramadevi Gudemela[1], Ms. Aditi Mane[1]
[1]Assistant Professor, ICFAI Law School, IFHE, Hyderabad
[2]Research Fellow, Symbiosis Law School, Pune, Symbiosis International (Deemed University)

ABSTRACT

The need for a specific legislation on the Inter- Country Adoptions (ICA) in India was stated in the 153rd Law Commission Report on ICA, 1994 which led to emergence of Central Adoption Regulating Agency (CARA) guidelines issued in various series of Laxmikanth Pandey's case which have also acted as source of regulation for inter country adoptions since 1990's. The paper highlights importance of ICA from the view point of NRI's and OCI's and foreigners living in reciprocating (Hague Convention relating to ICA countries) and non-reciprocating countries. The study also lists out the reasons for fall in the ICA statistics from India to Scandinavian countries. The aim of the paper is to analyze the provisions of Juvenile Justice Act, 2015 with respect to ICA and the comprehensiveness of the provisions incorporated thereby. The paper aims to provide remedies for the fallacies in the implementation of the Act and the role of CARA in dealing with ICA.

Keywords: Inter Country Adoptions, Juvenile Justice, CARA guidelines, Hague Convention

Article Received: 10 August 2020, Revised: 25 October 2020, Accepted: 18 November 2020

Introduction

Based on the principles issued in *Laxmikant Pandey* v. *Union of India [5]*, Indian Government has comprised a Central Agency - Central Adoption Resource Agency under protection of the Women and Child Welfare Ministry, to regulate Adoptions (both In-country and ICAs). The Agency is responsible for issuing guidelines and for regulating adoptions, both Domestic and ICA, in India. Presently, The Government of India has repealed the JJ Act, 2000 and re-enacted a new JJ Act, 2015.

This Act is a secular gender-neutral law for all the people in the society. Any one irrespective of their religion can adopt a child under this Act. This Act defines under Sec. 2 the terms like "adoption", "Best Interest of Child", "ICA", which are in consonance with Hague Convention. Moreover, Act describes "Central Authority" and gives it a status of "Statutory Authority" in the Country for regulating Adoptions. The Act primarily, prescribes procedure for ICA under a separate chapter VIII. This Chapter deals with "Adoptions" that presents comprehensive requirements for adoptions and penalties for procedural non- compliance. Hence, the Provisions of the Act are based on the International Conventions and are in consonance with them, which clearly reflect a more Child-Centric Act. It also considers the principles of "Best Interest of the Child" clearly. [6] As per provisions of this Act, the child who is given in ICA is cleared with adoption procedure and formalities in child's origin country where court finally grants adoption deed to the Prospective Adoptive Parents under the Juvenile Justice Act, 2015.

The regulations even prescribe Post Adoption procedure. The whole system is now made virtual and every application is mandated to be followed by the Receiving Countries Authorized Adoption Agencies, thereby bringing in more transparency in the adoption process.

Access to Institutional credit among Schedule Tribes in Telangana – A case study of Shankarpally Mandal in Ranga Reddy District.

S.Kannan

Abstract

The persistence and dominance of non-institutional financial sources in the rural credit is a major concern in India, particularly among the Scheduled Tribes households. In this context, present study focuses on the penetration of credit flow among the tribal household in Telangana. The study covers both macro and micro-level perspective of access to institutional and non-institutional sources among the tribal households. The macro-level and micro-level analysis portrays that they depend upon non-institutional credit mainly from money lenders and relatives. Further, borrowing from money lender makes them to lose their rights on selling their farm products on their own, which leads to falling in debt trap. The study suggest that formal financial institutions should develop more flexible products and services to meet the income and expenditure pattern of the tribal households, to come out of the debt trap.

1. Introduction

Borrowing money (or going for credit) to manage the various livelihood aspects is one of the critical condition for the Tribal households. The various livelihood activities that tribal people conduct typically include agricultural cultivation, daily wage labour (farm and non-farm labour), forest collection/hunting, fishing, animal husbandry, etc., The livelihood aspects in the form of food grains, food items (fish, meat, milk, vegetables, fruits, etc.,) and fuel wood directly fulfill the food need of the household. While the need for other non-food items like clothing, soap, footwear, medicine, celebration of festivals and to conduct important (life cycle) ceremonies they require money. When their income is not sufficient and lack of poor savings to manage the non-food items they start approaching the financial agencies to borrow money. A large number of formal and informal financial agencies lend

EVOLVING CAPACITIES OF CHILDREN AND JUVENILES IN CONFLICT WITH LAW IN INDIA - AN ANALYSIS

D.V.N.Murty

ABSTRACT

Child is unique in himself or herself. A child happens to be what an adult is in front of him or her.In our daily life we hear about different crimes from petty to heinous being committed by children who are either economically affluent, or poor or orphans. They are the takers of different fate but what is common among them all is that they are children still in the stage of development. When a child develops right from infancy to the teenage he or she has got some capacities in all these stages. These capacities may be to take a decision or to form an opinion or any talent which may be much beyond their age which they want to express but the adults around them unmindfully snub them for what they are saying or doing. This leads to suppression of their feelings affecting their psychologies which later on either construct them or destruct them. This psychological depression sometimes leads some children to commit crimes through which they satisfy their frustration which emerges out of the former. Children are taken for granted as not having any capacity to think, act or take any decision, but children at every stage have got some capacities which must be respected. This paper will deal with the definitional aspect of evolving capacities, reasons for the juvenile delinquency in evolving children, different reasons for such delinquency and the responsibility of the parents or guardians in making better the future citizens.

Key words: Juvenile; evolving capacity; child psychology; societal influence; parents role.

INTRODUCTION

Juvenile means a young person with immaturity with little bit or more with childishness. In recent few years with the rise in the electronic media we found that in most of the crimes that are reported a juvenile is involved. Children commit most of the crimes relating to the robbery, theft, molestation, murder and petty crimes like pick pocketing etc. When a child commits any offence then the society recognizes them as an offender, similarly when all the juveniles who are appearing either before the juvenile justice boards or are in the observation homes are made to assemble in a place, people recognize them as an offender with different crimes, but before recognizing them as offenders, we must understand that they are children. Going by the definition of child, child is any person who is below the age of majority, the age

Abstract
Change is the law of life, Law always supports changes for development and prosperity. Science is the inevitable tool for achieving progress in human civilization. The relationship of science and law is as old as the creation, the modern tendencies of human life and human attitudes Vis-a-Vis the technical development often lead to miscalculations and over enthusiastic estimations.
The fact is that both science and Law are the two sides of human life and they always move hand in hand for happy human life. Genetical Engineering, Cloning, Stem cell therapy and Clinical Trials etc., have been few of modern perplexities.
Traditionally Clinical Trials are associated more with serving the humanity, as a trend to understand disease patterns and seeking solutions for the dreadful diseases in the terms of better diagnostics. But in the recent times through Clinical Trials on humans, have created great alarm as it has been directly impacting on Human Rights philosophy.
This write-up intends to sketch a general sweep on the issues of Clinical Trials which have consumed many lives in the process of the Experiments and procedures by the scientific researches and the pharmaceutical sector.

"'Science in itself' is nothing, for it exists only in the human beings who are its bearers. 'Science for its own sake' usually means nothing more than science for the sake of the people who happen to be pursuing it."

Rudolf Virchow

Introduction

India has been continuing to be the cynosure of all civilizations, creatures, preachers, practitioners and wonders. India's pride and reputation as giver of knowledge even at the cost of self-destruction, is mysterious qualitative attitude inviting perdition from outside world. Law and Science in our Country were embraced spiritually exposing the scientific propositions of Indian science which always permitted scientific inventions to touch human body for relief and alleviation of pain, and creatures hardly were sacrificed for predictions and practical experiments. Modern Indian scientific knowledge appears to have lost its

Corporate Crimes – Investigations and Adjudication: A Snapshot

*Veena**

The white-collar crimes are shaking the corporate base by siphoning off the funds of the companies through various unfair means and schemes. Corporate frauds are unearthed only after enough damage has been caused. It is very difficult to anticipate or predict the actions, as the parties involved are influential in the society. Even directors and other prominent employees having good reputation are involved in such huge monetary manipulations. Mostly, they involve in unauthorized diversion of funds, exploiting the flaws in the accounting systems, data misuse, resources misuse, formation of shell companies, undervaluation or overvaluation of assets and overstating of profits to attract investments. Unless a serious in-depth investigation is undertaken, it will be difficult to adjudicate and punish the true offender. There is every need to strengthen the whistle blower mechanism to avoid the untoward frauds and crimes in the corporate world. Against this backdrop, the paper presents a snapshot of the investigations and adjudication of corporate crimes.

Introduction

The expansion of business empires has directly contributed to the expansion of the corporate sector because of their inherent advantages over any other forms of business. The concept of limited liability and availability of capital to corporate business houses are other contributing factors for the growth of the company model of business. The growth of business in the corporate sector has also thrown out many challenges, and companies are becoming the hideout for illegal activities such as money laundering. The changed business and economic environment has opened up new pages containing various guidelines and best practices for governing the company for the benefit of the business houses on the one hand and other stakeholders on the other.

Taking shelter under the advantageous status of the companies under the law, business people with malafide intentions started playing with the money of the general public. This approach has led to many wrongs and crimes in capital generation, utilization and distribution. Many manipulations are made, fraudulent transactions are carried out, and unwanted money accumulations are created resulting in facilitating the business people to control the government itself. In the light of the minimum regulation and control of the corporate business and major share of business in the economy, many crimes are committed by professionals. The corporate crimes are serious problems having direct impact on the economy of the country in addition to that on the company itself. Experienced professionals are designing the crimes in business, not known at the initial stages, but explode at a later date and time. A white-collar crime

"PUBLIC HEALTH SYSTEM AND COVID CONUNDRUM" (With special reference to Primary Health Care)

Hamsika Moparty[1], Madhuri Irene[2]

Medical Researcher[1]
Associate Professor, ICFAI LAW SCHOOL, ICFAI Foundation for Higher Education, Hyderabad[2]

ABSTRACT— Health Care is not an exclusive province only of doctors, hospitals and social services but a legal mandate to State to ensure right to life with dignity to its citizens in compliance of national and international covenants. Through Hippocratic Oath, health care depicts an unending sea of medical service for humanity beyond parochial cleavages of race, religion, ethnicity, property and penury, and "Health for All" has become a clarion call under the aegis of Millennium Development Goal. Public Health Care throughout the globe is poised to vindicate healthy societies and citizenry by thwarting the health inequalities hosting on social stratification and unequal social, economic and political pitches. Public Health Care system is an instrument of social justice to be operated by both the ruler and ruled. India like many other developed countries built up four-corned network of medical services covering urban and rural areas. Public health systems, everywhere, are grappled with communicable and non-communicable, emerging and re-emerging diseases like drug resistant T.B., malaria, SARS, avian flu, HIN and Corona pandemic. Covid-19 the newly detected invisible virus playing truant with medical profession devouring millions of people throughout the globe has become most dreaded enemy of public health and human existence. Though our medical researches and solutions portray silver lines of hope for cure, the non-recurrence of corona death-dance is not fully assured, and threat of Covid-19 in various forms looms large over the public health. Researches throughout the world roar against the Corona pandemic, and health is sought to be not a mere escape from death but an escape from disease. The statistics of Covid-19 pandemic are frightening that need to be arrested and annihilated through a collective global endeavor to save humans rich or poor or great or small. This article intends to portray a comparative study of the deadly prevalence of Corona virus and its impact on public health system and human existence, and the efforts of W.H.O. to contain the epidemic.

KEYWORDS: Covid-19, Corona Pandemic, Public Health Care, Emerging and Re-emerging diseases, World Health Organization, Millennium Development Goals.

"Health is not mainly an issue of doctors, social services and hospitals. It is an issue of Social Justice" [1].

1. HEALTH – FROM INDIVIDUAL TO UNIVERSAL OUTLOOK:

Our ancient adage – When money is lost nothing is lost; when health is lost something is lost and when character is lost everything is lost – applicable to medical profession indicates the lofty ideals of medical profession i.e. medical professionals prefer to save life before money, consider ill-health of an individual as a deprivation of societal vitality and any disregard of these two precious principles results in loss of professional character of a medico, which has been tersely adumbrated in the Hippocratic Oath coupled with the reflections of ethics of medical profession. Through Hippocratic Oath, health care depicts an

Indians are gold lovers and invest a major portion of their finances in buying gold ornaments which reflect status and provide a safe investment option. However, most of the gold in Indian households lies idle in bank lockers (Kumar, *Arthshastra Indian Journal of Economics & Research*, 2014), safes and vaults making it a dead investment (Laurence, *International Advances in Economic Research*, 2000). The demand for gold in India has resulted in a surge in gold imports which inversely affects the value of the rupee and is creating an outflow of currency into world trade (Laurence, *International Advances in Economic Research*, 2000). The idleness and unproductive use of gold in India is creating a gap in the Indian economy (Panda et al., *Indian Journal of Finance*, 2016). Gold monetization can help fill the gap without importing gold from other countries (D'Souza, *Economic and Political Weekly*, 2015). Realizing the need to increase the circulation of gold in the market and to reduce gold imports, gold prices and the burden on the Indian economy, the Government of India (GoI) introduced initiatives such as gold bonds, gold monetization and gold coin schemes in 2015 (Government of India, Gold Monetization Scheme, 2015, https://www.dea.gov.in/gms2015) (Online Supplemental Appendix Table 1). A thorough literature review revealed studies related to the importance of gold monetization for macroeconomic stability, the emotional attachment of Indians to gold, and bankers' and refineries' perception of gold monetization policy in India (Singh et al., *IIMB WP No. 534*, 2017 https://repository.iimb.ac.in/bitstream/123456789/7725/1/WP_IIMB_534.pdf). No existing literature was identified explaining the performance of these gold bond schemes (GBSs) and underlying reasons for this performance in India. The present research attempts to fill this research gap and study the reasons underlying the non-performance of GBSs in

Prisoners Right to Conjugal Visitation: A Legal Perspective

Dr.P.L.Jayanthi Reddy

Assistant Professor

IFHE,HYDERABAD

Prison Population in India has increased tremendously in recent years. The growing prison population led to various challenges before prison administrators. One of the recent challenge is the right to conjugal visitation of convicted prisoners. It is considered as a privilege for prisoners who have exhibited good behaviour during their term of incarceration. In recent times the Courts have taken a progressive approach and various countries allowed conjugal visitation and also considered it as an important human right. Studies backing conjugal visits recommended it as a factor to cut down crimes in Jail and to help reform inmates. Recently the Delhi High Court directed Delhi government and Director General of Prisons to respond regarding the petition filed by a lawyer and social activist seeking to hold conjugal visits in jail as a fundamental right of prisoners and their spouses.[1] In 2018 the division bench of Madras High Court Justice Vimala Devi and T.Krishna Valli granted leave for the 'Purpose of Procreation' to the convict who is serving a life term imprisonment by inspecting international perspective of laws in other countries which have progressive approach towards such a visit.[2] Internationally the idea of conjugal visit is slowly adopted by several countries worldwide based on the agreed grounds that conjugal visits help in preserving family bonds and reduce tendencies in prisoners to break prison rules and regulations. A correctional rehabilitation model for inmates has been recommended by psycologists, psychiatrists and academicians. Even the prison reforms suggest a correctional rehabilitation model and also agree that conjugal visits help an inmate to return to normal life after being released.

India has not codified the rights of prisoners. Hence there is no legislation. It is the Judiciary that has recognized a long list of rights of prisoners under the Constitution of India. Moreover it is because of absence of legislation, these rights are found only on paper and no prison authority follows these rights. It is based on the precedent law which is more powerful than legislation and binding on all the courts in India. It has been rightly observed by Justice V.R. Krishna Iyer J: "In our world prisons are still laboratories of torture, warehouses in which human commodities are sadistically kept and where spectrums of inmates range from drift-wood juveniles to heroic dissenters".[3] It was observed that the rights of prisoners are mentioned in the Jail Manuals and that prison and its administration is a State subject as it is listed in List II in Schedule VII of the constitution of India. But a temporary right exists i.e to all the prisoners .They have right to apply for the temporary release from the prison on the specified grounds mentioned either in the local Act or Jail Manual, as the case may be. However, the number of days for which a prisoner is eligible for a furlough or parole is not provided in the Central Act and neither there are any guidelines prescribed. Further as furlough and parole are State subjects and Jail Manuals of different States are so old and confusing that their meanings are not at all clear. The Bombay High Court held that release of furlough is a legal and substantial right of the prisoner and denial of the same must be based on material facts indicating that the same otherwise it would disturb public peace and tranquility.

THE EVOLVING CONCEPT OF COMPENSATION TO THE VICTIMS OF TERRORIST ATTACKS IN INDIA

Dr. Sumanta Meher

ABSTRACT

The concept of compensation to victims of crime has made its entry into the criminal jurisprudence of India in 2008 through an amendment of the Code of Criminal Procedure (India), 1973. Under the amended law, the victims of general crimes can avail of financial assistance under Section 357A of the Code of Criminal Procedure, 1973. However, it is opined that the above general provisions of criminal procedure are not adequate to all the victims of crimes as all the victims of crimes are not homogeneous. For instance, victims of terrorist attacks can always be differentiated from the victims of any other crimes, on considerations of nature of violence and injury suffered. In the absence of a specific law for the victims of terrorist attacks, the Central Government has framed the specific Assistance Scheme in 2008 and reframed it in 2016 for providing financial support. However, the implementation of the above Assistance Scheme raises several pertinent issues. After considering the above facts, the paper aims to ascertain the initiative made in the international sphere in the development of the concept of support to the victims of terrorist attacks. The key purpose of the work is to trace the development of the concept of compensation to the victims of terrorism and the contemporary issues in the Indian legal framework. The paper analyzes the Indian statutes and judicial decisions concerning the financial help to the victims of terrorist attacks. The paper also appraises the Assistance Schemes made by the Government of India for the compensation to the victims of terrorist attacks. Based on the study, this paper suggests a specialized robust legal framework towards compensatory justice to the victims of terrorist attacks in India.

CRIMINAL PUNISHMENT WHERE IS THY STING? THE POST NIRBHAYA SCENARIO

Dr P.L.Jayanthi Reddy

Assistant Professor

IFHE

"No punishment has ever possessed enough power of deterrence to prevent the commission of crimes. On the contrary, whatever the punishment, once a specific crime has appeared for the first time, its reappearance is more likely than its initial emergence could ever have been."

... Hannah Arendt[1]

Introduction

In a war against the crimes against women in India the web of the Criminal Justice System of our country kept on expanding and has been trying to get more and more tough and harsh with the perpetrators over a period of one and a half century now.[2] After having travelled so long in this battle what we get to see today in our country is utterly disheartening. The National Crime Reports Bureau of India released a tragic picture of the Indian crime status reporting an average of 80 homicides, 289 kidnappings and 91 rapes committed every single day in 2018 across the country.[3] Taking the things from bad to worse the 2019 NCRB Report brings out the number of the crimes against women going up by 7.3% between 2018 and 2019.[4] Unfortunately, this is what India has to show to the world after inserting several new offences in the Indian Penal Code and making the existing criminal punishments more stringent in a bid to curb the menace of several heinous crimes committed against women.[5]

Following the nationwide public outrage over the ghastly rape case of Nirbhaya,[6] the Criminal Law (Amendment) Act of 2013 was brought into force inserting in the Indian Penal Code new offences[7] and

1 (1906-75), German-born U.S. Political Philosopher. Eichmann in Jerusalem, Epilogue (1963).

2 As early as in 1856 the special penal legislation started coming into existence to curb the menace of crimes against women in India: The Immoral Traffic (Prevention) Act, 1956; The Dowry Prohibition Act, 1961 (28 of 1961) (Amended in 1986); The Indecent Representation of Women (Prohibition) Act, 1986; The Commission of Sati (Prevention) Act, 1987 (3 of 1988); The Preconception and Pre-natal Diagnostic Techniques (Prohibition of Sex Selection)] Act, 1994, The The Preconception and Pre-natal Diagnostic Techniques (Prohibition of Sex Selection)] Act, 1994; Protection of Women from Domestic Violence Act, 2005; The Sexual Harassment of Women at Workplace (PREVENTION, PROHIBITION and REDRESSAL) Act, 2013; The Criminal Law (Amendment) Act, 2013; and the Criminal Law (Amentdment Act) 2018. Changes were also brought in the legislations that relate to this problem namely, the Indian Penal Code,1860; The Indian Evidence Act,1872.

3 Average 80 murders, 91 rapes daily in 2018: NCRB data, New Delhi, January 09, 2020. https://www.thehindu.com/news/national/average-80-murders-91-rapes-daily-in-2018-ncrb-data/article30523916.ece (According to the data, overall, 50,74,634 cognizable crimes were reported consisting of 31,32,954 Indian Penal Code (IPC) crimes and 19,41,680 Special and Local Laws (SLL) crimes registered in 2018, up from 50,07,044 in 2017.)

Email: iti.savernika@gmail.com

A conspicuous feature of cities in India is that the basket of revenue sources with municipalities is very narrow. However, the authorities have not exploited the revenue sources already available to them such as property tax, vacant land tax, and other land-based revenue instruments. This is puzzling as land values in Indian cities are increasing exorbitantly, creating windfall benefits to landowners. The economic theory highlights the merits of land as a tax base to finance local public goods on efficiency, ability to pay, equity and benefit principles. Further, internationally, countries have successfully adopted land-based instruments to finance, urban development projects during their urban transition. This article attempts to draw lessons from theory and practice for municipal finance reforms in India. As the context of fiscal federalism differs between countries, obviously not all revenue instruments adopted in other countries can be readily applied in India. Accordingly, we study the initiatives of Hyderabad and Bengaluru cities in using urban land as a resource to identify appropriate instruments for Indian cities. We combine theory with the practices followed by the two pioneering cities to suggest a reform agenda in India for designing land-based tools to finance city infrastructure and services.

1 | INDIA: CHALLENGES OF FINANCING CITIES

India's urban population, estimated at 410 million in 2014, is projected to rise to 814 million by 2050 (United Nations, 2015). Catering to the housing, infrastructure and civic service needs of such huge numbers in cities and towns is a daunting problem for policy-makers and administrators. McKinsey (2010) projects that India would need to build 38 million affordable homes to plug the current backlog and meet the projected gap in the demand for affordable housing in urban areas. It would require 700–900 million square meters of commercial and residential space each year till 2030. Connecting these spaces will require 2.5 billion square meters of new roads and 7,400 km of new metros and subways, representing 20 times the infrastructural capacity added in India since 1999. While the "growth" needs of urbanisation are huge, the "backlog" and "current" needs are also substantial. According to the 2011 census, only 71% of the urban population had access to individual water connections. Only 44.5% of urban households had access to closed drainage; 37.3% is subjected to open drainage and 18.2% have no drainage at all. Public transportation systems in most cities are grossly deficient. While urban problems are massive, the state of municipal finances required to meet the urban infrastructure and service needs of Urban India is precarious.

McKinsey (2010) estimates that India needs to spend Rs.9.74 million crore in its cities by 2030, with Rs.5.31 million crore for capital expenditure. The largest demand for capital funding would come from affordable housing – almost one-third, followed by mass transit. If we exclude affordable housing, the capital expenditure required until 2030 would be Rs.3.54 million crore. The High Powered Expert Committee (HPEC) for estimating the investment requirements for urban infrastructure services (2011) estimates that India would need Rs.3.92 million crore for urban infrastructure over the period 2012–31. If operation and maintenance costs are added, the figure would be Rs.5.92 million crore. However, whereas the financing needs of Urban India are mind-boggling, paradoxically cities in India suffer from a "rich city-poor city government" syndrome. The share of municipal revenue in combined central, state revenues declined from 3.71% in 1990–91 to 2.43% in 2000–01, and less than 2% presently. Municipal

Activity Based Costing (Abc) For Better Cost Management

Dr.KOMATI DURGA PRASAD,
Associate Professor, ILS, ICFAI Foundation for Higher Education, Hyderabad
Dr. SOOFI ASRA MUBEEN,
Lecturer, Higher College of Technology, Muscat.
Dr. BANDA RAJANI,
Asso.Pforessor, Department of Business Management, Chaitanya(Autonomus) Degree and P.G College, Hanamkonda, Waranga, India

Abstract

The new industrial policy, although likely to be in the interest of the country in general and Indian consumers in particular, in long run would create new pressures and challenges for Indian organization s specially in terms of rising competition both from within and outside, ABC involves a two-stage overhead allocation process. In the first stage production or services overheads (resources) are allocated to the activity cost pools to the product or service (cost object) through the activity driver. The ABM output and next evaluation of ABC can help the business organizations in stopping an internal war of numbers, better understanding of the business, in taking right strategic decision among others in the areas of product pricing, product sourcing, product mix and market segmentation and supports the ideal of an agile, responsive organization.

Key Wards: Activity Based Costing System, Activity Based Management

Introduction

Business scenario is changing rapidly and continues to change never before had the pressures from the environment had been so great on Indian Industry as they are today with Liberalization measures opening the doors of completion the whole paradigm of macroeconomic management has changed. There is of course a mix of both opportunities and threats. In short term, the threats are probably more visible. The new industrial policy, although likely to be in the interest of the country in general and Indian consumers in particular, in long run would create new pressures and challenges for Indian organization s specially in terms of rising competition both from within and outside. In the emerging environment only those organizations that are fast to adopt them to changing needs can survive. So it is inevitable and must to organizations to improve their strength time to time to withstand for the Global Completion.

Strength of an organization depends up its strength in technology, manufacturing and marketing. But in the long run, it is manufacturing strength alone that can give a company competitive advantage, which directly depends upon how profitably on can manufacture a product. To know the profitability of a product it is imperative that cost of the product is known. In simplest terms, cost of an product is built up through three components: Raw material cost, direct labour cost and overhead cost

Buyer's Cartels: An Amendment too Late

Hartej Singh Kochher[1]

Abstract

This legislative comment aims to examine a proposed amendment suggested by way of the Draft Competition Law (Amendment) Bill, 2020 to the Competition Act, 2002 to include within the definition of a 'cartel' under the Act, a 'buyer's cartel'. This study will delve into the decisional practices of the Competition Commission of India, while dealing with buyer's cartels and offer insights into the same. It will also discern as to why the amendment was needed. The amendment process and the rationale for the amendment will be elucidated. Finally, the author will offer his comments on the same.

I. Buyer's Cartels: An Amendment Too Late

The Competition Commission of India (CCI), is a regulatory body established under The Competition Act, 2002 (the 'Act', hereinafter), which became functional in mid 2009.[2] One of the mandates of the CCI, as enshrined u/s. 3 of the Act, is to prohibit anti-competitive agreements. It is u/s. 3(3) of the Act that cartelization is dealt with. It is considered to be a "per se" violation[3] of the Act, if a cartel, by way of an agreement with its cartel members, fixes prices, output, divides the market, or indulges in bid rigging/collusive bidding.[4]

Since 2009, CCI as the sectoral regulator has evolved a distinct competition law jurisprudence, which has been accompanied by the decisions of the Appellate Body[5] and the Constitutional Courts. In 2018 it was felt by the Government that there was a need to initiate reforms through the learnings of the functional years of the CCI. In furtherance of this, a 'Competition Law Review Committee' (CLRC), was structured to confirm that the "Legislation is in sync with the needs of strong economic fundamentals,"[6] and to ensure that competition law was "strengthened, and re-calibrated".[7]

The brief given to the CLRC included a review of the present Competition Law framework, in light of the dynamic business environment.[8] The CLRC submitted its report in August 2019.[9]

UNDERSTANDING JURISDICTION AND RELATED ISSUES IN INTERNATIONAL COMMERCIAL ARBITRATION WITH SPECIFIC REFERENCE TO INDIA

Written by ***Dr. P.L. Jayanthi Reddy***

Assistant Professor, ICFAI Law School, Hyderabad

"Discourage litigation persuade your neighbours to compromise whenever you can point out to them how the nominal winner is often a real loser in fees, expenses, waste of time..."

– Abraham Lincoln

ABSTRACT

Jurisdiction is fundamental to the validity of arbitration proceedings and the enforceability of arbitral awards. An arbitral tribunal, unlike a national court, derives its power, authority and jurisdiction from an arbitration agreement between parties to a contract. The available legal framework on the point provides for determination of jurisdiction having reference to each specific arbitration agreement. Due to this fact as well as the growing sophistication in the practice of international arbitration, challenges to the jurisdiction of arbitral tribunals are becoming more frequent. In the context of the complexity of this issue, this article thus to discuss the various aspects of the concept of arbitral jurisdiction, different kinds of challenges to the jurisdiction, Jurisdictional issues relating to interim measures and challenges in its enforcement, the principles and laws governing the issue, and the attitude of the courts of various state jurisdictions with special reference to Indian scenario.

Do financial development drive remittances? Empirical evidence from India

Jijin Pandikasala[1] | Iti Vyas[2] | Nithin Mani[3]

[1]Madras Institute of Development Studies (MIDS), Chennai, India
[2]ICFAI Law School, IFHE, Hyderabad, India

Email: iti.savernika@gmail.com

Remittances being a stable inflow of foreign currency, account for a substantial part of India's Balance of Payment account. In several developing countries, remittances exceed the receipts from the export of goods and services, and even capital flows such as Foreign Institutional Investment, Foreign Direct Investment, and Official Development Assistance. Remittances are known for their countercyclical nature during the sharp economic downturns, compared to other financial flows that are typically procyclical. Hence, it is known as a possible financing source for economic evolution in emerging economic systems. It is essential to determine the elements that drive remittances, as it may enable us to channelize this inflow to reap its developmental potential efficiently. Several macroeconomic determinants of remittances are well researched in the literature by researchers around the globe. However, not even a single study has been given to the financial development, determinants of remittances in the Indian setting. Therefore, this survey is a humble effort to bridge this gap. We utilize multiple regression and autoregressive distributed lag approach to cointegration which finds that several financial developments and financial openness variables have a substantial impact on remittances in the short run as well as in the long run. In accession to that, we incorporate each dummy variable for the global financial crisis and the concurrent negative oil price shock and negative output shock in the host nations. Remittances are found to be resilient during the crisis period while being adversely affected by the adverse economic shocks in the host nations.

1 | INTRODUCTION

Migration and remittances have always been an exciting arena for economic experts around the earth. However, the fundamental questions that pop up in the minds of the researchers and policymakers, which are not settled well in the literature are as follows. What is the role played by remittances in development? Are they countercyclical toward the economic fluctuations in the home nation? What are the key variables that drive the remittance inflow to the developing countries?

Remittances are fundamentally a transfer of money as payment or gift from migrants to their folks or other people in their domicile state. It primarily represents the household income arising out of the migration of people in foreign countries. It includes cash and non-cash items which occur either through the formal or informal channel. Free transfers, extended across borders are generally not read in national reports. Formal channels include regulated institutional channels like banks, nonbank financial institutions, postal service positions, and money transfer operators (e.g., Western Union and Money Gram). Unregistered money transfer businesses happen through "semi-formal" and "informal" channels such as Hawala, couriers, and cash or kind carried by either oneself or sent via friends or relatives. Advanced Hawala in Pakistan and Hundi system in India allow the fast and cheap transaction and relies on an extended network of brokers. This kind of information is not adequately covered in the current Balance of Payment (BoP) since it is hard to answer for the informal remittance transactions.

Email: misalok@gmail.com

This study explains a novel glide path to model the stock prices of five major commercial banks in India. The purpose of this work is concerned with identifying the macroeconomic drivers of stock prices of five core banks listed in NIFTY50 index, namely, SBI, HDFC, ICICI, INDUSIND and KOTAK MAHINDRA, and to test their stability during periods of fiscal tension. The study utilized a Principal Component Analysis (PCA) of the respective stock prices and has proceeded with the multivariate method to make the required predictions. The choice of statistical technique primarily consists of decomposing the respective stock prices of the five banks using PCA and then selecting one optimal Principal Component (PC1). A multivariate regression model is employed to predict the optimal PC of such stock prices in which PC1 is the dependent variable and NIFTY50 and INR-USD is the independent variables. Ultimately, the optimal PC is returned to the stock prices of the corresponding levels. The model is set up to be performed comfortably and the hardiness of the model is supported from various selection criteria; particular, the model assumption testing, goodness of fit, sample stressed period (using Rolling Average method on Indian VIX: 2008:Q1 to 2009:Q2) testing and out of sample performance. In addition to this, the estimated results are consistent with Monte-Carlo simulation results. The envisioned model satisfies the model objective, while sufficiently capturing the historical dynamics of the stock prices as reflected by various performance indicators (RMSE, MAPE, RMSE over standard deviation) presented in this paper.

JEL CLASSIFICATION
C58; E44

1 | INTRODUCTION

The direction in which the stock prices are likely to change is the focal point of all financial market analytics. However, the forecasting of stock prices is a challenging and difficult task because of its nonlinear and nonstationary trend. Further, it is a well-established fact that there is a potential relationship between the movements in stock prices and macroeconomic scenario, represented by macro-financial factors like interest rates, equity index, equity volatility, inflation, and so forth. The stock price models are designed to forecast the future projection of the bank-specific stock prices under various firm-wide stress testing scenarios. To capture a broader stream of stock price dynamics across the five major banks in India, this paper proposes a new model, which is induced up of two segments of analysis. The first being, the principal component analysis (PCA) to cover all available stock prices for the selected five major commercial banks in India along with simplifying the modeling approach by configuring a single model for all the stock prices as well as simultaneously addressing the problem of multicollinearity. The second analysis is a multi-variant linear regression model. The analysis consists of three steps-(a) Decomposing all five stock prices using PCA, (b) Regressing the best representative PC against selected independent variables in the proposed multivariants regression and (c) Reverting the estimated PC to the original stock prices across the banks. The model, however, will be

Abstract: At the enterprise level, inventory holding assumes significance importance, as inventories represent an oversized proportion of the entire assets of the many issues. Proper control over inventories provides the management with flexibility in making purchases systematically rather than buying strictly according to the production schedule and hand to mouth supplies. The major drawback of internal control is to maximize profitableness by reconciliation investment price of materials against what's needed to sustain level operations. The purpose of this paper is to study the status of inventory holding the Medium and Scale Enterprises. An attempt is also made to test the optimality of inventory holding in these enterprises concerning the cost of sales by applying simple regression models For testing the optimality of inventory holding in relationship cost of sales, correlation coefficient, coefficient of determination (R-square), F-test through ANOVA, regression coefficients and their standard errors, values of t-statistics and their P-values have been computed. The analysis reveals that Medium and Light Engineering Central Public Enterprises could reduce the inventory holding in terms of the number of days of consumption, cost of production and cost of sales.

Keywords: Inventories, Medium, and Small Enterprises, Regression, ANOVA

1. Introduction

Inventory control deals with the acquisition, storage, handling and use of inventories, therefore, it needs to maintain the availability of the material when needed. Providing adequate cushion for contingencies account for the most economy and minimum wastage [1]. At the enterprise level, inventory holding assumes significance importance, as inventories represent an oversized proportion of the entire assets of the many issues [7].

It requires a substantial investment of capital besides involving the cost of storage and handling as well as the risk of damage, loss, and obsolescence [4]. To minimize costs and also to ensure that capital is not unnecessarily locked up, inventories must be efficiently managed. Errors in inventory management cannot be rectified, as it is the least liquid among all the current assets. The major drawback of internal control is to maximize profitableness by reconciliation investment price of materials against what's needed to sustain level operations [3]. Proper control over inventories provides the management with flexibility in making purchases systematically rather than buying strictly according to the production schedule and hand to mouth supplies [3]. It also permits flexibility in production management and marketing. Through the production need not be geared to immediate sales, this does not warrant increasing the level of inventories indiscriminately.

Efficient management aims at increasing the level of inventories as long as the resulting economies and benefits exceed the total cost of holding such inventories and benefits exceed the total cost of holding such inventories [7].

Appropriate control over inventories affects the operational efficiency and profitability of the organization.

It also helps in achieving a higher return on investment by minimizing locked up working capital and also in improving the cash flow and liquidity position.

Inventory control should meet two opposing needs. Viz

1. Maintenance of an inventory of sufficient size and diversity for efficient operations, and
2. Maintenance of financially favorable inventory.

Public Enterprises, of late, are subjected to the criticism that their economic performance is not satisfactory [2].

Himalayan Glacial Retreat: Need for Protective Legislation in India

*Rama Devi Gudemela**

Himalayan glaciers are one of our most precious resources that have sustained civilizations for thousands of years. They hold economic value in terms of agriculture, industrial, energy, tourism and scientific development. Glaciers are crucial buffers thereby releasing the water into the rivers during droughts and summer season. However, the major global concern in today's time is the melting glaciers. As the glaciers shrink, they have long-lasting effect on water supply which can halt the agriculture, industrial, energy, tourism and scientific development of regions within the nations. The paper addresses the primary issues for this glacial retreat which cannot be only attributed to climate change but also the anthropogenic activities carried out on glaciers. These activities need to be regulated through Indian and international protective legislations. The paper comprehensively analyzes the existing domestic and international legislations and their applications to protect the glaciers retreat thereby finally concluding with suggestions.

Author Copy

Introduction

Glaciers are the largest reservoir of fresh water and the earth's most viable resources which need to be protected as they create a water source which is important for plants, animals and humans when other sources of fresh water may be scant. Himalayan glaciers are broadly divided into three river basins, viz., Indus, Ganga and Brahmaputra. They are the important source of fresh water for northern Indian rivers and water reservoirs. The river systems receive almost 30-50% of the annual flow from snow and glacier melt run off.[1]

One of the detrimental consequences of global climate change is glacial retreat. As the glaciers melt away, their ability to be water towers also diminishes. Glacial ice protects against extreme water shortages on seasonal and longer timescales, since the glacial melt supply can be sustained through droughts, while all other river-basin water inputs and stores decline. They act as a buffer against droughts. This retreat hampers the ecological balance of major river systems in India and also its neighboring countries. Perennial rivers could be changed into seasonal streams giving rise to freshwater scarcity in the summer months, since melted water contributes the

"ON LINE REVOLUTION IN DISPUTE RESOLUTION"- A SHORT SHIFT ON ODR

Dr. M Madhuri Irene[*]

"The technology is there for widely separated parties to meet in cyberspace, exchange and analyze complex information on preferences and needs, do deals, and execute binding settlements."

- Richard Shell

ABSTRACT

India is always hailed as a repertoire of rational virtues, vivacious values and persistent principles. Being a land of karma, people all over the globe repose utmost confidence in the transactions generated on this land, believe in the integrity and honesty of the contractual and commercial obligations with the people on this soil. Indian system intends to resolve the issues and differences through bilateral co-ordination and mutual satisfaction. 'Adjudication' is given the ancillary place and 'pragmatic solution for the problem' is given the primary place in the Indian thought.

Law being dynamic and organic has to live with both the science and sentiments of human race. The beneficiaries of 'On-line Arbitration' all over the globe remain unflinchingly grateful to Robert Brinier, the master of 'Arbitration Avionics.' In just a few years the picture has changed dramatically. Each year close to a Million disputes are resolved online and over a hundred online dispute resolution providers offer their services worldwide. From a technology gadget, ODR has become a major phenomenon in dispute resolution. Admittedly, it may appear to lack any connection with international commercial arbitration yet, the day-to-day operation of Commercial arbitration cannot remain unaffected by such a vast phenomenon. This article mainly focuses on the evolution and conceptual significance of On-Line Arbitration and its utility and futility in the present day national and international trade and commerce. This article refers to the techno-legal implications and their impact on international relations.

Key Words: *Online dispute resolution, Indian Judiciary, Cyber Arbitration, Arbitral Awards*

I Introduction

If body is a reality, Soul must also be a reality; if soil is a reality, space should also be a reality and if dispute is a real problem, then Resolution is also a real solution – be it in substance or space. Philosophy might not have been acknowledged by all as a science, but none could assail it as a source of pragmatic reasoning – both legal and logical. Clash and conflicts occur not only in physical form but also in psychological form. If conventional mediation, conciliation and arbitration represent the physical form, On-line Dispute Resolution represents a combination of both physical and psychological forms. Neither space nor technology, like any other species, could march or lead new generations without the aid and assistance of Law and Justice. Technology being a part of science, created a new world known as 'Cyber Space' and Information Technology has become the nucleus of this imaginative but real world.

The tardy judicial locomotion compelled the evolution of alternate dispute resolution, though not displacing conventional court system, and the impatient litigation-gentry demanded the instantaneous solution and agreed-justice, on the soil and in the space.

II Indian soil and Instant justice

India is always hailed as a repertoire of rational virtues, vivacious values and persistent principles. Being a land of karma, people all over the globe repose utmost confidence in the transactions generated on this land, believe in the integrity and honesty of the contractual and commercial obligations with the people on this soil. Innumerable historical and epical episodes testify the morality of Indian kings and traders. To

Aditya Laroyia
Advocate, Delhi High Court

ABSTRACT

Quis Custodiet Ipsos Custodes is an old Latin adage that has been in use for over a millennium asking the basic question - who watches the watchmen? Currently, the Competition Law jurisprudence of our nation is in a flux. The new Draft Competition (Amendment) Bill, 2020 has suggested certain radical changes, inductions and deletions from the current Act. While, the changes so suggested are wide ranging, this paper simply seeks to look into and demystify certain changes to the regulatory architecture of Competition Law of our country. The first being the establishment of a Governing Board in the Competition Commission of India and the second, the merger of the office of the Director General with the Commission. A genuine attempt would be made to understand the fantastical and grandiose expression used in the Competition Law Review Committee report. This paper seeks to understand how these two changes are going to actually affect the workings of the Competition Commission of India and office of the Director General. The main inquisition would be on the question - *Is this an attempt by the executive to overrun a relatively independent institution and turn it into another one caged parrot bowing down to every writ of its master?*

Keywords: Competition, Draft Competition (Amendment) Bill, 2020, Competition Commission of India, Director General, Governing Board, Selection Committee.

INTRODUCTION

The Ministry of Corporate Affairs and the Competition Commission of India (CCI), recently put out a Draft Competition (Amendment) Bill, 2020 in the public domain to invite suggestions and comments, as to the proposed changes they wanted to bring into the Competition Act, 2002.[1] A Competition Law Review Committee (CLRC) was constituted to enable a holistic review of the existing legislation, and to help keep it up with the present-day economic environment.[2] Also, the lacunae that were identified in the implementation of the aims of the existing legislation, needed to be plugged and a method to that end was needed. The CLRC submitted its report in mid-2019[3] and suggested a host of changes which to a large extent aim to alter the existing paradigm of the Competition Law regime in the

THE CONTROL CONUNDRUM: A STUDY ON THE PROPOSED DEFINITION OF 'CONTROL' UNDER THE DRAFT COMPETITION (AMENDMENT) BILL, 2020

Surya Saxena

Assistant Professor, School Of Law,

Delhi Metropolitan Education, Noida

Hartej Singh Kochher

Assistant Professor, ICFAI Law School, Hyderabad

ABSTRACT

The Ministry of Corporate Affairs had constituted a Competition Law Review Committee (CLRC) in 2018 to review the competition law framework, in order to ensure that the Act *"is in sync with the need for strong economic fundamentals"*. The CLRC submitted its report in July, 2019 and advocated for multiple changes in the Act, to keep it in sync with the ever changing and developing economic realities and implementation issues. Taking these considerations into account, the Ministry of Corporate Affairs has come out with a Draft Competition Law (Amendment) Bill, 2020, laying out the proposed changes. Amongst other changes, the Draft law proposes to change the definition of '*control*' with respect to '*combinations*' in the Act. This paper is a study of this proposed change. The authors have made an attempt to evaluate and study the current definition, and the decisional practices of the Competition Commission of India (CCI) as regards applying the definition, the new proposed definition, and the reasoning behind it as given by the CLRC. Finally, the authors will give their suggestions as to whether the *'decisive influence'* or *'material influence'* standard should be adopted while assessing as to what actions/practices relating to a combination bestow control.

INTRODUCTION

The financial and economic policies of India went through noteworthy changes post liberalisation of the Indian economy in the year 1991.[1] A series of legal reforms that were introduced then, were directed towards deregulation of various industries and giving a boost to private businesses in our country.[2] In this backdrop, a High level Committee on Competition Policy and Law ("*Raghavan Committee*") was given the task to restructure the anti-trust law that were in operation during that time i.e. The Monopolies and Restrictive Trade Practices Act, 1969 ("*MRTP Act*").

The Raghavan C... 1969 was inadequate for fostering

custodian of the morals of his workmen. However, if the act subversive of discipline committed outside the establishment or outside the working hours is found to be inconsistent with the fulfilment of the express or implied conditions of service, or be directly linked with the general relationship of employer and employee, or have a direct connection with the contentment or comfort of the men at work, or have a material bearing of the smooth and efficient working of the concern, the employer will be well within his rights to take disciplinary action against the employee concerned. In this connection, it is to be noted that the Karnataka High Court has held that "....it can be safely concluded that any act of an employee which would constitute an offence of penal consequences under the Indian Penal Code or any other analogous legislation is misconduct. Broadly stated, all offences with penal consequences are misconducts but not all misconducts are offences".

Finally on inflicting punishments in case of indiscipline in industry, it must be noted that an Industrial Tribunal can interfere with the decision of the management in regard to dismissal or discharge when it finds that there is a want of bone fides, or it is a case of victimisation or unfair labour practice, or there is violation of principles of natural justice, or there is a basic error of facts, or there has been a perverse findings on the materials placed at the enquiry.

CONSTITUTIONAL DIMENSIONS OF THE MAHATMA GANDHI NATIONAL RURAL EMPLOYMENT GUARANTEE ACT, 2005- AN ANALYSIS

By

Dr. Y. Gangi Reddy

Prof. D. Sreenivasa Chary

"I am working for winning swaraj ... for those soiling and unemployed millions who do not get even a square meal a day and have to scratch along with a piece of stale roti and a pinch of salt" - Mahatma Gandhi.

Abstract

Preamble of the Indian Constitution aims at securing socio, economic and political justice to the people of India whichprovides a strong legal foundation to make the right to work reality. Within the framework ofthe "rights based approach" particularly after 1960s, the Government of India has launched a series of wage employment programmes for the rural poor. The Mahatma Gandhi National Rural Employment Guarantee Act, 2005 (MGNREGA) aims at enhancement of livelihood security of the households in rural areas of the country by providing at least one hundred days of guaranteed wage employment at the prevailing minimum unskilled wage rate in every financial year in every household whose adult members volunteer to do un-skilled manual work. In this backdrop this paper attempts to discuss the concept of right to work, its constitutional dimensions, itsdevelopment and statutory recognition in India. This article also analyses the contribution of Indian Judiciarywhich played an important role in recognizing the right to

REDUCTION OR DEFERMENT OF SALARY AND IT'S CONSTITUTIONALITY

By

Dr. Y.Gangi Reddy*

President of India issued two ordinanceson 7th and 9th April, 2020 making certain amendments to 'The Salary, Allowances and Pensions of Members of Parliament Act, 1954' and 'The Salaries and Allowances of Ministers Act, 1952'. The amendments have proposed reduction by 30% of the salary and sumptuary allowance payable to Members of Parliament and Ministers of the Union Government with effect from 1st April, 2020 for a period of one year. This measure has been taken to overcome the financial stress on government in its effort at controlling and managing the situation arising out of pandemic, Covid-19. Several states like Kerala, Telangana and Andhra Pradesh have issued executive orders deferring payment of salaryand allowances or a part thereof due to their employees which measure has caused concern among the employees. Doubts have been raised about the jurisdictional competence of the President to issue such ordinances and about the constitutionality of the measures taken by State Governments to defer payment of salary to employees.

On 7th April, 2020, by promulgationof 'The Salary, Allowances and Pensions of Members of Parliament (Amendment) Ordinance 2020, No 3of 2020'Clause (1A) after Clause (1) was inserted in Section 3 of the aforesaid Act of 1954. Clause (1A) provided that salary payable to Members of Parliament would stand with effect from 1st April, 2020 reduced to 30% for a period of one year from 1st April, 2020. Similarly, by issue of 'The Salaries and Allowances of Ministers(Amendment) Ordinance, 2020, No 4of 2020' issued on the same day Section 5 of the Actwas re-numbered as Clause 1 and after Clause (1) a new Clause (2) was added whereby the sumptuary allowance payable to the Ministers of the Union Government wasreduced to 30% for the same time period. It is noteworthy that the reduction the reduction applies only to the salary and sumptuary allowance payable to Members of the Parliament and Ministers of the Union Government only and not of the salary payable to other constitutional functionaries.

President has issued the ordinances evidently in exercise of the powers vested in him under Article 123 of the Constitution.It is pertinent to note that such power to issue ordinance has been vested in President only when Parliament is not in session and if he is satisfied thatcircumstances exist which warrant require immediate action.There could be no doubt in these cases when the ordinances were issued Parliament was not in session and that circumstances existed which necessitated issue of ordinances. However,the exercise of power has been limited to reducing salaries of only the Members of Parliament and Ministers of the Union Government. This raises a question as to what is the extent of ordinance making power of President and whether in these cases it has been exercised appropriately?

Ordinance making power is part of the legislative powers of President of India and the Governor. President and Governor is empowered under Article 123 and Article 213 to promulgate an ordinance in respect of all matters over which Parliament and State Legislature can make lawrespectively. The extent of the ordinance making power of

TRIPLE TALAQ IN THE WAKE OF SC JUDGEMENT

*Md. Akbar Khan**

Abstract

On 22 August 2017, the Indian Supreme Court deemed instant triple talaq (talaq-e-biddah) unconstitutional. Three of the five judges in the panel concurred that the practice of triple talaq is unconstitutional. On 30 July 2019, Parliament of India declared the practice of Triple Talaq as illegal, unconstitutional and made it punishable act from 1 August 2019 which is deemed to be in effect from 19 September 2018. In this article the author deals with the question of triple talaq in the light of the recent practices of triple talaq which is treated as talaq-ul-biddat and is not acceptable in accordance with the injunctions of Quran and Hadis and this article throws light on how it is not a good form of custom. This article explains the forms of talaq laid down under the holy Quran and the procedure for the same. This article analyzes one of the hottest and most tricky issues of the Muslim personal Law. The whole triple talaq issue has become a battleground for the culture versus mordernity debate.

I Introduction

India is a country where there is unity in diversity. There is a diversity of religious beliefs, culture, languages and practices. People follow different religions and faiths. These religions lay out different sets of personal law which govern marriage, divorce, succession, etc. The sources of the laws come from their religious books, customs, jurisprudence, digest and commentaries, etc. which are then codified into statutes. Personal laws play a vital role in the society as well as in the religious community. These laws have acquired special position in the present age.[52]

In Islam, the word Quran which is the divine communication and revelation to the Prophet of Islam is the first source of Muslim Law. It contains the revelation of God to His Prophet Mohammed, through angel Gabriel. It is the paramount and universal authority of Muslim Law. Apart from Quran, the other sources of Islam and the most legitimate one after Quran is the Sunnah. The personal laws are laid down in Quran which deals with marriage, divorce, succession, etc. Quran does not approve of divorce but lays down the forms of divorce which were approved by the Prophet.

The other two important sources are Ijma and Qiyas. Ijma has been defined by Sir Abdul Rahim as "agreement of the jurists among the followers of Prophet Mohammed in a particular age on a particular question of law". Wilson defines it as concurrence, meaning propositions shown to have been accepted as indisputable under the first four "rightly directed", Caliphs or in the time of the companions and of the generation immediately succeeding them.[53]

Maulana 'Usmani points out that Hazrat 'Umar had enforced triple divorce as triple divorce and it had become law. It is within the power of the caliph of the time to enforce certain ordinances in view of the prevailing situation, or to meet some crisis situation and no one can question it. It is, therefore, possible that Ibn Abbas might have given a fatwa accepting triple divorce after Hazrat 'Umar enforced the

Activity Based Costing (Abc) For Better Cost Management

Dr.KOMATI DURGA PRASAD,
Associate Professor, ILS, ICFAI Foundation for Higher Education, Hyderabad
Dr. SOOFI ASRA MUBEEN,
Lecturer, Higher College of Technology, Muscat.
Dr. BANDA RAJANI,
Asso.Pforessor, Department of Business Management, Chaitanya(Autonomus) Degree and P.G College, Hanamkonda, Waranga, India

Abstract

The new industrial policy, although likely to be in the interest of the country in general and Indian consumers in particular, in long run would create new pressures and challenges for Indian organization s specially in terms of rising competition both from within and outside, ABC involves a two-stage overhead allocation process. In the first stage production or services overheads (resources) are allocated to the activity cost pools to the product or service (cost object) through the activity driver. The ABM output and next evaluation of ABC can help the business organizations in stopping an internal war of numbers, better understanding of the business, in taking right strategic decision among others in the areas of product pricing, product sourcing, product mix and market segmentation and supports the ideal of an agile, responsive organization.

Key Wards: Activity Based Costing System, Activity Based Management

Introduction

Business scenario is changing rapidly and continues to change never before had the pressures from the environment had been so great on Indian Industry as they are today with Liberalization measures opening the doors of completion the whole paradigm of macroeconomic management has changed. There is of course a mix of both opportunities and threats. In short term, the threats are probably more visible. The new industrial policy, although likely to be in the interest of the country in general and Indian consumers in particular, in long run would create new pressures and challenges for Indian organization s specially in terms of rising competition both from within and outside. In the emerging environment only those organizations that are fast to adopt them to changing needs can survive. So it is inevitable and must to organizations to improve their strength time to time to withstand for the Global Completion.

Strength of an organization depends up its strength in technology, manufacturing and marketing. But in the long run, it is manufacturing strength alone that can give a company competitive advantage, which directly depends upon how profitably on can manufacture a product. To know the profitability of a product it is imperative that cost of the product is known. In simplest terms, cost of an product is built up through three components: Raw material cost, direct labour cost and overhead cost

Buyer's Cartels: An Amendment too Late

Hartej Singh Kochher[1]

Abstract

This legislative comment aims to examine a proposed amendment suggested by way of the Draft Competition Law (Amendment) Bill, 2020 to the Competition Act, 2002 to include within the definition of a 'cartel' under the Act, a 'buyer's cartel'. This study will delve into the decisional practices of the Competition Commission of India, while dealing with buyer's cartels and offer insights into the same. It will also discern as to why the amendment was needed. The amendment process and the rationale for the amendment will be elucidated. Finally, the author will offer his comments on the same.

I. Buyer's Cartels: An Amendment Too Late

The Competition Commission of India (CCI), is a regulatory body established under The Competition Act, 2002 (the 'Act', hereinafter), which became functional in mid 2009.[2] One of the mandates of the CCI, as enshrined u/s. 3 of the Act, is to prohibit anti-competitive agreements. It is u/s. 3(3) of the Act that cartelization is dealt with. It is considered to be a "per se" violation[3] of the Act, if a cartel, by way of an agreement with its cartel members, fixes prices, output, divides the market, or indulges in bid rigging/collusive bidding.[4]

Since 2009, CCI as the sectoral regulator has evolved a distinct competition law jurisprudence, which has been accompanied by the decisions of the Appellate Body[5] and the Constitutional Courts. In 2018 it was felt by the Government that there was a need to initiate reforms through the learnings of the functional years of the CCI. In furtherance of this, a 'Competition Law Review Committee' (CLRC), was structured to confirm that the "Legislation is in sync with the needs of strong economic fundamentals,"[6]and to ensure that competition law was "strengthened, and re-calibrated".[7]

The brief given to the CLRC included a review of the present Competition Law framework, in light of the dynamic business environment.[8] The CLRC submitted its report in August 2019.[9]

Abstract: This paper examines the role of mobile wallet google pay digital payment in transforming India towards cashless economy. A self-administered questionnaire comprising of 16 questions with five point Likert scale yielded data for 386 digital payment users from India. In addition to the conventional principal axis factoring method, stepwise regression was also applied. Findings revealed a total accumulated variance of 63.94% for the three factors which were extracted using the PAF method. The three factors were customer friendliness, feasible facilities and cost benefit services which form the paramount framework of digital payments. Regression results further revealed that easy accessibility, financial services, cost saving, rewards, speed, hassle- free, use for purchase at store and efficiency had significant impact on usage of google pay digital payment method as a substitute to cash in India.

1. Introduction

Long before money came into existence, people transacted services and goods for other services and goods in return with a common agreement on the value of goods by the parties involved. This system was called the barter system. Barter system made people of one country dependent and reliant on people of other countries. Countries imported what they required and exported what they had in surplus. This interdependence among countries slowly paved way to the advent of money. With the invention of money, people started buying things they wanted in exchange for money. Money ruled the economic sector for centuries and is still a key player in the economy of a country. Every country made their own currency for which they could buy goods and services they wanted.

K. S. Rekh Raj Jain[1]

Abstract

The tail-end of the criminal justice system is the prison. In the era of mass incarceration a question arises how can a prisoner be restored to live a successful life after incarceration? The architecture of restoration of prisoners to begin the movement the prisoner placed under the authority of prison officials.

Restoration is not a soft option, as many prisoners find it extremely difficult to face up to the impact of their crimes. The entire prison environment and the stakeholders of the prison department shall be involved in the restorative process.

Restoration is the shift from retribution and vengeance to a more human approach. Hence restorative processes shall focus on physical, behavioral, emotional and restoration of dignity. The transition from prison to re-integration into the society after being incarcerated for number of years is the most difficult task for the prisoner. Therefore perseverance of restoration in prisons shall be a continuous process which would be a great investment to everyone.

Research and studies across the world reveals that the scale of victimization among the prisons is very high and at time most devasting and India is not an exception. Adoption of restorative restoration approaches and practices in prison setting will not only successfully navigate reentry both into the family and society but also a realistic future and an effectiveness and positive impact outside the prison world. If prison officials want to reduce recidivism it is vital that they ensure effective and humane restoration of prisoners.

This paper takes the stock of the current context and aims to bring greater clarity pertinent to the thematic area of concerns regarding effective and humane restoration of prisoners with special reference to India.

1. MEDICINE – IN SERVICE AND TRADE

Medicines in the service of the medical treatment to patients are the adhesive substance that binds firmly the humane affection between the doctors and the patients apart from the society and medical profession. Medicines are the life giving and life protecting substances forming part of medical service and medical profession.

The global revolution of Information Technology is studded with many stars, one prominent and promisingly progressive refulgence being E-Pharmacy. The hegemony of pharmaceutical industry in health care received substantial philip through on-line trading of medicines and drugs. Internationally reputed drug manufacturers like Pfizer, Hoffmann-La Roche, Johnson & Johnson forecast huge growth of bio-pharma market in the next few years, by presumably 2025.[1]

Glaxosmithkline and Novartis Ag too optimistically expect that the global drug delivery technology could reach from 508630 of 2019 to USD 580190 million by 2025.[2] The global Pharma & Cosmetics market is valued at 1500500 million US$ in 2017 and will reach 1952700 million US$ by the end of 2025, growing at a CAGR of 3.3% during 2018-2025.[3]

It is further stated in the Report Hive that the world pharmacy & cosmetics production will increase at a growth rate of about 2.38%. With the development of economy, the world of pharmacy & cosmetics capacity will continue to expand in the future and the main consumption region will be in NA and EU, apart from Asian countries.[4]

Abstract

Purpose- The purpose of this paper is to identify the Gaps that exsist in Food Delivery Apps which impacts the customer services. It also focuses on the determinants which affect the customer satisfaction and service quality.

Design/methodology/approach-A systematic literature review is made and the gaps are analysed. Literature were collected from 20 articles of reputed journal from 2012-2017.

Findings-Through the extensive literature review, the analysis reveals that additional cost of labour, compromised Food Quality, Lack of Streamlined order in mode of delivery, inefficient system for ordering placing, potential delays and Technical Issue are the gaps that are identified in delivering the services to customers through food Delivery App. The determinants that affect the customer satisfaction are scrutinized and implications to reduce the gap.

I. INTRODUCTION

A positive customer experience can result customer satisfaction. Providing a excellent and high quality customer service by meeting the needs and desires of the customer will demonstrates their positive attitude and resulting in increased level of Satisfaction. Customer service is a key value for every business in the food industry. Customer seek newer experience with their changing lifestyle. The food industry has always tapped into the need for convenience and attracted many customers with advent of the digital world, their standards of convenience is raisen further. Therefore the food industry is booming with the massive development of technology through the food delivery apps which is convenient and easy for the customers to get the food delivered at their doorstep. Besides the growing market of food delivery App, there are several challenges associated with the maintanence of food delivery system. Hence the particular study has been undertaken to understand the 'Gaps in delivering the services to the Customer through Food Delivery Apps.'

II. OBJECTIVE OF THE STUDY

The purpose of this paper is to identify the Gaps that exsist in Food Delivery Apps which impacts the customer services. It also focuses on the determinants which affect the customer satisfaction and service quality.

III. DESIGN/METHODOLOGY/APPROACH

A systematic literature review is made and the gaps are analysed. Literature were collected from 20 articles of reputed journal from 2012-2017.

IV. LITERATURE REVIEW

In the process of food delivery, customer service plays a critical role (Pantouvakis, 2010). The service quality in food delivery can turn the new customers into regular ones. In addition to this, an online food ordering system can reap many benefits by providing proper customer service. These benefits

WHETHER THE ECONOMIC GROWTH OF INDIA IS TRADE OPENNESS LED?

Iti Vyas
ICFAI University, India
Email: itivyas@ifheindia.org

Received: March 14, 2020 Accepted: March 29, 2020

Abstract

The prime aim of the paper is looming around the doubt whether the economic growth of India is trade openness led? If yes, whether the trade openness led growth could be a short term or a protracted-term phenomenon. To check this, the paper took the annual time series data on the GDP per capita income as a proxy for economic growth, and also the different standards of trade openness like the amount of exports and imports as a percentage of GDP, export and import of products and services as a percentage of GDP, and per cent of World exports and imports. The model is grounded on the extended version of the Cobb-Douglas production function. The short-run and long- term dynamics of the connection between trade openness and economic growth is analyzed by employing Toda Yamamoto's Granger's non- causality test, Johansen's Maximum Likelihood test and Fully Modified Ordinary Least Square model. The findings of the study exposed that the GDP per capita income is positively statistically explained by the trade openness, exports of goods and services as per cent of GDP, imports of goods and services as a percentage of GDP, per cent of total World exports, capital investment, and labour force participation rate. There exists a long-run equilibrium relationship between the economic growth and trade openness indicators considered within the study. The positive impact of trade openness on economic growth suggests that India should give more emphasis on the optimal allocation of domestic resources, technological progress and knowledge spillovers and encourage integration and competition among domestic and international markets.

1. Introduction

Trade openness is critical to any economy. As economies become more open and competitive, there are more chances of growth and innovations and enlistment of the society in developing economies. Trade openness has transformed many nations from the state-based economies of the former Soviet Union to the over-regulated economies of South America and also the rising tigers of Asia. Many countries have opened their economies for the aim of economic growth and development after the 1980s. This may be due to the fact that export promotion measures through trade liberalization brought incentives for domestic optimal resource allocation and efficient production. It has been well established within the literature that trade acts as an engine of economic growth as postulated by trade led hypothesis. However, this can be

Abstract:

Banking industry is the one of the significant support to the financial part of Indian Economy. Because of International compressions, Competition among the banks and liberalization plan have been affected and its outcomes in the blend of business strategies with human resource management. The investigation of Indian Bank's Association (IBA) statement and Boston Consulting Group (BCG) will face two difficulties. Feasible monetary solution for financial inclusion and structure of HR. The public sector banks have complexities outstandingly and make conservative HR practices unproductive. The commitment of banks has supported up in the money related consideration activities like "Pradhan Mantri Jan-DhanYojana" and furthermore the desire for worker from the financial business likewise increments. It prompts to redesign the banks HR practices and expands the employee efficiency. The current investigation purposes to give such advancements swhich are associated to Human Resource Management with the assistance of primary data depends the standpoints of HR managers of public and private sector banks in Hyderabad. The current examination defines advanced method of Human Resource Practices will be helpful to the banks and to grow in more competitive world.

The Role of Local Self-Governments in Protection of Water Resources

*Astha Srivastava**

In recent years, India has witnessed unprecedented stress on its water resources, and the scarcity of usable water has drawn considerable attention. The problem of scarcity is exacerbated by widespread pollution of water bodies that renders even the available water resources unfit for use. Past experience, internationally and in India, has demonstrated that water resources are best managed at the local level with a watershed-based approach and involvement of local communities. Therefore, institutions of local self-government like the Panchayati Raj Institutions in rural areas and Municipal Councils in urban areas can play a central role in management of water resources. The local self-government bodies in India have indeed been vested with the responsibility of management of water resources under the constitutional scheme. However, the impact of these institutions on water resources management has been miniscule and unsatisfactory, and so is their involvement in centrally-sponsored schemes in this field. This paper discusses the facts stated above and builds a case for better involvement of local bodies in water resource management.

Introduction: The Vitality of Water

Water is an essential and indispensable resource for human, animal and plant life. The existence of biosphere cannot be imagined without water. Such is its link to life that scientists search for traces of water on celestial bodies[1] to determine if life can exist on them. Our earth, the blue planet, faces severe water crisis today. Water resources have been rendered inconsumable for several purposes.[2] Preservation of the purity of water has taken center-stage. These 'water debates' have drawn the attention of the administrators all over the world. Improvements in water resources management and access to water supply and sanitation services are essential for addressing various social and economic inequities, such that 'no one is left behind' when it comes to enjoying the multiple benefits and opportunities that water provides.[3]

NOVARTIS AG V. UNION OF INDIA: Rise of the Pharmaceutical Industries.

I. Introduction: -

India's approach to intellectual property (IP) rights is new and is still is in the transition of recognizing and developing the framework of the same. The pattern that India is following is identified by the Trade-Related Intellectual Property Rights Agreement (TRIPS) governed by WTO. The areas covered by IP are patents, copyright, trademarks, geographical indications, layout designs and an interesting addition to this family in 2001 known as traditional knowledge. Throughout there has been some good and some negative impact on the agreement on TRIPS.

India, before independence, followed the footsteps of the United Kingdom (U.K) as India was still under colonial rule. Until that time, U.K forced its sets of laws on Indian bodies. The Indian Patents Act of 1970 (1970 Act) explicitly prohibited patents on pharmaceutical products, although it allowed patents on the process for making pharmaceutical components [1]. India was compelled to enact patent law provisions that would protect them from the exploitation faced by developed countries based on Ayyangar Committee Report; This report is considered the backbone of Patent Laws in India. The government appointed Rajagopala Ayyangar Committee(RAC) in 1957 to revise patent laws and to amend these laws as per the industry needs. [2] After this it was the golden period for the Indian Companies as they were allowed freedom to make, sell, and use, at highly inflated prices, drugs were made elsewhere. The generic products produced in India were in high demand, and India was termed the "pharmacy of the world" for its free generic pharmaceutical industry and it was a significant exporter of generic products to other nations.[3]

After India became a member of WTO in 1995, things changed. Though a treaty mandating and improving the intellectual property rights system was in consideration before 1995, with these laws the country's economic development, it became essential to enact strong IP laws

"TREMBLING ON TRANCE – A MESMERISM FOR MUSLIM WOMEN"

Dr. M. Madhuri Irene *

INTRODUCTION

Among all the religious of antiquity divorce was regarded a matrimonial right in one or other form. Islam is the first religion in the world which has expressly recognized the termination of marriage by way of divorce.

Divorce among ancient Arabs was easy and frequent occurrence. Prophet Md. showed his dislike to it. "It was regard as the most hateful before almighty god of all permitted things.

The Prophet of Islam never thought that he was bringing a new religion, but that he was merely trying to reintroduce the old faith in the „One God□to the Arabs. It was basically a social reform movement brought about to teach the savage pagan Arabs the laws of humanity and to create a society where weak and vulnerable is treated with respect. The Prophet of Islam was indeed a social reformer, thinking far ahead of his time. The emancipation of women was a project dear to prophet□s (PBUH) heart. According to Karen Armstrong,[1] "Muhammad was one of those rare men who truly enjoy the company of women. Some of his male companions were astonished by his leniency towards his wives and the way they stood up to him and answered back.[2]" Prophet of Islam disliked the practices of pagan Arabs of treating women as goods and chattels. He looked upon those customs with extreme disapproval and regarded their practice as calculated to undermine the foundation of society. He told to his people: "Now onwards, only twice in the whole life can a husband pronounce a *talaq* and revoke it; whenever he does so for the third time the marriage would be instantly dissolved, leaving no room for remarriage between the divorced couple.[3]" This simple reform of the Prophet got corrupted in the course of time and this pre-Islamic custom of arbitrary divorce, which was abhorred by the prophet once again, became prevalent. In the following paper a study has been made on the origin of this practice of triple-*talaq* and its *sharia* basis, and its impact on the society so far.

Abstract:

NBFC raise the required funds through the different ways out of which deposits mobilization from public is major one. Acceptance of deposits is managed by NBFCs as per regulations and directions of Reserve Bank of India (RBI). In recent past, the four active players of Leasing and Hire purchase viz., Alpic Finance, Apple Finance, Apple Credit Corporation and Srei International Finance have announced their plans to merge. NBFCs eccentric services are most essential and indispensable in filling the gap made by the financial institutions and commercial banks in the fast changing economy. Because of only the failure of CRB capital market, RBI issued scare and difficult directives that discouraged NBFCs and made entire sector a scapegoat.

Introduction

Non-Banking Financial Companies (NBFCs) are the concern rendering financial services similar to commercial banks and financial institutions, but do not qualify to be branded banks, entered into Indian Financial System in a big way to increase resources to Indian corporate world, during 80s due to frequent credit squeezed, cash crunches and laborious procedures with Financial Institutions and commercial banks.

According to their nature, NBFCs can be grouped into different types as Loan and Finance companies, Investment companies, Hire purchases Finance Companies, equipment leasing companies, Hire-purchase Fiancée Companies, Equipment Leasing Companies, Mutual Benefit Financial Companies, Housing Finance Companies and Residuary Non-Banking Companies.

NBFCs offer eccentric and a variety of functions in different areas such as Corporate Finance[1]Companies and Residuary Non-Banking Companies. NBFCs offer eccentric and a variety of functions in different areas such as Corporate Finance, Corporate Advisory Services, Issue management, Secondary Market

Work-Life Balance among Information Technology Professionals in Bengaluru City

[1]Dr. Yaduvamsi Sai Krishna C, [2]Dr. A. Arun Kumar
[1, 2]Assistant Professor, ICFAI Law School
[1, 2]ICFAI Foundation for Higher Education, Donthanpally, Shankarpally Road, Hyderabad-501203

Abstract

This paper is pointed towards the subject of work life balance, and with this we have attempted to audit an assortment of perspectives identifying with the theme. Work life balance is a key territory of worry for specialists, who feel that solidness among capacity and presence is of essential significance in the event that we talk in connection to execution in the work power in an association. Through this paper we've attempted to survey the adequacy of workforce from IT sector in Bengaluru city. Work-life balance is gradually getting increasingly significant for IT professionals. This is a state including evenness in which the interest including both individual and expert life can be equivalent. An individual assumes many jobs for a mind-blowing duration and pretty much every job offers its distinctive number of requests just as prerequisites and when these necessities cover you need to confront different issues. While organizing the work-life policies an administrator ought to recall that every one of the variables related with a representative's similarly close to home alongside proficient everyday lives.

Keywords: *Work life balance, Attributes, IT sector and Bengaluru*

1. Introduction

The conventional wisdom indicates that a happy worker is a better worker. But it seems that the employers find it difficult to understand this fact. We need it to motivate us and enable us to perform at our best otherwise excessive pressure leads to stress. Stressful life events at the workplace such as lack of job security, changes in working hours and working conditions, layoffs, downsizing, organizational readjustments, etc. IT industry in India has long been exempted from labor regulations in or-der to facilitate its rapid growth and competency in the glob-al market. On the large-scale part of the IT sector is moving from a standardized eight hours a day to operate twenty-four hours a day for seven days of the week. Most of the employee work on Saturdays and Sundays too so there is a changing pattern in the working hours which is quite different from the standard one, which normally operates from 9 am to 5 pm. Employees who perform under pressure are likely to go under depression. The constant requirement to work at optimum performance leads to job dis-satisfaction, employee turnover, reduced efficiency, Absenteeism, alcoholism lack of motivation or creativity are all byproducts of an over stressed workplace. So, the differentiations between work-life and family-life have disappeared. On the planet loaded up with clashing duties and responsibilities, work/life equalization has become an overwhelming issue in the work environment. Three main considerations add to work/life balance:

- Global challenge;
- Renewed passion for individual lives/family esteems; and
- A growing workforce.

Abstract

Prostitution is one of the major problems which beset the human societies the world over, from the very dawn of civilization. It is one of the kaleidoscopic images nurtured by social fabric, which wishes to perpetuate the status of women as sexual objects. Sometimes, prostitution can be viewed as a sociological phenomenon, an inevitable outcome of ignorance and misery, as a flesh trade in the society. A narrower view is that, yet equally valid concern, is that prostitution constitutes a health hazard, both directly in the spread of Sexually Transmitted Diseases, as well as indirectly, as a conduit for drug trafficking and abuse. Giving legal recognition to prostitution would enable the prostitutes to make some contribution towards the development of the nation, as they would have legal protection, their children can get education and would be entitled to participate in the main stream of the society. Recognizing prostitution as a profession will at least reduce the real illegalities that come with it, such as child prostitution, drug trafficking and other crimes. This article provides a comprehensive overview of the philosophical and socio-legal perspectives relating to sexual exploitation of women and girls. In India, one lakh minors are forced into prostitution every year. The menace of child trafficking in India has been growing at an alarming pace. According to United Nations Children's Fund, the state of the Worlds Children's Report, Indian country has been identified as the leading hot-spots of child sex trafficking in the world. Half of the missing girl children in India were sold into prostitution. Under this scenario, in this paper an attempt has been made to analyze the various deleterious effects of prostitution and its socio-economic and legal impact on the society.

Keyword: Prostitution; Sex work; Trafficking, Victimization, Legalized sex work; Sex trafficking policy.

KV Ravi Kumar. Understanding the Socio-Economic and Legal Context of Prostitution and Sex Trafficking on Women in India. Indian J Law Hum Behav. 2019;5(3):313-320.

Introduction

Prostitution has been generally be defined as promiscuous intercourse for hire whether in money or in kind. According to Geoffrey May, prostitution may be defined as the practice of habitual or intermittent sexual union, more or less promiscuous, for mercenary inducement'. Thus, there are three important constituents of Prostitution, viz. illicit and promiscuous sexual intercourse, mercenary basis whether in cash or in kind, and lack of affection or personal interest. It

© Red Flower Publication Pvt. Ltd.

refers to the sexual behaviour of a female, outside or without wedlock on a commercial basis. It is regarded as a vice, a sinful or degrading indulgence of a natural appetite for itself alone. It is forbidden by religious and civic groups, and also prohibited by law in some societies. Prostitution often results into drug addiction, scandal, venereal diseases, AIDS and deterioration of the neighbourhood in which it occurs. Prostitution itself is not punishable under law but activities related to it, such as running brothel, any act being taken out in public place, pimps etc. are punishable. There are three million sex workers presently working in India. As there is no proper law, the sex workers are exploited by the pimps and the owners because they have nowhere to go. Once a female is involved in such activities, she is not accepted back in the society or family, resulting in them continuing with same under social pressure.

There are references to prostitution even in the pre-historic days in the religious books and epics such as the Vedas, the Ramayana, the Mahabharatha and the Bible. It is to be noted that the ancient thinkers such as Koutilya, Manu, Brihaspati endeavoured to prohibit prostitution and looked upon it, as a social evil and tried to eradicate it. It is pertinent to mention that the Bible says emphatically that the Prostitution should be banned. When we look at history in India, it was much in vogue during Mohammadan period, and many kings used to keep prostitutes and dancing girls as courtiers. However, during the British period, the rapid urbanisation and industrialisation increased this evil. The origin of the prostitution is an earmarked in the history. The flesh trade or selling the body for money is perhaps as old as male-female relationship. It is pertinent to mention that a prostitute known as a glamour girl, as a deva-dasi set apart in the service of a God.

International perspective

According to the Report of Havoc-scope, the revenue for prostitution can be estimated around 190$ billion per year worldwide. Even Amnesty International arguing that prostitution is a matter of free choice, a stance heavily promoted by the multi-billion-dollar commercial sex industry. International cooperation to end the traffic in women, for the purpose of prostitution began in 1899. In 1921, the League of Nations established the Committee on the Traffic in Women and Children, and in 1949, the United Nations General Assembly adopted a Convention for the Suppression of Prostitution and its Protocol.

Prostitution in United States of America is a booming billion dollar business and it has been seen as an organized institution, ever since colonial days. It was virtually uncontrolled till the Mann Act, was passed in 1910, famously known as White-Slave traffic Act, which prohibited inter-state transportation of women for immoral purposes. It primarily addresses about the prostitution, immorality and human trafficking. This is one of the several Acts of protective legislation aimed at moral reform during the progressive era. By 1915, nearly all States had passed the laws banning brothels. In most of the large Western cities, prostitution was tolerated, and the law enforcement agencies are more concerned with regulating the crimes associated with prostitution. A British Parliamentary Act of 1959 prohibits open solicitation by prostitutes, but permitted them to operate in their own homes and provided rehabilitative training to all, who wish to change their occupations. Regulations in the Scandinavian countries emphasized hygienic aspect. They made medical examination and hospitalization of the victims who are infected with venereal diseases compulsory. Prostitution is also rampant in Europe. There are many countries that have legalized the prostitution, such as New Zealand, Austria, Belgium, Bangladesh, Columbia, Denmark, Netherlands, and Germany. But the Soviet Union, prostitution has been officially outlawed. Interestingly, in Canada, which has limited legality, selling sex is legal, but buying sex has become illegal since December 6, 2014. Buyers face a minimum $500 fine and up to five years' imprisonment, if caught, and similarly in Iceland, selling sexual services is legal but paying for sexual services is illegal.

Prostitution as a violation of a Human Right

International human rights law recognizes prostitution as a violation of human right and specifically prohibits exploitation of the prostitution of others, including pimping, procuring and the running of a brothel. States and United Nations agencies have a direct, binding obligation to oppose any trivialization of prostitution and to work towards the elimination of its exploitation. It is to be noted that one year after the adoption of the Universal Declaration of Human Rights in 1948, the General Assembly of the United Nations adopted the Convention for the Suppression of the Traffic in Persons and the Exploitation of the Prostitution of Others, 1949 and this Convention is part of the United Nations universal human rights instruments and

of Registration Act and under other Legislations. As and when an un-regd. document is in hand, the litigant may search for protection U/S.49 of Registration Act, 1908. When there is an ambiguity in implementation of Law, generally the need of precedents will be high in necessity, to protect the rights of litigants. If the implementation or application of principles of Law is rigid (though harsh against some litigants) it may guide the citizens in a right way, in future.

JUSTICE AT DOORSTEPS-NEED TO REVITALIZE THE GRAM NYAYALAYAS ACT, 2008

By

Dr. Y. Gangi Reddy[1]

"Every human being is entitled to access to justice. It is as important to our society as our schools, our hospitals, or our housing. And at same time, we recognize the connection between access to justice and these essential institutions and capacities. Access to justice does not exist in a vacuum. In particular, we now recognize that there is only one system of justice, not civil and criminal justice systems that are separate. The average person does not know whether they are in a civil or criminal court."[2]

It is universally recognized that justice delayed is justice denied. Access to justice is considered to be another dimension of Rule of Law. If the right to have access to justice is denied, people would not be in a position to make their voice heard, and consequently cannot exercise their rights and hold the decision makers accountable. India is one of the countries where the population-judge ratio is the lowest in the world[3]. It is relevant to mention here the timely reminder given by Chief Justice of India T S Thakur on the issue of judge-population ratio in April, 2016 when his Lordship lamented the executive's inaction in at least doubling the number of judges to handle the "avalanche" of litigations, prompting Prime Minister Narendra Modi to assure him of the government's resolve in finding a solution jointly with the judiciary. "... It is not only in the name of a litigant or people languishing in jails but also in the name of development of the country, its progress that I beseech you to rise to the occasion and realize that it is not enough to criticize. You cannot shift the entire burden on the judiciary," the Chief Justice of India had said in an unpleasant voice while addressing the inaugural session of a joint conference of chief ministers and chief justices of high courts[4]. It is therefore necessary to have more courts and more judges in India to address the question of speedy and effective justice delivery system in general and particularly in the rural settings. It is in this background that an attempt is made in this article to examine

Abstract

In this study, it is discussed about the investor's awareness on mutual funds in Bengaluru. It is difficult to selective group the investors in a sample as such the population of Bengaluru city is large in number. Compared to earlier days the investment options are changing from risk free to riskier investments. The analyses also show that compared to earlier days the growth of investments in the stock market increased to significant level compared to other conventional investments which are of lesser risks and lower returns. The inexperience of investors about mutual fund coupled with aggressive selling by promising higher returns to the investors have resulted into loss of investors' confidence due to inability to provide higher return. This requires the Asset Management Companies (AMCs) to comprehend the reserve/conspire determination/changing conduct of the speculators to structure appropriate items to meet the changing budgetary needs of the financial specialists. With this foundation a study was directed among 128 Mutual Fund Investors in Bengaluru to study the factors influencing the fund/scheme selection by the Investors. For analyzing the difference in awareness of mutual funds done through SPSS, Z-Test and One-way ANOVA analysis has been made. Hence, this study is made to evaluate the investor's awareness on mutual funds'

Keywords: *Investors, mutual funds and Bengaluru city.*

1. Introduction

At the- present scenario Indian mutual fund industry shows a vital role by mobilizing the savings and investments. More and more individual investors have shown interest in special financial products. With more emphasis on professional managed investments, the role of mutual funds has boosted. Mutual funds are financial tools which help the individual investors to diversify their investments with the aim of making good returns. Mutual fund is trust or Investment Company, which undertakes the work of intermediary by pooling in the savings of large number individual investors in corporate securities and bonds. In this way many individual investors get good returns, capital appreciation at a lower risk than direct equities. Mutual fund schemes are right choice for individual investors as the schemes are professional managed, diversified and offers steady returns at - very low cost. At present there are many differences of mutual fund schemes available in the market and the asset management companies compete with one other to launch schemes.

LEGALIZATION AND INSTITUTIONALIZATION OF CRONY CAPITALISM IN THE INDIAN POLITICAL ECONOMY THROUGH ELECTORAL BONDS: AN ANALYSIS

Ranjeet Kumar*

Abstract

This article is an attempt to analyse the role of government launched electoral bond scheme in the legalization and institutionalization of crony capitalism in the Indian political economy, particularly, in rent-thick sector where government permission is required to operate. It also argues that the removal of the cap on political funding by corporate entities to political parties will lead to the uncontrolled power to fund elections that gives an infinite leeway to the corporate over the politically influential parties and more importantly, control over public policies i.e. policy capture and regulatory capture. With the passage of time, motivations of key actors of the politico-economic configuration viz. the political executives, political parties, bureaucracy and capitalist firms have undergone transformation. This has led to the alignment of all such players to a system where such rents could be shared surreptiously among them. When crony capitalism plays a dominant role in any economy, it leads to inefficiency in the economy and the system would fail to provide level- playing field to all players in the market and society and result in further social and economic disruptions.

Keywords: Crony Capitalism, Rent-thick sector, Revolving Door, Policy and Regulatory Capture, Round Tripping, Greenfield Category, Democratic Trust-deficit

I. Introduction

One of the fundamental principles of representative democracy is that a leader, to provide legitimacy to his leadership and the government he forms, should seek the consent of and obtain mandate from citizens[1]. Citizen's participation is, thus, an important aspect in the choice of their leaders who would enjoy popular acceptance and legislative majority. Election process is the mechanism through which citizens exercise their right to self-determination and participate in decision- making by the state[2]. In other words, it could be said that elections are the means of filling public offices through competitive struggle by capturing people's vote.

Elections have become synonymous with democracy itself in popular perception as they empower citizens with the absolute right to choose their leaders[3]. As a result, election process has come to be one of the touchstones to measure as to how democratic a country is. Therefore, participation by citizens in election process and the conduct of free and fair elections are considered major policy objectives in a democratic society so much so that one of the political responsibilities of every citizen is considered to be his duty to vote for emergence of responsible leadership in their community or country.

Election matters a lot for many other reasons. *First*, elections are not just elections; they are part of a process. *Secondly,* elections determine the right kind of leadership and its continuity or change in time. *Thirdly,* even flawed elections may have certain value in institutionalizing electoral integrity provided subsequent electoral cycles reinforce the key democratic or electoral principles.

In general, we could deduce four principal objectives or functions that elections in a democracy could serve to achieve. They are[4]:

1. *Legitimization.* In a democratic polity, it would be necessary for the government in power and its leadership to garner and maintain popular will represented by the majority support of the electorate, the absence of which raises possibilities of discontentment, rebellion and violence leading to revolution and overthrow of the government. The legitimacy to the ruling dispensation is ideally conferred through 'free and fair' or 'clean' electoral processes devoid of corruption, intimidation or choices restricted or restrained by reasons other than popular will[5].
2. *Exercising Accountability.* Periodical elections play an important role in ensuring accountability of leadership directly to people. Such accountability could include issues such as safety and security of

Insurance Product Designing: An Analysis of Regulatory Guidelines

*Veena**

The concept of insurance has been prevalent in India since ancient times and has a great social significance. Insurance contributes to the economic growth of a nation, and it has evolved as a process to safeguard the interests of people from loss and uncertainty, and plays a major role in reducing the risk of loss of life and property. In today's competitive market the insurance companies design and market various insurance products to cater to the changing needs of people, business and industry. In the process, they have to design insurance products which have market viability and also capture the attention of the people, where security is the prime motivating factor. While insurance companies design and price the product, IRDA, a regulatory body regulates the same. Without IRDA's prior approval, no new policies could be launched or priced by the insurance companies. Marketing of insurance products is more complex in the present scenario, and products are regulated by a three-tier model—designing, pricing and marketing. The present paper deals with these phases along with the latest IRDA regulations pertaining to the insurance products and pricing. It further discusses the enormous efforts and challenges faced by insurance companies in planning and designing insurance products in the country and the major role played by IRDA in protecting the interests of the insurance policy holders.

Introduction

A well-designed insurance product is a milestone for insurance companies, paving the way for business success. It is the most critical and important step in designing a business plan and creating a blueprint for the growth of the company. The pricing of the product also depends on various factors, including the risks covered by the product and the terms and conditions of the insurance product. As such, more attention is required to be paid to insurance product design.

There is a paradigm shift in the approach towards designing insurance products as the products are required to comply with the quality parameters laid down by the regulators. The rules[1] framed by the Insurance Regulatory and Development Authority (IRDA) to protect the interests of the policyholders have further injected concerns in

"ADULTERY ACCOSTING MORALITY AND RELATIONS LANGUISHING UNDER LEGALITY IN INDIA – A FESTSCHRIFT TO LIBERTY"

Dr. Madhuri Irene M.[1] & Apoorv Gupta[2]

Associate Professor & 3rd year B.A., LL.B (Hons.) Student

ICFAI Law School, IFHE, Hyderabad, India

Abstract: The contours of modern Indian state driven by the philosophy of neo liberalism are constantly shrinking. However, in the domain of criminal law the state remains the holder of Leviathan like power and monopoly over legitimate violence; indeed, its authority is solidifying its roots and gaining fresh ground. Speaking with regard to the realm of criminal jurisprudence, the decisions to criminalize or decriminalize CERTAIN ACTS OF HUMAN RELATIONS in India appear to be quite contradictory to the established principles. It therefore leads to a variety of confusion and most discussion in this regard remains centred around personal opinions and conjectures. Adultery smeared with evil nature mainly arises from regressively conventional ideas of infidelity. Thus, it energises one to relook the assumption surrounding sexual exclusivity. However, in today's neo-liberal morality numbing civilised world, instances of adulterous life are not exceptions but a normal feature, consent of moral turpitude stands on adultered platform. Deviance of human interpretative morality may make the sentiments senile and results in slippery slope of human relations and institutions like marriage, social fabric of decency and rationality. Whether adultery is a mere biological phenomena insouciant to moral philosophy that could pave way for unhindered freedom and liberty or a notion approved by criminological perspective or whether it could be condoned by the expansive empathy of family prudence – is a ponderous penumbra not for the wisdom of sages and religious rants but for the ordinary prudence of a common man. In order to assess the proposition, this paper focuses on the initiative of the Supreme Court in decriminalizing adultery.

Key Words: Adultery, Indian Penal Code, Family Jurisprudence, Liberty, Morality

NATIONAL FOUNDATION FOR HIGHER EDUCATION HYDERABAD

I. INTODUCTION

"Adultery is a most conventional way to rise above the conventional." - Vladimir Nabokov

Just like Law is dynamic, change is law of life. No entity is exception in the creation, spiritual, physical or metaphysical. Generations prior to Marcony will not be permitted to govern people living with mobiles in virtual world and robots in real world. True, as Thomas Jefferson said – the Dead from the grave cannot rule the Living on the earth. The entire human history from Adam and Eve to religion-flavoured political governance of modern societies would testify the prevalence and power of change. Judicial cosmos, with infinite patience, too falls in obedience to the nature and its evolutions, revolutions and dissolutions. Is nature and its creation a supernatural product or process of sentiments, sensitivities of limited human ingenuities or a cycle of creation or destruction (Yat Bhavati Tat Nasyati) beyond the ken of human knowledge and power? After all, a person belonging to 5000 years of civilization and knowledge is not far away from the truth that after all body is perishable and soul is imperishable and everlasting. Now natural bodily instinct is placed between the hammer and the anvil.

Adultery – involves cheating resulting out of a spousal lie with regard to the lying with another person (extra-marital enjoyment) which naturally and certainly hurts the victim and aggrieved. Why spousal cheating of the aforesaid kind

SCENE OF OFFENCE: A CRITICAL BUILDING BLOCK OF SENTENCING

*Dr. Veena**

ABSTRACT

The Indian criminal justice system, having accepted the adversarial system of common law borrowed from the British colonial rulers, deeply committed to the principles which considers the'accused as innocent' and the 'prosecution has to prove the guilty beyond reasonable doubt', have thrown challenges to the investigating agencies and prosecution for inflicting the accused. Many a times, the victim, who has the picture of the offence, is made as only witness, as a result, warrants more critical evidences corroborating the witness statements in order to fix the crime against the offender. Thus, the present system is more tilting towards the accused than that of the victim.

Ultimately, the investigations and prosecution are under responsibility to search for the facts and truths for proving the case. The dependence on natural persons as witnesses is not that safe as they are prone to influences and change their stand for the reasons of their own. Effective evidence collected scientifically and acceptable legally, known as the forensic evidence, is needed for framing the accused. The trained investigators, with the help of scientific tools, collect the information and material at the place of the crime which is commonly known as the 'scene of the offence'. They undertake the search of the scene of the offences for truth and facts

CORRUPTION: TROLLING FROM CRIME TO CONFUSION

Dr. Y. Gangi Reddy*

ABSTRACT

Disrobing the ignominious "sin" status, the concept of corruption has been recycled into tolerable criminal colour and subsequently reformed, as a mark of progressive revolution, into development confusion. Today, it is universally understood that corruption is the insignia of industrial, trade and political functioning. After all, by nature, human body is a simultaneous composition of both good and bad. It is philosophically spoken by powered politicians and enriched giant business. Corruption has become omniscient and omnipotent.

Corruption is in existence in the society from the time immemorial, variously deep rooted in the society that, people got used to it, over a period of time. It has become a pre-requisite in the public offices for the movement of any file, related to public service. For the persons extending the service, though as a part of their duty, it becomes a right to demand, and for the recipients of the service, it is a necessary evil for getting the work done with ease. The complexion of corruption damsel often depends upon multiple cosmetics of location, nature of work, governance, administration rule, value system, ethical emboss etc.

The present paper makes an attempt to discuss the existence of corruption in the society, philosophical and metaphysical

perception of corruption, impact of corruption on various segments of social life, contributory reasons for corruption in India, relative position of India in the world corrupt countries based on Corruption Perception Index, World Bank observation and data collected from various reliable sources. How to control the multi-headed dragon of corruption? It is a trillion dollar enigma but a quiescent question. The commoner heaves a sigh of dejection stating that "corruption is cultivated by the privileged, powered and advantaged authorities".

The article commences with an introduction to corruption. Philosophical and metaphysical perceptions of corruption are discussed in the second part. The consequences of corruption are demonstrated thereafter. Corruption and political expediency are discussed in the fourth part. The position of India as against the rest of the world, as per "Doing Business 2018", report and "The Cor'uption Perception Index 2017", is discussed in the subsequent two chapters. In the following parts, global experiences on containing the corruption are discussed. The eighth part sums up the statutory provisions dealing with corruption in India. The next part furnishes the statistical data pertaining to the corruption and conviction rate in India. The last and the tenth part contain conclusions and recommendations.

INTRODUCTION

THE distinction between popularity and notoriety in the present day world, is just separated by a thin and transparent membrane of public perception and their value system. Good enables construction and evil drives to destruction. The term 'Corruption', which was considered as a detestable trait earlier, is now treated as an unholy alliance of both good and evil. It is surprising that though corruption is loathed by public as a multi-headed monster, it is tolerated and accepted by them as an inevitable evil. Even though, literature could not fully and comprehensively describe the 'death dance' of corruption, it exists, stays and plays its game everywhere without any exception. The progression of corruption over a period of time transgressed from a sin, an offence, a moral degradation and a wrong, to a state of 'confusion' today. It could neither be condemned nor tolerated, and surprisingly at times some tacit permission is accorded for its stay.

Kofi Annan, the then Secretary General of U.N. in his foreword to U.N. Convention against Corruption, 2004 at Vienna observed

SHARIA COURTS AND ITS CONSTITUTIONAL VALIDITY IN INDIA

By

Dr. Md. Akbar Khan*

Abstract:

The Sharia model of judiciary has been known in Western countries from the middle ages and today Sharia courts are still functioning in some of them.From the 1990s, Sharia courts began to emerge in India as religious or civil structures.Recently the subject matter of Sharia courts has been drawing the attention of the Indian media.The All India Muslim Personal Law Board or AIMPLB, the highest decision making body on Muslim affairs, plans to open Darul-Qaza (Sharia courts) in all districts of the country to resolve issues in line with Islamic laws.This article touches on the fundamental principles of Sharia judiciary, the modern practice of Sharia court activity in Muslim and Western countries, their establishment and functioning in India and their Constitutional validity in India. The place which Sharia courts occupied in the judicial system of the Muslim during middle age, the general historical evolution of Sharia justice institutions and the role played by modern Sharia courts in India, which depends on the place which Islamic Sharia occupies in their legal systems, are shown.

Keywords: Sharia, Constitution, Sharia courts, fiqh, sulh, Arbitration, arbitration tribunal, alternative methods of dispute resolution, mediation.

Introduction:

The subject matter of justice and law has always taken a significant position in fiqh—the Islamic jurisprudence or science of the rules regulating the explicit behaviour of human beings. A famous letter written by Caliph Umar ibn Al-Khattab about Shariajudiciary is a benchmark as it covers all the key issues of Sharia[1]. This brief document is just a few dozen lines but thecomments run to hundreds of pages, and make it one of the most outstanding works of medieval fiqh, created by Ibn al-Qayyim al-Jawziyyah, a notable Muslimlegal scholar[2]. Interpreting the idea of the Caliph's letter, he gives a detailed rendering ofIslamic legal theory.Characteristic features of Islamic law simultaneously manifest themselves both in the organization and functioning of the Sharia courts. What is meant hereare the norms elaborated by fiqh (the norms are also called fiqh) which meet the criteria set to the law[3]. In the first instance, it covers thesource of Islamic law represented by the doctrine over the course of history and theworks by Muslim legal scholars Sharia judges (qadi) referred to while taking their decisions.

It is no coincidence that Sharia courts as state institutions played a crucial role in the enforcement of Islamic law. According to fiqh the principal designation of the power is the implementation of Sharia and this task is completed in the activity of judicial bodies. Taking into account the concept of the separation of powers, modern Islamic legal thought highlights the leading role of the judicial power not the legislative one. The practical effect of the Sharia norms is impossible without the Sharia judicial bodies executing the principal function of the Islamic state.

Over the course of history in most Muslim countries Sharia courts specifically were the core of the judicial system and ensured Sharia's implementation. The situation started changing in the second half of the 19th century when profound political and administrative reforms in the Ottoman Empire and Egypt entailed a shift of positions in more developed Muslim countries Islamic law gave central place in the legal system to European type legislation. The Sharia courts were significantly modified as a result of those changes. In most countries their jurisdiction was limited to the consideration of the personal status of Muslims.

Functioning of sharia courts

At present the organization of Sharia courts and procedural rules applied by them comprise traditional Islamic norms and institutions with forms typical for modern European law. In particular, traditional Sharia justice was based upon thesitting of a single judge (qadi), while nowadays a panel hearing

THE ICFAI FOUNDATION ... REGISTRAR ... THE ICFAI FOUNDATION FOR HIGHER EDUCATION ... HYDERABAD

Since the Universal Declaration of Human Rights was ratified by United Nations member countries in 1948, the principle of basic human rights has gained global acceptance. In recent years, proponents of environmental justice have extended that principle into the sphere of the environment, driven by a recognition that increasing scarcity of, and conflict over natural resources requires new approaches for securing a peaceful future. It is to be noted that between the world wars there was no significant development and only after Second World War, with the establishment of United Nations, International Union for Protection of Nature, International Union for Conservation of Nature were formed with the Government. As a result of Non-Governmental Organisation participation, a Wildlife Fund was created to work in association with International Union for Conservation of nature.

Till the coming of Stockholm Declarations, the environmental measures were dealt in fragmentary manner, in various Conventions such as Western Hemisphere Convention, 1940, International Plant Protection Convention, 1951, Brussels Convention relating to Intervention on High Seas in cases of Oil Pollution, Civil Liability for Oil Pollution Damage, 1969, Convention on Wetlands, 1971. The United Nations Conference of Human Environment held at Stockholm in 1972 is the first major attempt to solve the problems of environment by international agreement on an universal level. Principle of 1 of the Declaration on Human Environment also emphasis that "Man has the fundamental right to freedom, equality and adequate conditions of life, in an environmental of a quality that permits a life of dignity and well-being, and he bears a solemn responsibility to protect and improve the environment for present and future generations." Again, Paragraph 1 of the preamble of the same declaration states that "Man is both creative and moulder of his environment, which gives him physical sustenance and affords him the opportunity for intellectual, moral social and spiritual growth.

II. ENVIRONMENT AS A HUMAN RIGHT

As a part of Right to Life, there is no direct mention of environment protection as a human right either in the Universal Declaration of Human Rights, 1948 or in the two International Covenants on Civil and Political and Rights, and Economic, Social and Cultural and Rights, 1966. But, there are indirect references in relation to environment, such as Article 25(1) of Universal Declaration of Human Rights says that everyone has the right to a standard

RFCTLARR Act, 2013: Implementation Issues and Challenges

*S V Damodar Reddy**

While land acquisition is necessary and inevitable for economic and social development, the power of government to acquire land under the "Doctrine of Eminent Domain" is draconian as well as in violation of human rights of the land owners under the Land Acquisition Act, 1894. This paper discusses the provisions of the much talked-about people-friendly Right to Fair Compensation and Transparency in Land Acquisition, Rehabilitation and Resettlement Act, 2013 (RFCTLARR Act, 2013) which is said to imbibe the maxims Salus populi est supreme lex and Necessitas public major est quam privata. The paper also discusses the issues related to implementation of this Act in letter and spirit and how unjust efforts are made to water down the provisions of the RFCTLARR Act, 2013.

Democracy is a government of the people, by the people, and for the people.

– Abraham Lincoln

We are not opposed to development. But development needs to have a human face and it should suit the needs of the people and the environment ... anything that pollutes the air and destroys agriculture and anything that increases heat and destroys fishing is not welcome.

– Konkan Vinashkari Prakalp Virodhi Samiti's Satyajit Chavan

Introduction

The four essential elements of a state are population, territory, government and sovereignty. The progress and prosperity of the country largely depends on the type of land it possesses and its geographical nature, yielding quality and capacity, value and extent. Land plays a vital role amongst the factors of production, viz., land, labor, capital and organization. Moreover, land is treated as the symbol of social status since generations.

In the good olden days, whoever is in occupation of land is treated as the owner of those lands. Now there will be no land without an owner. Ownership of land can be broadly divided into two: state ownership, i.e., lands owned by state; and private ownership, i.e., lands owned by private individuals or groups.

A QUALITATIVE ANALYSIS OF CROSS-DRESSING LEGITIMACY WITH SPECIAL REFERENCE TO INDIA

Dr. K.S. Rekh Raj Jain
Assistant Professor, ICFAI Law School, Hyderabad,
nabariya_jain@yahoo.co.in

Received: Oct. 2018 Accepted: Nov. 2018 Published: Dec. 2018

Abstract: The ways of dressing echoes human prerequisite which attempt to align one's self with a specific sexual group and also reflects sensation of attire. Attires influence and shape the appearance with substantial impression on the construction of social identity. Cross-dressing is morphism of expression of disguise and self-expression usually associated with the opposite sex which been practiced in ample in many societies. Crossdressing reveals a form of gender transgression indicating the most visible form of gender non-conformity. Crossdressers can be categorized into four clear groups – Transvestites, Eunuchs, Transsexual men and Drag queens.

Cross-dressing are of diverse diversities and various reasons may be attributed. Mostly cross-dressing has been used for purposes of disguise, comfort, and self-expression throughout history including the modern times. Even socio-psycho and religious inference also reveals that individuals who cross-dressed did so for innumerable reasons.

Originally cross dressing was a private affair but currently it is visible openly due to growing acceptance of different sexualities as people are veering away from the strict confines of dress code. Dressing to express sexual orientation adds a different layer of complexity.

The laws pertinent to dress varied around the world. Laws criminalizing cross-dressing flourished throughout the 20th century, which was perhaps a reflection of society's perception of cross-dressing as sexual deviance yet cross-dressing existed. Later on cross-dressing laws are challenged on various grounds. The present contention is that one's choice of attire may be described as an expression of individual liberty and autonomy, or an expressive statement protected under the right to freedom of expression.

This paper takes the stock of the current context and aims to bring greater clarity pertinent to the thematic area of concerns regarding a qualitative analysis of cross-dressing legitimacy with special reference to India.

Keywords: Attire, Cross-dressing, Cross-dresser, Sexuality, Transgender.

Introduction: The ways of dressing echoes human prerequisite which attempt to align one's self with a specific sexual group and also reflects sensation of attire. When a person intentionally dress to reflect his sexuality it represents a means to increase the visibility of sexual identities which are not universally accepted. When it comes to dressing and sexuality, context is everything and sexually differentiated people willing to be considered different from the mainstream dress differently to express their sexual orientation in public. This includes forms of cross-dressing intended to break down stereotypical gender roles. Crossdressers can be categorized into four clear groups – Transvestites, Eunuchs, Transsexual men and Drag queens.

The sex of a human baby is determined at the time of birth either as male or female. Being male, female or something else is an individual's internal sense. The notion of gender complexity is deeply rooted in every society. How a person represents or expresses one's gender identity is internal. A question haunts whether fashion choices of dressing appearance represent our sexual identities. Yes there is long been a connection between dress and sexuality, particularly in relation to gender.[8]

Excluded among the excluded: status of tribal women in Telangana

S.Kannan

Assistant Professor, ICFAI Law School, ICFAI Foundation for Higher Education (Deemed University), Hyderabad

Abstract: *In the process of planned development in India, the different segments of the population uplifted their socio-economic condition by utilizing the educational, occupational and other infrastructural facilities provided by the central as well as state governments. However, certain segments of the population like schedule caste and schedule tribe population were excluded and highly exploited in the process of industrialization and urbanization. The most vulnerable and excluded group in the process is Schedule Tribe population in general and in particular the tribal women. They are the most excluded among the excluded. Against this background the study analyses through the tribal literatures in which way they are excluded in the process of development. The literature review reveals that the factors like mean age of marriage and fertility, sex ratio, literacy and work participation rate can better reveal the status of tribal women. The study covers only the tribal population of Telangana state of India (as it is newly formed in 2014 from the state of Andhra Pradesh and no study conducted on status of tribal women). Further, Scheduled Tribes also constitute about 9.34% (the tribal women constitutes 4.5%) of the total population in Telangana state. The information was gathered from Census of India reports, social development report, National Family and Health Survey report and Statistical Year Book of Telangana. This paper analyze the status of women among the scheduled tribes in Telangana state. Frequent comparisons made by using the factors like mean age of marriage and fertility, sex ratio, literacy and work participation rate to the tribal women with other segments of the women population. Through the analysis, the study portrays the backwards of the tribal women in terms of literacy, mean age of marriage and fertility. The tribal development policies need to keep eye on the above factors to uplift the status of tribal women in the state of Telangana.*

Keywords: *Tribal women; Social exclusion; Literacy; Sex ratio; Work participation*

1. INTRODUCTION

The present study is an attempt to throw light on the status of tribal women in the wake of state reorganization of Telangana from Andhra Pradesh. In most tribal societies woman holds a high and honorable place and shows proudly free about the country-side, in field and forest she works in the happy companionship with her husband. Women's contribution in tribal economy has been emphasized by several authors (Veena Bhasin, 2017; Sen, 1982). However, recently changes have been noticed among tribal women due to contact with non-tribal cultures, changes in the subsistence patterns and impact of agricultural technology and industrialization. The tribal social system has been affected by the entry of non-tribal into tribal areas. Women are drawn into factories, mining, construction labor and are sexually and economically exploited. The influx of non-tribal has led to deforestation and land alienation resulting in growing proletarianization of tribal women, rendering them subject to wage exploitation and even flesh trade (Venkata Rao, 2001). For the development of tribal, focus has been on agriculture, animal husbandry, small scale and cottage industries and provision for institutional credit. Various schemes taken up under these are mostly aimed towards men. Tribal women who constitutes nearly half of the population, and who are partners to men, do not figure much as beneficiaries. In agriculture and dairying where women do most of the work, the trainings, demonstrations, education tours, etc., are oriented towards men. Land is distributed to men and loans , inputs, etc., are given to them. Women are assumed to be associated with or assisting their menfolk who own the land and hold the decision making power. Theoretically, it is possible for a women to get institutional finance. But unable to fulfill the formalities, even a widow having children may go for local credit. Since the developmental personnel are mostly men and are oriented towards men their interaction with women is minimal and women beneficiaries receive little attention. In this process women lag behind men in having access to information, technical knowledge related to improved methods and other services. Role of women is not only of importance in

VICTIMIZATION AND VULNERABILITY OF TRANSGENDERS IN CHANGING WORLD

Dr. K.S. Rekh Raj Jain[*]

ABSTRACT

Gender binary is a social construct. Transgender is a term used to describe people who identify with a gender different from the sex they were assigned at birth. The transgender community is a small subculture within the LGBTQ. Deviancy with regard to gender expectation leads to the pervasive pattern of discrimination and prejudice against transgendered people within the society. Transgenders in general face some of the highest rates of stigmatization, discrimination and marginalization.

In any society the citizens carry some risk of victimization and vulnerability and the victimization and vulnerability of transgenders is due to 'transphobia'. Their victimization ranges from verbal abuse to armed assault, multiple incidences of violence in particular high risk of sexual violence due to their sexual orientation.

Recent studies across the world indicate that there is massive increase in hate crimes against transgender community. In spite of greater attention is being given to research and data collection of transgender people in general, quantitative and qualitative data is still sparse, especially related to violence by or against transgender.

Across the globe transgender lives in the fear of racism, sexism, and criminalization. Due to their high risk sex behaviour, research studies indicate that HIV prevalence is highest among transgender persons impelling the areas of health and mental health. Transgenders are also vulnerable to high risk of suicide due to discrimination, harassment and violence.

This article explores how this marginalized community is subjected to victimization and vulnerability and pursues for the protection from victimization, violence, harassment and crimes with a hope of reducing future oppression and discrimination towards transgender community.

INTRODUCTION

SEXUALITY is an integral part of every individual. Sexuality includes our sexual orientation. Sexual orientation means who you are sexually attracted to and want to have sexual relationships. Sexual orientations include gay, lesbian, straight, bsexual and a sexual which indicates a diversity of sexuality and gender identity based cultures. Sexual identity is an important concept for lesbian, gay, bisexual and transgender individuals.

Sexual orientation is different from gender and gender identity. Gender identity is a person's internal feelings of being a woman, man, both or neither.

Gender binary is a social construct. Transgender is a term used to describe people who identify with a gender different from the sex they were assigned at birth.The transgender population is diverse in gender identity, expression, and sexual orientation.[1] The transgender community is a small sub-culture within the LGBTQ. Gender identity for transgender, presents challenges because it is complex concept that is rooted in social and political contexts.

Transgender community face many challenges in a society due to intolerance of any system of gender that is not binary, inimical behavior and their sexual orientation.The victimization and vulnerability of transgenders is due to 'transphobia'.Transphobia is prejudice directed at people whose gender identity or gender expression does not conform to social norms and expectations.[2] It is globally acknowledged that transgender face some of the highest rates of stigmatization, discrimination and marginalization. The transgenders endure horrific physical,

2. Stigma, Discrimination, Violence & Human Rights, Retrieved 28th November, 2017, www.undp.org.

psychological, and/or sexual abuse. Most of the sexual assault incidents are due to intimate partner violence. These incidences will have a serious impact on health, existence, development and dignity. Due to their high risk sex behaviour, research studies[3] indicate that HIV prevalence is highest among transgender persons impelling the areasof health and mental health. Transgender avoid preventative health care because of concerns related to both discrimination and insensitivity by health care providers.[4] Transgenders are also vulnerable to high risk of suicide due to discrimination, harassment and violence. A 2014, study by the Williams Institute and American Foundation for Suicide Prevention found that forty six percent of trans men and forty two percent of trans women have attempted suicide at some point in their lives, compared with four point six percent of the general population.[5]

Transgender are victimized at higher rates than any other minority group because they have several areas of vulnerability. Victimization and vulnerability of transgender on account of various factors is a truly global phenomenon. Vast majority of incidents are not reported. Even if reported, the transgender victims often provide incorrect or incomplete information. A majority of transgender individuals continue to live in trauma and fear of possible repeat of victimization.

None recognition of transgender community and their rights across the world reveal the betrayal of their gender identity and sexual orientation. Some of the horrific incidences across the globe highlights that transgender are being denied of protection from harassment and abuses on grounds of sexual alteration. Various data analysis and surveys of the International reveals that every year thousands of transgender become victims hate crimes.[6] Protecting transgender community against the fear of crime and from becoming victims of crime must be a global priority. In recent past,

SOCIAL AND ECONOMIC ISSUES OF TRIBAL AND INDIGENOUS PEOPLE VIS-À-VIS LAND ACQUISITION

Abhisek Ray [1]
D V N Murty [2]

"Our breathing is the same breath which springs from the world: the airs, the winds, and the breeze. All the races of people are equal."

-Arhuaco, Colombia

Before discussing the social and economic issues of tribal and indigenous people, the first is to understand what a 'people' is. The word people have two superficially similar meanings. The most common is the plural of 'person'. The other, is 'a people' meaning an identifiable society. This could be used to refer to a nation, for example, the Scottish and the Moroccans. This does not indicate that Scottish individuals are different from those in Morocco, though of course they are: it signifies that the one nationality is distinct from the other. In this sense, 'people' is a singular, not plural word. Extremist's views aside, it is obvious that the world's population is divided into countless different peoples.

A tribe is viewed, developmentally or historically, as a social group existing before the development of, or outside of, states. A tribe is a group of distinct people, dependent on their land for their livelihood, who are largely self-sufficient, and not integrated into the national society. Stephen Corry defines tribal people as "those who have followed ways of life for many generations that are largely self-sufficient, and are dominant society".[3]

Tata Group history and legacy

> Be it JRD Tata or Ratan Tata. We always saw the Tata Group as a rather different Indian enterprise, one that stood for decency, fairness, conscience, honesty and even social transformation (Sanghi, 2016) – Ashwin Sanghi, (Quartz India, November 16, 2016).

Goparaju Purna Sudhakar is Faculty Member at The ICFAI University Group, Hyderabad, India.

On October 24, 2016, according to *The Economic Times*, the Tata Sons board meeting was supposed to discuss the corporate governance framework, "What happened though was very different: the points never came up for discussion, and instead, Cyrus Mistry, Chairman of Tata Sons, was unceremoniously ousted" (Moneylife, 2016). As of October 31, 2016, Cyrus Mistry began vacating the iconic Bombay house, which is the headquarters of Tata group (Mishra, 2016). He moved into Bombay House in November 2011, as vice chairman of the group and to be the successor of Ratan Tata for Chairmanship, a year later. Mistry moved to Bombay house with a dream of a long haul of three decades till retirement at age 72. However, his dreams came to halt with the replacement of him by Ratan Tata as interim chairman of Tata Group on October 24, 2016.

Tata Group is a multinational conglomerate based in Mumbai, India, founded in 1868 by Jamshedji Tata. It gained a global reputation for the series of foreign acquisitions it made over a long period. As of 2016, Tata Group is into airlines, automotive, chemicals, financial services, software consulting, electrical distribution, engineering services, locomotives, consumer goods, steel, telecommunications, health care, real estate, defence and aerospace. Ratan Tata who hails from the Tata family was the chairman of the group between 1991 and 2012. Cyrus Mistry was the chairman of the group from 2012 till his ouster on October 24, 2016. Tata Group is a salt to software conglomerate. They make from salt up to Jaguar and Land Rover cars[1].

Tata Group ($103.51bn revenues in FY2016) employs around 660,800 persons across the world as on December 2016[2] (Exhibit 1). As on September 13, 2016, 70 per cent of the Tata group's revenues come from overseas businesses (IANS, 2016a). They do business in all five continents. They are the group who launched the cheapest car of the world "Tata Nano" for Rs 1,00,000 ($1500) in 2008 by their venture Tata Motors.

Tata Group has 29 publicly listed companies with a combined market capitalization of $120bn (Exhibit 2). Tata Sons is the holding company of the group companies and Tata Trusts are the promoters having shares in Tata Sons (Exhibit 3). Tata Sons is not a publicly listed company. In addition to Tata Sons stake in group companies, one group company has a stake in other group companies leading to a complex governing structure for the group. The evolution of Tata Group is presented in Exhibit 4. On October 24, 2016, Mistry would like to strengthen five different layers of proposed *corporate governance structure* (Exhibit 5) for Tata Group with clear roles, responsibilities and authorities.

As of November 8, 2016, Tata Sons shareholding pattern included Pallonji Mistry's (Father of Cyrus Mistry) group Shapoorji Pallonji (Shapoorji Pallonji Group, 2016)(18 per cent), Tata

Abstract

Humanity, having crossed primitive stone age, agrarian age, industrial age and Information age, has been galloping into 'Nano age'. Over the past few years, this little word 'Nano' with big potential has been rapidly insinuating itself into the world's consciousness, and conjured up speculation about a seismic shift in almost every aspect of science and engineering.

The newly emerging science of nanotechnology, the first new field in the present century has a peculiar trait that this field is ambitious, at the outset, to patent the basic ideas in many of the most important fields of inventions over the past century like computer hardware, software, the internet and even biotechnology.

The opulence of Nanotechnology as a science is marked with the great inflow of abundant inputs from many disciplines like physics, chemistry, electronics, biology and engineering etc. It is construed to be a science with great magnitude and potential to create new materials with specific properties and devices with wide ranging applications in medicine, electronics and energy production. But it appears that nanotechnology is at a speculative early stage; only a few nanotech inventions have So far actually made it into commercial products. There are about more than 2000 consumer products in the market which are developed containing Nano-particles and using nanotechnology. But the expectations surrounding the field are immense, ranging from a utopia of free energy and abundant materials to astounding alarm of probable industrial and environmental hazards.

This Article comprehends the significance of the application of Patent rights in nanotechnology products and devices, and how private domain taking away the nanotech-regime from public regime, how distinct the nanotech patents are from other patents and patentability exemptions and exclusions, examines critically whether the supposed Nano-world is becoming the paradise of privileged rich or penurious common people.

Key Words: *Nanotechnology, Patent rights, engineering, National Institute of Standards and Technology*

I. INTRODUCTION

The beginning of nanotechnology can be said to have taken place in the imagination of humans, through alchemists who hoped to combine materials to create compounds never before created. Science fiction also contributed to humankind's imagination with Dick Tracey's (a cartoon-strip character from 1950s-60s) wrist watch he could use as a communication device, decades before the cell phone.[1]

The twentieth century, now came to an end, has been one of rapid technological innovation and consequent social and legal change. From railroads to space travel, from computers to nuclear power and genetic engineering, new technologies have emerged in succession, each promising to upset settled expectations and change society's established patterns of human interaction. By consequence, in the past few decades many have come to believe that it is necessary to begin thinking about the impact of new technologies before they arrive. Such forward thinking has been applied to fields as diverse as space travel, artificial intelligence, and genetic engineering, with constructive results for the legal debate. Now a new technology, little more than a blip on the horizon, promises or threatens to create changes far more drastic than any of those mentioned is Nanotechnology.[2]

It is known to everyone that Richard Feynman's erudition on "There's Plenty of Room at the Bottom" stirred the scientific thinking on Nanotechnology in 1959, who confidently declared that doing things on an atomic level cannot be avoided, and suggested that atoms could be manipulated one at a time to form combinations which would be useful. In 1974, NorioTaniguchi, a Japanese Scientist coined the term "nanotechnology".

In 1981, invention of the Scanning Tunneling Microscope (STM);

Virginity Test – An Infringement on Women's Rights and Dignity: Evidence from India and Turkey

Sridevi D Shet[*]

A woman is the creator (Janani) of life and is the one who assures the existence of human race on the earth through her 'procreative' ability. But yet she has been subjected to a great deal of violence by our society. One of the most demeaning forms of violence is the virginity test. Virginity test is the physical examination for finding ruptures in a woman's hymen and then determining whether the woman is still 'a virgin' or not. Virginity is used as a parameter for assessing her reputation which underlines the plight of the woman being relegated to a mere object. The paper focuses on the medical utility of virginity test by hymen examination and its potential impact on the examinee. The paper focuses on the key distinctions between the perspectives on the virginity test used as a determinant for the chastity of women in India and in Turkey. The paper highlights the steps taken by the Indian and Turkish governments to uphold the dignity of women against virginity test practices.

Author Copy

Introduction

In patriarchic societies, gender roles are specifically and rigidly defined and as such a woman is valued not only for her reproductive capacity but also for her virginity. Virginity is considered to be a parameter for assessing her reputation and is considered to be important to her marriage ability. Virginity is assumed to be an honor to be lost during the consummation of marriage. In connection with marriage, virginity test is a practice some communities follow to detect the virginity of a woman or a girl (i.e., whether they had sexual intercourse prior to marriage or not). Communities often use the test to separate 'pure' females from 'impure' females, creating a question on the chastity of the women. The apparent virginity test, also referred to as hymen, two-finger, or per vaginal examination, is the examination of the female genitalia to decide whether the individual has had or has been habituated to sexual intercourse.[1]

The prevailing social validation for test is that an unmarried female's virginity is indicative of her moral character and social value, whether in the context of suitability

Democracy in Singapore

Dr. S. Uma Devi
Assistant professor, Faculty of Law,
ICFAI Foundation for Higher Education, Hyderabad.

Received: May 12, 2018 Accepted: June 16, 2018

ABSTRACT *Democracy is the most popular form of government because it is based on the will of the people and for their welfare. Singapore has a parliamentary democracy as a form of government with a unicameral legislature. With free and fair elections, the Singapore government was recognized for its stability, honesty and efficiency. Like any other constitution of a democratic country, Singapore constitution also providesfor provisions such as existence of political parties, popularly elected government, free and fair elections, right to vote, ministerial responsibility to the executive fundamental rights, includingfreedom of expression,etc. In spite ofall these democratic provisions of the constitution, the government is accused ofblocking the rise and growth of an effective opposition essential for a democracy.In practice, the freedom of expression of the people and the presswhich is the fourth pillar of democracyis curtailed. Since independence, People's Action Party (PAP) has been the only ruling party in Singapore with hardly any opposition. Singapore in all these years has elevated its position of third world country to a first world country. It has become one of the most developed countries in the world under the efficient rule of PAP headed by LeeKuan Yew, the first Prime Minister of Singapore. This paper analyses how the government's policies of meritocracy and discipline, though restricted the freedoms of the people, contributed to national integration and economic development of the country. Laws like the Internal Security Act (ISA), restrictions on the press and banning of trade unions violated the fundamental rights of the people. These laws on one hand, denied freedom of expression which is one of the basic prerequisites of democracy, on the other hand, they promoted multi-racialism and the concept of the welfare state in the real sense of the term. The state took the responsibility of cleanliness, housing and employment of the people and was successful in providing the same. This led to a dominant one party system which blocked the rise and growth of opposition necessary for a democracy. The PAP gave more importance to merit and talent than popularity to foster economic development. This attitude of PAP ultimately depoliticized the country and led to the emergence of an "administrative state".*

Keywords: *Democracy, Political parties, People's Action Party, Internal Security Act, meritocracy, administrative state, de-politicization.*

INTRODUCTION:

Democracy is a form of government in which people elect their own rulers with free and fair elections. Ina democracy universal adult franchise, political equality and freedom of expression are very significant as they reflect the will of the people.This paper examines the Democracy in Singapore. It studies whether the people of Singapore actually have a choice in electing their own representatives, enjoyment of fundamental rights, freedom of press etc.

A small island nation like Singapore became one of the developed countries in the world under the leadership of Lee Kuan Yew, The first Prime Minister of Singapore. He is also called as the father of Singapore as he is responsible for setting Singapore, a small country with no natural resources, as one of the important countrieson the world map. The great leap of Singapore from third world to first world was the remarkable achievement of Lee Kuan Yew.The PAP government has been instrumental in providing a comfortable material life, education and safety for the citizens. In Singapore you can go out at unearthly hours and go back home safely.

Regardless of all the achievements, Singapore government is criticized as being undemocratic and suppressing freedom of expression. The Internal Security Act, banning of strikes, establishment of National Trade UnionCongress and the government's monopolizing of the trade unions encouraged foreign investments. These policies ensured peaceful and uninterrupted economic activities,therefore, attracted foreign investors and many foreign companies opened their branches in Singapore and many Singaporeans got training in these companies. This created lots of employment in the country.

This paper tries to analyze how far it is justified to sacrificefreedom of expression for the sake of economic development. Important achievements of the PAP government like success in providing basic needs to the people, which is absent in many democratic countries is also discussed, as political democracy cannot be achieved without the fulfilment of basic needs. This paper also discusses the issues of whether it is justified to sacrifice freedoms of the people for the sake of economic development and weather people of

Victimization and Vulnerability of Children in a Changing World

*K S Rekh Raj Jain**

The children and the youth of any nation are supreme assets and are pedestal on which a strong, vibrant and dynamic nation can be built. Children are among the most vulnerable members of our society and need our nurture, care and protection. Millions of children around the world are the victims of violence, sexual, physical, and emotional abuse and exploitation on a daily basis. Victimization and vulnerability of children on account of various factors is a truly global phenomenon. Statistics across the globe reveals a rise in cases of victimization and vulnerability of the children. The concept of welfare and wellbeing of children is basic for any civilized society. With a view to protecting them, various protective legislations have been enacted both at national and international levels. Encompassing every aspect of child, the protection of victimized and vulnerable children must be the top priority of every community and also of vital importance to improve the quality of life. Despite the efforts of the child protection system, child vulnerability fatalities remain a serious problem. The worldwide victimization of children can be prevented, or at least its incidence can be greatly reduced, if decisive action is taken. The paper takes stock of the current context and aims to bring greater clarity as to how the children are victims and vulnerable to various crimes.

Introduction

The children and youth are a nation's most valuable assets. They symbolize the bright future of the nation by ensuring an abundant source of talent, potential economic value and economic growth. The children are, in fact, the foundation on which a strong, vibrant and dynamic nation can be built.

The concept of welfare and wellbeing of children is basic for any civilized society. Therefore, every nation has to ensure a safe and sustainable present and future for all the children since the nation's prosperity depends upon its future generation. Every child of the nation needs protection, promotion, nourishment and appropriate environment to become a useful and responsible citizen to serve the nation. It is the legitimate duty of every nation to provide a fertile ground for harmonious and comprehensive development of a child's personality.

DISCRIMINATION AGAINST UN ORGANIZED LABOUR: A CHALLENGE BEFORE EQUILITY

Written by ***Dr. M. Madhuri Irene*** *

ABSTRACT

Introduction:

The labour in India consists of about 487 million workers, the second largest after China. Of these over 94 percent work in unincorporated, unorganized enterprises ranging from pushcart vendors to home-based diamond and gem polishing operations. The organized sector includes those employed by the government, state-owned enterprises and private sector enterprises. In 2008, the organized sector employed 27.5 million workers, of which 17.3 million worked for government or government owned entities.

The unorganised sector of the economy refers to the house-hold based manufacturing activity and small scale and tiny sector of industry. An unorganized sector is one in which there is no stability in profits or gains. Its production is limited and it is confined to limited area. It requires less man power and investment. The handicrafts, artisan professions, khadi and village industries, such as handloom sector, beedi making, agarbatti making, hand paper manufacture and match box industries etc., can be located in the unorganised sector of the Indian economy.

Amongst the characteristic features of this sector are ease of entry, smaller scale of operation, local ownership, uncertain legal status, labour-intensive and operating using lower technology based methods, flexible pricing, less sophisticated packing, absence of a brand name, unavailability of good storage facilities and an effective distribution network, inadequate access to government schemes, finance and government aid, lower entry barriers for employees, a higher proportion of migrants with a lower rate of compensation.

This Article basically highlights the nature and essential characteristics of un organized sector and further analyze the legal issues raised in the protection of unorganized sector labour.

FEMALE GENITAL MUTILATION: INHUMANE TREATMENT OF WOMEN

M.Geethapriyadarsani[1]

"Female genital mutilation targets little girls, baby girls – fragile angels who are helpless, who cannot fight back. It's a crime against a child, a crime against humanity. It's abuse. It's absolutely criminal and we have to stop it. ***-Waris Dirie***

Introduction:

Female genital mutilation has been on discussion in recent years. Female genital mutilation (herein after referred as FGM), also known as female genital cutting and female circumcision, is the ritual cutting or removal of some or all of the external female genitalia for non medical reasons. It is a custom practiced by many religious sects all over the globe.

It is an unjust practice and one of the worst violence on women. It is mostly done to young girls mostly between infancy and adolescence. To the utmost surprise, this worst culture is being developed by the parents and community. Parents consider that, there should be "sexual purity" for girls and to preserve their virginity, FGM is performed and this is an honor to the family and sometimes contended that the practice is to save or maintain the honor of the family. This is performed by a traditional circumciser in the victim's house, with or without anesthesia and in a most unhygiene manner.

FGM is an insult and assault to womanhood by parents itself. The worst thing is that the female relatives of the bride and groom watch the opening of the vagina to check that the girl is a virgin or not[2]. FGM degrades the physical and emotional health of the women till her death. The World

Death Penalty in a Fallible Criminal Justice System

Md Akbar Khan and Abhimanyu Singh***

The existence of a punishment such as Death Penalty in contemporary India presupposes a blameless, unmarred Criminal Justice System. When a court decides to take the life of a human being, with the intention to punish for a wrong deed, it assumes that all the chains in the machinery that led to the conviction of this man are faultless. Through this paper, the authors aim to analyze the procedures of criminal justice that take place in our country. The purpose of this paper is to understand whether this brutal punishment relies on a system that is just, fair and dependable. The authors introduce their stance on the issue with the help of a contemporary Indian case. Then, the processes of investigation and collection of evidence by the police are scrutinized. Further, decisions of the judiciary are analyzed to develop an understanding of the methods of the judiciary. Later, the final stage of criminal justice, the executive clemency, is broadly analyzed. Once the system that awards this punishment is scrutinized, the authors attempt to prove the alleged brutality of the punishment by analyzing its impact.

Introduction

The old order changeth, yielding place to new, / And God fulfills himself in many ways, / Lest one good custom should corrupt the world.

– Alfred Lord Tennyson

In January 2013, the Trial Court of Honorable Justice Pawan Jain acquitted Mohammad Hussain, a Pakistan national of all charges, after eight years of being on death row.[1] This case of Mohammad Hussain or the Delhi Bus Blast Case of 1997 correctly depicts the reality of our criminal justice system. For a long time after the blast, the police made no headway towards solving the case and remained absolutely clueless. Suddenly, two months after the blast, the police received some 'secret information,' on the basis of which Mohammad Hussain was eventually arrested. He was charged with criminal conspiracy, murder and under the Explosive Substances Act, 1906.[2]

The Concept of Right to Development in the Neoliberalism Era with Reference to Transnational Corporate Accountability

*Annapurna Devi Munaganti**

In the neoliberalism era, the concept of Right to Development (RTD) plays a crucial role for the development of an individual as well as institution. The RTD—treated as third generation right—has wider scope in its interpretation because of its unique mixture of both civil and political rights and economic and social rights. The RTD had its influence from western capitalism and eastern socialism. This paper tries to focus on the impact of RTD on the Transnational Corporations (TNCs) and the role of TNCs in the development process of the host country. The paper finds as to how the TNCs, under the umbrella of development, change the dynamics of accountability in a new sense. Besides, the concept of RTD is not intended for the TNCs to escape their liability from accountability. The paper also enlightens as to how the concept of RTD has been misinterpreted and misconceptualized by the TNCs. The paper tries to draw a cordial relationship between the development and accountability concepts of TNCs with some suggestions.

Introduction

The Right to Development (RTD) is an inalienable human right, by virtue of which every human person and all peoples are entitled to participate in, contribute to, and enjoy economic, social, cultural and political development, in which all human rights and fundamental freedoms can be fully realized.[1] The definition of 'development' is a comprehensive economic, social and cultural process, which aims at the constant improvement of the wellbeing of the entire population and all individuals, on the basis of their active, free and meaningful participation in the development and the fair distribution of the benefits. Unless the people meaningfully participate in the process or in the distribution of benefits, it will not be regarded as development. The process of development is regarded as one of the fundamental freedoms which is capable of being realized and can qualify as an object of the claim as human right.[2]

The concept of RTD focuses not only on the ends but also the means of the development. The goals and the outcomes of development as the realization of rights

"WHISTLE BOWLER A SWEET FRIEND OR A SOUR ENEMY"

Dr. Madhuri Irene. M[*] & Ms. Anubha Srivastava[**]

Abstract

Corruption, which today has become a plague ruining the economical and ethical environment at the industrial level in India, often goes unchallenged when people are frightened to raise voice about it. Initiations to a committed Whistle-blower Policy will provide an invaluable insight into corruption. From exposing high profile scandals to financial scam, whistle- blowers play a critical role in saving both resources and lives. Timely disclosure of wrongdoing can also help to protect human rights. A whistle-blower is an employee that reports an employer's misconduct. There are laws that protect whistle-blowers from being fired or mistreated for reporting misconduct. One of these laws is the Whistle-blower Protection Act. This lesson explains the whistle-blower Protection Act and other laws that protect whistle-blowers. But today, in a country blowing the whistle can result into high personal risk because in the current state there is no legal procedure against an unauthorized expulsion, humiliation or even physical abuse related to whistle blowing conduct. Whistle- blowers often face retaliation, from the group or organization, which they have accused, and sometimes under the law. Discussions of whistleblowing whether in academic literature or in more popular media have tended to very one-sided assessments of the moral worth of the act? Indeed, much of the current literature concentrates on psychological or managerial aspects of whistleblowing while taking for granted this or that moral position or eschewing any normative commitment on the question.

Keywords *Corruption, Unchallenged, Personal risk, Popular media*

I Introduction

In the realm of philosophical writing, whistleblowing normally has been identified as an action taken by an employee, alerting society to potential or actual damage to the public as a result of present or future actions of the firm. Philosophical writers have presented a strong moral case for internal reporting of actions to be taken by a firm which will not be in the public good, defining these actions as "dissent." Only those who go outside the organization to report wrongdoing are termed "whistle- blowers." from a managerial perspective, whistleblowing is defined somewhat more generally, and ultimately must include both internal and external reporting. Rongine defined whistleblowing as "communication to the public of the illegal or conduct of one's employer that is likely to result in unnecessary harm to third parties." James stated that "whistleblowing may be defined as the attempt by an employee or former employee of an organization to disclose what he or she believes to be wrongdoing in or by the organization."[61] Such definitions, although somewhat immoral different, all establish broad parameters within which the reporting of organizational wrongdoing may be considered as "whistleblowing" and clearly allow for either internal or external reporting.[62]

Questions relating to the design and implementation of internal whistleblowing policies/procedures have become urgent, as many corporate governance codes around the world today prescribe whistleblowing policies/procedures as part of best practice. However, corporate governance principles or regulations do

Evaluation of Anganwadi Centers (AWCs) in Batala block of Gurdaspur district, Punjab

S Kannan
Assistant Professor, ICFAI Law School, IFHE, Hyderabad, India

Abstract
The Integrated Child Development Services (ICDS) has generated considerable interest among social scientists, planners and administrators and fairly a large number of studies have been conducted to evaluate and assess the impact of this programme. However, though the implementation of ICDS programme is largely dependent on Anganwadi Centers (AWCs) and they are the kingpin of the programme. However, studies on AWCs, in particular their contribution to ICDS is rare. Against this background the present study makes an attempt to examine the role of AWCs in ICDS project of Punjab. Analysis in the study has been carried out both at the macro and micro levels. The macro level analysis covers the state as a whole and based on secondary data. The micro level analysis is based on an empirical exercise confined to the AWCs of ICDS project in Punjab with reference to Batala Block of Gurudaspur district. As there are 120 Anganwadi centers in this block, 11 centers were selected by using simple random sampling method and interview method used to collect the required information from the supervisors of AWCs. The study found that though an elaborate arrangement has been made for the implementation of the ICDS Programme, the AWCs shouldered the major responsibility for the delivery of services. However, the whole programme appears to be insensitive and indifferent to the practical problems faced by AWCs at the grassroots level. Problems like inadequate infrastructure and resources, interference of local elites, non-cooperation of local community and associated complex bureaucratic procedures at various levels put the AWCs at a disadvantage position to carry out the assigned responsibilities. Finally, the study concludes by providing few policy suggestions to come over the obstacles faced by the AWCs.

Keywords: anganwadi, infrastructure, evaluation, child care, nutrition

Introduction
The ICDS has generated considerable interest among social scientists, planners and administrators and fairly a large number of studies have been conducted to evaluate and assess the impact of this programme (Kandpal 2006; Patil and Doibale 2013; Singh *et al.* 2013; Chudasama *et al.* 2015, Meena *et al.* 2017) [6, 11, 12, 3, 13]. However, though the implementation of ICDS programme is largely dependent on AWCs and they are the kingpin of the programme, studies on AWCs, in particular their contribution to ICDS is rare. Against this background the present study makes an attempt to examine the role of AWCs in ICDS project of Punjab. The ICDS provides a packages of services to the children in the age group of 0-6 years, to the expectant and nursing mothers and to women between 15-45 years of age from the disadvantaged segment of the society through an elaborate administrative arrangement and organizational set up where the AWC act as the nerve centre of all programmes. The focal point for the delivery of the package of services under ICDS scheme is an Anganwadi centre. Anganwadi Centres are the kingpin of the ICDS programme whose success rests to a large extent on her ability and capacity to perform her role and responsibilities effectively.

Anganwadi Centers
Anganwadi is a government sponsored child-care cum mother care center in India. It caters to children in the 0-6 age group. They were started by the Indian government in 1975 as part of the Integrated Child Development Services (ICDS) program to combat child hunger and malnutrition. The Anganwadi system is mainly managed by the Anganwadi worker. She is a health worker chosen from the community and given four months training in health, nutrition and child-care. They provide outreach services to poor families in need of immunization, healthy food, clean water, clean toilets and a learning environment for infants, toddlers and pre-schoolers. They also provide similar services for expectant and nursing mothers (Manichander 2016) [7].

Review of Literature
Many of them conducted studies at macro level (Gupta *et al.* 2013; Kumar and Garg 2008 [4, 15]; Sundararaman 2006) blames the operational and ineffective education system for the partial and poor coverage of the programme. Some of the studies at micro level conducted by Kharkongor (2012) [14] in Meghalaya, Chudasama *et al.* (2015) [3] in Gurjarat and Helena *et al.* (2014) [5] in Visakhapatnam provided only piecemeal information and have made only passing references to AWCs while analysing the performance of the programme. They have not provided ample evidence on contribution of AWCs and their problems and their impact on ICDS programme. Further research studies shows that Anganwadi's working is urban and semi-urban centers were functioning better when compare to the AWCs functioning in the rural areas (Asha, 2014) [1]. Against this background the present study makes an attempt to examine the role of AWCs in ICDS

Isaac Newton once asked his carpenter to make two cat holes to his house gate, one is in bigger size and another is in smaller size. Then the carpenter asked Newton "why two cat holes ?". "The Newton replied, the bigger one is to enter the cat and the smaller one is to enter the kittens". Then the carpenter told the Newton that the two cat holes are not required as the bigger one is sufficient to enter the cat and kittens too.

"Intellectuality is whose property? It is the property of an intelligent".

JURISDICTIONAL ISSUES IN CYBERSPACE AN ANALYTICAL PERSPECTIVE

By

Dr. Md. Akbar Khan (HoD) and

Abhimanyu Singh (Assistant Professor)*

ABSTRACT

In this article the authors wish to discuss the various issues involved in determining the jurisdiction under cases of cybercrimes that are emerging with special reference to developing countries like India. By developing we mean where growth of Information Technology is rampant but still it has not reached its peak. Cybercrimes can take place across various jurisdictions and hence the legal issue of jurisdiction of International Courts and country specific Indian Courts arises. We try to throw light on the present system in India, how it is effective and also upon international treaties and legal solutions to deal with the same. We have [illegible] consideration the [illegible] problem taking into consideration the [illegible] Laws in India. The inefficiency of legal [illegible] enact a more user friendly law is also [illegible] in detail. Turning back our focus on the [illegible] legal dilemma of Jurisdiction of Cyber [illegible] Courts we have suggested a model that [illegible] be successful in India taking into consider[illegible] its working in other countries. In our conclu[illegible] remarks a problem solution approach is [illegible] where we have addressed the issue and after [illegible] consideration the solution is suggested. [illegible] proposal taken and implemented with [illegible] effectiveness it would lead to a better result and [illegible] can be followed by other nations in solving the predicament regarding cybercrimes and crimes.

* Faculty of Law, The ICFAI University, Jaipur, Rajasthan.

INTRODUCTION

No matter how we enact laws and various control regimes, in the end it is the judiciary, which in any legal system, is responsible for administration of justice. Since cybercrime is relatively a very recent phenomenon, the judicial response in terms of interpretation of various statutes of cyber law assumes vast significance. In traditional crimes, there is a plethora of judicial decisions, which act as a guide and precedent for comparatively easier decisions but in case of cybercrimes, it is not so. Here we have very little go ahead and look forward to for interpretation of laws on the matter. Moreover, judicial decisions in cyber law have lot of bearing on technicality of the subject matter. There has been some litigation or judicial response to cybercrime all over the world, mainly in USA but it is expected that administration of justice in cybercrimes will be more challenging in near future due to the fast growing Information Technology.

JURISDICTION—THE CONCEPT

The effectiveness of a judicial system rests on bedrock of regulations, which

Can a President Self-Pardon? – A Comparative Study Between the US and India

*Priti**

The Presidents of the US and India enjoy certain executive powers under their respective Constitutions. One such power is the power to grant pardon or clemency. The pardoning power of the President is not an unbridled one, and judicial review of such a power is possible under the Constitutional framework. This paper discusses the scope and limits of the pardoning power of the President of the US and compares the same with the Indian scenario. The main issue of discussion is whether the President can self-pardon and if so, whether such power is permissible under the Constitution or not. Self-judging or self- dealing is one of the most pertinent principles of natural justice and such a power goes against the constitutional structure as well. Furthermore, an attempted self-pardon will undermine the confidence of the people in the President and the Constitution.

Introduction

November 08, 2016 was indeed a historic day for the US when Donald Trump was elected as the 45th President of the US, one of the oldest democracies in the world, winning against all odds and predictions. Unlike India, the US has a Presidential form of government, and the President of the US enjoys abundant powers and privileges like executive powers,[1] power to make treaties,[2] and military powers[3], and one of the most important among them is the power to grant clemency.[4]

Most civilized nations recognize the power to grant pardons as an act of grace or humanity in certain cases where the Court judgements may have led to the miscarriage of justice and the US is one of them. With close to 75 lawsuits pending against Donald Trump, it would be interesting to note the effect of the same on his Presidency. Several lawsuits, ranging from alleging that Trump's school was a criminal organization[5] to fraud[6] to illegal termination of a woman from her job[7]or violation of the consumer

Socio-Psycho Legal Aspects of Restorative Justice for Crime Victims

*K S Rekh Raj Jain**

Crimeless society is a myth. The most obvious effect of crime is the victim suffers the resultant social, legal and psychological problems. Adversarial system of criminal justice model has not served the crime victims well. The upsurge in the concern for crime victims is a relatively new issue in criminal justice, as the Movement for victims' rights started. Restorative justice is a new movement in the fields of victimology and criminology. Restorative justice is not just about healing the victim's wounds; it is also about restoring the offenders to their previous status as law abiding individuals and repairing the harm done to the interpersonal relationships and the community. A central premise of restorative justice is that victims, offenders and the affected communities are all key stakeholders in the restorative process. It is a powerful way of addressing not only the material and physical injuries caused by crime, but also the social, psychological and relational injuries as well. This paper highlights the socio-psycho legal aspects of restorative justice for crime victims.

Author Copy

Introduction

Crimeless society is a myth. In fact, there can be no society without the problems of crimes and criminals. Crime happens in many forms and has different effects. There are many categories of crimes and many genera of offenders in all age groups, among both sexes, in all the strata of the society. Crime symbolizes a major form of conflict in the society. It is the obligation of the state to grapple with crimes and criminals.

Governments have legal systems as an apparatus to enforce the standards of conduct necessary to protect the individuals and the society. The legal system of any nation is intended to be a self-contained legal entity with authority to provide for its own system of laws. The criminal justice system operates in accordance with specific criminal statutes. Criminal justice system operates by apprehending, prosecuting, convicting and sentencing those members of the society who violate the basic rule of law. The justification for punishment becomes varyingly relevant and significant at different stages of criminal justice process. The sentencing has to ultimately determine the quantum and nature of punishment to suffice the ends of justice.

The tail-end of the criminal justice is prison—an institution to house undertrials and prisoners. In fact, the concept of prison has remained closely linked with theories

Cyber Crimes and Cyber Torts: A Comparative and Analytical Perspective

Md Akbar Khan*

INTRODUCTION

A cybercrime is defined as an offence where the Internet, computers and mobile devices are used to commit criminal misconduct. Some examples of this may be cyber-terrorism or online piracy. Unlike a cybercrime, a cyber-tort falls in the sphere of using the Internet or computers to commit a negligent or intentional civil wrong against others. The cardinal principles of the same are attributed to a tort that differs from a crime both in principle and in procedure. A tort is an injury or a breach of duty to an individual for which he is entitled to get reparation from the wrong doer, while a crime is regarded as a breach of duty to the public as a whole for which the offender is punished by the State in the interest of society. The remedy for the former is an action for damages by the aggrieved party in a Civil Court, while the remedy for the latter is a prosecution in a Criminal Court.

Instances of cyber torts could be a trespass to chattels or online defamation. It is pertinent to delve deeper and calibrate the preemptive measures in order to thwart the imminent threats of cybercrimes and cyber torts and enquire as to how both can happen and impact within virtual worlds in order to unleash tangible and intangible harm that affects the physical and real environment.[1] Let us evaluate what cybercrimes are.

Definition: Some of the common definitions of cyber-crime are[2]:

- A criminal activity that involves unlawful access to or utilization of computer systems.
- Any illegal action in which a computer is used as a tool or object of the crime; in other words any crime the means or purpose of which is to influence the functions of a computer.

Housing Wealth Effects and Household Consumption in India

Vighneswara Swamy

I. INTRODUCTION

Wealth is a key determinant in explaining consumption. Economists often mention the 'wealth effect' - denoting the association between the level of personal wealth and the decisions about spending or savings. The "wealth effect" is mostly based on the premise that consumers tend to spend more when there is a bull market in widely-held assets like real estate or stocks because rising asset prices make them feel wealthy. Intuitively, the notion that the wealth effect stimulates private consumption is logical. The wealth effect is a psychological phenomenon that causes people to spend more as the value of their assets rises. The premise is that when consumers' homes or investment portfolios increase in value, they feel more financially secure, motivating them to spend more.

The conventional wisdom on the wealth effects informs that fluctuations in household wealth have driven major swings in economic activity. The topic of wealth effects has gained increased attention (see Sundaresan, 1989; Deaton, 1992; Muellbauer and Lattimore, 1995; Skinner, 1996; Rudd and Whelan, 2002)as the changes in stock and property prices become more important since the liberalization of financial markets and the deregulation of mortgage markets in the 1980s. Undeniably, the fall in wealth during the global financial crisis is often mentioned as an important contributing factor to the unusually slow economic recovery. This has brought new concerns about the response of consumer spending to the asset price shocks.

Theoretically, according to the '*life-cycle hypothesis*', an increase from stock or housing wealth should have the same effect on consumption as the marginal propensity to consume out of wealth is slightly bigger than the real interest rate in the long-run(Ando and Modigliani, 1963).According to Milton Friedman's '*permanent income hypothesis*', households consume a constant fraction of the present discounted value of their lifetime resources. Therefore, the changes in wealth that permanently alter households' resources should cause consumption to change in the same direction. Undoubtedly, the traditional macro-econometric models of wealth effects represent a workhorse tool for analysts seeking to gauge the influence of wealth on macroeconomic dynamics. Wealth effects literature also presents alternative views challenging the life-cycle hypothesis (Mishkin, 2007).

Relying upon aggregate data on consumer spending, financial wealth, and nonfinancial

NEGOTIATION STRATEGIES & TACTICS FOR BUSINESS SUCCESS

Prof. Mahesh Kumar Soma
Associate Professor, Department of Soft Skills
IBS Hyderabd, India.

Synopsis

Negotiation is one of the key elements for the success of a business. A business enterprise uses an elaborate process of negotiation to source its raw materials and also to sell its products to its dealers or customers. Negotiation has therefore become an important tool for all business dealings and a highly planned negotiation always bestows numerable benefits to the company or enterprise.Further, there will be no post-negotiation dissatisfaction for the parties involved in the process of negotiation and may lead to long lasting business cooperation and relationships.

Most of the times, the executives of a company are aware of the stages of negotiation— Planning Stage, Preparatory stage, Introduction stage, Opening Stage, Discussion Stage, Exploration Stage, Signalling Stage, Closing Stage and Post -Negotiation Stage-- and also the things to do in each stage of negotiation but many a time they are not aware of the "actual tactic or tactics" to be employed to strike a successful business deal.Similarlly, the executives of the company may be aware of the negotiation styles—Aggresssive, Collaborative, Passive, Compromise and Ignoring styles—but may not be aware of the differeent tacics to be followed while negotiating a deal or arriving at a successful negotiated settlement.

The present article titled "Negotiation Strategies & Tactics for Business Success" discusses in detail the various tactics involved in the process of negotiation and how to use or execute the tactic in a specific stage of negotiation and while using a particular style of negotiation.

ABSTRACT

In this paper, we examine the role of stock liquidity as a governance mechanism to discipline managers for withholding bad news (stock price crash-risk). This topic is useful to emerging markets because the dominance of controlling owners limits the monitoring of internal governance. Stock liquidity can be altered by the financial market regulations, thereby improving firm-level governance. In empirical analysis, we show that stock liquidity decreases stock price crash-risk. We identify two possible mechanisms through which stock liquidity reduces stock price crash-risk: the threat of intervention and price informativeness.

1. Introduction

Stock liquidity has become an increasingly important mechanism for monitoring management, thereby improving corporate governance. This is because it facilitates good governance of the firm either by trading (also known as "exit") (Edmans, 2009) or by the intervention of blockholders (also known as "voice") (Maug, 1998). Our study is motivated by a literature suggesting that stock liquidity can affect shareholders' incentive to monitor managers. This study empirically examines the consequence of stock liquidity as governance on managerial short-termism, which is regarded as one of the most important concerns by academicians and the practitioners alike (Edmans, 2009). Our study is mainly motivated by Jin and Myers (2006) and Kim, Li, and Zhang (2011), who argue that the short-term benefits encourage managers to accumulate bad news to inflate stock prices because their incentives are tied with stock prices. However, when the accumulation of bad news reaches its upper bound, it tumbles at once, resulting in a significant drop in stock prices. We posit that, if stock liquidity actually facilitates good monitoring, stocks with higher liquidity should have a low level of stock price crash-risk (crash-risk).

Most empirical studies examining the role of stock liquidity in facilitating good governance are concentrated on developed markets[1], which are different from emerging markets in several aspects. First, Indian minority shareholders are vulnerable

1. Synopsis

Working capital constitutes one of the important aspects of successful financial management in a business organization. It is extremely important for the smooth running of the organization and a company has to take adequate care to plan its short term financial requirements. In some cases better Working Capital Management also leads to improved profitability of the firm. The corporates choose an array of instruments to finance their working capital requirements--working capital term loan, bank guarantee, letter of credit, bill discounting, debentures, bonds, commercial paper and company deposits or public deposits. The choice of a source of working capital is determined by rate of interest and the covenants that govern the loan from a bank or financial institution. Public deposits constitute one of the important sources of working capital for meeting the financial requirements in the short and medium term. The present article deals and focuses on the growth trends and innovations in the public deposits.

Company's Act
Founder ownership
Abnormal returns
Tax signaling

ABSTRACT

We revisit the information content of dividend announcements in India from 2012 to 2014 in a unique market setting which involves the introduction of Company's Act 2013. We find that announcement of increase in dividend lead to increase in stock prices, while the dividend decrease announcements are associated with decrease in stock prices. Firms that announce no change in dividends, experience insignificant negative returns around the event date. Our results contradict the tax-signaling model, which argues that higher taxes on dividends than capital gains are necessary for dividend announcements to be informative. The abnormal returns increase post the introduction of Company's Act 2013. The results of the firm-specific panel regressions indicate that the information content of dividends has a non-linear relation with the founder ownership consistent with the monitoring and rent extraction hypotheses.

1. Introduction

Many studies have documented that announcement of 'dividends' or 'changes in dividends' convey information to the market (Pettit, 1972; Aharony and Swary, 1980). Firms that pay dividends face less information asymmetry than those which don't (Howe and Lin, 1992; Khang and King, 2006; Li and Zhao, 2008). The information of dividend announcement may be interpreted as a positive signal if dividends are up to the expectations and leads to increase in the stock prices (Kato and Loewenstein, 1995; Shih-Jen and Wu, 2001; Nguyen, 2014; Al-Yahyaee, 2014). However, decreasing the dividends would create a negative signal which results in the fall in stock prices and thus the firm value (Yilmaz and Gulay, 2006) and (Pan et al., 2014). We have literature supporting both the positive as well as negative market reaction of dividend declarations. Despite so many studies, dividend policy still remains a controversial issue in the area of corporate finance (Andres et al., 2013). However, there is very scarce literature on the dividend puzzle for the emerging markets as majority of studies have been conducted on the US data (Dasilas and Leventis, 2011).

In this paper, therefore, we study the impact of cash dividend announcements made by different companies listed on the National Stock Exchange of India (NSE) for 2012 to 2014 period. To the best of our knowledge, this is the first study to investigate the effect of dividend announcements on stock returns before and after the Company's Act, 2013, which provides us with a unique market setting. We investigate the Indian stock market as it offers several institutional differences in contrast to other capital markets. *First*, in India, the dividends are tax-free in the hands of the investors in contrast to the US where the tax rate on the dividend income is more than capital gains. Literature suggests that taxes might have an impact

LEAP model
Energy forecasting

ABSTRACT

This paper applied a scenario-based analysis to explore Nigeria's future energy demand, supply and associated GHG emissions from 2010 to 2040 using the Long-range Energy Alternative Planning (LEAP) model. The impact of different energy policies are analysed for the Nigerian energy system by considering four scenarios: the reference scenario (REF), the low-carbon moderate scenario (LCM), the low-carbon advanced scenario (LCA), and the green optimistic scenario (GO). By considering aggressive energy policies and strategies from LCM to LCA, and even more aggressive options in the GO scenario, we find that under the REF scenario energy demand is expected to reach 3,075 PJ and a corresponding increase in GHG emissions of 201.2 Mt Co2e by 2040. More aggressive policy intervention by the Nigerian government, as in the GO scenario, would lead to a decrease in energy demand (2,249 PJ) and GHG emissions (124.4 Mt Co2e) in 2040. A cost-benefit and energy system analysis were also carried out in the study.

1. Introduction

During the pre-industrial revolution, the global development was hindered by low energy intensity in the form of hydro and wind resources. The second industrial revolution saw the increase in fossil fuel consumption which lead to electrification and technological commercialization of goods and services [48]. From last century, the world has metamorphosed and experienced a phenomenal transition in the way energy is used, from coal-based to petroleum-based. Ever-increasing globalisation and industrialisation have exponentially increased the demand for energy worldwide [43]. To cope with this exponential increase in demand for energy, energy production has proportionately increased to such an extent that approximately 80% of global energy supply comes from fossil fuel (IEA, 2008). The increase in dependence on fossil fuels has resulted in an increase in global greenhouse gas emissions, which has raised issues about the sustainability of our environment due to tribulations such as climate change and the depletion of natural resources [47].

Energy consumption has been one of the most unswerving indicators of development and quality of life attained by any country, and the necessity of satisfying a forecasted energy demand for a given period of time is the key rationale for energy planning [7]. As defined by the World Energy Council, "Energy planning is that part of economics applied to energy problems, taking into account the analysis of energy supply and demand, as well as implementation of the means for ensuring coverage of energy needs in a national or international context" [11]. Researchers around the world have employed different energy models to address policy and planning concerns of energy, economy, and the environment [35].

Access to clean energy is unreliable and has high disruption costs, affecting production efficiency and competiveness in many developing countries in Africa and Southeast Asia [18]. Despite being gifted with the widest possible range of energy resources, the African continent has experienced a relatively low energy consumption in general, and electricity consumption in particular (Mayo, 2012). Nigeria is experiencing a remarkable paradox—the abundance of energy resources and widespread energy poverty. About 40% of the population have access to the grid electricity supply, while 70% depend on firewood even to this day [13]. This dependence on firewood constitutes a major indoor pollution hazard and has resulted in the death of nearly 79,000 Nigerians due to smoke inhalation in 2011 [12]. According to a study by the World Health Organization in 2013, the deaths caused by smoke

Supply chain
Carbon emission
Strict carbon cap
Stochastic demand

ABSTRACT

Due to stringent laws and increasing awareness of customers, organizations are becoming environmental conscious and looking beyond conventional cost minimization/profit maximization approach and striving to curb carbon emission. In this article, we have considered strict carbon cap policy to determine the optimal order quantity, reorder point and number of shipments in a two-echelon supply chain under stochastic demand considering partial backorders. All the major sources of emission such as production, inventory, and transportation have been considered. The objective is to minimize the total expected supply chain cost while satisfying the carbon emission constraint. A numerical example is given to illustrate the solution procedure. Further, sensitivity analyses have been carried out to get insight that how with operational adjustments both cost and emission can be controlled.

1. Introduction

Environment pollution is a burning issue in recent era. Continuous emissions of greenhouse gases (GHGs) into the atmosphere have raised the threat to environment and existence of human civilization. Scientists have revealed that over the past 100 years, the average temperature of the earth has raised by 0.75 °C. It is anticipated that between 2030 and 2050, approximately 250,000 deaths will take place annually due to weather change. Melting glaciers, rising sea levels, extreme weather conditions are the results of global warming [1]. Therefore, governments, business houses, NGOs, and even customers pay a great deal of attention to reduce GHGs associated with industrialization. The Kyoto protocol, an international agreement linked to the United Nations framework convention on climate change, targeted to reduce emission by 8% by 2012 from 1990 levels. Scientists have suggested more aggressive reduction target of 25% of emission from 1990 level by 2020 [2]. Among all GHGs, carbon dioxide (CO_2) is considered as most important because it contributes 60% of enhanced greenhouse effect [3]. As CO_2 is the predominant component of GHG, and so GHG emission is calculated in units of tones of CO_2 equivalent, expressed as tCO_2e [4].

To reduce carbon emission, governments and different regulatory bodies have started implementing different carbon policies and initiated different carbon trading schemes. The existing carbon policies can primarily be grouped under three categories: carbon cost/tax, carbon cap-and-trade, and strict carbon cap. In this paper, we consider a strict carbon cap policy. Under this policy, regulatory bodies allow organizations to emit CO_2 to a certain threshold limit which is known as cap, and the penalty for exceeding the cap is infinitely large [5]. Therefore, organizations are forced to manage their emission

Abstract: Consider a firm facing an infinite horizon inventory problem with two suppliers, a local one with zero lead time and a global one with positive lead time. Assume that both suppliers have variable yields with known mean and standard deviation of yields, but no assumption made about the distribution of yield. Order cycle length is assumed to be a given industry standard supply window of unit length. Depending on the lead time taken t by the global supplier, the unit period is divided into two segments, 0 to t and t to 1. Demand is independent and uniform with different parameters for each of the two segments. The firm also has different holding and shortage costs in each segment and has the same selling price per unit for the entire period. We solve the problem of finding the optimal order quantities for each supplier that maximises the expected discounted profit for the entire horizon. We also solve an extension of this problem, where the length of the period along with order quantities are decision variables by proposing a robust heuristic procedure.

Keywords: supplier quota allocation; inventory; yield; lead-time; supply chain; optimisation.

Abstract: A large number of organisations across globe are actively involved in different social responsibility programs aimed at increasing consumer trust in their offerings and benefit the image holistically. This study investigated the impact of corporate social responsibility on purchasing behaviour of consumers. In the current highly competitive business world, corporate social responsibility has gained momentum across various cultures. The study was conducted in the Indian context with reference to purchase of mobile handset with focus on aim to purchase and how much they are willing to pay for its explicit social features. We employed discrete choice modelling experiment and likelihood ratio test to achieve study objectives. The empirical findings of the study provided evidences of the positive relationship between corporate social responsibility and Indian consumers' behaviour in the purchasing of mobile handsets. The results revealed that the effect of price is higher than both the effects of corporate social responsibility and corporate ability attributes. Sample size comprised of 144 subjects.

Keywords: corporate social responsibility; CSR; corporate ability; Indian consumers; experimental design; willingness to pay.

Impact of psychological capital on organizational citizenship behavior

Mediation by work engagement

Manish Gupta, Musarrat Shaheen and Prathap K. Reddy
Department of HR, IBS Hyderabad, IFHE University, Hyderabad, India

Received 8 June 2016
Revised 25 October 2016
Accepted 17 April 2017

Abstract

Purpose – The purpose of this paper is to examine the mediating role of work engagement (WE) between psychological capital (PsyCap) and the two facets of organizational citizenship behavior (OCB) which involves both individual and organization. It also examines the moderating role of perceived organizational support (POS) between PsyCap and WE, and WE and the two facets of OCB.

Design/methodology/approach – A total of 293 responses gathered from employees working in diverse service sector industries in India were assessed using structural equation modeling.

Findings – Overall, the results support the mediating role of WE in the PsyCap-OCB relationship, and the moderation of POS between WE and the two facets of OCB.

Research limitations/implications – This study helps in understanding how WE-OCB relationship can be negatively affected in the presence of high POS.

Practical implications – The results encourage organizations to establish systems for enhancing the engagement levels of their employees, which according to this study may be achieved by creating and maintaining vibrant work environment.

Originality/value – This study helps in understanding the role of POS among PsyCap, WE, \and the two factors of OCB.

Keywords India, Organizational citizenship behaviour, Work engagement, Perceived organizational support, PsyCap

Paper type Research paper

Introduction

In the era of globalization and utmost competition, organizations survive and thrive on optimal utilization of their human resources (Seval and Caner, 2015). Therefore, it is important for the organizations to identify the factors encouraging employees to volunteer for activities beyond the call of their duties. Such discretionary extra-role behavior of employees is called organizational citizenship behavior (OCB) which is of paramount importance for organizational productivity and efficiency. Occupational psychologists believe that OCB is exhibited more by highly engaged employees because the engaged employees simultaneously invest their cognitive, physical, and emotional energies in their work. Similarly, psychological capital (PsyCap) is considered as a critical personal resource which facilitates employees in the completion and achievement of official targets. This accomplishment of task leads to a feeling of fulfillment and generate positivity among employees which motivates them to engage in extra-role behaviors.

Though scholars in the past have suggested linkage among PsyCap, work engagement (WE), and OCB, little attention has been paid to examine the mediating role of WE between PsyCap and OCB. Furthermore, there is a paucity of research about the effect of WE on the two-factor model of OCB, which consisted of OCB toward individual (OCBI) and toward organization (OCBO). Such studies are particularly important for the developing economies like India, where skilled workers are merely 2 percent and the market is highly competitive (Borpuzari, 2015). Several studies on India have recently

Solutions for Security Challenges in Cloud Computing – A Review

Rajesh Kalepu and C. Lakshmi Devasena
Department of Operations & IT, IBS Hyderabad, IFHE University, Hyderabad, India
devaradhe2007@gmail.com

***Abstract*—This literature review aims to identify the major security issues and their solutions in cloud computing security as well as identifying areas for future research. Utilizing a modified version of the approach suggested by Okoli and Schabram (2010) various articles were considered for the review. Although many security issues and solutions were identified in earlier research works, it is apparent that, much of the research being done based on considering only theoretical concepts of cloud computing. Thus this research review analyzed and explored plenty of issues that have been identified based on practical aspects of cloud computing, so that future research should focus more on the practical implications of these security risks.**

***Keywords*—Cloud Computing; Security Issues; Cloud Security Risks; Cloud Security Challenges; Virtualization; Cloud service provider**

INTRODUCTION

Cloud computing (CC) is a network model that makes it possible to attain on-demand network access and shared configuration resources, means that CC represents a framework for network access that doesn't need the same level of maintenance as a traditional organizational network would (Mell and Grance, 2011). Clouds are well integrated in our everyday life that most people don't even think about them being used. For example: iCloud, Office 365 and Google Drive. Since cloud computing is such a quickly expanding field within IT is not negligent to say that this network model has significantly changed how we observe networking today. In addition, it has also drastically changed how businesses, organizations and governments act and function. The growth of CC has brought with it new security challenges, which is why individuals and businesses alike act uncertain when confronted with the possibility of implementing a cloud solution (Subashini and Kavitha, 2011).

New security challenges leads to new opportunities for research, however this also means that an awesome amount of information available for organizations and individuals to goggle for information regarding CC security issues. Therefore this paper will present a literature review aiming to summarize the available information and make it more comprehensible.

1.1 Problem area

Initially it is important to mention that the reviewed subject (security issues and challenges) already has a solid foundation in the shape of pertinent literature. This review aims to analyze this foundation and summarize it in order to present the reader with an up-to-date, factual depiction of the present security risks and solutions within the CC field. The need for this is simple: since cloud computing endures to grow exponentially it is of absolute importance to stay updated on the current risks and solutions in order to ensure that future clouds are developed based on the cutting-edge insights. The problems presented in the massive amount of relevant literature have to sift through gain these aforementioned insights. Sometimes, it would be hard to know which literature is trustworthy in comparison with another. Thus, this review aims to analyze current literature within the CC field demarcated to security risks and solutions in order to form a concrete summarization which can then be used as an overview.

A summary produced in the form of Systematic Literature Review (SLR) would be of relevance to individuals and organizations, large and small, with a need for an up to date security overview as well as a tool for future research (Okoli and Schabram, 2010).

This literature review is built upon and discusses the following research questions:

1. What security risks and solutions are presented in the literature regarding cloud computing security?

2. What are the differences in security between public, hybrid, community and private clouds as well as the service models; IaaS, PaaS, SaaS and HaaS?.

The review is divided into five sections: introduction (1) definitions (2) Literature analysis (3) discussion (4) and conclusion (5).

DEFINITIONS

A. Security and information security

Information and communication technology (ICT) can arguably be considered a sub-component of information security since information security includes the protection of underlying resources. ISO/IEC 13335-1 (2004) defines ICT security as all aspects relating to defining, achieving and maintaining the confidentiality, availability, integrity, non-repudiation, authenticity, accountability and reliability of information resources. Thus, Solms and Niekerk (2011) argue that a clear understanding of these additional characteristics is essential as without them, information cannot be considered secure. As such, whenever this review utilizes the terms "security" or "information security", this is the definition being referred to.

Impact of other customers in high and low involvement services

Moderating role of customer's need for uniqueness

Aditi Sarkar Sengupta
Department of Marketing and Strategy, ICFAI Business School, Hyderabad, India, and
Sreejesh S
School of Management Studies, Cochin University of Science and Technology, Kochi, India

Received 18 August 2015
Revised 10 June 2016
28 August 2016
Accepted 22 September 2016

Abstract

Purpose – The purpose of this paper is to examine the effects of other customer perception (OCP) (Brocato *et al.*, 2012) on focal customer's service quality perception and revisit intention in high- and low-involvement services and the effect of customer's need for uniqueness (NFU) as a boundary condition of the above relationships.

Design/methodology/approach – Following a theoretical methodology, hypotheses were developed to analyze the effect of OCP, service involvement and customer's NFU. A 2 × 2 × 2 scenario-based experiment was designed. Multivariate analysis of variance (MANOVA) was used to test the hypotheses.

Findings – The analysis reveals that the presence of conforming (versus non-conforming) other customers improves service quality perception and revisit intention of focal customers in high-involvement services, but not in low-involvement services. However, the relationship between similarity perception and outcome variables does not hold good for high-NFU customers.

Practical implications – This study suggests that conforming and non-conforming other customers are critical in forming service quality perception of high-involvement services, and highlights the boundary condition of this relationship. If service managers take service involvement and individual differences into account, and strategize their service offering aligned to their target customers, influence of other customers can be managed more efficiently.

Originality/value – As this study is one of the first empirical studies to focus on the effect of OCP on service quality perception and examine its boundary condition, it contributes significantly to the body of knowledge. Future research directions are discussed and managerial implications are proposed.

Keywords Need for uniqueness, Other customer perception, Service involvement, Service quality perception, Service revisit intention, Similarity perception

Paper type Research paper

Introduction

One of the important drivers of customer's experience in service encounter is other customers. Extant research indicates that customers sharing service environment do affect each other's attitude and behavior toward a service provider, either through interpersonal interactions or by merely being part of the service environment (Martin, 1996; Brocato *et al.*, 2012). For example, Harris *et al.* (1995) suggested that 11.63 per cent customers are affected by interpersonal interaction with other customers while shopping. Concurrently, Grove and Fisk (1997) opined that 56.8 per cent customers are significantly affected by the mere

Impact of other customers on service quality evaluation and revisit intention in hospitality services

Aditi Sarkar Sengupta and Sreejesh S. Pillai

Aditi Sarkar Sengupta is Assistant Professor at the Department of Marketing and Strategy, IBS Hyderabad, IFHE University, Hyderabad, India. Sreejesh S. Pillai is Assistant Professor at the School of Management Studies, Cochin University of Science and Technology, Cochin, India.

Abstract

Purpose – *The purpose of this paper is threefold. First, the authors investigate the influence of other customer perception (OCP) on focal customer's service quality perception and service revisit intention in hotel services. Second, they examine whether negative effects of OCP can be managed through customer participation. Finally, they examine the effectiveness of CP as a strategy when individuals vary in terms of their need for uniqueness (NFU).*

Design/methodology/approach – *A 2 (OCP: favorable versus unfavorable) × 2 (customer participation: customer participation versus no customer participation) × 2 (NFU: high versus low) between-subjects experiment was conducted to collect responses. Analysis of variance and pre-planned contrast tests were carried out to test the hypotheses.*

Findings – *Customers who are exposed to unfavorable OCP reported low service quality evaluation and revisit intention. However, two-way interaction results supported that in unfavorable OCP situation, customers who are exposed to high customer participation have reported high revisit intention compared to those who are not exposed to customer participation. In addition, the three-way interaction effects indicate that customer participation may work as an intervention mechanism to reduce the negative effects of OCP to form favorable service quality perception and revisit intention only for customers with low NFU.*

Originality/value – *This is the first in its stream of studies examining the following research questions "Can the negative effects of OCP be mitigated with the help of managerial intervention?"; and "Would a customer's individual differences influence the effectiveness of such an intervention strategy?"*

Keywords *Revisit intention, Need for uniqueness, Service quality, Hospitality services, Customer participation, Other customer perception*

Paper type *Research paper*

Introduction

The importance of customer-to-customer interactions in hospitality services and its impact on customer satisfaction have attracted considerable attention among researchers over the years (Martin and Pranter, 1989; Nicholls, 2011; Wu *et al.*, 2014). Customers often affect one another's service quality perceptions (Siu *et al.*, 2012). These effects may be elicited by virtue of each other's observable characteristic or through specific interpersonal encounters (Wu, 2007). However, most extant literature's focus has been on direct interactions between customers. Only recently has the literature begun to suggest that customers may affect each other by mere observational characteristics. Though some evidence suggests that other customers' observable characteristics enhance or detract focal customer's evaluation of a service provider, a comprehensive scale to measure other customer perception (OCP) has been developed only recently by Brocato *et al.* (2012).

However, a general lack of theorizing OCP's influence on service quality perception and future behavior of customers calls for further investigation in this area. Particularly, we

Abstract. Internet has changed the way retailers do their business. They have gone electronic and are now termed as e-retailers. These e retailers face huge competition in securing their loyal customer base. In our study, we suggest that if e-retailers provide good information and system quality to their consumers and in turn show agility to resolve their issues, e-retailers may develop loyal customers. In our study, we propose a model to provide understanding of this process by studying the antecedents and consequences of e-retailers' agility. Partial least squares were used for testing the proposed relationships. The empirical findings based on 222 completed responses suggest that information quality and system quality of e-retailer website can be a factor in consumers perceiving e-retailers to be agile. Also, this results in customer loyalty.

Keywords: retailers' agility, consumer engagement, online reviews, electronic word of mouth, loyalty, commitment.

JEL Classification: C12, C42, L60.

Introduction

Agility has long been a competitive weapon for manufacturers and subsequently been investigated in multiple perspectives in supply chains. It is a competitive weapon in that it imparts a firm with the capability to satisfy the sudden requirements of its customers in a speedy manner (Gligor and Holcomb 2012, Tse et al. 2016). In other words, agility is, therefore, the capability of a firm to satisfy the dynamic requirements of its customers in a fast pace (Brusset 2016). Recently with the advent of the internet; e-retailers have started marketing products using the internet. Because of this growing internet operations, an e-retailer must also be in a position to quickly satisfy its customer dynamic requirements i.e. an e-retailer must be agile as the same will determine its competitive edge in the market.

An e-retailer website can be considered as an information system. Information systems quality is an important measure of information systems success (IS) success. Several factors have been studied in the literature to investigate information system success. Specifically, information quality and system quality have been given much importance in the literature.

Online consumers are increasingly becoming selective and involved in the information they acquire about various products and brands on the internet (Burton and Khammash 2010, Zahay et al. 2015). Information is an essential part of any website and the quality of information is considered as an important tool in the hands of the marketer, in the context of online shopping (Xu and Koronios 2004, Lukyanenko and Parsons 2015, Heang and Khan 2015, San Vivian and Yazdanifard 2014). Quality is an attribute of a product or a service, which refers to the degree to which it meets customer needs and requirements (Nagel and Cilliers 1990, Dabholkar 2015). Perceived quality is similar

Received May 27, 2016; revised and accepted May 19, 2017

Abstract: The case on sustainable development in Coal India Limited attempts to analyse the policies and practices of sustainability in Coal India in terms of social, environmental and economic dimensions. The study also throws light on some of the challenges and solutions for CIL towards sustainability development.

Key words: Sustainable development, Coal India Limited, social, environment, economic.

Introduction

Coal is fossil fuel formed by vegetation buried between the rocks. The high temperature and pressure results in formation of coal seam which is combustible organic rock composed of carbon, hydrogen and oxygen. Since the early civilization, it has been source of energy and is the main reason for industries to flourish and develop in today's modern world. Extraction of coal is called coal mining. Coal mining is done mainly in two ways: Surface or 'Opencast' mining and Underground or 'Deep' mining and it has many social, economic and environmental impact. As per the Green Gas Emission report (2010) of Ministry of Environment and Forest (MoEF), Government of India (GoI), India consumed 503 MTs of coal, generating 580 ktons of particulates, 2100 tons of sulphur dioxide, 2000 ktons of nitrogen oxide, 1100 ktons of carbon monoxide, 100 ktons of volatile organic compounds and 665 million tons of carbon dioxide, resulting in 80,000–1,15,000 premature deaths and more than 20.0 million asthma cases.

Coal combustion accounts more than 65% of total emission and is a major contributor of GHG emission in India and coal is an inevitable source of energy for Indian economy. Table 1 indicates that out of total power generation thermal power accounts nearly 66%. It is a known fact that coal extraction has harmful impact on environment and society; however complete ban on coal extraction is not possible as the whole economy is highly dependent on coal powered thermal stations.

Table 1: Present energy mix in electricity generation in India, 2003

Adoption of Cloud Computing in Business: A Multi-Case Approach to Evaluate the Fit-Viability Model (FVM)

Shailja Tripathi
IFHE University, Hyderabad, India
shailja.tripathi@gmail.com

Jigeesh Nasina
IFHE University, Hyderabad, India
jigeesh@ibsindia.org

ABSTRACT

The success of cloud computing adoption depends on several factors. These include how well task requirements fit the features of the technology and how viable the technology is, based on economic feasibility, maturity of the IT infrastructure, and social readiness of the organization. The purpose of this paper is to study the adoption of cloud computing in business and the use of the fit-viability framework for assessing the likely success or failure of cloud computing in an organization. The study analyzes cloud computing adoption in four multinational software companies in order to explore the application of the fit-viability model (FVM). This multi-case analysis involved detailed interactions with project managers and senior managers in all four firms and the analysis of feedback data collected from them. The results indicate that cloud computing adoption in all the firms has a high fit with the task requirements and that most of the firms exhibit a high viability regarding the technology. The findings of this study would be helpful to the managers in understanding the fit and viability of cloud computing to perform their jobs and would further enhance the benefits of cloud computing in their organizations.

Keywords: Cloud computing, fit viability model, task technology fit

This literature review explores the factors influencing a firm's decision to patent its innovation. From the review of the available literature, some factors were identified which are related to the degree of codification or simplicity of knowledge and characteristics of a company or firm. We discovered that patent propensity vary among firms, industry, and country. The influencing factors on a firm's patent propensity were discovered to be both internal and external. The literature review will provide assistance to researchers in understanding the factors influencing patent propensity.

Keywords: Patent propensity; patent; firm's strategy; innovation; imitation; R&D activities.

1. Introduction

In today's society, patenting is widely acknowledged as a tool to reward innovative firms for their research and developmental (R&D) efforts. However, the growing concern over the disclosure of vital information related to the technology involved has led to most firms deciding not to patent their technologies [Heger and Zaby (2013)]. According to Hall and Harhoff [2012], the disclosure of a technology through patent application may affect a firm's propensity to patent the innovation. However, other factors determining patent propensity still remain unclear in the literature. Before we can address these factors, the term "propensity to patent" needs to be properly understood.

A Content Analysis of the Leadership Styles of Steve Waugh and Sourav Ganguly: Leadership Lesson from the Game of Cricket

Pratyush Banerjee and Shantanu Shankar Bagchi
IFHE University, Hyderabad, India

In this study, the researchers focus on the leadership styles of two of the game of Cricket's most charismatic leaders of the twenty-first century – Steve Waugh of Australia and Sourav Ganguly of India in a bid to relate their styles with classic leadership theories. Both Waugh and Ganguly have been arguably recognized as the most successful cricket captains of their respective countries and have earned accolades from cricket pundits as brilliant leaders of men. In this study, a content analysis of the articles about these two legendary captains published in the highly-acclaimed Wisden almanac, electronic media such as Sportstar, Cricinfo Magazine and standard newspapers of India, Australia and other neutral countries was undertaken. The content analysis of eighty-seven articles spreading over a page length of 127 A-4 size papers revealed Waugh to be a more result-driven autocratic leader who led more by example, while Ganguly showed traits of a transformational leader who led by motivating his teammates. The study is expected to contribute to the existing body of leadership research with some new knowledge of the construct of leadership, which have been discussed at length in this paper. Keywords: Leadership, Decision-Making, Cricket, Content Analysis

Leadership may be defined as the "process of influencing the activities of an individual or group to achieve certain objectives in a given situation" (DuBrin, 1990, p. 257). Management researchers have spent over a century trying to fathom the concept of leadership. It all started with the conceptualization of the "Great Man" theory in the mid19th Century, in which it was proposed that leaders are born, and can't be made (Carlyle, 1841). Gradually, this theory met with criticism, and researchers developed new theories which helped to identify the characteristics necessary to be developed to become a great leader. These later theories came to be known as trait theories (Mann, 1959). The trait theories substantiated the importance of personal characteristics such as personality, intelligence etc. on leader effectiveness (Judge & Bono, 2004). Subsequent research helped in understanding other contextual factors which may affect leader effectiveness such as the economic health of the firm or follower readiness (Avolio, Walumbwa, & Weber, 2009) and degree of acceptance of the followers in the leaders' in-groups as captured by the leader-member exchange (LMX) theory (Graen & Uhl-Bien, 1995). More recent theories have identified great leaders as one who possess something called "charisma" which helps them to become transformational leaders (Bass, 1997). A criticism of these studies is that they have not been able to provide enough guidelines for practicing managers to apply their findings. More studies are needed to highlight the importance of these theories through real world case studies (Avolio et al., 2009).

In this paper, we tried to draw an analogy of management leadership in the corporate world from the game of cricket (Ashok, 2008; Easton, 1996). Corporate leaders such as Microsoft CEO Satya Nadella have expressed that their earliest leadership lessons were taught in day to day activities of life including playing sports (PTI, 2014). Cricket is a team game which demands a lot from the playing captain in terms of strategizing and decision

Exploring the importance of collaborative assets to hospital-supplier integration in healthcare supply chains

Santanu Mandal[a]* and Rajneesh Ranjan Jha[b]

[a]*Department of Operations & IT, IBS Hyderabad, IFHE University, Hyderabad, India;* [b]*Department of Finance, IBS Hyderabad, IFHE University, Hyderabad, India*

(*Received 21 July 2016; accepted 13 September 2017*)

Research has established the dominant influence of collaboration and integration in manufacturing supply chains. However, the role of these characteristics in healthcare supply chain operations and performance has not yet been investigated. The current research proposes three assets under collaboration as dominant enablers of hospital-supplier integration: collaborative planning, collaborative execution and collaborative decision-making. Considering the advances in technology in healthcare, we propose that technology orientation moderates the above linkages. Survey-based responses were collected from hospitals, chemistry and pharmaceuticals, and medical equipment and surgical suppliers that are key entities in healthcare supply chains. In total, 239 completed responses were collected and analysed using structural equation modelling. The findings suggest all three as dominant enablers of hospital-supplier integration. Furthermore, technology orientation was found to positively moderate the impact of planning and execution on hospital-supplier integration. This orientation also suggested that hospital-supplier integration results in positive operational performance.

Introduction

Recently, the Indian Government adopted several initiatives for developing the healthcare sector. For example, the E-health initiative targeted providing economical medical services to patients. Additional examples include the following: the National Deworming initiative for safeguarding 240 million children from intestinal worms; the development of 3000 new medical stores in the country; the GI Digital Dispensary for extending medical facilities to rural people; and the provision of additional healthcare coverage of 30,000 INR (447 USD approximately) to senior citizens (IBEF Sectoral Report 2016). These examples are good indications of the enormous potential that the healthcare sector in the country promises. However, the healthcare sector in the country remains underdeveloped and requires collaboration among its supply chain members at an optimal cost (Dasgupta, Ebi, and Sachdeva 2016).

Previously, the cost of hospital supplies and associated materials represented 45 per cent of a hospital's operating budget (Kowalski 2016). Therefore, focal firms, i.e. hospitals in medical SCs, are striving to reduce cost and increase efficiency through enhanced integration among their SC entities. Furthermore, it is suggested that hospitals should focus on successfully responding to their different challenges, e.g. the escalating cost of inputs and operations (Chen, Preston, and Xia 2013).

Hence, medical chain entities such as hospitals and accommodation providers should focus on developing their SCs through appropriate investments (Turkyilmaz, Bulak, and Zaim 2015). Consequently, SC management in healthcare has gained considerable importance (Albarune, Farhat, and Afzal 2015). While SC management had roots in manufacturing, there has recently been a paradigm shift to incorporate hospital SCs (Dobrzykowski and Tarafdar 2015). There is a need for theory development and empirical testing on healthcare SCs, considering the increased complexity in healthcare management (Beckman and Sinha 2005; Baltacioglu et al. 2007; Barlow 2010).

Such complexity has increased the challenges for successful integration in healthcare SCs (Aitken et al. 2016). The benefits of effective integration have been observed in manufacturing in terms of operational performance improvement (Flynn, Huo, and Zhao 2010; Ralston et al. 2015; Chang et al. 2016; Prajogo, Oke, and Olhager 2016). However, healthcare SCs have yet to identify the essential drivers of hospital-supplier integration (Drupsteen, van der Vaart, and

WHERE THE WORLD COMES TO LEARN QUALITATIVE RESEARCH

Evaluating Financial Planning Advertisements for Retirement in India: A Content Analysis

Ritu Gupta and Sudeepta Pradhan
IBS Hyderabad, IFHE University, India

For Indians, retirement is neither a formal stage of life nor an issue that people dwell upon while planning their future. Despite the lack of preparation for retirement, a burgeoning population indicates a huge mass of retirees in the coming decades. These statistics trigger the need for individuals to prepare for their retirement appropriately, while accounting for factors like inflation. To highlight the significance of retirement planning and create awareness among the masses, pre-requisites to retirement planning should be effectively communicated. Extant literature suggests advertising to be one such measure of effective communication. This study intended to capture the extent and method of retirement advertisement in the Indian context using 40 television advertisements (ads) of financial institutions focusing on retirement plans. A content analysis revealed that 61% of the ads were non-informative and filled with emotional content. Though celebrity endorsements have effective impact on the Indian audience, only five advertisements used a celebrity to voice their messages. It was concluded that retirement ads need greater focus in India due to the expansive retiring population and the changing family structure in India. The study concluded that financial institutions and banks should focus on this segment and promote their product appropriately. Keywords: Retirement, Retirement Planning, Finance, Advertisements, Content Analysis, India

India with its colossal population of 1.22 billion is the second most populous country in the world. Though India is benefiting from its young work force, it is also struggling with the aging population. Increased life expectancy has also improved the scope of a rapid aging process in near future (Bhat & Dhruvarajan, 2001). Traditionally, the older people in India have found support in the joint family structure during their old age (Datta & Nugent, 1984; Vlassoff & Vlassoff, 1980). In the new century, there has been a change in the family structure in India. Numbers of people are locating to urban areas for better jobs that have been steadily increasing over the last decade (i.e., 2005-2015). There are fewer joint families, fewer children taking responsibility for their parents in old age, and more moving towards a nuclear family structure (Bloom, Mahal, Rosenberg, & Sevilla, 2010; Kumar, 2003; Rajan & Kumar, 2003). Even though children in certain cases send financial support to their parents in villages for old age security, it is not sufficient to support them in their old age (Bhat & Dhruvarajan, 2001; Rajan & Kumar, 2003; Vlassoff & Vlassoff, 1980). There is a pressing need for adequate and affordable support for the elderly as the cost of living has increased rapidly (Hao, 1997; Rajan & Kumar, 2003). This indicates that individuals need to plan for retirement adequately. So far, retirement in India has meant having a son who will take care of parents in their old age (Vlassoff, 2013). Retirement is seen as a stage in life in which an individual does not have a source of income and withdraws from the important activities in life and society (Bhat & Dhruvarajan, 2001; Ekerdt & Clark, 2001; Parsons, 1942).

The financial aspect of retirement planning provided by banks and other financial institutions in India is still in its nascent stage (Bloom et al., 2010; Kaushik, 2010). People are unaware of the needs for and the benefits of retirement planning and it has become essential to communicate this. In India, banks are involved in retirement plans along with other financial

Information Content of Implicit Spot Prices Embedded in Single Stock Future Prices: Evidence from Indian Market

Rajesh Pathak[1], Thanos Verousis[2], and Yogesh Chauhan[3]

Abstract

This study examines the information content of pricing error, measured by the difference between the implied price computed using the cost of carry model and the spot price of Single Stock Futures (SSFs), traded on National Stock Exchange (NSE), India. The returns of portfolios, based on ranking of such pricing errors, are investigated. The consistency of results is verified by controlling for established risk factors, that is, market, size, value and momentum premium, and idiosyncratic factors such as firm's liquidity and size. Our study reveals that the pricing error is a priced risk factor that contains incremental information about stock returns of day t, and not beyond. We conclude that implied spot prices from stock futures market are useful for traders to profit in the spot market.

1. Introduction

In complete markets with no transaction cost and perfect information, the cost of carry model forecasts futures market's prices precisely. Not surprisingly, in the real world, the assumptions of complete market do not hold true. Therefore, futures market's prices often deviate from the cost of carry model estimates. Though arbitrageurs serve to narrow such inter-market price discrepancies, largely through simultaneous submission of stock and futures trades (Cummings & Frino, 2011), the disruption of the cost of carry relationship is reported frequently in literature (Bialkowski & Jakubowski, 2012; Vipul, 2005, 2008). The informed trading in futures market, due to the inherent rewards of trading derivatives (such as higher financial leverage, lower transaction cost and allowance of a bearish position), is one of the important reasons accredited for such pricing errors in existing studies. If futures markets are the preferred trading venue of informed traders, then pricing errors should be informative future stock prices.

This study examines the information content of pricing error, measured by the difference between the implied price computed using the cost of carry model and the spot price of Single Stock Futures (SSFs)

Received 30 December 2015
Revised 6 July 2016
Accepted 11 December 2016

Abstract

Purpose – The purpose of this paper is to develop and validate an empirical model examining the job seekers' perception about information quality of corporate employment websites and its impact on their attitude toward the websites through perceived playfulness and usefulness. Furthermore, the study also examines the job seekers' e-trust as condition under which these mechanisms generate website attitude.

Design/methodology/approach – A sample of 385 active job seekers was selected through systematic random sampling. A web-based questionnaire was used to elicit responses for the study. Structural equation modeling was used to validate the proposed model.

Findings – Results indicate that the information quality dimensions positively influence perceived playfulness and perceived usefulness, which in turn evoke the website attitude. Furthermore, e-trust was found to moderate the above said relationships.

Originality/value – The study contribution lies in an empirical validation of a model showing the mechanisms and the condition through which the relationship exists between perceived information quality of e-recruitment websites and job seekers' website attitude, and thus responds to the call for additional research that generalizes the influence of information characteristics of websites on job seekers' behavioral outcomes.

Keywords Playfulness, Website attitude, E-trust, Information quality, Usefulness

Paper type Research paper

Introduction

The mode of job recruitment has witnessed a significant transformation in last two decades. With the advent of information technology, both the job seekers and providers tend to move toward technology-based recruitment platform as an alternative to the traditional mode of recruitment (Sylva and Mol, 2009). This is basically due to the benefits it provides to both the employer, in terms of reduced recruitment time and cost per employee, and the employee, who is offered increased convenience such as submitting job application via online channels with a click of the mouse (Selden and Orenstein, 2011; Yoon Kin Tong and Sivanand, 2005). Thus, today's recruitment takes place increasingly through online channels, and it is undoubtedly hailed "the new recruitment frontier." Recruiting applicants through corporate employment website is an emerging facet of e-recruitment and is a rich platform for job search, information gathering, and assessing the person organization and person job fit. Furthermore, it is an intermediary free recruitment channel that offers enhanced value for potential job applicants by providing "direct," "any time," "anywhere access" to job search.

Revisiting the price-volume relationship: a cross-currency evidence

Satish Kumar
ICFAI Foundation for Higher Education, IBS Hyderabad, Hyderabad, India

Received 16 November 2015
Revised 14 April 2016
Accepted 18 July 2016

Abstract

Purpose – The purpose of this paper is to examine the contemporaneous and causal relationship between returns (volatility) and trading volume in the Indian currency futures market for selected currency pairs; USD-INR, EUR-INR, GBP-INR and JPY-INR, from August 2008 to December 2014.

Design/methodology/approach – The data for all the currency futures series has been taken from National Stock Exchange of India Limited which represents the daily settlement prices along with trading volume. The contemporaneous returns-volume relation is tested using the generalized method of moments, and Granger-causality framework impulse response function is used to test the predictive ability of returns (volatility) and volume for each other.

Findings – The author reports a positive contemporaneous relationship between futures returns and trading volume which persists even after controlling for heteroskedasticity providing support to mixture of distribution hypothesis. The results show a unidirectional Granger causality from futures returns to volume. However, there is a significant bidirectional Granger causality between returns volatility and volume lending support to sequential arrival of information hypothesis. Next, the results for cross-currencies show significant influence of US dollar on the volume and returns of all other currencies. Overall, the author suggests that the short- to medium-term movements in the currency markets are dominated by market microstructure and not by fundamentals.

Practical implications – The findings of this paper are very important for the participants in the market and regulators. The participants in the market require alternatives to diversify their risk. The significant relationship between futures returns (volatility) and trading volume implies that the current trading volume help predict the futures prices and should lead to creation of more reliable hedging strategies for investment purposes. Further, it may interest the regulators who need to decide upon the appropriateness of their policies in the currency futures market. Based on returns-volume relation, they need to set forth market restrictions such as daily price movement and position limits.

Originality/value – To the best of the knowledge, no study has yet investigated the forecast ability of trading volume to price changes and their volatility in the Indian currency futures market. Given that currency futures market is one of the largest markets in the world, and Indian rupee has seen wide fluctuations in the recent years, it seems exciting to explore the price-volume relationship in the Indian currency futures market.

Keywords Volume, Price, Currency futures

1. Introduction

Many of the fundamental variables such as interest rates differentials, money supplies and balance of payments were the primary determinants of exchange rates under the fixed exchange rates regime (Mougoué and Aggarwal, 2011). However, none of these fundamentals are able to explain the increased variability in the exchange rates in the floating periods at least in the short- or medium term (Frankel and Rose, 1994). Therefore, to account for the lack of explanations, other alternative models are required which would be doing well in modeling the changes in exchange rates. One such potential area of research is the market microstructure models where trading volume, among other variables, better explains the movements in exchange rates (Lyons, 2001). The price-volume relation contains information about market structures (Karpoff, 1987) and helps decide upon the success or failure of futures contracts.

While the relationship between price and volume in equity markets has been explored in wide body of literature (see e.g. Lee and Rui, 2002; Fleming and Kirby, 2011; Chen, 2012;

The influence of dynamic capabilities on hospital-supplier collaboration and hospital supply chain performance

Received 7 May 2016
Revised 14 July 2016
6 September 2016
Accepted 12 September 2016

Santanu Mandal
IBS Hyderabad, Hyderabad, India

Abstract

Purpose – The purpose of this paper is to explore the influence of hospital's visibility for sensing (VFS), learning, coordinating and integrating on hospital-supplier collaboration. Second, it explored the influence of hospital-supplier collaboration on hospital supply chain performance. The author also explored how the technology orientation of the medical chain units influences the above linkages.

Design/methodology/approach – The study adopted a multi-unit study of different hospital supply chains. Consequently, perceptual data were gathered from seven dominant entities in a typical medical/hospital supply chain: hospitals and clinics, accommodation (i.e. hotels), chemistry and pharmaceutical, marketing/public relations/promotion, medical equipment manufacturers, food and beverage and insurance. The responses were gathered using e-mail survey and were analyzed using structural equation modeling.

Findings – Based on 192 completed responses, the author found positive influences of VFS, learning and integrating on hospital-supplier collaboration and a positive impact of hospital-supplier collaboration on hospital supply chain performance. An insignificant influence of hospital's visibility for coordinating was noted on hospital-supplier collaboration. The study argued hospitals to invest more for enriching their dynamic capabilities to diagnose the changes in the environment so as to sustain their collaborative relationships leading to positive performance implications.

Originality/value – The study is the foremost to investigate the effects of hospital's dynamic capabilities on its collaborative efforts with its key supplier and their influence on hospital supply chain performance. Also the study is foremost in exploring the importance of technology orientation on hospital dynamic capabilities and hospital-supplier collaboration. An important contribution of the research is the conceptualization of supply chain visibility core components (visibility of sensing, visibility of learning, visibility of coordinating and visibility of integrating) in the context of hospital supply chains.

Paper type Research paper

Introduction

The health care initiatives by the Indian Government coupled with increasing demand for medical care by the public have urged health care firms and hospitals to improvise processes for optimum efficiency and reducing costs. Such initiatives, e.g., e-health initiative targeted to provide economical medical services to patients; National Deworming initiative for safeguarding 24 crore children from intestinal worms; developing 3,000 new medical stores in the country; GI Digital Dispensary for extending medical facilities to rural people and providing additional health care cover of INR30,000 to senior citizens, were the prominent ones to boost medical services in the country (IBEF Sectoral Report, 2016). However, there is an urgent need for hospitals to address financial challenges posed by increased operating costs and costs of hospital supplies (Chen *et al.*, 2013). Previously, costs of hospital supply and associated materials attributed for around 45 percent of a hospital's operating budget (Kowalski, 2016). Based on forecasted trends, health care firms might be required to invest in their supply chain development (Vähätalo and Kallio, 2015). Consequently, supply chain management in health care administration also has gained due importance (Lee and Fernando, 2015). While the initial literature on supply chain management concentrated on manufacturing and retail, there has been a paradigm shift to

Going European from American: does style matter?

Rajesh Pathak, Satish Kumar and Ranajee Ranajee
Department of Finance, IBS Hyderabad, Hyderabad, India

Received 18 January 2016
Revised 10 August 2016
17 November 2016
1 January 2017
Accepted 2 January 2017

Abstract

Purpose – The purpose of this paper is to examine the cross-sectional predictive power and the information content of volatility smirks for future stock returns using single stock options.

Design/methodology/approach – The study uses Fama-Macbeth procedure and portfolio approach to investigate the predictability and informativeness in a setup when options settlement style is changed from American to European.

Findings – The study reports that the volatility smirk of European style options, unlike American style options, predict the underlying cross-sectional equity returns. Firms with steepest volatility smirk underperform firms with flatter volatility smirks, by an average of 3.28 and 4.01 per cent annually for American and European options, respectively. The results are robust to the control of idiosyncratic and systematic risk factors.

Practical implications – The results confirm that a trader with negative information prefers to trade out-of-the-money put options. The more pronounced results of European options designate the trader's preference to less risky European style stock options. Results are robust and signify the delay of equity market in incorporating information impounded in the volatility smirk.

Originality/value – Very few studies examine smirk and returns relationship and to the best of the authors' knowledge, no study exists that examine the unique case of change in options style and its role in affecting relationship between smirk and future returns.

Keywords American, Stock options, European, Informativeness, Volatility smirk

Paper type Research paper

1. Introduction

Information diffusion in asset prices is one of the most important concerns of market participants when homogeneous assets trade on more than one market. Due to the distinct microstructure of markets, an informed trader prefers to trade in the markets that magnify his/her trading incentives and, makes these markets leader in price discovery (Xing *et al.*, 2010). Derivatives markets are reported to be the venue of informed trading in numerous studies[1] that examine the direction of information flow between spot and derivatives markets across time and space. One of the major anomalies reported in the literature of derivatives is the presence of prominent volatility smirk implicit in the prices of options (see, e.g. Bates, 2003; Xing *et al.*, 2010). Volatility smirk refers to the difference of the implied volatilities of out-of-the-money (OTM) put options and at-the-money (ATM) call options for the same underlying. The shape and patterns of volatility smirk and reasons thereof have been analysed well for both index options (Bates, 1991; Pan, 2002; Chen and Xu, 2014) and stock options (Bollen and Whaley, 2004; Xing *et al.*, 2010). However, the utility of volatility smirk in enhancing the incentives of traders remains to be examined in detail.

The presence of volatility smirk in the prices of index and stock options violates the Black-Scholes (1973) options pricing theory. The theory suggests that every option should imply the same volatility for a given underlying. However, the presence of volatility smirk specifies that implied volatility, as a function of exercise/moneyness for a certain maturity, is a negatively skewed curve for most of the options (Foresi and Wu, 2005). The recent option pricing theories (see e.g. Bates, 1991; Pan, 2002; Kim and Zhang, 2014) suggest that the presence of volatility smirk could be attributed to the aversion of investors to future negative jumps in the prices of the underlying.

Received 24 February 2015
Revised 28 December 2015
Accepted 2 January 2016

Abstract

Purpose – The purpose of this paper is to use an inter-disciplinary approach to examine the relevance of F.W. Taylor's principles to modern shop-floor practices in the context of a manufacturing organization.

Design/methodology/approach – Standard time study guidelines laid out by the ILO were adopted and random observations made between two operators independently performing an identical operation in the shop-floor premises of a particular factory.

Findings – It was evident from the study that modern management has developed the science for each element of the operator's manual work, as postulated and proposed by F.W. Taylor. It was also evident that completion of the operation on time was necessary for the operators but not as important as the total number of jobs performed during the duration of the shift. These empirical findings highlighted the high relevance of F.W. Taylor's principles to modern shop-floor practices.

Research limitations/implications – The authors adopted time study observation as the single method to collect real data from real practices but this could be considered as a biased approach. Since the time study observation is a slow, time consuming, and expensive process of obtaining data, the authors restricted the study to only two operators. Further, the study was carried out in a real setting under several assumptions that may limit its wider applications and practical implications. The study findings suggest that measuring the operator's performance in terms of time consumption and resource utilization is necessary but not sufficient to evaluate and improve his/her productivity because operators evaluate their performance in terms of the total number of jobs completed during the duration of the shift. Therefore, it is suggested that the managers on the modern shop-floor measure the output at the aggregate level for the given input, while developing new work methods as well as devising performance management and reward systems.

Originality/value – The study has contributed to the body of knowledge by conducting a complete assessment of F.W. Taylor's first principle from its origin to its application in modern shop-floor practices. Also, the authors empirically examined the relevance of Taylor's principles to modern shop-floor practices in the context of a manufacturing organization. The study supports the descriptive work of Freeman (1996), who envisaged the relevance of Taylor's ideas to modern management practices; also, it gives a few directions to test behavioral operations theory in terms of using real operational data to examine an established organization theory (Gino and Pisano, 2008).

Oil
Gold
NARDL
India

ABSTRACT

We examine the causal relation between oil and gold prices in the Indian context using the Hiemstra and Jones (1994) nonlinear Granger causality tests and nonlinear ARDL tests. The oil prices linearly Granger causes the gold prices in both short- and long-run. The results of Hiemstra and Jones (1994) nonlinear Granger causality test show a strong evidence of bidirectional nonlinear relation between oil and gold prices. The results of the nonlinear ARDL test reveal that positive shock in oil prices has more pronounced effect than negative shocks on gold prices. In the long-run, the relation between oil and gold prices is stickier towards upper side which emphasizes that gold prices are relatively more sensitive to increasing oil prices. We therefore conclude that the interactive mechanism between oil and gold prices is nonlinear and asymmetric.

1. Introduction

Recent co-movements in oil and gold prices have attracted the attention of academicians and practitioners given that these two are considered to be strategic commodities (Jain and Biswal, 2016). The price movements of oil and gold have important implications for financial markets and the economy as a whole due to their huge tradability and high liquidity (Tiwari and Sahadudheen, 2015). The volatility and impact of oil and gold prices has become invariably crucial for the economic development of all countries across the globe. The increase in the demand of oil in both developed and emerging countries has made it an indicator for all price trends and essential for production processes (Bildirici and Turkmen, 2015). Moreover, price changes in gold and crude oil market influences the price trends of the commodity markets. Therefore, it is important to understand the relationship between oil prices, gold markets and the overall economy (e.g., see, Herrera and Pesavento, 2009; Basher et al., 2012; Bal and Rath, 2015).

The positive co-movement between oil and gold prices can be explained through various channels, firstly, inflation channel (Narayan et al., 2010). They argue that the rising oil prices increase the cost of production of goods and services in the oil-importing economy, hence, increasing inflation. Moreover, gold has been identified as an effective and unique tool against inflation, such that an increase in oil prices lead to increase in gold demand (Bampinas and Panagiotidis, 2015; Van Hoang et al., 2016). Therefore, gold prices move up in an inflationary environment, and a positive relation between oil and gold prices is observed (Tiwari and Sahadudheen, 2015). A second explanation involves how oil prices affect the economic growth and asset values (Reboredo, 2010). Rising oil prices negatively impact the economic growth and lead to reduction in asset prices, forcing investors to buy gold as an alternative at least to store some asset value (Reboredo, 2013). A third explanation for the oil gold relation was given by Melvin and Sultan (1990) who show a strong correlation between oil and gold through the export revenue channel. When the oil prices, hence revenues, rise, the oil-exporting countries increase the proportion of gold in their portfolio for diversification benefits. Such an increase in demand for gold during rising oil prices leads to increase in gold prices. All these explanations support the argument that oil and gold prices follow similar behavioral patterns.

In this paper, we aim to analyze the cointegration and causal relation between oil and gold prices in India. Our study would extend the literature in several ways. *First*, in contrast to the studies mentioned above, we argue that the relation between oil and gold may be mis-specified since the traditional causality tests assume a linear relation between the variables (Hiemstra and Jones, 1994; Benhmad, 2012; Wang and Wu, 2012). Such models may no longer be suitable due to the increasing tendency of commodity prices to behave like financial assets (Jain and Biswal, 2016). Moreover, in the post 2008 global financial crisis period, the oil and gold prices have shown extreme fluctuations (see Fig. 1). The nonlinear relation between gold and oil could arise due to the effects of economic

Supply chain resilience and internal integration: an empirical examination of different visibility categories

Santanu Mandal

Department of Operations and IT,
IBS, Hyderabad, India
Email: shaan.nitw@gmail.com

Abstract: Supply chains need to be resilient to fight back the increasing environmental uncertainties. The current study complements the growing literature on resilience by exploring the influence of different visibility types on the development of supply chain resilience and how the same affects supply chain performance. Further, the current investigation explores the inter-relationship between different visibility types and their dominant role in the development of supply chain resilience. Further, our investigation has considered the moderating influence of internal integration on the proposed linkages between different visibility types and supply chain resilience. Survey-based data collected from 207 supply chain professionals largely support the proposed relationships. It has been observed that internal integration positively moderates the relationships between supply, market and demand visibility with supply chain resilience.

Keywords: supply chain resilience; demand visibility; supply visibility; market visibility; technological visibility; environmental visibility.

Reference to this paper should be made as follows: Mandal, S. (2017) 'Supply chain resilience and internal integration: an empirical examination of different visibility categories', *Int. J. Business Performance Management*, Vol. 18, No. 2, pp.216–235.

Biographical notes: Santanu Mandal is currently an Assistant Professor in the Department of Operations and IT at IBS, Hyderabad, India. He has been the Visiting Scholar (2012–2013) at Spears School of Business, Oklahoma State University. His research interests include supply chain management, customer relationship management and operations management.

1 Introduction

Supply chain resilience has recently gained attention of researchers and academicians as a result of increasing number of disruptions and calamities. The changing business scenarios have given the impetus to design various supply chain capabilities that can enable the concerned firm to react to these calamities in a proactive manner. Such a backdrop have led to the development of supply chain resilience that helps a firm to restore its supply chain operations once faced with a disruption (Brandon-Jones et al., 2014). Increase in supply chain disruptions have seen a growing trend over the past decade. For e.g. the incidents and losses faced by Dole, Ericsson, Ford and Land Rover offers several insights into managing these kinds of disturbances (Martha and

Abstract:

"Federal Express Corporation (FedEx) invented the express transportation and logistics industry in 1973. The company offered a service to ship packages of many sizes over both short and long distances. Speed and reliability were the core strengths of the company. Frederick Smith, the founder believed right from the inception that in order to stay ahead of competition and to deliver value to customers, he had to create a stimulating workplace and encourage his employees to give their best. FedEx encouraged employees to come out with innovative solutions apart from delivering documents and packages on time. It followed the people first policy at all times and shared the benefits of progress with employees. There was clear communication at all levels. There were sincere and genuine efforts to upgrade skills and competencies of employees through constant training sessions. Employee development was given top priority. The company had put excellent reward programs in place. It went out of the way to attract and retain talent through excellent HR practices. The case study throws light on how those HR best practices have helped the company to outwit competition and deliver unmatched value to customers all over the globe consistently".

Key words: *FedEx, HR practices, People-Service-Profit Philosophy*

JEL classification code: J5

INTRODUCTION

In 2014, FedEx delivered more than 10 million packages to customers in more than 220 countries and territories. It had 90,000 fleet vehicles, 650 planes and 300,000 employees running the show all over the globe. With a brand portfolio of transportation, e-commerce and business services, FedEx had annual revenues of nearly and 47 billion. Consistently ranked among the world's most admired and trusted employers, FedEx was known for its employee friendly policies and practices right from the inception. It was among the first few companies in the world to develop a formal HR policy that viewed employees as invaluable assets. The company realized the necessity of developing rapport and building trust with its employees in order to deliver value to customers consistently. To this end, it came out with a people-service-profit philosophy (PSP) (*Refer to Exhibit 1*) that recognized the value of employees as one of the key elements of company success. During the four decades of its operations, FedEx laid a solid foundation for innovative HR practices that, in a way, propelled the company to the top spot in the package and freight transportation business. It was actually a class room project at Yale University assigned to Fred Smith (Smith) that led to the formation of the company in 1973. To compete effectively, Smith felt that all businesses required sharing information, resources, documents, materials with all stakeholders almost on a daily basis. There was an urgent need for reliable and speedy delivery of time-sensitive documents and packages so as to meet the growing needs of an ever expanding market. By delivering documents overnight, which was a revolutionary idea at that time, Smith paved the way for the emergence of express transportation and logistics industry. He proposed a new concept of picking up and delivering cargo from point A to point B by a company operating its own aircraft, depots, posting stations and delivery vans. The carrier would collect packages from pickup stations and carry the same to a central clearing house, from where the items would get sorted out and sent to respective destinations in a quick and meticulously careful manner. Smith got only a "C" grade for the project, but held on to the idea and founded the Federal Express Corporation (original name) in 1971 in Little Rock, Arkansas. Smith moved the company to Memphis in 1973. Memphis was chosen because of its central location within the US and because Memphis International Airport was rarely closed due to bad weather.

Background

The company began service in 25 cities with a fleet of 14 Dassault Falcon aircraft and 389 employees in 1973. The planes were relatively small in size, collected packages from airports every night and brought them to Memphis, where they were immediately sorted. They were subsequently flown to airports nearer to their

Dynamic Reconfiguration of Communication Hubs during Offensive Military Operations

Akella Amarendra Babu[1], Siva Prasad Nadakuduru[2] & K.K Baseer[3]
[1]St. Martin's Engineering College, Dhulapally, Secunderabad, Telangana State, India,
[2]IBS, Hyderabad, India, [3]SVEC, Tirupati, Andhra Pradesh, India

Abstract:

In offensive military operations, the communication hubs move swiftly to provide multi-media communications to the fighting forces. As the fighting formations move forward with the progress of operations, the communication hubs also move forward. Existing dynamic routing algorithms update the configuration tables, but cannot converge quickly. In this paper, we present a dynamic and adaptive reconfiguration routing algorithm which would make the communication system transparent to the movement of fighting formations and improve the success rate of packet delivery.

Keywords

Dynamic reconfiguration, communication hubs, military operations.

1. Introduction

In battlefield, the armed forces conduct offensive operations to win over the enemy and occupy the ground. During offensive military operations, the forces move forward swiftly. The commanders at various levels communicate with one another to coordinate the movement of troops. Therefore communications take vital place in the offensive operations. In conventional warfare scenario, communication equipment was integral part of the formations and commanders at various formation headquarters were provided with radio sets to communicate with formations / troops under their command. The radio sets provided basic voice communication only. As the formation moves forward, the communication equipment which is integral to that formation also moves along with it.

Mobile Radio Engineering Network Communication Centers (MRENCC) were developed during 1980s to provide networked communication support to the troops on move to provide audio and data communications. It is based on the Radio Relay links networked using electronic switches and routers. The routing algorithms implemented on these routers were primitive.

1.1. Topology of the MRENCC

The MREN Communication Center (MRENCC) consists of MREN network terminals which are based on vehicles. A model of MREN terminal is shown in figure 1.1. These terminals are equipped with the radio relay links, switching / routing equipment. A formation hooks on to the communication center using the mobile communication terminals which are integral part of that formation. The MREN Communication centers are inter-linked with one another in mesh topology forming a grid which covers certain area of operations. As the formations move forward, they hook on to the nearest MREN center. As the operations progress and formations move forward, a new MREN center is moved ahead and established to extend the grid in the direction of offensive operations. Therefore, the formations are provided with communications continuously while on move.

Figure 1.1: Mobile Radio Engineered Network Terminal

1.2. Tactical Communication System (TCS)

As the technology changed, the conventional warfare has given way to modern warfare. Besides the three dimensions of war that is, land, water and air, two more dimensions are added. The additional two dimensions are electronic warfare and information warfare. These two dimensions of war are playing vital role in winning the battles. The commander needs data, video and information besides voice communications. Modern command and control systems like Battlefield Management System (BMS), Battlefield Surveillance Systems (BSS), Command, Information and Decision Support Systems (CIDSS) and tactical Command, Control, Communication and Information systems (C3I) are introduced to support fire power, night fighting, surveillance systems and night vision devices [1].

To support the above command and control system, Tactical Communication Systems (TCS) are developed.

ABSTRACT

Human-Robot interaction research is still relatively new compared to traditional service robots used to deliver hospital meals or vacuum cleaning or providing security services. The exponential increase rate in the elderly population across the globe made the service robots for personal use as the need of the hour. The proposed robot acts as a companion for the elderly people serves them in wide range of applications such as: communication that enables the elderly person to be in touch with his family, friends or care professionals; Safety measures in terms of reminders for medication fall detection and alert along with a emergency notification system; diary making which helps the care recipient to improve his daily life by noting and updating his daily agenda, keeping and dispensing his personal items; entertainment which improves his mood by means of playing his favourite media or by cognitive exercises and brain stimulating games. The Unique Selling Point (USP) of the proposed robot lies in the synergic combination of the features of a mobile companion robot with that of a stationary "smart home" solution. The mobile robot can navigate autonomously, or by means of voice commands given by the user. It can give remainders about their medication, give alerts to their care takers if any fall is detected , keeping and dispensing medicines, keys, wallet and other items that may be frequently be required by elderly and providing interactive media access for entertainment. It can also stimulate the brains of the care recipient by means of games deployed in it.

Keywords: Companion Robot, Elderly, fall detection, Landmarks, Voice recognition.

ABSTRACT

The prime aim of the study is to explore the impact of organizational culture on employees' work performance using Structural Equation Modeling (SEM) approach. The exploratory research design was adopted. This study explored the impact on organizational culture on employees' work performance at designer industry. Three designer organizations from Chennai was chosen and survey was conducted among 300 samples from those companies using structured questionnaire. The survey questionnaire has two main constructs such as organization culture and employees' job performance. The results of the study indicates that organizational culture is having impact on employees' work performance.

Keywords: Organizational culture, employee performance, job performance, organizational performance, work performance, Akbar Jan and Subramani SEM.

1. INTRODUCTION

Design industry in India is characterized by many small to medium sized "innovative" firms. There are a few well organized design companies with high employment rates. These firms offer multiple specialties and serve more or less as one-stop-shop for design needs (marketing, arts, publication etc.). Indian government is taking initiatives to improve the state of design industry in India and opening doors for satisfying employment

Detection of Dissimilarity Among Different Indian Banks: An MDS Approach

Subhabaha Pal, Kaushik Bhattacharjee** and Satyabrata Pal****

This paper addresses the aspect of detection of dissimilarity (in terms of 10 performance indicators) existing among major Indian banks. Towards attainment of the goal the well-known Multidimensional Scaling (MDS) approach has been employed. The interesting outcome of the paper is that the MDS technique is capable of discerning the dissimilarity (in relative terms) existing in the overall performance behavior (based on a number of relevant performance parameters) in the case of 37 leading Indian banks during the period 2004-05 to 2013-14 based on data obtained on yearly basis for this purpose. The dynamics of the overall performance behavior over time (year after year) during the above-mentioned period with respect to the parameters studied has been obtained. MDS analysis reveals that the four banks—SBI, ICICI, AXIS and PNB—differ significantly from the other 33 banks in each year in the mentioned period. Thus, MDS approach brings out an important feature related to inter-banks' differentiating status where a comparison of different banks is performed with the help of several attributes or performance indicators. In the introduction section, an exhaustive and interesting review of the major research works undertaken on the performance of Indian banks (available in literature as surveyed by us) has been presented.

Introduction

Banks are the backbone of a country's economy.[1] The commercial banks play a vital role in the economy for two reasons: they provide a major source of financial intermediation and their checkable deposit liabilities represent the bulk of the nation's money stock (Yue, 1992). As banks are seen as special, given their pivotal role in providing credit to enterprises, a great deal of attention is given to the performance of banks, expressed in terms of competition, concentration, efficiency, productivity and profitability (Bikker and Bos, 2008). Since many of these indicators cannot be observed directly, various indirect measures in the form of simple indicators or complex models have been devised and used in theory and in practice (Bikker,

Factors Affecting Non-performing Loans/Assets in the Public Sector Banks of India

Laila Memdani*, Shilpam Dubey and Suresh K.G.*****

IBS Hyderabad, IFHE University, India

Abstract: This paper aims to explore the determinants of Non-performing Loans (NPLs) in the Public Sector Banks (PSBs) in Indian Banking sector. The Non-performing Assets (NPAs) in the PSBs are increasing rapidly and are eroding profitability of these banks. Data for all the banks are collected from the Reserves Bank of Inida's (RBI's) website from 2005 to 2015. The variables are categorized into two categories: bank specific factors and macroeconomic factors. The banks are divided into two categories: PSBs and private banks (PBs) and a dummy for ownership is used. PSBs are assigned the dummy one and PBs which include Indian private and foreign banks are assigned zero. The Hausman Taylor model is applied. Results indicate that the bank specific variables are not significant but macroeconomic variables are significant and the ownership dummy is also significant. Therefore government can concentrate on macroeconomic fundamentals to control NPAs. It is also suggested to increase private sector participation or private equity and control over the management of these banks to improve their efficiency.

Keywords: Non Performing Loans/Assets, Public Sector Banks, India, Hausman Taylor model

1. Introduction

Non-performing Assets (NPAs) of banks in India have started rising visibly from the fiscal year 2014, but particularly 2016 has brought with it a lot of bad news for the Indian banking sector. Almost all of the attempts have failed, instead, the state of the stressed assets has exacerbated despite these attempts. Also, to add to the woes, investments are falling along with the credit. Bad loans are breaking all records, reaching levels where the provisioning has become very difficult. Total NPAs and restructured loans of SCBs soared to 11.5 % of total advances till March 2016. In just two quarters between March and September 2016, it steeply rose to 9.1 per cent from 7.8 per cent reaching 12.3 percent (Financial Stability Report, RBI, 2016).

Since 2011-12, scheduled commercial banks, SCBs have witnessed a slowdown in their growth. This period is coincident with the rise of NPAs too. Corporate sector started turning to other sources of financing corporate bonds and commercial papers (Economic Survey 2015-16, Government of India). One of the major reasons behind India's loan problem is the concentration of loans in the large companies. The corporate sector

Abstract

Sustainable development motives are well researched but very less focus is given to identify the factors. The present study examines sustainable development motives by factor analysis to identify the underlying factors. The dataset consisted of 283 responses from National Stock Exchange listed companies across India. The result identified three sustainable motives through factor analysis viz., Moral motives, Profitability motives and legitimate motives. The article proposed definition for three motives along with managerial implications.

Abstract: The organizational climate plays a vital role in determining the organizational performance. In supportive organization climate, the attrition rate will be low, which will result in higher productivity that all would motivate the employees to perform enthusiastically. Employees will utilize their knowledge and skills in everything they design, develop and serve. Organizational climate is an essential element of IT companies if the value and potential of its people is to be harnessed and grown. The most important issue in the IT sector are employee turnover and attrition. When employees are happy with their climate of the organization, they are committed to stay with the organization and are unwilling to exit from their current job. The purpose of the study is to assess the impact of demographic variables on discernment of organizational climate in Information Technology industries in Chennai city using inferential analysis tools such as Chi-square test, independent sample t test, One-way ANOVA, Correlation analysis and Friedman Test. The results of the study revealed that there is impact of demographic variables on discernment of organizational climate in Information Technology industries.

Keywords: Organizational Climate, Discernment, demographic variables, Information Technology,

1. BACKGROUND OF THE STUDY

Organizational Climate is the process of quantifying the "culture" of an organization, it precedes the notion of organizationalculture. Organizational Climaterefers to the team spirit at the Organization level.

An Empirical Analysis of Macroeconomic Variables Affecting Foreign Exchange Reserves Accumulation in India

Author(s): Aruna Kumar Dash, C S Shylajan, Subhendu Dutta

Citation: Aruna Kumar Dash, C S Shylajan, Subhendu Dutta, (2017) "An Empirical Analysis of Macroeconomic Variables Affecting Foreign Exchange Reserves Accumulation in India," Journal of Applied Business and Economics, Vol. 19, Iss.5, pp.69-80

Article Type: Research paper

Publisher: North American Business Press

Abstract:

This paper investigates the determinants of foreign exchange reserves in India by using Auto Regressive
Distributed Lag (ARDL) model during 2000:Q1 to 2014: Q4 by using the variables such as foreign exchange reserve, nominal exchange rate, inflation, current account deficit, trade openness and short term debt/GDP. We found that in the long run, variables such as inflation and short term external debt/GDP affects the foreign exchange reserves. One percent increase in inflation reduces the foreign exchange reserves by 0.12% where as one percent increase in short term external debt/GDP increases the foreign exchange reserves by 0.46%. On the other hand, in the short run, exchange rate affects positively foreign exchange reserves of India.

Pharmaceutical Outsourcing: Competitive advantage for India

Abstract

The paper analyses the response of the Indian pharmaceutical industry to the challenges of new drug discovery across the globe and the institutional changes in its domestic environment driven by economic liberalization and intellectual property reforms. The pharmaceutical Multi National Companies (MNC) in the US, Europe and Japan are increasingly facing the pressure of cost escalation and the need to bring new drugs to the market in time. The result is that the MNCs outsource the drug development, manufacturing and clinical trials to pharmaceutical firms in India and China to bring down costs and save time. It is in this context that the contract research and manufacturing services in the Indian Pharmaceutical Industry is gaining currency. The paper describes how some select Indian firms in this space have attained superior competitive advantage through optimal configuration of their resources and competences. In this process, Indian pharmaceutical industry can become one of the major drivers of the 'Make in India' initiative of the Government of India to promote manufacturing.

Introduction

Indian Pharmaceutical industry has made great strides since 1991, with the opening up of Indian economy to the forces of Liberalization, Privatization and Globalization (Rao, P.M. 1998). A look at the turnover of the Indian Pharmaceutical industry shows just how important these forces were to propel growth. As of 2015, the industry turnover stood at 21 billion USD of which the domestic market contributed to 12 billion USD (IMS Health, 2015). The balance 9 billion USD came from exports. Today, India is the fourth largest market by volume and thirteenth largest by value. In addition, India, with more than 175 US FDA-approved manufacturing facilities, is quickly emerging as a global hub for Pharmaceutical companies to outsource research, manufacturing services and clinical trials. The Indian contract research and manufacturing services market is expected to reach US$ 18 billion by 2018 (CARE Ratings, 2015).

Collaborative Team Learning Contributions to the Knowledge Management Process, Leadership, and Culture in a Multinational Indian IT Company

Veena Kandukuri
Institute of Chartered Financial Analysts of India (ICFAI), Hyderabad, India

Jigeesh Nasina
Department of Operations & Information Technology
IBS Hyderabad, IFHE University, India
Corresponding author: jigeeshn@gmail.com

ABSTRACT

Collaboration among individuals in the workplace creates a team environment that provides faster access to knowledge, facilitates information sharing, and ensures multi-directional information flow that allows employees to collectively achieve project-based goals. Such an environment not only enhances learning, but also fosters the creation of new ideas and information. In the information technology (IT) industry, different teams work on different modules or functions, and team members have varied skills and experience, each occupying a different position. This paper investigates collaborative team learning and its contribution to the knowledge management (KM) process, leadership, and culture in a large multinational Indian IT company with more than 100,000 employees. The authors interviewed 21 members of six teams working on different projects using a questionnaire that comprised 13 items. The results indicate that collaborative team learning helps to develop sophisticated and ethical intelligence-gathering mechanisms, to understand the revenue-generating potential of knowledge assets, and to develop strategies for marketing and selling these assets. The results also show that collaborative team learning helps to encourage and facilitate knowledge sharing and to create customer value. The teams preferred that KM culture be strengthened first in an IT organization, ahead of KM process and leadership.

ABSTRACT

Closed-Loop Supply Chain Management (CLSCM) is considered as a strategic response to the call for corporate sustainability while further expanding the scope of value creation to include product reconstruction. The Closed-Loop Supply Chain (CLSC) performance is directly related to the CLSC network design. The CLSC network design, with long-term and strategic connotations, involves selection of an integrated network of partner organizations to be engaged on one hand in the forward supply chain processes relevant to families of existing and new products and also involved in reverse supply chain activities relevant to reconstruction of the returned products. At the tactical level, Closed-Loop Supply Chain Configuration (CLSCC) attempts to address issues pertinent to launch of a new product and its reconstruction. The CLSC network design is well studied in the current literature, but addressing the CLSCC is neglected. To study the CLSCC problem we: (a) develop an integrated optimization model for problem; (b) present a real-world case study of a battery manufacturer; (c) based on the case study, we conduct a comprehensive set of computational experiments followed by a series of what-if analyses to compare profitability of the Forward Supply Chain Configuration (FSCC) versus the CLSCC; and (c) discuss the key observations and managerial implications drawn from the computational experiments, applicable to other real-world instances. The significant outcomes of the study suggest that: (i) performance of the firm's base case integrated CLSCC model is significantly better than the current supply chain model (ii) the sales-price ratio of new battery is found to be negatively related with the maximum acquiring price of used batteries; (iii) combination of sales price ratios of new and reconditioned batteries determines the total net profit for a given return rate. Finally, important managerial insights and scope for future research are discussed.

Published by Elsevier Ltd.

1. Introduction

The scope of value creation in traditional supply chain management requires engagement of the partner organizations in design, sourcing, manufacturing, marketing, and distribution of innovative products to meet the needs of the end customers, while achieving a desirable balance between the two critical performance measurements, responsiveness and efficiency [1–3]. Emphasis on corporate sustainability potentially extends the current value creation span to include product reconstructions. Product reconstruction requires an integrated system of activities which is known as Closed-Loop Supply Chain (CLSC). CLSC is defined as "the design, control and operation of a system to maximize value creation over the entire life-cycle of a product with dynamic recovery of value from different types and volumes of returns over time" [4]. In the context of CLSC, product reconstruction demands supply chain partners to be involved in recycling, remanufacturing, and refurbishing/reconditioning of products offered to the marketplace [5,6].

Pierce II [6] provides definitions and differences between recycling, remanufacturing, and refurbishing/reconditioning. Recycling is defined as the process by which a product is broken down into its constituent parts, which are then used in the manufacturing of new products. Aluminum, glass, plastics, electronic products, and rubber are usually known to be recyclable products. The US consumer electronics industry in 2013, for instance, recycled 620 million pounds of electronics with Apple, Best Buy, Dell, and DIRECTV each recycled more than 125 percent of the consumer hardware recycling goals set by Consumer Electronics Association (CEA) for the year 2013[4]. Remanufacturing, on the other hand, is a value recovery

A Study on the Development of Entrepreneurial Skills by Masonry Workers Migrating from Rural to Urban Areas

*R Raghunath Reddy**

The present paper attempts to understand the entrepreneurial skills developed by migrant masonry workers in the states of Andhra Pradesh and Telangana by examining the nature of change in working skills that migration brings in the people who migrate from rural to urban areas. It is observed that the decision to migrate is taken by individuals or by the household as expressed by the 60 seasonal workers who were interviewed. The reason for the decision is based on factors like no income-generating opportunities at the place of origin and more opportunities at the place of destination, which are referred to as the push and pull factor. The survey reveals that over a period of 15-20 years, the migrant workers attain the skills of masonry and become independent contractors.

Introduction

History shows that migration in India is not a new phenomenon and people have shifted their residences for a variety of reasons such as livelihood, employment, environmental shocks, and religious, social and political conflicts. Migration is the mobility of people changing their residential locations across boundaries for reasons which are probably voluntary or involuntary or both. Over the years, migration from the rural to urban areas in search of livelihood has gained significance. It could be attributed largely to distress, complete or partial collapse of employment generation in rural areas, financial difficulties related to agriculture, natural calamities, etc.

Certain groups of people plan their migration, and for some, it is spontaneous. The motives of people who are migrating may differ such as people migrate to provide better social and financial environment and education to their families. Such category of people support their families even from a long distance. Another category of people migrate to escape from their families and their expectations. This migration happens after conflicts and arguments and may lead to severance of ties with their families. Another category of people migrate for short time to achieve the goal of saving money for building a house or starting a business.

What determines the gold inflation relation in the long-run?

Satish Kumar
IBS Hyderabad, ICFAI Foundation for Higher Education, Hyderabad, India and Indian Institute of Management, Amritsar, India

Received 7 April 2016
Revised 8 November 2016
Accepted 8 November 2016

Abstract

Purpose – The author aims to examine the long-run dynamic relation between gold price and inflation in the Indian context from 1982 to 2015. The author measures inflation using consumer price index and wholesale price index (WPI). However, this study focuses on the long-run dynamic relation between gold price–WPI inflation.

Design/methodology/approach – The author uses Johansen's cointegration technique (Johansen, 1991); single equation error correction model based on Pesaran *et al.* (2001) and Kanioura and Turner (2005); and the Saikkonen and Lütkepohl (2000) approach. The author also uses a time-varying regression framework in level form based on Kalman filter to examine the dynamic nature of gold–WPI relation.

Findings – The author finds no evidence of cointegration between gold and WPI. However, The author reports a significant dynamic relation between gold and inflation using a Kalman filter framework, and the comovement between these variables has in fact increased in the past decade. The results further indicate that variation in gold's sensitivity to inflation can be explained by real effective exchange rate which supports the notion of using gold as an alternative to paper currency. Moreover, the WPI beta of gold is found to be predicted by both short- and long-term interest rate changes highlighting the monetary value of gold as a valuable asset.

Practical implications – From an emerging economy point of view, the results have implications for policy makers, particularly the central banks. The results of this paper caution the Reserve Bank of India against increasing its gold holdings as a reserve asset presuming that gold would preserve its purchasing power parity, at the same time providing a hedge against inflation.

Originality/value – To the best of the author's knowledge, this is the first study to examine the gold price–inflation relation in the Indian market for such a long period of time. More importantly, the study shows that the changes in gold's long-term sensitivity to WPI can be forecast using fundamental variables like interest rates.

Keywords Cointegration, Inflation, Gold, Kalman filter

Paper type Research paper

1. Introduction

Does gold have an ability to act as a hedge against inflation? Many studies conducted recently argue in favor of gold as an inflation hedge (Wang *et al.*, 2011; Beckmann and Czudaj, 2013; Shahbaz *et al.*, 2014; Bampinas and Panagiotidis, 2015; Van Hoang *et al.*, 2016). Although gold is no longer followed by the International Monetary Fund since the breakdown of Bretton Woods, it is still accepted as a durable commodity by both investors and researchers across the globe. Given the complex nature of financial markets, portfolio diversification using hedging has become more important. In particular, the researchers argue that the gold price and consumer price index (CPI) are cointegrated and share a common long-term trend. Therefore, gold may be viewed as safe haven for investors to at

31 January 2017
Accepted 31 January 2017

Abstract

Purpose – Using dynamic capabilities theory, this paper aims to posit logistics capabilities (namely information, demand, supply, cooperation and coordination) when integrated at the supply chain level gives rise to supply chain resilience. The current investigation explores further on the inter-relationship among dominant logistics capabilities and integrated logistics capabilities.

Design/methodology/approach – To test the proposed hypotheses, data were gathered from 339 supply chain professionals and were evaluated through structural equation modeling. The measures were pretested through exploratory factor analysis and confirmatory factor analysis and then measures were deployed for final testing.

Findings – Findings suggest that logistics capabilities do exert a strong influence on supply chain resilience through effective logistics integration. Further, these logistics capabilities do share certain inter-relationships among themselves. Supply chain resilience does have positive performance implications. The authors also tested for moderation of cooperation and coordination and proposed an alternate model which found support in post hoc testing.

Originality/value – The study holds immense value for practitioners and managers, as they undersigned that logistics capabilities need to be integrated at the supply chain level for developing overall supply chain resilience. Further, it underscored how the inter-relationship among the individual logistics capabilities varies in the development of supply chain resilience.

Keywords Capabilities, Resilience, Performance, Integration, Supply chain, Logistics

ABSTRACT

We study the effect of founder ownership on foreign investments for Indian firms. We show that foreign investors underinvest in firms with higher level of founder ownership, since these firms are more vulnerable to information problems and expropriation risk. This effect is particularly stronger when founder ownership exceeds a threshold beyond which founders hold effective control on firms. We exhibit that information problems are the main cause of the relation between foreign investments and founder ownership. This is because the relationship is more pronounced in case of business group firms and firms that are engaged in more earnings management.

1. Introduction

Due to liberalization, foreign capital has gained importance as a source of capital in many markets, particularly in emerging markets where the capital market is yet to be developed (Bekaert et al., 2002). In addition, emerging markets offer more attractive opportunities to foreign investors compared to developed markets, because of their relatively higher growth prospects (Batten and Vo, 2015). Given the growing importance of foreign investments, it is imperative for an incumbent manager to understand the factors that attract foreign investors. Several studies illustrate that corporate governance, both at the firm and country level, is one of the important factors to attract foreign investors (Aggarwal et al., 2005; Leuz et al., 2010). Miletkov et al. (2014), for example, document that foreign investors are inclined to firms with more independent boards. In this paper, we examine how the concern of expropriation by insiders, coupled with poor governance, affects foreign equity investments. Particularly, we study the effect of concentrated founder ownership on foreign investments for Indian firms where concentrated founder ownership is the norm, rather than the exception (Chauhan et al., 2016; Claessens et al., 2002).

The extraction of private benefits by a firm insider or a founder is well documented in the literature, particularly for emerging markets (Claessens and Yurtoglu, 2013; Claessens et al., 2002; Bertrand et al., 2002; La Porta et al., 1999). This is because founders not only decide how the firm would be run, but also how the profits are distributed among shareholders (Claessens et al., 2000).

Performance Evaluation Using Ratio Analysis: Public Versus New-Generation Private Sector Banks

B Amarender Reddy and D Sreenivasa Chary***

Stabilization and Structural Adjustment Program of 1991 has brought unprecedented changes in the Indian economy. The post policy initiatives resulted in the abolition of licensing policy, de-reserving the areas for the participation of private entities, disinvestment of government investments in public sector organizations, opening up of the Indian economy for global players in various sectors, disintermediation in the financial markets, reducing the role of public financial institutions, and the emergence of new-generation private sector banks. This paper examines the impact of the entry of new-generation private sector banks on the performance of public sector banks, by analyzing 29 performance-related ratios for 12 years (2004-05 to 2015-16), relating to these banking groups, to determine whether there is any significant difference in their performance. The results indicate that new-generation private sector banks are able to show better performance by judiciously sourcing the funds either from public/market at a cheaper rate of interest and deploying them on deserving assets at less operational costs. The competition warranted the public sector banks to improve their performance, to comply with the profitability considerations and as well realize the social obligations.

Introduction

An efficient and effective financial system is a prerequisite to any country for its overall industrial development. A financial system is said to be efficient and effective only when there is a mix of financial institutions, financial markets and financial instruments to suit the needs of both the savers and users. Indian economy has been witnessing financial liberalization after the responsibility of development of financial system was taken up by the government.

Banks play the vital role of intermediation between the small investors and the deficit borrowers particularly the corporate and help channelize the resources from surplus holders to deficit holders. Prior to 1955, all banks in India were private sector banks. The Banking

ABSTRACT

In Data Mining, the usefulness of association rules is strongly limited by the huge amount of delivered rules. Association rule mining is considered as one of the most important tasks in Knowledge Discovery in Databases among sets of items in transaction. To overcome this drawback, several methods were proposed in the literature such as item set concise representations, redundancy reduction, and post processing. However, being generally based on statistical information, most of these methods do not guarantee that the extracted rules are interesting for the user. Thus, it is crucial to help the decision-maker with an efficient post processing step in order to reduce the number of rules. This paper proposes a new interactive approach to prune and filter discovered rules. First, we propose to use ontology's in order to improve the integration of user knowledge in the post processing task. Second, we propose the Rule Schema formalism extending the specification language for user expectations. Furthermore, an interactive framework is designed to assist the user throughout the analyzing task. Applying our new approach over voluminous sets of rules, we were able, by integrating domain expert knowledge in the post processing step, to reduce the number of rules to several dozens or less. Moreover, by using page ranking algorithm, the required data can be mined.

I. Introduction

Today the Web has become the largest information source for people. Most Information retrieval systems on the Web consider web pages as the smallest and undividable units, but a web page as a whole may not be appropriate to represent a single semantic. A web page usually contains various contents such as navigation, decoration, interaction and contact information, which are not related to the topic of the web-page. Furthermore, a web page often contains multiple topics that are not necessarily relevant to each other. Therefore, detecting the semantic content structure of a web page could potentially improve the performance of web information retrieval. Many web applications can utilize the semantic content structures of web pages.

For example, in web information accessing, to overcome the limitations of browsing and keyword searching, some researchers have been trying to use database techniques and build wrappers to structure the web data in building wrappers, it is necessary to divide the web documents into different information chunks. Previous work uses ad hoc methods to deal with different types of web pages

1.1 Existing System

- Appropriate is the first algorithm proposed in the association rule mining field and many other algorithms were derived from it. Starting from a database, it proposes to extract all association rules satisfying minimum

IMPROVED IMAGE SEARCHING USING USER INPUT IMAGE FUNDAMENTAL FEATURE TECHNIQUE

D. Saravanan

Faculty of Operations & IT, IFHE University, IBS Hyderabad, India. Email: sa_roin@yahoo.com

Article received 7.10.2016, Revised 17.4.2017, Accepted 25.4.2017

ABSTRACT

Image processing plays a key role in every human's life today. The use of images has widely increased due to many factors, but technology makes it very easy to upload images from any corner of the world. Information is exchanged via images easily and effectively and is an important mode of communication today. Searching for images on the web has its own advantages as well as disadvantages. The latest technique involves searching the content by using traditional text retrieval, and it never gives any guarantee to find the required information. For searching image content today most of the researchers spend time for creating various indexes to bring the effective result. This research paper brings one image searching technique which uses image feature based searching with the help of image fundamental feature. The experimental results also confirmed that the proposed approach can always retrieve intended targets even with poor selection of initial query points.

Key words: Image processing, Image Retrieval, Image content, Pixels, Data Mining, Knowledge Extraction, Image Query, Image preprocessing.

INTRODUCTION

Content-based image retrieval (CBIR) and the query by image content (QBIC application of computer vision to the image retrieval problem, namely, the problem of searching large database of digital images. "Content-based" colors, shapes, textures (Salton et.al., 1998) or any other information that can be derived from the image itself without referring to. (Saravanan and Srinivasan 2013). That means that the search will examine the actual contents of the image. The term 'content' in this context to analyze image content and searches can be expensive to produce or work on such titles or Meta keywords, the ability to rely on (Oikonomopoulos et al., 2006). Each image is a color map that identifies a ratio of pixels in color similarity by computing retrieve images based on the image will reveal colors that humans possess certain values. Current research by region and by category of multi-colored parts of the spatial relationship of the color ratio is sought. Their study, based on the colors of images it does not depend on one of the most widely used techniques, the image size or orientation. Color and color histograms comparing searches generally, though not the only technique in practice is required (Saravanan and Srinivasan 2012).

EXISTING SYSTEM

The existing Image extraction using users query deal with a single query in a single retrieval session only.

There are no virtual features for session modification and maintenance

They are using short term cross session

In Short session, each image can contain only one virtual feature

The system cannot output the retrieval results to a given query based on a sufficiently large set of training data

The system has no knowledge about which database images are relevant and which are no relevant to a set of known labels, since we do not know the user's intention until the user starts the response iteration.

Disadvantage of Existing System:

1. Unrelated search results occurs
2. Responses are not used
3. No further improvement in Image retrieval

PROPOSED SYSTEM

- The proposed image fundamental feature based system differs from the existing technique by the way
- The user initializes a query session by submitting an image.
- The system then compares the query image to each image in the database and returns the r images that are the nearest neighbors to the query.
- If the user is not satisfied with the retrieved result, the user can activate an Retrieval Response process by identifying which retrieved images are relevant and which are not relevant.
- Based on the retrieved result users can give notification to the system which is relevant and which is not relevant this will store in virtual feature
- Virtual feature can adapt that reference with that image category for future effective retrievals

Advantages of Proposed System:

1. User Response is included
2. Reduces the unrelated searches
3. The images are searched using the image properties
4. Single Image can have multiple concepts

EXPERIMENTAL SETUP

Image Preprocessing: Content based image retrieval system has database for store images and virtual concepts (Barbu, et al., 2012). Before initializing image operation, we must upload images into database based on application. In this application admin have a responsebility to upload images into database. As admin process, he must login into system. After login process, he can view list of image which is available in database If he wants to upload image with corresponding index values he can upload new image into database (Saravanan and Srinivasan, 2011). This process output shown in the fig 4. The image preprocessing steps are shown below

Understanding the Determinants Affecting the Continuance Intention to Use Cloud Computing

Dr. Shailja Tripathi
Department of Information Technology and Operations,
IFHE University
IBS Hyderabad, Telangana, India
Shailja.tripathi@ibsindia.org

ABSTRACT

The purpose of the paper is to understand the fundamental factors influencing the senior manager's continuance intention to use cloud computing in organizations. A conceptual framework was developed by using the Technology Acceptance Model (TAM) as a base theoretical model. A questionnaire was used to collect the data from several companies in IT, manufacturing, finance, pharmaceutical and retail sectors in India. The data analysis was done using structural equation modeling technique. Perceived usefulness and perceived ubiquity are identified as important factors that affect continuance intention to use cloud computing. In addition, perceived ease of use is found having indirect influence through perceived usefulness. The validated model can be used as a framework for managers to ensure successful implementation of cloud computing. The study extended TAM by incorporating additional variables like perceived ubiquity, perceived costs and perceived risks to explore the determinants of continued intention to use cloud computing.

Keywords: TAM, Cloud computing, Continuance intention

ABSTRACT

Investors need not be rational for markets to be efficient. The axiom of efficient market hypothesis that it is not possible to earn excess profits because the available information gets factored in instantaneously fell flat due to influence of human behavior on the investment process. Exuberance of investors escalates asset values unduly on the back of financial irrationality. The intersection of human behavior and the investment decisions has since evolved as "behavioral finance." Research demonstrates that investment decision-making process is more human than analytical, owing to behavioral biases. Recent studies in prospect theory and heuristic decision-making process focused more on investor behavior causing market anomalies. At a time when irrational behavior is demonstrated not only in security markets but also in other markets such as property, bullion and commodities, this paper explores the contemporary research in behavioral finance.

Keywords: Behavioral Finance, Capital Market, Financial Irrationality, Irrational Behavior

"The fact that people will be full of greed, fear or folly is predictable. The sequence is not predictable." ~ Warren Buffett

1. INTRODUCTION

Investors take irrational decisions notwithstanding high performance technology platforms that enhance the probability of rational decisions. Investors have repeatedly been making the mistake of ignoring the supply response to rising prices in every market. An irrational investor is a normal human being - his/her utility contains benefits that cannot be understood or programmed into a computer (Statman, 2011). The foundation of traditional finance is associated with the modern portfolio theory (MPT) and the efficient market hypothesis (EMH). MPT is a stock or portfolios expected return, standard deviation, and its correlation with the other stocks or mutual funds held within the portfolio (Ricciardi and Simon, 2000). From the academic perspective, investor's behavior is not only related to finance, but also influenced by a combination of psychological, sociological and financial variables making "behavioral finance" truly interdisciplinary (Figure 1). The what, why, and how of finance and investing, viewed from a human and a social perspective is the scope of behavioral finance. It provides explanations to many market anomalies, speculative market bubbles and crashes.

2. EFFICIENT MARKET THEORY

Introduced by Fama (1970) EMH, fairly successful in traditional finance, states that financial prices incorporate all available information and can be regarded as optimal estimates of true investment value at all times. The basic assumption driving EMH is that people behave rationally, allocate their funds optimally and process all available information in the market while making an investment decision. However, this idea is flawed as there have been many instances in the past showing the markets to be behaving irrationally. Basic human behavior towards finance varies from individual to individual and a lot of financial decisions are made emotionally, rather than rationally. The idea of fully rational investors who always maximize their utility and demonstrate perfect self-control is becoming inadequate and inappropriate for the current investment scenario.

Theoretically the EMH rests on three basic assumptions viz., (a) investors in stock markets make decisions with complete rationality by valuing securities to their intrinsic value or true

Transmission of Volatility across Asia-Pacific Stock Markets: Is There a Pattern?

Amarnath Mitra[1] and Vishwanathan Iyer[2]

Abstract

The present study attempts to track the transmission of volatility across 11 international stock markets in the Asia-Pacific region over a period of 20 years, which includes both crisis (i.e., contagion form) and non-crisis periods. It also investigates whether the global transmission of volatility follows a pattern. The study contributes to the literature in two ways: (a) it provides a historical map of volatility transmission in the Asia-Pacific region and (b) it identifies the path and pattern of volatility spillover across stock markets in the Asia-Pacific region.

Keywords

Volatility, spillover, financial contagion, bivariate EGARCH, volatility pattern.

Introduction

In the last few decades, development in the international financial markets has been characterized by increase in international trade, investments and capital movements across borders, which have led to the integration of geographically separated financial markets. As a result, a market in one country now reacts to the fluctuations happening in markets of other countries and gets affected. In case of stock market returns, it has been empirically established that a market not only gets influenced by its own past innovations (i.e., information) but also by news from other stock markets (Lin, Engle, & Ito, 1994). Researchers have found that increasing integration and openness among national capital markets also increase the exposure one country has to another country's economic and financial turbulence, which leads to higher volatility in the concerned markets (Dungey & Martin, 2007; King & Wadhwani, 1990). Hence, chances of financial contagions (i.e., transmission of volatility during a financial crisis) are likely to be greater if international financial markets are integrated.

The concepts of interdependency should be carefully understood. Interdependency between stock markets implies a much broader notion of interrelations such as correlation, co-movement, co-integration, etc., with respect to both the first and the second order moments (i.e., mean and variance) of the return series. A traditional approach to gauge the extent of integration among international stock markets has been to study the correlation among them over time (Eun & Shim, 1989; Goetzmann, Lingfeng, & Rouwenhorst, 2005).

Tourism, trade, and economic growth in India: a frequency-domain analysis of causality

K. G. Suresh[a], Aviral Kumar Tiwari[b], Gazi Salah Uddin[c] and Ali Ahmed[c]

[a]IBS-Hyderabad, IFHE University, Hyderabad, India; [b]Montpellier Business School, Montpellier, France; [c]Department of Management and Engineering, Linköping University, Linköping, Sweden

Downloaded by [Florida State University] at 17:26 03 December 2017

ABSTRACT

We examine causal relationships among the macroeconomic entities tourism and output dynamics in India, using the frequency–domain causality approach. Our results show that there is a bidirectional causality between openness and tourism as well as between output and tourism, at various frequency bands. Hence, this study suggests a multiplier effect of tourism on the Indian economy.

ARTICLE HISTORY
Received 11 January 2016
Accepted 19 November 2017

KEYWORDS
Trade; economic growth; frequency–domain analysis; India

Introduction

Demand for international tourism keeps growing each year. The number of international tourist arrivals exceeded 1.2 billion in 2016, and this number has grown at a pace of 4% for the past seven years according to the UN World Tourism Organization (2016). According to the World Travel and Tourism Council (2017), the direct share of tourism to GDP in India was almost 5,000 billion rupees, or over 3% of GDP, in 2016 and it is predicted to increase by roughly 7% in 2017. This trend is expected to rise by 7% annually during the period of 2017–2027. Furthermore, visitor exports resulted in over 1500 billion rupees, or over 5% of total exports, in 2016 and is expected to increase by roughly 6% per year during the period of 2017–2027.

Tourism development is a part of the overall development strategy for many countries like India, in order to earn foreign exchange receipts, generate employment opportunities, and facilitate economic growth. This has raised interest among economics scholars to study the relationships of tourism with economic growth, international trade and other macroeconomic variables. Four hypotheses have in particular been put forward and tested in the previous research as regards the relationships between tourism and other macroeconomic variables: the Tourism-Led Growth (ToLG) hypothesis (Katircioglu, 2009; Surugiu & Surugiu, 2013), the Growth-Led Tourism (GLTo) hypothesis (Tang & Tan, 2013), the Tourism-Led Trade (ToLT) hypothesis (Goh & Law, 2003), and the Trade-Led Tourism (TLTo) hypothesis. Previous studies have applied various econometric approaches to examine the ToLG, GLTo, ToLT, and TLTo hypotheses. However, these hypotheses have not yet been tested in a frequency-domain framework. In this study, we are testing these hypotheses by utilizing a frequency–domain Granger-causality approach.

From a broad theoretical perspective, four different hypotheses can be tested when studying the relationship between tourism and output growth. First, the growth hypothesis, which is supported when tourism is Granger-causing economic growth. This suggests that historical information on

MACROECONOMIC AND BANK SPECIFIC DETERMINANTS OF NON-PERFORMING LOANS (NPLS) IN THE INDIAN BANKING SECTOR

MEMDANI Laila
IBS Hyderabad, IFHE University, India

Abstract:

The main objective of the paper is to find out the determinants of NPAs in the Indian Banking sector and to study if these determinants vary across the three different ownership structures viz., public sector banks (PSBs), private banks (PBs) and foreign banks (FBs), of banks in India. The panel data for all the banks from 2005 to 2014 is collected from the official website of Reserve Bank of India (RBI), the Central Bank of the country. The econometric technique of Fixed Effects model and Random Effects model is used for the purpose. The results reveal that Macro economic factors, like log of percapita income (LPCY) and Inflation (INFN), are significantly affecting NPLs in Public Sector Banks (PSBs). In case of private banks (PBs) LPCY is highly significant while bank specific variables like size and total loans to total loans of the banking sector (TLTLBS) are significant at 10% level. For FBs none of the variables were significant.

Key words: *Non-performing assets, Macroeconomic determinants, banks specific determinants*

1. Introduction

The Non Performing Loans (NPLs) of Indian Banking sector are continuously increasing. According to Nair and Iyer (2016), the NPAs of the listed banks in India increased by Rs.1 trillion in the last quarter of 2015. The aggregate net profit of the 39 listed banks fell 98% to Rs.307 crore in the December quarter from Rs.16,806 crore in the year earlier. The provisions made towards NPAs and loss assets wiped out the profits of these listed banks. Out of the 27 banks that reported a quarterly profit, six saw profits plummet more than 70% from a year-ago period (Nair and Iyer, 2016).

The high levels of NPLs have devastating consequences on the banks profitability. Most of the banks are getting losses. There is also the risk of bank failure

PREDICTABILITY AND PREDICTORS OF VOLATILITY SMIRK: A STUDY ON INDEX OPTIONS

Rajesh PATHAK[1], Amarnath MITRA[2]

[1,2] *Department of Finance, IBS, IFHE University, Hyderabad-501203, India*
E-mails: [1]rpathak@ibsindia.org (corresponding author); [2]amarnath.mitra@gmail.com

Received 19 April 2016; accepted 10 October 2016

Abstract. The purpose of this study is to examine the presence of volatility smirk anomaly in index options and its predictability for future returns. The study tests the temporal properties of volatility smirk and further explores the factors determining the anomaly. The daily volatility smirk is computedfor the period 2004–2014 and the first lag of smirk is used in generalized least square (GLS) estimation framework, with set of control variables in two different specifications, to test the predictability as well as the determinants of volatility smirk. The study reports significant presence of volatility smirk in index options with an auto-regressive structure. Smirk predicts marginal returns and the predictability is robust to the control of major risk factors. It is also found that open interest of calls and puts, along with market risk premium and momentum premium, act as significant predictor of volatility smirk. The results are helpful in enhancing returns on investment in Index based funds and designing options strategies from the perspective of volatility risk. The study is first of its kind in the Indian market examining the reasons and consequences of existence of volatility smirk in index options.

Keywords: options, implied volatility, informed trading, moneyness, volatility smirk.

JEL Classification: G1.

Introduction

One of the major anomalies reported in the literature of derivatives is the presence of volatility smirk implicit in the prices of options (see Bates 2003, Xing et al. 2010). Volatility smirk refers to the difference of the implied volatilities of out-of-the-money (OTM) put options and at-the-money (ATM) call options for the same underlying. The presence of volatility smirk in the prices of index and stock options violates the Black and Scholes (1973) options pricing theory (B–S). The B–S theory suggests that every option should imply the same volatility for a given underlying. However, the presence of volatility smirk indicates that implied volatility, as a function of exercise/moneyness for a certain maturity, is a negatively skewed curve for most of the options (Foresi and Wu 2005).

Series of options prices provide insights into the climate of expectations of various market participants. For instance, a call option pays off only when it finishes in-the-money (ITM) implying that the underlying asset price is in excess of the exercise price. On the other hand, a put option pays off only when the reverse is true. Thus, the set of call and put options premium across all exercise prices provides a very direct indication of market participants' aggregate subjective distributions (Bates 1991, 2000). Therefore, an assessed downside risk in the market will lead "put options with exercise prices well below the current spot price"(OTM puts), being priced higher than "calls with exercise prices close to the spot price: (ATM calls). Large downward movements in the market make the "puts" more likely to finish ITM than the "calls"and results in steeper volatility smirk. Pan (2002) reports that investors tend to choose OTM puts to express their concerns about possible future negative jumps, thus making OTM puts more expensive.

The characteristics of volatility smirk and reasons thereof have been thoroughly analyzed for index options (Bates 1991, Pan 2002, Chen and Xu 2014) as well as stock

The influence of organizational culture on healthcare supply chain resilience: moderating role of technology orientation

Santanu Mandal
Department of Operations and IT, IBS Hyderabad, Hyderabad, India

Abstract

Purpose – This paper aims to explore the influence of dimensions of organizational culture, namely, development culture, group culture, rational culture and hierarchical culture, on healthcare supply chain resilience (HCRES). Further, the study explored the moderating role of technology orientation on organizational culture dimensions and healthcare resilience linkages.

Design/methodology/approach – The study adopted a multi-unit study of different hospital supply chains (SCs). Consequently, perceptual data were gathered from seven dominant entities in a typical medical/hospital SC: hospitals, hotels, chemistry and pharmaceutical, marketing/public relations/promotion, medical equipment manufacturers and surgical suppliers, food and beverage providers (i.e. restaurants) and insurance providers. The responses were gathered using online survey and were analyzed using structural equation modeling.

Findings – Based on 276 completed responses, positive influences were found for development, group and rational cultures on HCRES. As expected, a negative influence of hierarchical culture was found on HCRES. Further, technological orientation was found to enhance the positive effects of development, group and rational cultures on HCRES. However, no prominent moderation was noted for hierarchical culture's influence on HCRES. The findings suggested managers to focus more on developing competing values framework (CVF)-based dimensions of organizational culture dimensions for effective risk mitigation so as to provide healthcare services in a timely manner to patients.

Originality/value – The study is the first to investigate the effects of organizational culture's dimensions on resilience. The study has empirically established the association between CVF view and dynamic capabilities. The study underlined the importance of resilience in healthcare SCs. Resilience is an important dynamic capability in healthcare SCs to provide uninterrupted treatments and services to patients. Any failure in such a service can be fatal. Further, the study developed the measures of development, group, rational and hierarchical culture for further investigation in healthcare. This study is also the first to develop a measure for resilience in the healthcare sector.

Keywords Organizational culture, Supply chain, Resilience, Technology orientation, Healthcare

Paper type Research paper

Introduction

Healthcare firms require a supply chain (SC) perspective to control escalating costs and enhanced service delivery (Syahrir *et al.*, 2015). Such a perspective can only be realized in practice once the key entities in healthcare SCs work in close coordination for delivering effective healthcare services. Hospitals are also troubled with increasing competitive pressures for providing effective and timely healthcare services (Zepeda *et al.*, 2016). While healthcare research is increasingly becoming important as a consequence of lifestyle changes and increasing complications (Zepeda *et al.*, 2016; Patel *et al.*, 2016), an assessment of risks associated with healthcare service delivery is equally relevant (Zepeda *et al.*, 2016). Risk assessment would help healthcare entities prepare well for adverse conditions and adapt to the same.

Healthcare services require proactive planning complemented with efficient execution. Increased adversities in associated service environments urge hospitals to develop risk management strategies (Dobrzykowski *et al.*, 2014). In this regard, hospitals and their partners in healthcare SCs should devise capabilities that can safeguard their operations in the event of a disruption. The study defines disruption in the healthcare SC context as an unexpected event that can hinder the delivery of healthcare services to patients (Harvey, 2016; Zepeda *et al.*, 2016). Supply chain risk management literature has acknowledged SC resilience as the essential SC capability required for safeguarding operations (Wieland and Marcus Wallenburg, 2013). SC resilience is a dynamic capability that enables firms to prepare for uncertainties through adequate planning with their SC partners so as to sustain performance in the event of a disruption (Christopher and Peck, 2004; Jüttner and Maklan, 2011; Scholten and Schilder, 2015). Resilience is more important in healthcare services compared to manufacturing. This is because failure to provide timely treatment and associated services to patients can have fatal effects (Zepeda *et al.*, 2016; Dobrzykowski *et al.*, 2014; Harvey, 2016).

Dominance of agility in tourism value chains: evidence from India

Santanu Mandal, Venkateswara Rao Korasiga and Payel Das

Abstract

Purpose – *Tourism supply chains (SCs) are recently gaining importance and there is a dire need for empirical testing and theory development in allied areas. The current investigation aims to explore the importance of management learning, relationship development, shared vision, inter-firm integration and technology perception as essential management capabilities required for the development of dynamic capability of tourism SC agility. Furthermore, the study explores the agile influence on competitive advantage.*

Design/methodology/approach – *The study collected perceptual responses from 233 active participants and respondents in the tourism sector. The collected data were analyzed for the validity of the proposed relationships through partial least squares.*

Findings – *Findings suggest relationship development, shared vision, inter-firm integration and technology perception as significant enablers. Furthermore, tourism SC agility was found to enhance competitive advantage.*

Originality/value – *The study further advances theory development and empirical testing through extending the concept of agility to tourism SCs and examining its enablers. Furthermore, the study developed measured for the utilized enablers of tourism SC agility through appropriate development in tourism contexts.*

Keywords *Competitive advantage, Agility, Dynamic capability, Tourism sector, Management learning, Tourism supply chain*

Paper type *Research paper*

Payel Das is Assistant Professor at the Department of Media and Communication, Symbiosis Institute of Media and Communication, Pune, India.

Introduction

Supply chains (SCs) are the competing units in recent business world amongst different firms. Consequently, stress is more on managing the different SCs and obtaining more value through appropriate optimization in manufacturing and distributing products (Chen, 2009; Piboonrungroj *et al.*, 2016). The tourism and travel industry has extended the optimization principles to its SCs, thereby giving the birth of a new area known as tourism SC management. Drawing from manufacturing SC philosophy, the tourism SCs are more complex due to more diversity in operations and nature of partner involvement (Piboonrungroj *et al.*, 2016). Tourism SCs are mostly participated by entertainment providers, shipment arrangers and logistics support teams, hospitality providers, advertisement and travel operators, etc. that are responsible for the efficient execution of tourism industry (Peng *et al.*, 2011; Azmi *et al.*, 2017). Research on SCs has investigated multiple interfaces, but practitioners and researchers are yet to explore tourism SCs fully. Based on a published report of Ministry of Tourism Report (2015), Indian tourism sector is forecasted to witness high growth, as the arrival of foreign tourists in India increased by 6.8 per cent as on December, 2014, compared to that of 2013. Furthermore, a market research report published by the Ministry of Tourism, Government of India suggests a prominent growth. Compared to 2015, the total number of tourists visiting the country (through e-VISA) has increased by 142.5 per cent (Ministry of Tourism Report, 2016). This shows that India

Accepted 4 December 2016

Abstract

Purpose – The purpose of this paper is to explore various risks that are associated with recruitment process outsourcing (RPO) strategy in the Indian information technology (IT)/IT-enabled service (ITes) industries.

Design/methodology/approach – Purposeful intensity sampling was used to select respondents from IT/ITes organizations. Twenty-eight respondents were interviewed through face-to-face semi-structured interviews and telephonic interviews. Each interview lasted for approximately 65 min. All interviews were audio recorded with the permission of the respondents and were then transcribed. The data were analyzed with the help of a qualitative technique, thematic analysis.

Findings – Results show that the stakeholders associated with RPO are not satisfied with several issues such as violation of initial contact between the applicant and the potential employer, violation of contracts by the vendor, unfair practices by the vendor, poor quality service provided by the vendor, plausibility that the vendor does not understand the culture of the client organization, inappropriate placement of human resources by the vendor, low morale of the employees and loss of managerial control due to RPO.

Research limitations/implications – Small sample size and qualitative research design reduces the external validity of the findings to certain extent.

Practical implications – Companies deploying RPO should be wary about the plausible negative consequences. This paper offers various solutions to mitigate such risks.

Originality/value – This paper is a novel attempt which details various risks due to deployment of RPO from multiple stakeholder perspectives.

Paper type Research paper

1. Introduction

Attracting and selecting proficient and skilled applicants is an important challenge for organizations (Michaels *et al.*, 2001). Braeseke *et al.* (2013) state that recruitment is an organizational process which helps in attracting skillful prospective employees to work in the organization, which includes testing, evaluation and the selection of potential candidates (Garcia *et al.*, 2014). In the past, recruiting has been usually a reactive process, an organization engaged in every now and then when a position needed to be filled. At present, nevertheless, more organizations consider the recruiting function as a strategic requisite and, consequently, an ongoing process (Bohlander and Snell, 2013).

Recruitment process lately is considered to play an important role in determining the quality of a firm's human capital (Barney, 1991; Terpstra and Rozell, 1993; Pfeffer, 1998; Amit and Belcourt, 1999). Recruitment may be conducted by a human resource (HR)

An empirical competence-capability model of supply chain resilience

Santanu Mandal
Department of Operations & IT, IBS Hyderabad, Hyderabad, India

Received 4 February 2015
Revised 30 March 2016
Accepted 24 January 2017

Abstract

Purpose – This paper aims to investigate the influence of supply and demand competence on supply chain (SC) resilience and its impact on a firm's operational and relational performance. While the former competence refers to production and supply management-related activities, the latter refers to distribution and demand management-related activities. Within this framework, process compliance, i.e. how well SC management processes are internally executed by the firm's employees, is observed as an enabler (moderator) on the relationship between SC competence and SC resilience. Further the model also explores the moderating influence of environmental uncertainty (EU) on the linkage between SC resilience and firm performance.

Design/methodology/approach – Data were collected through a Web-based cross-sectional survey from SC professionals working in different industries at various designations. Further, the collected data were analyzed using partial least squares for hypotheses' testing.

Findings – The findings suggest a positive influence of demand- and supply-side competences on SC resilience. Supply chain resilience was also found to have a positive influence on operational and relational performance. Further, process compliance was found to positively moderate the relationship between the competences and resilience. Lastly, the relationship between resilience and performance was found to gain momentum in the presence of EU.

Research limitations/implication – Data were collected from a single respondent per firm. Hence, future research should attempt to collect data from multiple respondents for increased generalization.

Originality/value – The study holds significance for academicians and practitioners, as it investigates the importance of supply- and demand-side competences on the development of SC resilience and its impact on performance. This investigation showed that building resilience in a SC is dependent on the degree to which firms are process-compliant. Further, it was empirically proved that resilience's positive influence on performance increases more with the presence of uncertainties.

Abstract

Jugaad represents an innovative way to fix a problem or simple work-around used for solution that bend rules or resources that can be used as such or a person who can solve a complicated issue. Startup is an entrepreneurial venture which is typically newly emerged, fast-growing business that aims to meet a marketplace need by developing or offering an innovative product, process or service and Sustainable livelihood is 'A livelihood comprises the capabilities, assets (including both material and social resources), and activities required for a means of living. A livelihood is sustainable when it can cope with and recover from stresses and shocks and maintain or enhance its capabilities and assets both now and in the future, while not undermining the natural resource base.' The case is a startup which uses jugaad to provide sustainable livelihood to solve the problem of water

Abstract

The paper examines the regulatory compliances of the trading rules and regulations of the Stock Exchanges by trading members while serving its clients in the securities market in India. The paper opted for a case study approach to study the unauthorised trading practices of trading members on Indian Stock Exchange system and identified the nature and complexity of securities market's misuses and abuses. The paper identifies how trading members are violating and avoiding the compliances of trading regulations of the Stock Exchange. The paper provides empirical evidences and insights how the trading members were indulging in unauthorised trades and recovering the losses on account of unauthorised trades from the respective clients. The paper finds that these practices are not only violation of trading rules of the Stock Exchange but also unfair and unethical trading practices. The limitation in a case study approach, the research findings and results may lack generalizability. Hence, researchers are encouraged to study results in other countries. This paper provides inputs for the development of appropriate regulatory framework for prevention of unauthorised trading in Indian securities market, curtails capital market abuses and enables the investor protection. The findings and results provide critical perspectives on regulatory challenges and encourage the regulatory authorities to issue relevant guidelines to stock brokers to prevent executing unauthorised trades for clients. These guidelines will certainly prevent the menace of unauthorised trades and curtail capital market abuses and enhance investor protection.

Structured Abstract

Purpose:
The purpose of this paper is to find out the role of conflicts and conflict management in Top Management Teams (TMTs).

Design/Methodology/Approach:
Based on the secondary research and literature review a conceptual model for conflict management in TMTs is proposed. 66 reasons for conflicts and 55 conflict resolution techniques are identified for TMTs from literature review. They are ranked based on reference count in the literature. TMT processes interaction is shown pictorially.

Findings:
Top 5 reasons for conflicts in TMTs identified are *value differences, resources, attitudes, structures* and *trust*. Top 6 conflict resolution techniques identified in TMTs are *avoidance, compromise, withdrawal, collaboration, confrontation* and *integration*.

Research Limitations/Implications
Further empirical research can be done based on the identified top reasons for conflicts and conflict resolution techniques. Also impact of countries and culture can be further be researched.

Practical and Social Implications
Based on the findings executive teams can manage the conflicts effectively in organizations. This research is useful for the society in proper management of organizations.

Originality/Value:
The main contributions of this work are the conceptual model of conflict management in TMTs, TMT processes interaction diagram, top 5 reasons for conflicts in TMTs, top 6 conflict resolution techniques in TMTs, managing conflicts in TMTs and the factors impacting TMT performance.

Keywords:
Top Management Teams, TMT, Executive Teams, C-Level Executives, CEO, Conflict Management, Conflict Resolution, Conflicts, Teams, Senior Management Teams

The Impact of Core Self-Evaluation on Attrition in IT Industry

M Showry and Kuchi Sayulu***

Individual's perceptions, decisions and behaviors are influenced by personal characteristics. Research and theory have mostly examined the motivations and attitudes as the predictor variables for attrition. In the light of the volatile business environment, emerging personality variables like core self-evaluations require considerable examination in attrition research. This paper addresses the question whether a personality trait like core self-evaluation has a significant relationship with attrition and widens the understanding of the causes behind attrition. The paper presents the problem of attrition in the IT industry, explains the components of core self-evaluation and discusses their relationship with attrition. The paper also provides unique insights on how emerging personal traits like core self-evaluation can affect job attitudes and attrition.

Introduction

The problem of attrition, a burning issue in IT industry, has received wide attention from the researchers and practitioners. IT employees exit, despite the retention measures as the lower and middle level software engineers are ready to seize the advantage of increasing opportunities. The unprecedented competition for talent from global players who offer lucrative pay and inspiring work culture has set in a spiraling effect of attrition. Attrition in organizations is a concern of late considering its adverse consequences on both the employee and the organization (DeMicco and Giridharan, 1987).

Attrition decisions are strongly influenced by several factors at individual, firm and environmental levels (Joseph *et al.*, 2007). Organizations attempt to identify the factors responsible for attrition either at the individual level or at the organizational level (Jeswani and Dave, 2011). Since long, research by the practitioners and academics has classically been focused on analyzing the impact of organizational, work or job attitudes and environmental-related determinants on attrition. However, whether personality

Factors affecting satisfaction and loyalty in online grocery shopping: an integrated model

Anusha Sreeram
Department of Operations and Systems, IBS Hyderabad, Hyderabad, India
Ankit Kesharwani
Department of Marketing and Strategy, IBS Hyderabad, Hyderabad, India, and
Sneha Desai
Department of Strategy Management, Indian Institute of Management, Indore, India

Received 6 January 2016
Revised 21 April 2016
Accepted 24 January 2017

Abstract

Purpose – This paper aims to conceptualize and test an integrated model of online grocery buying intention by extending technology acceptance model by adding several antecedents of online grocery shopping behaviour such as physical effort, time pressure, entertainment value, product assortment, economic values, website design aesthetics, etc. The ultimate dependent variable was consumer's satisfaction with buying process of grocery product via online platform.

Design/methodology/approach – The model was tested over online grocery shoppers using structural equation modelling approach. To enhance the validity of the finding, common method bias and social desirability bias were also assessed.

Findings – As product assortment was found to have a significant impact on both perceived ease of use and perceived usefulness, it supports the notion of one-stop solution as a major driver to attract buyers to buy groceries online. Findings also highlight the importance of entertainment value and economic value as key variables which shape the buyer's satisfaction and purchase loyalty behaviour. Overall, the results support the proposed model.

Practical/implications – The findings of this study would be helpful for online marketers to get more website visits and to increase conversion rates, i.e. getting their visitors to spend more time on the website and to make purchase.

Originality/value – This integrated framework tested here is quite comprehensive in nature, as it includes the influence of time pressure, physical effort and product assortment on online buying behaviour. These basic yet important variables to study, especially when the industry (online grocery shopping) is still in its nascent stage, are missing from the literature. The present study also involves a rigorous data analysis process followed by assessment of common method bias and psychometric property test. Such approach is rare in existing body of knowledge. The study uses S-O-R framework for hypothesis and model development, which is also rare in context of online grocery shopping.

Abstract: This study investigated the impact of culture on attitude towards advertising of various brands according to hedonism or pleasure; product information; social integration with masculinity and power distance as cultural dimensions. Analysis of variance (ANOVA) analysis was used to test the overall significance of the model. Multiple regression analysis showed positive significant impacts of social integration (β = 0.412, p < 0.000), product information (β = 0.208, p<0.000) and hedonism (β = 0.181, p < 0.000) on attitude towards advertising. Results of the study confirmed the moderation effect of culture on relationships among product information, social integration, hedonism and attitude towards advertising. Study comprised sample size of 287 respondents.

Keywords: attitude; advertising; product information; social integration; hedonism; culture.

Gandhian values and consumption behavior: scale development and validation

Anubhav A. Mishra[a], Suresh C. Sharma[b], Vikas Gautam[b] and Reshmi Manna[b]

[a]T. A. Pai Management Institute, Manipal, India; [b]ICFAI Business School, Gurgaon, Haryana, India

ABSTRACT

Researchers have long been interested in the measurement of human values. Gandhi was a leading figure in the independence of India and also in the fight against racialism in South Africa. His teachings are invaluable and have inspired generations all over the world. Following standard procedure for scale development, we aim to identify the various Gandhian values that can be imbibed by an individual. We validate the applicability of the instrument by assessing its relationship with potentially related constructs like socially responsible consumption behavior and consumer frugality. We also assess its relationship with a negatively valenced construct of materialism. To develop the Gandhian values scale, we used a mix of both qualitative and quantitative methods. We conducted three data collection rounds corresponding with four separate phases of scale development. We ensured the stability of the Gandhian value scale across different contexts by testing and validating it across three different sets of sample. To the best of our knowledge, our scope of research is second only in the line of similar research like the *Confucian values*. Our primary contribution is the development and testing of a parsimonious Gandhian values scale that captures the value system of individuals.

Carefully watch your thoughts, for they become your words. Manage and watch your words, for they will become your actions. Consider and judge your actions, for they have become your habits. Acknowledge and watch your habits, for they shall become your values. Understand and embrace your values, for they become your destiny. – M. K. Gandhi

Generations to come, it may be, will scarce believe that such a one as this ever in flesh and blood walked upon this earth! – Albert Einstein on Gandhi

1. Introduction

Social psychologists have long been interested in the measurement of human values and value systems. Human values are abstract representations of desired end-states that serve as guiding principles in people's lives (Schwartz, 1992). They serve as ideals or oughts and act as an internal moral compass that guides self-regulation, actions, attitudes, judgments,

The Mediating Role of Customer Relationship on the Social Media Marketing and Purchase Intention Relationship with Special Reference to Luxury Fashion Brands

Vikas Gautam [a] and Vikram Sharma[b]

[a]IBS Business School Gurgaon, IDPL Complex, Dundahera, Gurgaon, India; [b]IBS Business School Gurgaon, Marketing, IDPL Complex, Dundahera, Gurgaon, India

ABSTRACT

The reach of internet technology and social media has opened abundance of opportunities for marketers as well as for consumers across the globe. To anticipate future purchase behavior of consumers, marketers are not leaving any stone unturned. The main objective of this study is to investigate the direct and indirect impacts of social media marketing activities (entertainment, customization, interaction, word of mouth, and trend) on consumers' purchase intentions in luxury fashion brands. This study employed higher order Structural Equation Modeling to test the study model with ($n = 243$) sample data. We found positive significant impacts of social media marketing and customer relationships on consumers' purchase intentions. In addition, our study model confirmed full mediation of customer relationships in the relationship between social media marketing and consumers' purchase intentions. Based on our research findings, we strongly recommend that marketers of luxury fashion brands engage in social media marketing activities to provide value to customers.

KEYWORDS

Introduction

The growth of internet technology has transformed the communication mode that affects billions of people across the globe. Popularity of social media has its roots in the early nineties and it is some sort of online community built on internet technology that aimed at facilitating more interactions among businesses and its customers without any physical boundaries (Campbell, Anitsal, & Anitsal, 2013). According to Zhou and Wang (2014), a large number of companies are making social media as an important part of marketing strategy on the basis of highly promising features such as; large and swift expansion of internet users, ease of use, speed of internet, etc. Marketers are motivated to engage in social media marketing due to high growth of internet and registered social media users (Carim & Warwick, 2013).

ABSTRACT

Healthcare has been in focus over the past decade due to its criticality and continuous revolution. In this digital era, with the advent of various technologies, healthcare is undergoing a massive transformation. This study attempts to analyze the impacts of three major digital technologies which are being adopted in the healthcare sector which are electronic medical records (EMR), enterprise resource planning (ERP) and internet-of-things (IoT) enabled medical wearables in the hospital context. Focusing towards analyzing the impact of these technologies towards process-integration and further towards dynamic capabilities like quality, agility and responsiveness; the study framework is well-grounded by two theoretical-underpinnings - Cybernetic Control theory and Dynamic Capability theory. Questionnaire has been finalized through extant literature review and focused-group-discussion. Empirical investigation has been done with a sample of 154 hospital respondents from four major metro cities from the private tertiary-care hospitals in India. The empirical analysis of the framework is carried out by exploratory-factor-analysis, confirmatory-factor-analysis and structural-equation-modelling. The study outcomes highlight linkages both from technologies to process-integration and further towards dynamic capabilities. This study uniformly

Foreign tourist arrivals in India from major source countries: an empirical analysis

Aviral Kumar Tiwari [a,b,c], Aruna Kumar Dash[b,c*] and Badri G. Narayanan[d,e,f]

[a]*Montpellier Business School, Montpellier, France;* [b]*IBS Hyderabad,Hyderabad, India;* [c]*Department of Economics, IFHE University, Hyderabad, India;* [d]*Center for Global Trade Analysis, Purdue University, West Lafayette, IN, USA;* [e]*School of Environmental and Forestry Sciences, University of Washington-Seattle, Seattle, WA, USA;* [f]*Global Economics Research, McKinsey Global Institute Knowledge Center, Seattle, WA, USA*

(*Received 4 April 2016; accepted 12 February 2017*)

The tourism industry is a significant contributor to the world economy and needs to be carefully evaluated for impact by influencing factors such as external shocks. Several practical implications are associated with the testing of the unit root hypothesis in the context of foreign tourist arrivals in India. For instance, if the unit root process is followed, it implies that shocks to foreign tourist arrivals are permanent in nature rather than temporary. This study employed a battery of time series unit root tests in an attempt to examine whether foreign tourist arrivals in India from 17 major source countries between 1981 and 2012 were permanently or temporarily affected by shocks. The empirical results of this study revealed that shocks to foreign tourist arrivals in India from eight source countries have only a temporary effect and shocks form rest of nine countries have permanent impact. It may therefore be concluded that the government should focus on long-term solutions for those eight source countries where the null hypothesis of unit root is rejected in order to promote international tourist arrivals rather than implementing temporary measures.

JEL Classification: C32; L83; O40

1. Introduction

The international tourism sector has undergone continuous expansion and diversification in the last few decades, making it one of the largest and fastest growing sectors on the global platform. In terms of world trade, it is the largest service industry, accounting for 6% of global exports and contributing about 9% to the global gross domestic product (GDP) (United Nations World Tourism Organization [UNWTO], 2013). Between years 2010 and 2030, international tourist arrivals are estimated to show an average annual increase of 43 million (UNWTO, 2016). At present, it is one of the 12 major generators of employment worldwide, in addition to being the major export sector for many developing as well as developed countries (UNWTO, 2016). There is a consensus among policy-makers that foreign tourist arrivals increase foreign exchange revenue, create more employment opportunities and promote further growth of the tourism industry, thereby triggering the overall economic growth of a country.

CAN CUSTOMER BASED BRAND EQUITY HELP DESTINATIONS TO STAY IN RACE? AN EMPIRICAL STUDY OF KASHMIR VALLEY

Anish Yousaf
Insha Amin

Preliminary communication
Received 1 December 2016
Revised 31 January 2017
30 May 2017
Accepted 17 July 2017
https://doi.org/10.20867/thm.23.2.4

Abstract
Purpose – Current study focus on measuring the customer based brand equity of a tourist destination (CBBETD) named Kashmir valley (India).
Design – A structured questionnaire was prepared, using Man (2010) consisting of 21 items. Single stage cluster sampling and systematic simple random techniques were used to collect final responses of 290 responses with a response rate of 87%.
Findings – Findings of the study revealed a high destination based brand equity for select destination. Analysis also revealed lowest mean for perceived service quality dimension for Kashmir which needs to be relooked into by policy makers. Age and length of stay were found to have associated with each other. Also, length of stay was found to have an impact on CBBETD.
Originality – Originality and core beneficence of the current study lies in the fact that brand equity measurement of Kashmir valley (mini Switzerland of the world) as a destination brand has been taken for the first time with an empirical evidence supporting the findings. It is evident from the study that Kashmir as a destination is very popular among travelers and destination image dimension for Kashmir has a strong and affirmative influence on the overall development of the destination equity.
Keywords customer-based brand equity, CBBETD, destination branding, destination image, Kashmir, Tourism

1. INTRODUCTION

As per 2016 UNWTO report, there has been 4% increase in the number of global tourist arrivals during the last decade with a record 1.2 billion tourist arrivals in 2015. This has increased inter-destination competition and had prompted destination planners to differentiate their destinations with strong unique selling propositions (Gartner, 2014). The concept of destination branding is not new and holds too much importance for destination planners It has been widely established that destinations which are successful in establishing / differentiating themselves have a strong destination image and increased tourist inflow (Chigora & Zvavahera, 2015). The essence of destination branding also lies in forming overall moving service experiences for customers and influencing them in such a way that they revisit the destination over and over again (White, 2013). Developing destinations also helps in generating stronger and unique competitive advantage and destination repositioning (Hemmonsbey & Knott, 2016; Same & Vasquez, 2014).

Sport team brand-equity index: a new measurement

Anish Yousaf
Department of Marketing, Lovely Professional University, Phagwara, India
Anil Gupta
Department of Management, University of Jammu, Jammu, India, and
Abhishek Mishra
Department of Marketing, IIM Indore, Indore, India

Received 14 July 2016
Revised 31 December 2016
Accepted 20 February 2017

Abstract

Purpose – Sport teams not only compete with other teams for the ultimate prize but also for a share of customer mind space. For winning fan loyalty and resultant economic success, management of sport teams need to focus on team-branding, and thus, developing and measuring a team's brand equity becomes essential, which is the core purpose of this paper.

Design/methodology/approach – Current work builds upon previous efforts to develop a reliable and, more importantly, a parsimonious sport team brand-equity (STBE) index, as opposed to the usual multi-dimensional reflective scales, too complicated and not of much use to practitioners.

Findings – The authors propose that the STBE index having eight indicators is enough to capture the full domain of the concept and provide a snapshot about the ability of a team's administration to create strong emotional bonds with its fans.

Research limitations/implications – Apart from demographics of the respondents, an important drawback is that the STBE index is from the perspective of television or online viewers and not those watching live in stadiums. This work contributes to extant sports brand equity literature by proposing a simpler scale made of casual variables, as opposed to reflective scales running into large number of similar items, a first of its kind in this domain. The authors also are able to forward the growing call for developing more of such scales through this effort.

Practical implications – Not only can the present scale be easily used by sport-marketers and researchers, it will be especially useful for marketing managers who want to associate their brands with sport teams, as it affects performance of their own brand.

Originality/value – The work represents a novel effort for developing a team-based brand equity and, to the authors' knowledge, has not been attempted in this literature before.

Paper type Research paper

Introduction

Marketing of sports and marketing through sports is an emerging phenomenon, with revenues from this industry expected to grow at a rate of 4.5 per cent to $73.5bn by the end of 2019, just in North America, and which does not even represent half of the global revenues (PwC Report, 2015). The magnitude of revenues outside of North America can be gauged from the fact that sporting events such as the international soccer, European soccer leagues, Olympics, Indian Premier League (IPL), international cricket, tennis grand slams, Tour de France, UEFA Champions League, Formula 1, MotoGP and, more

ABSTRACT

Market structure is one of the important indicators of competitiveness and consumer welfare. An attempt is made in this study to examine the state of competition and market structure of microfinance industry in India. In order to understand the state of competition and market structure of microfinance industry in India, three indices i.e. Concentration Ratio (CR), Hirschman-Herfindahl Index (HHI) and Learner's Index (LI) are employed. Using data from MIX market database for 60 MFIs for the period 2008-09 to 2012-13, these indices are estimated. The study reveals that the competition in the Indian Microfinance industry has increased over the years. In the light of economic literature, it is also affirmed that the Microfinance Industry in India is nearly marked with the monopolistic market structures.

Keywords: Competition, market structure, microfinance institutions, Concentration ratio, Lerner' Index.

1. INTRODUCTION

Market structure is one of the important indicators of competitiveness and consumer welfare in any industry segment. Understanding market structure of the Micro Finance Institution (MFI) is unabatedly important due to its very socio-economic purpose and service targets to normally vulnerable low income underprivileged household of the society. The fragility of MFI market can be well understood from its definition itself. Though, there is no unanimous definition of MFI, however, MFI in general is an organization that focuses on offering credit and financial services to low income households so as to alleviate poverty and to help the poor and downtrodden households to set up their own income generating activities. There are various

Service Sector IPOs - Factors Influencing Underpricing: An Indian Perspective.

- **Source:** IUP Journal of Applied Finance . Jan2017, Vol. 23 Issue 1, p56-68. 13p.

- **Author(s):** Kumar, C. Vijaya Chandra

- **Abstract:** Initial Public Offering (IPO) has been one of the most popular routes chosen for raising funds by any growing company. It is a common experience that many IPOs are underpriced. This paper attempts to find out the factors which influence the underpricing decision. Earlier researchers had found the influence of financial factors like ownership retention, size of the issue, age of the firm, Debt-equity ratio, NAV and non-financial factors like underwriter's reputation, venture capital funding. An attempt is made to find out if Net-worth to Total Assets, Qualified Institutional Buyers allotment, Earnings per share, Return on Net-worth and IPO Grading, Green-shoe option also would influence the degree of underpricing of IPOs in the Indian context. Data relating to April 2003 to March 2012 have been studied with reference to the infrastructure sector.

mHealth and the management of chronic conditions in rural areas: a note of caution from southern India

Papreen Nahar[a], Nanda Kishore Kannuri[b], Sitamma Mikkilineni[c], G.V.S. Murthy[b] and Peter Phillimore [d]

[a]Institute of Population Health, University of Manchester, Manchester, UK; [b]Indian Institute of Public Health, Hyderabad, India; [c]IFHE University, Hyderabad, India; [d]School of Geography, Politics and Sociology, Newcastle University, Newcastle upon Tyne, UK

ABSTRACT

This article examines challenges facing implementation of likely mHealth programmes in rural India. Based on fieldwork in Andhra Pradesh in 2014, and taking as exemplars two chronic medical 'conditions' – type 2 diabetes and depression – we look at ways in which people in one rural area currently access medical treatment; we also explore how adults there currently use mobile phones in daily life, to gauge the realistic likelihood of uptake for possible mHealth initiatives. We identify the very different pathways to care for these two medical conditions, and we highlight the importance to the rural population of healthcare outside the formal health system provided by those known as registered medical practitioners (RMP), who despite their title are neither registered nor trained. We also show how limited is the use currently made of very basic mobile phones by the majority of the older adult population in this rural context. Not only may this inhibit mHealth potential in the near future; just as importantly, our data suggest how difficult it may be to identify a clinical partner for patients or their carers for any mHealth application designed to assist the management of chronic ill-health in rural India. Finally, we examine how the promotion of patient 'self-management' may not be as readily translated to a country like India as proponents of mHealth might assume.

ARTICLE HISTORY

KEYWORDS
mHealth; South India; diabetes; depression; medical pluralism; informal providers; RMP

Introduction

The term mHealth refers to the delivery of health-related services via mobile communications technology. The potential of mobile phone technology to extend the reach of health care has been attracting increasing global attention and investment, with accompanying claims about its possibilities (Malvey and Slovensky 2014; Mosa, Yoo, and Sheets 2012; Qiang et al. 2011; WHO 2011).[1] While initial advances in mHealth are predictably taking place in the wealthiest countries where health systems and media technologies are most developed, much of the advocacy for mHealth concerns its potential in developing countries, where large segments of the population are scarcely served by health services (Arie

The Relationship between Psychological Capital and Turnover Intention: Work Engagement as Mediator and Work Experience as Moderator

(Hubungan antara Modal Psikologi dan Niat Lantik Henti: Keterlibatan Kerja sebagai Pengantara dan Pengalaman Kerja Sebagai Penyederhana)

Manish Gupta
Musarrat Shaheen
(ICFAI Business School- Hyderabad, ICFAI Foundation for Higher Education University)

ABSTRACT

This study examines the mediating role of work engagement, and the moderating role of experience with the current organization, in the relationship between psychological capital and intention to turnover. The questionnaires was sent to a sample consist of 217 employees working in diverse industries in service sector. The results from Structural Equation Modeling indicate support for the mediating role of work enggagement, but not the moderating role of work experience. This suggests that psychological capital is a distant precursor of intention to turnover and affects it indirectly through work engagement. Practical implications and directions for future research have been discussed in detail..

Keywords: India; turnover intention; psychological capital; structural equation modeling; work engagement

ABSTRAK

Kajian ini menyiasat peranan keterlibatan kerja sebagai pengantara, dan peranan pengalaman bekerja dengan majikan semasa sebagai penyederhana dalam hubungan antara modal sosial dan niat lantikhenti. Soalselidik diedarkan kepada 217 pekerja dari pelbagai industri dalam sektor perkhidmatan. Dapatan daripada Structural Equation Modeling menunjukkan sokongan terhadap peranan keterlibatan kerja sebagai pembolehubah pengantara, tetapi tidak kepada peranan pengalaman kerja sebagai penyederhana. Dapatan ini mencadangkan modal sosial sebagai peramal langsung niat lantikhenti, dan peramal tidak langsung menerusi keterlibatan kerja. Implikasi praktikal dan cadangan untuk kajian masa hadapan juga dibincangkan secara terperinci.

Kata kunci: India; niat lantikhenti; modal psikologi; structural equation modeling; keterlibatan kerja

GALLEY PROOF

INTRODUCTION

In order to retain a highly productive workforce, organizations devise ways and means of evaluating and enhancing the attachment of employees with their work. One such measure of attachment is work engagement. Work engagement is defined as a positive state of mind that is full of vigor, dedication, and absorption (Schaufeli, Salanova, González–Romá & Bakker 2002). Based on a survey, it was found that only 13% of the world's workforce was engaged during 2011-12 (Crabtree 2013), hence, efforts of both industry and academia in the direction of understanding the nuances of engagement are of paramount significance. Nonetheless, engagement literature indicates that organizations can enhance work engagement levels by

Critical success factors: the success of business intelligence systems

K. Rajesh and D. Saravanan

Published Online: August 16, 2017 · pp 334-343

Abstract

Business intelligence (BI) systems have the potential to improve business performance by facilitating innovations, creating new products and service, and enhancing decision making effectiveness. However, it requires certain institutional and scientific capabilities to fully realise the values of BI systems. One of the critical issues concerned with BI systems (BIS) for both researchers and practitioners is to identify the factors which are very important for successful implementation of business intelligence projects. Hence, this paper provides a brief explanation about the most general and impact factors which can be impacting in implementing business intelligence projects in organisations. I anticipated that it is critical to determine these factors, particularly for practitioners of those companies are involved in carry out business intelligence projects and they face a problem in evaluating the willingness of their organisations before implementing the project in pre-implementation stage. The objective of this paper is to provide a better understanding of the vital and valuable success factors and it is to conduct a survey and comprehensive study of the critical success factors before implementation phase of the willingness by categorising the factors into two main groups; institutional and scientific factors. It is clear that each category has its own features and a brief explanation of each factor is discussed.

Investigating young customers' retail purchase embarrassment

Juhi Gahlot Sarkar
IBS, Hyderabad, India, and
Abhigyan Sarkar
Institute of Management Technology, Ghaziabad, India

Received 30 March 2016
Revised 14 June 2016
Accepted 17 July 2016

Abstract

Purpose – The purpose of this paper is to examine the inter-relationships between product category embarrassment, consumption contexts, individual's attachment styles, and their combined effects on individual's preference toward online and physical store channels while buying embarrassing products.

Design/methodology/approach – Experimental design was employed by taking a sample of young adult students.

Findings – The results of this study shows that embarrassing product class and social consumption context can potentially elicit embarrassment. Anxiously attached individuals are more prone to be embarrassed compared to the individuals adopting secure and avoidant attachment styles.

Originality/value – Value of the paper lies in empirically investigating the complex inter-relationships between product class-specific embarrassment, context specific embarrassment, individual's attachment styles and buying channel selection.

Keywords Attachment style, Consumption embarrassment

Paper type Research paper

Introduction

Embarrassment as a human emotion is known to be very pervasive in everyday life (Miller, 1995). Past research has also established the widespread prevalence of embarrassment in consumption domain (e.g. Grant and Walsh, 2009; Dahl *et al.*, 2001). A customer may feel embarrassed due to the nature of product category like condoms, or due to the purchase, usage or disposition situation involved (Dahl *et al.*, 2001).

Prior research states that young customers are more likely to be affected by embarrassment than older adults. This is because the coping mechanisms are at developmental stages for young people (Frydenberg, 1997), and stress related to embarrassment is felt by younger adults in more intensive ways compared to older adults (Grant and Walsh, 2009). Susceptibility to social influence is known to generate greater embarrassment among young people (Dahl *et al.*, 2001; Zhan *et al.*, 2015). Hence, the same is expected to be true in retail consumption context.

Dahl *et al.* (2001) highlight the scarcity of research investigating embarrassment in consumption domain, and suggest filling this gap by examining the antecedents of consumption-related embarrassment. Qualitative study by Grant and Walsh (2009) explores the concept of brand embarrassment amongst British young adolescents. However, quantitative research comprehending the impact of consumption embarrassment on young customers' purchase intentions (PIs) is still wanting. Young customers are of special interest also for the reason that online retailing is booming, and youngsters are the early adopters of such technological innovations which would later be adopted by older people (Luo, 2009).

Prior studies in marketing have established significant roles played by individual customer's attachment styles in impacting customer's response toward consumption situations (e.g. Thomson and Johnson, 2006; Swaminathan *et al.*, 2009; Mende and Bolton, 2011; Mende *et al.*, 2013). These studies have built a solid foundation toward understanding customers' consumption orientations based on their attachment styles. However, none of these studies address how attachment styles can shape consumption embarrassment.

Does skewness help in better investment decision making?

Satish Kumar
Department of Finance, Indian Institute of Management Amritsar, Amritsar, India

Received 3 April 2017
Revised 24 October 2017
Accepted 1 December 2017

Abstract

Purpose – The purpose of this paper is to examine the significance of skewness in maximizing the investor utility using the daily data for eight sectors listed on the National Stock Exchange of India.

Design/methodology/approach – The analysis is carried out in three different steps. In the first part, the author analyzes the monthly stock returns and the important financial ratios – price-to-book (PB) ratio, price-earnings (PE) ratio and dividend yield (DY). Second, the author tests the sector-wise return predictability using Westerlund and Narayan (2012) flexible generalized least squares estimator. Third, the author compares the mean–variance–skewness (MVS) utility function with the mean–variance (MV) utility function.

Findings – The author forecasts the sectoral stock returns using three financial ratios – PB ratio, PE ratio and DY – as predictors. The results indicate that sectoral stock returns are significantly predicted by these financial ratios. The author then formulates trading strategies by including skewness in the utility function and finds that the investor utility is high when the utility function includes skewness as opposed to when the skewness is excluded.

Originality/value – The author extends the MV utility function to the MVS utility function and shows that the Indian stock market is more profitable when the investor uses a MVS utility function which highlights the main contribution to the literature.

Keywords Investor, Returns, Utility, Skewness

Paper type Research paper

1. Introduction

Asset pricing has been the vanguard of research in the area of financial economics, of which returns predictability is a popular sub-area. There is voluminous literature on the use of financial ratios as predictors of stock returns (see e.g. Lamont, 1998; Welch and Goyal, 2008; Rapach *et al.*, 2010; Gupta *et al.*, 2014; Narayan and Bannigidadmath, 2015; Phan *et al.*, 2015; Bannigidadmath and Narayan, 2016). In this paper, we focus on the stock returns predictability by examining whether financial ratios predict sectoral stock returns on the Indian stock exchange. There are two main elements of research that are leading in this area of literature. First is the advancement of econometric methodologies for testing returns predictability (see e.g. Campbell and Yogo, 2006; Westerlund and Narayan, 2012, 2015). The second aspect is derived from the first in that after the evidence of return predictability, the economic significance of such predictability has to be understood. Ideally, the economic significance analysis involves the development of trading strategies. Among them, the most accepted trading strategy involves the mean–variance (MV) utility function.

In this paper, we focus on the second aspect, that is, economic significance of the stock return predictability. We argue that the utility function used to estimate the investor utility mostly considers only the first (mean) and second (variance) moments of the stock returns. We seek to include the third moment (skewness) of returns and see whether its inclusion will improve the investor utility. By doing so, we intend to extend the utility function to mean–variance–skewness (MVS) investor. Although several studies have considered the importance of skewness in financial economics (for instance, see, Kraus and Litzenberger, 1976; Golec and Tamarkin, 1998; Garrett and Sobel, 1999; Bhattacharya and Garrett, 2008; Patton, 2004; Prakash *et al.*, 2003; Jondeau and Rockinger, 2006; Mitton and Vorkink, 2007); however, only a few researchers have accounted for the role of skewness in financial decision making to understand its economic significance. For instance, Jiang *et al.* (2016) examined

ABSTRACT

Dividend policy relevance has been researched extensively, but little consensus has been built from the findings. There are many factors that affect a given firm's dividend policy which can be found in the literature such as risk faced by the firm, cash flow situation of the firm, agency costs etc. According to Bhattacharya (1979) dividend decision of a firm can be seen as a source of signal which shows that profitable firms with good project investment opportunities will pay higher dividends to present themselves distinct from other firms which are having projects with lesser profits. This paper attempts to analyze whether the dividend policy of a firm affects the market value of a firm and the shareholders' wealth. We have set our objective to find out the impact of dividend policy on the shareholders' wealth in the Indian electrical equipment manufacturing industry. For this, we have adopted a sample of dividend paying electrical machinery manufacturing companies listed in Bombay Stock Exchange (BSE). There were totally 439 companies in the industry of electrical machinery manufacturing. Out of them 194 companies were listed in the Bombay Stock Exchange (BSE) and there were 72 companies paying dividends frequently. Therefore the data of these 72 companies were taken into consideration. Our study revealed the empirical evidence with some of the dividend irrelevance theories such as M&M. The results indicate that there is a negative non-linear association between market value of a share and the dividend yields.

Keywords:

Dividend Policy, Firm Valuation, Wealth Maximization

1. Introduction

The returns associated with the shareholders are composed of dividends received ar capital gains. The dividend payout decision of a company has got a direct influence on both n. So, for management it is a very important function to decide upon whether to pay the di ; or to invest the money back into the company to exploit on other opportunities which res capital gains. The exact proportion of earnings that the company wants to pay in the form o nds is

Time Taken to Reach the Performance Summit: Nature of Relation Between Working Capital Management and Firm Performance in the Indian Context

Nitya Nand Tripathi[1]*, Naseem Ahamed[2]

[1]IFHE University, Hyderabad, Telangana, India, [2]IBS, The ICFAI, Hyderabad, Telangana, India. *Email: nityanand.tripathi@ibsindia.org

ABSTRACT

This article examines the impact of working capital management (WCM) measured by cash conversion cycle (CCC) on the financial performance of firms in the Indian context. The period of study is from the year 2000 to 2014 for companies listed on the National Stock Exchange, India. The study uses regression model to analyze panel data. Financial and banking related companies have been removed from the dataset to mitigate bias. This study finds that WCM is an important variable that affects the financial performance of firms. An empirical examination has been conducted in this study over a fairly big dataset spread over a long period in the Indian context. Increasing the efficiency of CCC would lead to an increment in firm's performance up to a certain point which is referred to as the "performance summit" in this study. Our study concludes that there exists an inverse U-shaped relationship between WCM and performance.

1. INTRODUCTION

Working capital management (WCM) refers to investment in current assets and current liabilities which are liquidated within 1 year or less and is therefore crucial for firm's day-to-day operations (Kesimli and Gunay, 2011). Working capital is the money needed to finance the daily revenue generating activities of the firm. According to Vahid et al. (2012) WCM plays a significant role in determining success or failure of firm in business performance due to its effect on firm's profitability as well on liquidity. Business success depends heavily on the ability of financial managers to effectively manage the components of working capital (Filbeck and Krueger, 2005).

Modern theories offer two alternative strategies of WCM, that is, conservative WCM policy and aggressive WCM policy. The literature contains an extensive debate on the risk/return trade-off among different working capital policies (Gitman, 2005; Moyer et al., 2011; Brigham and Ehrhardt, 2004). While more aggressive working capital policies are associated with higher returns and risk, conservative working capital policies offer both lower risk and returns (Gardner et al., 1986; Weinraub and Visscher, 1998). Nyamao et al. (2012) conducted a study to investigate the effects of WCM practices on the financial performance of small-scale enterprises (SSEs) in Kisii South District, Kenya. The study, which adopted a cross-sectional survey research design, found that WCM practices were low amongst SSEs as majority of them had not adopted formal WCM routines. Similarly, their financial performance was on a low average. The study concluded that WCM practices influence the financial performance of SSE. The study relied on primary qualitative data to measure the WCM practices, but the present study measured WCM in terms of aggressiveness/conservatism using secondary quantitative data. The findings of the study also required validation in other areas of the country and among companies listed in the NSE. Similarly, Ogundipe et al. (2012) conducted a study to examine the impact of WCM on the performance and market value of companies. The study used Tobin Q, return on assets (ROA), earnings before interest and taxe, and return on investment as the dependent variables while the independent variables were CCC;

Abstract

Aaker's (1997) brand personality scale has been widely used to measure the personality of brands. However, studies also show that Aaker's brand personality dimensions are not stable across cultures. In pursuance of this issue, we examine the structure of brand personality dimensions in India. This research presents the results of two studies conducted to develop a brand personality scale in Indian context, and to make an empirical comparison between Indian brand personality scale and Aaker's brand personality scale. Results reveal that brand personality in India can be described in six dimensions: sophistication, excitement, popularity, competence, trendiness and integrity. The findings empirically support the reliability and validity of the scale developed. The results also reveal that Indian brand personality scale is a suitable alternative to Aaker's brand personality scale in Indian context.

Predicting Internet banking adoption in India: a perceived risk perspective

Sanjit Kumar Roy[a]*, M.S. Balaji[b], Ankit Kesharwani[c] and Harjit Sekhon[d]

[a]*Department of Marketing, The University of Western Australia, Perth, Australia;* [b]*Nottingham University Business School China, University of Nottingham Ningbo China, Ningbo, China;* [c]*IBS Hyderabad, Hyderabad, India;* [d]*Faculty of Business and Law, Coventry University, Coventry, UK*

(*Received 10 March 2015; accepted 27 January 2016*)

The emergence of Internet banking has transformed the banking systems across the globe. As a channel to market, Internet banking allows geographical constraints to be overcome by offering various products and services at lower customer costs. An understanding of the factors influencing customer adoption of Internet banking is both relevant and timely. This study integrates technology acceptance model and perceived risk theory in understanding Internet banking acceptance among Indian bank account holders. Specifically, this study categorizes perceived risk as external risk and internal risk, and examines its influence on customer beliefs and adoption of Internet banking. Using two-step predictive analytics of structural equation modeling and artificial neural network analysis, the 270 responses reveal that both external risk and internal risk inhibit customer acceptance of Internet banking. More importantly, neural network analysis reveals that perceived ease of use and external risk are two important factors determining how well Internet banking is accepted by customers. The implications of the study findings and future research directions are presented.

Keywords: Internet banking; perceived risk; technology acceptance model; emerging economy; attitude

Introduction

The advancement of information technology has resulted in significant technological changes in the financial sector, more specifically the banking industry. Internet banking has changed the landscape of the banking industry (Yu, Balaji, & Khong, 2015). It has transformed the way banks operate and offer products and services to customers by reducing the geographical constraints and costs of financial transactions (Durkin, O'Donnell, Mullholland, & Crowe, 2007). Internet banking has made banks more efficient, highly competitive, user friendly, and able to provide improved customer services (Martins, Oliveira, & Popovič, 2014). As a channel to market, it is considered as one of the most profitable e-commerce applications over the last 10–15 years as well as becoming ubiquitous within the banking sector (Lee, 2009; Yadav, Chauhan, & Pathak, 2015).

Despite the benefits offered by Internet banking, its adoption rate in India remains modest with only 7% of bank customers in the country using it (Business Standard, 2011). The recent McKinsey Asia Personal Financial Services Survey (2014) reveals that while digital banking penetration in India rapidly increased to 18% in 2014, it still

India has emerged to be an attractive destination for foreign investments in the manufacturing sector which was estimated to be one of the high growth potential sectors. By 2020[a], India is projected to be the fifth largest manufacturing country globally (IBEF, 2017). Indian manufacturing sector has the potential to reach US$ 1 trillion by 2025 and be able to contribute approximately 25 percent to the GDP, generating approximately 90 million jobs (Samal & Raju, 2016).Among the major manufacturing sub-sectors, cement and gypsum products attracted Foreign Direct Investment (FDI) worth US$ 3.117 billion between 2000 and 2016 (IBEF, 2017).Indian cement industry has witnessed many investments and developments in recent time sowing to consistently growing demand due to increased construction and infrastructural activities, and ensured profit margins. A good number of foreign players as well as investors are expected to enter the Indian cement industry since 100 percent FDI is allowed into the industry. However, investment decisions are generally based on market potential, which is a direct result of the business environment. Thus, the business environment plays strategic role in the development of the sector through facilitation foreign investments.

A CASE STUDY ON HINDALCO'S 'EVER LAST' ALUMINIUM ROOFING SHEETS COMMUNICATION STRATEGY

Mohandas J Menon[1], Mahesh Kumar Soma[2] and Aviral Kumar Tiwari[3]

[1,2,3] **Faculty of Management, IBS Hyderabad, India**

Key Words:
Communication Strategy, branding, brand recall, Influencers, Marketing Plan

Subject Area:
Marketing- Integrated Marketing Communication Strategy (IMC)

Abstract:
Globalization has brought in tremendous changes in the manner in which companies/ marketers communicate with their customers. The communication landscape has undergone a metamorphosis in recent years. Marketing and promotion have become totally customer-driven and hence, it has become a challenge to the marketers to plan communication strategy in such a way to establish a perfect connect with the customer. It is an established fact in marketing, that people always prefer a 'connection' to 'information'. A company might present a wealth of information to the customer about the company and its products. However, the customer makes a buying decision only by getting the 'connection' ie. Feeling connected with the product/brand. The point of focus is "how an Integrated Marketing Communication (IMC) strategy should be designed to ensure strong brand equity for a product". The case focuses on the challenges faced by a Marketer of Aluminium roofing sheets to ensure strong brand equity by designing an appropriate Integrated Marketing Communication (IMC) strategy.

INTRODUCTION

Mr. KedarRele, Head, Market Development Cell, Hindalco Industries Ltd-a subsidiary of the Aditya Birla Group & an industry leader in Aluminium and copper -was in a contemplative mood looking at the sunset from his cabin situated at the corporate office, Mumbai, after presenting the marketing plan to his team. He was preoccupied with the thought of making "Everlast Aluminium Roofing Sheets" a national brand with a pan-India presence and the challenges to be faced.

The selective launch of 'Everlast Roofing sheets' in the three states (Kerala, West Bengal & Himachal Pradesh) received a mixed response. He was looking at developing communication strategies for the end users & key influencers. He was aware of the fact that a brand has to achieve 'top of the mind recall' to emerge as a leading brand. The brand awareness among end users and key influencers should be high. He opined that understanding the perception of the target audience is important to develop Integrated Marketing Communication (IMC) strategy for successful sales of Everlast roofing sheets across the states in India.

Abstract: Online reviews have become an essential tool for evaluating products and services with the exponential growth of online shopping. Marketers are also using online product reviews as important promotional tools that motivate the consumers to buy. Websites that provide better information in the form of online reviews will eventually attract more consumers. In this context, it is important to improve the perceived diagnosticity of online reviews. The present empirical study aims to investigate whether argument quality and source credibility of information in online reviews affect the review website diagnosticity. The study also investigates whether this perceived diagnosticity in turn affects consumer's attitude towards the website and revisit intention.

Keywords: electronic word of mouth communication; product reviews; online reviews; argument quality; source credibility; diagnosticity.

AN SECRET OF TWOFOLD IMAGE USING FLOW CODE PROCEDURE

D.Saravanan*
IFHE University, IBS Hyderabad, Faculty of Operations & IT.
Email: sa_roin@yahoo.com

Received on: 12-08-2017 *Accepted on: 22-09-2017*

Abstract

Background and objective: Secret of twofold images is essential for message communication. During communication more chances for hacking the message communication take place between the sender and receiver, because this communication normally take place through network.

Methods: This paper brings the solution for the above problem using twofold image code procedure using stream secret message technique. The Twofold image is represented in a transcript technique this input then encrypted using stream secret message.

Results: This reduce the message hacking both networks. Increasing message communication it is important to maintain the privacy in networks. Thus, it is essential that the images must be encrypted before being transmitted in a network. Image encryption done with help of character convention chart. Inputs are encoded with help of character conversation chart.

Conclusion: This technique reduce the traditional problem such as remembrance of key values.Experimental results prove that proposed technique produces good result than existing system.

Keywords: Image processing, twofold image, Secret, Decryption, Simple text, Converted Image.

Introduction

Introduction Twofold image are the simplest type of image which is used widely in a variety of commercial applications. Twofold images will be of monochrome images and that has been quantize with two values, usually 0 and 1, represents black and white. It brings twofold images are easy to acquire also occupy less storage. In both communication technique communication between the sender and receiver are not safe more chances for message hacking. Reduced image size

Analyzing the topography of financial regulation

Vighneswara Swamy
Department of Finance, IBS Hyderabad, Hyderabad, India

Received 21 June 2017
Revised 21 June 2017
Accepted 17 July 2017

Abstract

Purpose – This paper aims to assess the topography of financial regulation, supervisory styles and performance of banking systems across the world.

Design/methodology/approach – The author gains insights by comparing regulatory and supervisory practices and their impact on banking system performance before and after the global crisis. The study illustrates the differences in regulation/supervision among crisis, non-crisis and BRICS countries. Even as capital ratios increased, bank governance and supervision regimes were strengthened, the private sector incentives to monitor banks deteriorated.

Findings – The results show that the crisis-countries had weaker regulatory and supervisory frameworks than those in emerging countries during the crisis period. BRICS countries as a distinct block have demonstrated uniqueness in their regulatory/supervisory styles that are similar neither to those in the crisis-countries nor to those in the non-crisis countries.

Originality/value – The originality of this study lies in its unique approach to assessing the bank regulation and supervision styles around the world and their impact on banking system profitability, as it uses a robust database. Further, this study provides not only a general assessment but also a comparative analysis of the BRICS and emerging economies. Regulatory agencies around the world would greatly benefit from systematic evidence on the relationship between bank performance and regulatory/supervisory systems.

Keywords Banks, Government policy and regulation, Central banks and their policies, Financial markets and institutions, Capital

Paper type Research paper

1. Introduction

Financial regulation and supervision have been the subject of much recent debate and attention due to the devastating effects of the global financial crisis. As the role of the banking sector is undoubtedly indispensable in the process of financial intermediation and thereby in achieving faster economic growth and sustainable development, a prudent regulatory environment can not only facilitate performance of the banking systems but also ensure financial stability. At the heart of bank regulation is a deep-seated concern that the social and economic costs of such systemic crises are enormous. Financial crises are of unique concern because they often have real effects on economic growth and employment. As such, the goal of prudential regulation should be to ensure the financial stability of the overall financial system. The recent global financial crisis has revealed the inadequacies in supervisory enforcement and market discipline, underscoring the importance of combining strong, timely and anticipatory supervisory enforcement with better use of market discipline. The crisis has triggered a healthy debate on approaches to regulation and supervision among regulators, policymakers and academics, leading to multiple proposals for further reforms. As financial regulators around the world endeavor to decide how best to reform bank regulation and supervision, an essential input ought to be a thorough

Antecedents and Consequences of Customer Brand Engagement: An Empirical Study in the Mobile Headset Category

Souvik Roy, Department of Marketing, IBS Hyderabad, IFHE, Hyderabad, India
Santanu Mandal, Department of IT & Operations, IBS Hyderabad, IFHE, Hyderabad, India

ABSTRACT

Mobile phone markets are one of the most turbulent market environments today due to increased competition and change. Thus, it is of growing concern to look at consumer buying decision process and cast light on the factors that finally determine consumer choices between different mobile phone brands. With its calculated roots in fields including psychology and authoritative conduct, the engagement idea is rising in the promoting writing, with preparatory exploration showing that connected with buyers may display more prominent dedication to central brands. Notwithstanding these progressions, the engagement idea stays underexplored to date. On this basis, this article deals with consumers' choice criteria in mobile phone markets by studying factors that leads to customer brand engagement and the consequences to it in the context of mobile headset brand. Findings indicate that brand self-congruity, involvement, and interactivity leads to customer brand engagement and which itself influences satisfaction, trust and commitment for mobile headset brands.

INTRODUCTION

India is the world's twelfth biggest buyer market. It is anticipated that by 2025, it will be in front of Germany and will turn into the fifth biggest economy of the world (Singh, 2009). There is an unstable development in every one of the territories of buyer products and services. Correspondence that record for 2 percent of purchaser's spending today will be one of the quickest extending classifications with development of around 13 percent (McKinsey, 2007). Mobile telecom industry has demonstrated a huge development in the course of the most recent couple of years and at present there speak the truth twenty crore (1 crore = 10 million) subscribers of the mobile telecom benefits in the nation. The business for the mobile handset is additionally developing with the developing interest for mobile telecom services. This interest will keep on growing in future moreover. India at present is the second biggest business for mobile handsets (Indian Brand Equity Foundation, 2005). The expanding rivalry between the telecom service suppliers has expanded interest for both mobile telecom services and the handsets.

As indicated by Indian Brand Equity Foundation (2005), the mobile handset market, which was worth about $ 2 Billion two years back, had demonstrated a development of 60% for every annum. The GSM (Global System for Mobile Communications) handsets had 84% offer and CDMA (Code Division Multiple Access) handsets has 16% piece of the market share. There are different players

Abstract

This case is an appeal matter with the Stock Exchange on the award passed by the sole arbitrator with regard to a dispute between a client and trading member of the Stock Exchange. Mumbai Capitals Ltd. contended that the award passed by the arbitrator did not take into account of the evidences, supported documents and rules of stock exchange appropriately while determining the case matter and passing the award. Appellant challenged the Award on grounds that the award was beyond the scope of submissions to the arbitration, pre-mediated conclusion, non-application of mind, ignorance of established judicial principles, and misreading of the provisions of stock exchange. The Appellate Tribunal had to determine whether there had been any lapses on the part of the arbitrator in applying the trading rules and procedures of the exchange while analyzing the matter, determining the case and passing the award. Based on that, the Appellant Arbitral Tribunal had to decide whether to set aside the award passed by sole arbitrator, modify the award or uphold it.

Brand religiosity

An epistemological analysis of the formation of social anti-structure through the development of distinct brand sub-culture

Juhi Gahlot Sarkar
IBS Hyderabad, Hyderabad, India, and
Abhigyan Sarkar
Institute of Management Technology-Ghaziabad, Ghaziabad, India

Abstract

Purpose – The purpose of this paper is to define the brand religiosity phenomenon and develop a theoretical process model showing the interrelationships between brand religiosity and other related concepts leading to the formation of a distinct brand sub-culture or community.

Design/methodology/approach – A large volume of prior literature on consumer–brand relationships has been reviewed to develop the conceptual framework.

Findings – The framework developed shows several actionable antecedents and desirable marketing outcomes of brand religiosity. The framework also depicts that brand religiosity leads to the creation of social anti-structure by forming a distinct brand community that frees individuals from the regular social structure and motivates them to adopt a distinct brand sub-culture formed. Theoretical contributions and business policy-related implications of brand religiosity are discussed.

Originality/value – Value of the study lies in conceptualizing brand religiosity and developing an integrative process model centering the concept.

Paper type Conceptual paper

Introduction

Bill George (an imaginary character) completed his MBA degree from Harvard Business School in 2002. In any social gathering, he always first introduces himself by saying that he is a Harvard alumnus, and then he tells his other affiliations such as serving as the CEO of a highly reputed multi-national company. In his life, he loves three things the most – his wife, daughter and Harvard. Despite being a Catholic Christian, he does not attend the church since long and most probably would not be able to remember when he attended the church last time. However, he religiously attends Harvard conferences in his area of interest and never fails to attend Harvard alumni meetings. So what makes Mr X show a religious devotion to Harvard, which is superior to his devotion toward Christianity? This review-based conceptual article intends to theoretically understand the structure of such deeper consumer relationships with few special cult (Belk and Tumbat, 2005) brands that can be equivalent to interpersonal relationships with loved ones and can even sometimes substitute religion in one's life. This article aims to understand such special consumer-brand relationships (CBRs) in connection and contrast to the extant research in this domain.

Shachar *et al.* (2011) state that both religions and brands can help an individual to express his/her self-worth to the environment, and this way brand can substitute religion. In other words, an individual might perceive that brands and religions are having equivalent characteristics, and the person can chose to follow either of them to express his/her identity

Abstract

Day-ahead spot electricity market of Indian energy exchange operates all 24 hours, 365 days a year. Many studies in literature have explored modeling spot electricity prices particularly in the context of NordPool, CalPx and PJM markets but very few studies in literature have explored modeling spot electricity prices in Indian context. Is Indian Spot Electricity Price Series Stationary? Answering this fundamental question paves way for application of techniques inspired from time series econometric modeling and forecasting literature which makes an inherent assumption that the underlying price-series is stationary. In this study we empirically investigate whether Spot Electricity Price Series is Stationary by using 17,520 hourly spot prices for each of the five regions of Indian electricity market and applying Augmented Dickey-Fuller Test, Phillips Peron Test, Kwiatkowski–Phillips–Schmidt–Shin Test and Narayan and Popp Test allowing for structural breaks. The results of the study will help power market participants understand the nitty-gritty's and nuances associated with Indian spot electricity prices for effective application of time series econometric models.

1. Introduction

The Indian Electricity Act (IEA) 2003 has been influential in setting the 3rd largest electricity producer in the world [1] for strategic evolvement and improvement of electricity sector in India, streamlining of power tariffs in India, endorsing and executing policies ensuring in attaining energy efficiency together with being environmental friendly. However, India still faces a critical issue of energy shortfall. Post IEA 2003, power trading is a detached and distinctive

Abstract- Renewable Energy Certificate (REC) symbolizes traits of electric power which has been produced by means of renewable energy as a primary source. The traits of REC are unbundled from electric power which is produced and both are sold / purchased separately in India and are traded in a market-place such as Power Exchange of India Ltd (PXIL) or Indian Energy exchange (IEX). REC trading in India via power exchanges as a platform started in 2011. In this study we review Solar Renewable Energy Certificate trading in India using Indian Energy Exchange data which has impelled in the last few years owing to a host of policy initiatives taken by the Central Government of India and State Governments along with the guidelines/norms prescribed by the Electricity Regulatory Commissions particularly from Renewable Purchase Obligation perspective. The study would help power market participants and other stakeholders to develop a perspective based on the nuances associated with Solar REC trading in India.

Keywords Solar, Renewable Energy Certificate (REC), Indian Energy Exchange

1. Introduction

India is the 3rd largest electricity producer in the world after China and USA and the 7th largest producer of renewable energy in the world. The total installed electricity generation capacity in India is 310005.28 MW as on 31st December 2016 out of which 89056.38 MW of installed electricity generation capacity is from Renewable energy sources accounting for approximately 28.72% total installed electricity generation capacity in India [1]. Table 1 elucidates details about total electricity generation capacity in India region-wise i.e. Southern region, north-eastern region, western region, eastern region, northern region and Islands by different players such as Centre, State and Private sectors on the basis of the mode by which electricity is generated namely thermal energy comprising of coal, diesel, gas or by using hydro power, nuclear power and electricity generation by using renewable energy sources. Today, private producers of electricity in India have surpassed installed generation capacity compared to central or the state which dominated till 2003. Enactment and effective implementation of the Indian Electricity Act 2003 post deregulation and electricity market reforms is playing a significant role in propelling India's electricity generation capacity particularly from renewable energy sources [2-5]

Table 1. All India Total installed Generation capacity (in MW) as on 31st December 2016

DETERMINANTS OF CROPPING PATTERN IN TELANGANA ECONOMY

Dr. KOTI REDDY TAMMA*, Dr. I.R.S. SARMA**
and Dr. M. ARUNA***

ABSTRACT

Telangana agriculture is increasingly getting influenced more and more by economic factors. The present study explores the change of Cropping Pattern in the Telangana State based on secondary data. Data on important variables like area, production, yield, minimum support price, gross and net irrigated area and size of holdings were compiled from various published sources. The analysis of data reveals that the cropping pattern in Telangana has undergone significant changes over time. There is a marked shift from the cultivation of food grains to commercial crops. Since 1980s there has been a shift from traditional cereal-based towards commercial commodities such as oilseeds, cotton and sugarcane.However, during the 1990s the crop sector witnessed high fluctuations due to consecutive droughts and decelerating crop yields. The authors opine that an accelerated pace of diversification to create positive import of higher income, higher employment and conservation and efficient use of natural resources emphasizes the need for efficient policies, especially in technological development, selective economic reforms and institutional change.

Key words: Cropping Pattern, Minimum Support Price, and Gross and net Irrigated Area, Productivity, Government policy, Technological development

1. INTRODUCTION

Cropping pattern represents the behavior of the farmers in their agricultural operations."In a tradition ridden country with a very low level of knowledge, the peasants are unwilling to make experiment" in an agricultural community where the members are illiterate and tradition ridden there is hardly any possibility of crop shifts **(S.N.Sinha 1964).** But with the passage of time, things have changed a lot. Now the people started to believe that the cropping pattern can be changed and must be changed for the interest of the people so as to bring diversity in Indian agriculture. During the process of five-year plans the cropping pattern has undergone significant changes in India. Increasing attention is now being focused more on horticultural crops in order to achieve a between crop balance and attracting the

RISK

Managing Assets and Liabilities in the Insurance Sector 25

The aim of this article is to provide an overview of the Indian insurance industry, with specific focus on how they manage their assets and liabilities cash flow mismatch. The article also discusses the basics of life insurance, the risks they face, and the importance of Asset Liability Management in life insurance.

Who Benefits from Public Issues by Indian Insurers? 35

After the release of public issue norms by IRDAI in August 2016, seven insurance companies came with IPOs to procure around 40,000 cr. Six out of these seven tapped the market within a span of three months, from September to November 2017. Insurers who till now enjoyed the comfort of operating as private companies with concentrated ownership and hardly any disclosures, have to face certain issues in going public in terms of the need for improved corporate governance practices. However, public issues by the insurers are expected to benefit the issuers in sourcing capital, customers in availing quality insurance products, promoters in unlocking the value of their investment, public shareholders in having more transparency, government in reducing the burden to exchequer arising from capital infusion, and the economy as a whole with increased penetration of insurance services.

WEALTH MANAGEMENT

Goal-Based Investing Enhances Financial Awareness 44

Goal-based investing is not a new concept; however, over the years the focus has shifted from goals to investment performance. The process of goal-based investing starts with clearly defining the financial goals. Half the job is done for goal-based investing with identification of goals and the cost for each of the goals. In the absence of financial goals, performance monitoring tends to be more with reference to the market performance. However, the puzzle here is to determine what represents market performance for a portfolio with a mix of asset classes. The ROBO advisory platforms have simplified investing and have reduced the interactions with wealth managers to the minimum by automating the investing process.

CORPORATE FINANCE

Financing Working Capital with Public Deposits: Enhancing Profitability in FMCG Sector 50

The companies in the FMCG sector have a very high demand for working capital, and to finance their requirements, various options are available to the companies like commercial paper, working capital term loan, factoring, letter of credit, bill discounting, trade credit, inter-corporate deposits and public deposits (PDs). Of late, PDs are one of the important sources used by companies for working capital purposes. This article highlights the benefits of financing working capital using PDs and enumerates the benefits of using PDs, especially in FMCG sector.

Financing Working Capital with Public Deposits: Enhancing Profitability in FMCG Sector

Mahesh Kumar Soma

The companies in the FMCG sector have a very high demand for working capital, and to finance their requirements, various options are available to the companies like commercial paper, working capital term loan, factoring, letter of credit, bill discounting, trade credit, inter-corporate deposits and public deposits (PDs). Of late, PDs are one of the important sources used by companies for working capital purposes. This article highlights the benefits of financing working capital using PDs and enumerates the benefits of using PDs, especially in FMCG sector.

Introduction

Working capital forms the lifeline of any running enterprise and a company has to pay much attention to this important aspect because efficient management of working capital enhances the profitability of the enterprise. Efficient working capital provides a good cash cushion and enables the company to avoid shortages of cash in meeting the day-to-day financial needs. When a company approaches the bank to finance its working capital, the rate of interest on bank borrowing is around 15% per annum, whereas if a company subscribes or issues public deposits at an interest rate of 10 to 12%, it has a net savings of 3 to 5% when compared to the cost of borrowing from the bank using one of the instruments of finance available-working capital term loan, factoring, bank overdraft, letter of credit and bill discounting. Further, when a company is financed by a commercial bank, there are a number of covenants, rules and other terms and conditions that govern the lending process. They may restrict the flexibility of choices while performing the operations of the company. Sometimes, the terms of finance governing the lending process are rigorous and difficult for the company to comply with and operate in a smooth manner.

Public Deposits

Public Deposits (PDs) constitute one of the important sources of finance for the companies, especially for meeting their short-term and medium financial needs. PD is a loan or a deposit invited from the public and does not include the

Mahesh Kumar Sona is an Associate Professor at IBS Hyderabad (Under IFHE- A Deemed to-be University u/s 3 of The UGC Act 1956), with 19 years experience in teaching Business Communication and Soft Skills to MBA and BBA students and Corporate and Bank Executives. He has given guest lectures at reputed national institutions like Railways, National Academy of Construction, NFC, NALSAR, ESCI, etc. He has published several papers in various national and international journals. He can be reached at maheshk.soma@gmail.com

money received in the form of share capital or debentures. PDs are also called 'corporate fixed deposits'.

Companies invite deposits from the public for different time periods of six months to three years. Normally, the interest paid by the companies to the public is higher than the interest offered by the commercial banks on its savings or deposits. For the company, the interest paid on PDs is less when compared to borrowings from a commercial bank. The rate of interest offered by the companies to the people on PDs ranges from 11% to 12.5% depending upon the period of deposit and reputation of the company. The PDs are regulated by RBI under Section 58A of the Companies Act, 1956.

Operating Cycle

The operating cycle of a business is the average time taken from the initial investment of cash to purchase the raw materials to process and pack the goods during the manufacture, send the goods to the customer through a distributor and finally receive the cash payments from the customers for the goods supplied. The length of the operating cycle of a manufacturing company determines the amount of working capital required to run the business. If the operating cycle is very short, the extent of funds required in the form of working capital is limited. Conversely, if the operating cycle is a longer, a firm needs more amount of working capital.

There are three main factors that determine the duration of operating cycle of a firm: (i) the average credit period extended to a firm by its suppliers (payable turnover days); (ii) the time taken to convert the raw material into finished goods (inventory turnover days); and the (iii) payment terms or average credit period extended to the purchases by a firm and the credit policy (accounts receivable turnover days). The operating cycle is also called 'cash to cash cycle' or the 'cash conversion cycle' and the profitability of a company along with its smooth operations are determined by effective

EFFECTIVE VIDEO RETERIVAL USING CLUSTERING TECHNIQUE

Dennis Joseph and D.Saravanan

Faculty of operations & IT, IFHE University, IBS Hyderabad, Telangana.

Article received 20.7.2017, Revised 3.11.2017, Accepted 11.11.2017

ABSTRACT

Knowledge extraction is one of the fastest growing fields today. Proper extraction of the needed information presents a challenging job for many researchers. This becomes even more complicated in the case of multimedia content. Clustering is a useful technique for finding useful patterns from the given data set. Video clustering is done on video files for video data mining. Existing clustering techniques works well for only a few particular types of inputs. It has been experimentally verified that the proposed clustering technique offers the best clustering solution for a majority of input files.

Keywords—Video Frames, Video indexing, Histogram Values, Frame Comparison, Data mining, Clustering, Image mining.

INTRODUCTION

Information retrieval is an emerging technology which is currently researched by many. Information retrieval may be from several types of files like document files, image files and even audio and video files (Saravanan *et al.,* 2013) is the size of data increases the retrieval process becomes more complex and this poses a challenge for any researcher. Technology allows the users to create and store data very easily. Due to this, the amount of information which is produced every year goes on increasing (Saravanan *et al.,* 2012). Multimedia data is a combination of all media like audio and video, and retrieving the required information from multimedia files is a really challenging task for users. Information retrieval is either text base or image based. Here, there is no guarantee that the user may get the relevant data in a single search either for text or for image. Users must spend at least two or three iterations to arrive at the needed content. For simplifying this, several techniques and methods have been proposed for information retrieval. Most of them are concerned with arranging the datain a proper form so that it is easy to retrieve the required information for the users in a single search (Imaran *el al.,* 2012). For this the data is clustered and then stored. Clustering, in data mining is a useful technique for discovering interesting data distributions and patterns in the underlying data. It is useful for determining groups and recognizing interesting distributions in the fundamental data. Many clustering algorithms have been developed to retrieve the relevant information, but every clustering technique works well only with some particular type of data set. Some clustering algorithms works well for texts while other techniques work well with images (Monserrat 2013). But none of the algorithms works well with all types of files. In the field of video data mining, the retrieval process is more complicated as it combines image understanding and knowledge extraction. Data either in the form of an image or text is required. For this process both the stored data sets and the retrieved set require special attention. Creation of image type data sets is easy but retrieving the particular set is really more complex.

A. Disadvantages of the existing system:

Existing techniques work well only for text type data.

The existing techniques are based on the users input, and the accuracy of output is less.

Time required for execution is more.

In clustering the difference between two clusters are not properly defined.

The quality of cluster formation is very poor.

Existing clustering algorithms are not suitable for different types of video files.

Number of clusters formed depends on the input video type.

Proposed system: The proposed clustering technique called CURE removes the number of duplicated values compared to other hierarchical clustering algorithms. This works well especially for video data files. The processes involved are shown in the Table 1. By removing excess duplication, the extraction of the needed information becomes easier and the performance of the algorithm increases (Bhatt 2013). This brings about a good cluster formation for the given input video or image files. Functionality of CURE differs from other clustering processes. CURE initially examines the complete input first, afterwards it identifies certain positions from the input, and finally the selected points are reduced towards the centre position. This process is repeated for the entire input file for various data

Improved Set Partition Hierarchical Tree Algorithm for Video Zipping in Real time Applications

C. Lakshmi Devasena
Department of Operations & IT, IBS Hyderabad, IFHE University, Hyderabad, India
devaradhe2007@gmail.com

***Abstract*—This paper describes an improved video compression for Real time surveillance applications using Improved Set Partition Hierarchical Tree Algorithm. In the proposed system Improved Set Partition Hierarchical Tree algorithm is used to zip the video to track the moving object. This proposed motion detection algorithm comprises of motion detection of successive frames with background frame subtraction for efficient compression. The motion detection of sequential frames is used to detect continuous moving objects between two successive frames and remove it to form the zipped video. After the compression of the video, background subtraction of frame is used to detect moving objects in the current frame of the video. The proposed method is implemented and tested using some sample videos. The proposed system can be used in real time applications like Motion pixel Estimation, Video Surveillance, Weapon Storage Area and Atomic Research Area Surveillance, etc.**

Keywords —Background Deduction; Real time video compression; Video Compression; Video Zipping;

I. LITERATURE REVIEW

There are unforeseen requirements for automated surveillance systems in commercial applications, Law enforcement and military applications. Installing video cameras is inexpensive, but finding accessible human resources to observe the output is costly. Although surveillance cameras are customary in banks, parking lots, and stores video data currently is used only as a forensic tool, thus losing its primary advantage as a dynamic, real-time medium. What is needed is round the clock monitoring of surveillance video to alert security officers to a theft in progress, or to an apprehensive individual loitering in the parking lot, while there is still time to prevent the offense. Apart from security applications, video surveillance can be proposed to measure traffic flow, monitor pedestrian congestion in public spaces, detect accidents on highways, compile consumer demographics in shopping malls, etc. The main aim of this research is to implement and verifies the SPIHT algorithm on video files, to compress the videos and to show how beneficial this will be while handling large video files. The key of this research work lies in the initialization and updating of the background image. The effectiveness of both will distract the accuracy of test results. Therefore, this research work uses an effective method to initialize the background, and update the background in real time. Sometimes problem may occur while applying the encoding, decoding, DWT, Background subtraction methods to the large size videos even though the video, that is the process may take much time for producing the output for the selected large sized video. To avoid this time consumption a method called compression is being carried out in this project. Compression is a method which is used to reduce the total size of the video which has been selected. The two main use of compression technique are namely,Reduced memory and Use of Efficient bandwidth.

Sometimes problem may occur while applying the compression, DWT, Background subtraction methods to the large size videos even though the videos are being compressed, that is the process may take much time for producing the output for the selected large sized video. While splitting the video into frames if the video size is large, more number of frames will be produced. While considering all separate frames for encoding and decoding process it will consume large amount of time. If the bandwidth is very low, great attention must be paid to cut down the bit rate of compressed video bit stream. The Frame Subtraction is generally tough to obtain a complete outline of moving object, liable to appear the empty phenomenon; as a result moving object detection is not accurate. Optical Flow method leads to: large quantity of calculation, sensitivity to noise, poor anti-noise performance, and makes it not suitable for real-time demanding occasions.

II. LITERATURE REVIEW

The objective of the Video Surveillance and Monitoring (VSAM) developed by the Defense Advanced Research Projects Agency (DARPA) was to progress automated video understanding technology in future urban and battlefield surveillance applications. Technological advancement of this project enabled a single human operator to observe activities over a wide area using a distributed network of active video sensors. Thesevideo sensor platforms are mainly independent, notifying the operator only of salient information as it occurs, and engaging the operator minimally to alter platform operations.

A.Existing Works regarding Background Separation

Due to its pervasiveness in various contexts, background subtraction has been elaborated by numerous researchers, and abundant amount of literature has been published [3 - 5]. The usual method to find moving object detection is through background subtractions which require maintaining an up-to-date model of the background to detect moving objects by finding the deviation from such model [1]. Compared to other approaches, such as optical flow, object detection approach is computationally feasible for real-time applications. The key problem is its sensitivity to dynamic scene changes, and the succeeding need for the background model adaptation via

INTERVIEW WITH MS. DOLON GUPTA, HEAD OF CULTURE AND LANGUAGE INITIATIVES AT TATA CONSULTANCY SERVICES, MUMBAI, INDIA

Interviewee: MS. DOLON GUPTA
Head, Culture & Language Initiatives at Tata Consultancy Services, Mumbai

Interviewer: MR. MUSTAKHUSHEN S M
Assistant Professor, ICFAI Business School, Hyderabad &
Ph.D. Research Scholar at K L University, Guntur Dist.

Ms. Dolon Gupta's Profile:

Ms. Dolon Gupta is the head of Culture and Language Initiatives at Tata Consultancy Services, Mumbai, India. Conceptualizing and driving strategic initiatives across the globe and aligning training with business outcomes are the main areas of work. Past experience in academics and existing experience in a corporate has proved to be an enriching combination. Grounding in content creation, curriculum development and content design in natural languages and culture coupled with an insight into the dynamic needs and complexities of a growing business as well as the impact of changes effected through intercultural communication make a fascinating journey.

Prior to the existing job, she has worked at the University of Calcutta and University of Mumbai where Didactics, Linguistics, FLE, methodologies of foreign language teaching were the primary areas of interest and research. Comparative study of literature is also an area of interest. Going forward, she would like to continue to work in the niche space of creating value in business through natural languages and cross-cultural transformations.

Mr. Mustakhushen S. M.'s Profile:

Mr. Mustakhushen S. M. is an Assistant Professor at ICFAI Business School, popularly known as IBS Hyderabad. He handles Business Communication, Business Writing, Career Management, and Soft Skills courses for management graduates and undergraduates. He has over 13 years' experience in academics and industry. Prior to IBS Hyderabad, he worked with Educomp Solutions Limited, Holy Grace Academy of Management Studies, ICFAI National College, Al Habeeb College of Engineering and Technology, CDAC Pace Bureau, etc. His area of interest is Business English, English for Specific Purposes, Nonverbal Communication, Cross-cultural communication, Content Writing, Soft Skills, Employability Skills, etc. He has taken up and successfully completed more than 15 courses in relevant areas on MOOC platform. Currently, he is pursuing Ph.D. in English from KL University.

1. Tell us a little bit about your career so far.

I started my career as a teacher of French at Alliance Française. As a freelancer, I translated literary works and also worked as an interpreter. I have had the opportunity to teach at all levels, beginner's courses to Masters level and found each level equally enjoyable. I have taught primarily adult learners at Alliances but also young students at Universities. Designing curriculum for French language and also setting up French speaking KPOs are some other areas I have worked in. Having dabbled in multiple kinds of jobs helps me today in my present role.

2. What difference do you find in academics and corporate?

The single most difference between academics and corporate is the end result. In any academic set-up certificates, diplomas or degrees are end results. The mark of success is the

Challenges to Agriculture Sector in Indian Economy

Dr Koti Reddy Tamma, Professor in Economics, IBS Hyderabad (A Constituent of ICFAI Foundation for Higher Education)

Dr I.R.S.Sarma, Associate Professor in Economics, IBS Hyderabad (A Constituent of ICFAI Foundation for Higher Education)

Dr M.Aruna, Associate Professor in Economics, IBS Hyderabad (A Constituent of ICFAI Foundation for Higher Education)

Abstract: *This paper examines the performance and challenges to the agricultural sector of Indian Economy by using the annual data for the period 1950-51 to 2014-15. In this paper an attempt has been made to study the change in cropping pattern and the reasons for deceleration in the growth of agricultural sector in Indian Economy. The authors opine that the cropping pattern in India has undergone significant changes with a significant shift from the cultivation of food grains to commercial crops. The key challenges documented are related with small size of landholdings, low productivity, fall in the value of agricultural exports in the total value of exports, low public investment,, low food grain production, gap between irrigation potential and utilization and growing indebtedness of the farmer households. The study suggests that Government policies must be supportive for small and marginal farmers and agricultural laborers.*

Key words: *households, food grains, commercial crops*

I. Introduction:

Indian agriculture has witnessed a profound change since Independence. Agriculture is considered as the only source of primary occupation as a huge size of rural population of the country is solely depending on agriculture. From the very beginning, agriculture is contributing a major portion to our national income. In 1950-51 agriculture and allied activities contributed about 57 per cent of the total national income. Although the share of agriculture has been declining gradually with the growth of other sectors but the share still remained very high as compared to that of the developed countries of the world. The share of agriculture has declined to 54 per cent in 1960-61, 48 per cent in 1970-71 and then to 17 per cent in 2015-16.According to 2011 census the workforce dependent on agriculture is 48.9 per cent.

Economic reforms were introduced in India in 1991 in many sectors except in agricultural sector. As a result, reforms failed to yield the desired progress in the overall development of the economy. Attempts were made to introduce reforms in agricultural sector by some state governments in 1996.Further, many state governments in India are not keen in implementing reforms in agriculture sector and hence the policy changes in agriculture are still slower. The rate of structural changes in agriculture sector is lower in 1990's.Further the export growth of agricultural product was slow and

The Impact of Core Self-Evaluation on Attrition in IT Industry

M Showry and Kuchi Sayulu***

Individual's perceptions, decisions and behaviors are influenced by personal characteristics. Research and theory have mostly examined the motivations and attitudes as the predictor variables for attrition. In the light of the volatile business environment, emerging personality variables like core self-evaluations require considerable examination in attrition research. This paper addresses the question whether a personality trait like core self-evaluation has a significant relationship with attrition and widens the understanding of the causes behind attrition. The paper presents the problem of attrition in the IT industry, explains the components of core self-evaluation and discusses their relationship with attrition. The paper also provides unique insights on how emerging personal traits like core self-evaluation can affect job attitudes and attrition.

Introduction

The problem of attrition, a burning issue in IT industry, has received wide attention from the researchers and practitioners. IT employees exit, despite the retention measures as the lower and middle level software engineers are ready to seize the advantage of increasing opportunities. The unprecedented competition for talent from global players who offer lucrative pay and inspiring work culture has set in a spiraling effect of attrition. Attrition in organizations is a concern of late considering its adverse consequences on both the employee and the organization (DeMicco and Giridharan, 1987).

Attrition decisions are strongly influenced by several factors at individual, firm and environmental levels (Joseph *et al.*, 2007). Organizations attempt to identify the factors responsible for attrition either at the individual level or at the organizational level (Jeswani and Dave, 2011). Since long, research by the practitioners and academics has classically been focused on analyzing the impact of organizational, work or job attitudes and environmental-related determinants on attrition. However, whether personality

Inequalities in Industrial Development in The Residuary State of Andhra Pradesh: 1960-61 To 2015-16

I.R.S. Sarma, Tamma Koti Reddy and S.V. Seshaiah

INTRODUCTION

During the British rule industrial development in India was very much restricted to some particular areas. But after the introduction of planning India industrial sector has achieved a significant achievement in diversifying its productive capacities. In respect of almost all consumer goods both durables and non-durables the stage of self-sufficiency has already been attained. A sustainable increase in the production of capital goods has also been achieved. The country has also achieved an impressive industrial productive capacity in respects of some key industries like mining and metallurgical, steel, chemical, software, fertilizer, paper and construction industry etc. The index of industrial production has increased from 18.3 in 1950-51 to 65.3 in 1970-71 then to 212.6 in 1990-91 and finally to 316.2 in 2009-10 (Economic Survey 2014-15).

Industrial sector in India in general is suffering from the problem of under-utilization of plant capacity. The problem of under-utilization of plant capacity is very much acute in the power sector where the capacity utilization is at best on and around 20 to 25 per cent of total installed capacity. As a result of concentration of industries in some particular developed regions, the country is now facing the problem of over-concentration of industries. This over concentration has led to growth of slums in and around urban centers.

Industrial Development in Residuary State of Andhra Pradesh

In the wake of employment transition from the agricultural sector to industry, the industrial sector has got due emphasis for both in growth and employment generation in Andhra Pradesh economy. To create a good ecosystem for investments, the government has come up with an innovative industrial policy coupled with attractive fiscal incentives. Sector specific policies have been put in place for developing different segments like food processing, textiles, electronics hardware, automobiles, aerospace, defence, and tourism etc. These sectors are expected to create opportunities for entrepreneurs and generating employment. To accelerate growth in industrial sector, the Andhra Pradesh Government initiated number of industrial friendly policies. The government is striving towards creation of quality infrastructure coupled

Dr Ambedkar Perspective on Agriculture and its Relevance to Current Agriculture in India

Koti Reddy Tamma

Introduction

The performance of agricultural sector influences the growth of the Indian economy. The growth of agriculture and allied sectors is still a critical factor in the overall performance of the Indian economy. But India suffers from major drawback of an inadequate development of agriculture. Even though the contribution of agriculture to the Gross Domestic Product has declined more than 60 per cent of the population continues to depend on Agriculture. In the 1990's the growth of agricultural production had decreased to 2.2 per cent per annum compared to 3.1 per cent in the 1980s. The average annual growth of agricultural sector was decelerated during the post-reform period due to lack of public investments and unfavourable weather conditions. The average annual rate of growth in the agricultural sector over the eleventh plan period at 3.7 per cent (2007-12) was less than the target of 4.0 per cent.

In 1950-51 agriculture and allied activities contributed about 57 per cent of the total national income. Although the share of agriculture has been declining gradually with the growth of other sectors but the share remained very high as compared to that of the developed countries of the world. The share of agriculture has declined to 54 per cent in 1960-61 . 48 per cent in 1970-71 and then to 17 per cent in 2013-14.According to 2011 census the workforce dependent on agriculture is 48.9 per cent .

The crisis in agricultural sector during the post-reform period has led to more farmers suicides. The total number of farmers committed suicide in India has increased from 18834 in 2009 to 41126 in 2014 registering an increase of 118.36 per cent. Minimum support price the government are not all remunerative for the farmers under the inflationary conditions and debt burden situation in the country. The total impact of land reforms has been less than hoped for this there are several reasons. In the first place, there has been recognition of land reform as a positive programme of development, and it has been only too often regarded as extraneous to the scheme of community development and the effort to increase agricultural production (Planning commission 1972).

Raise in Farm Input Prices

Since the inception of Mahatma Gandhi National Rural Employment Guarantee Act (MGNREGA) and demand from construction sector the farmers are facing enormous problem of labour

I. INTRODUCTION

The federal structure adopted in India has made a clear cut distinction between the union and state functions and also its source of revenue. States have been given an exclusive authority to levy and collect some taxes and also to share the revenue realized from certain union taxes. Moreover,, the states are receiving grants in aid from the center which are a kind of transfer of resources from the center to the states. In India the financial dependence of states on the Central Government is a very common practice of most of the states and specially the degree of dependence is much for the financially weaker states. Financial position of the state governments continues to show sharp deterioration since 1998-99. The strain on state finances is largely the outcome of significant growth in committed expenditures. The revenue expenditure mismatches and the consequential rise in the borrowings by the states added further stress to the state finances and fiscal sustainability (Khan and Hasan 2006).

Moreover, the states are not equal in respect of area, population or income. Some are able to raise more revenue per head than others. And so, in every federal constitution there are provisions for grants to be made by the central government to the state government (Prest W, 1955).

States have been seeking an increase in the share of central taxes citing a number of reasons viz., (i) reduction in the size of the divisible pool due to increase in the scope of cesses and surcharges; (ii) declining shares of state plan outlays; and (iii) increasing expenditure needs of states in areas such as infrastructure development, social and human development, environmental protection and pay revisions. The total expenditure by the states as a share of GDP has risen in the 1990s and early 2000s, but this rise is primarily to finance non-developmental expenditure like interest payments (Ram Kumar 2008).

The FC-XIV attempted to address these issues and made major recommendations in the area of Centre-state transfers. The share of tax devolution has increased from 32 per cent to 42 per cent of the divisible pool, sector-specific Finance Commission grants are dispensed with.

The consolidated finances of states has deteriorated in recent years, with the GFD-GDP ratio averaging around 2.5 per cent in the last five years (2011-12 to 2015- 16) as compared

Human Development in Residuary State of Andhra Pradesh: Emerging Issues and Policy Perspectives

T. Koti Reddy

I. INTRODUCTION

Human Resources are playing an important role inattaining economicdevelopment of a country.Economic development of a countryinvolvesproper utilization of its resourcesbyits labour force and other forms of manpower for the proper utilization of production potential of the country. Proper utilization of natural endowments and the level of production of the national wealth depends very much on the extent and efficiency of the human resources. Human Development is thus a process of widening people'schoices as well as raising the level of well-being achieved(World Bank 1992).The concept of human development puts people back at center stage, after decade in which amaze of technical concepts had obscured this fundamental vision(World Bank 2013).

The liberalization process has reduced the role of the public sector investment, it has failed to fill the vacuum created by the withdrawal of public sector investment in infrastructure, more especially in the backward states. Former president of America W.J. Clinton while speaking in Hyderabad on March 24, 2000 on the need to harness new technologies like info-tech for eradicating poverty emphasized "millions of Indians are connected to the internet, but million more are not yet connected to fresh water. India accounts for 30 percent of the world's software engineers but also 25 percent of the world's malnourished. So our challenge is to turn the newest discoveries into best weapons humanity has ever had to fight poverty"(The Hindu 2000). India is still among the countries with some of the lowest indicators of human development. Its levels of malnutrition, illiteracy and poverty are unacceptably high. The rise in income inequalities and regional disparities is also a matter of concern. Employment has grown, but the jobs created are not of high quality. Although there has been an expansion in several social services like health, nutrition and education, the quality of most of these services remains poor in most of the rural areas. And above all, an overwhelming majority of the population is deprived of basic social protection.

Residuary State of Andhra Pradesh

Since 1956-57 the Government while emphasizing on development, is equally committed to focus on social infrastructure for not only meeting basic minimum requirements of the people but for ensuring higher level of social justice in society. The government is confident that

Using Indian Data to Measure the Impact of the Eurozone Debt Crisis Through the Financial Channel

Vighneswara Swamy

Published: December 2017

Economic data for the period 2000 to 2013 shows that the sovereign debt crisis in the Eurozone had a macroeconomic impact on India by transmission through financial channels. Capital flows into India slowed down significantly due to the crisis: net external loans availed by banks stood at US$2.7 billion in the third quarte (Q3) of 2012–13 as against outflows of US$87 billion in Q3 of 2011–12. The number and quantity of Euro issues by Indian firms declined from INR159.6 billion (wit 18 issues) in 2009–10 to only INR10.3 billion (with 5 issues) in 2012–13 and portfolio investments into India fell significantly. One significant lesson from the Euro debt crises is that the Indian financial system is relatively more open than that of the Chinese

Using Indian Data to Measure the Impact of the Eurozone Debt Crisis Through the Financial Channel

Vighneswara Swamy

Key Points

- Economic data for the period 2000 to 2013 shows that the sovereign debt crisis in the Eurozone had a macroeconomic impact on India by transmission through financial channels.
- Capital flows into India slowed down significantly due to the crisis: net external loans availed by banks stood at US$2.7 billion in the third quarter (Q3) of 2012–13 as against outflows of US$87 billion in Q3 of 2011–12.
- The number and quantity of Euro issues by Indian firms declined from INR159.6 billion (with 18 issues) in 2009–10 to only INR10.3 billion (with 5 issues) in 2012–13 and portfolio investments into India fell significantly.
- One significant lesson from the Euro debt crises is that the Indian financial system is relatively more open than that of the Chinese.

Introduction

The global financial crisis followed by the Eurozone debt crisis laid bare the growing macroeconomic interdependencies among major regions of the world economy. The Eurozone sovereign debt crisis,[1] which caused widespread instabilities, led to a crisis of confidence in the global financial markets amid growing market turmoil and the risk of contagion as many of the countries in the Eurozone struggled with a combination of high levels of

[1] '*Aegean Contagion*' is an alternate nomenclature for the 2010 European sovereign debt crisis making reference to its point of origin along with a general term for an epidemic.

Abstract

As the of population increases the country faces different form of pollution which creates challenging environmental issues and cause climate changes in India. Pollution includes air pollution, water pollution, noise pollution, light pollution, garbage pollution, industrial pollution etc. Due to these factors, the environment gets polluted and, it spoils the natural environment. Air and noise pollution in India is creating serious issues with, most Indian cities violating the central government norms. This paper is a comparative study of the various pollution causes and effects.

Image Retrieval by image feature using Data Mining Technique

D.Saravanan[1] Dr.S. Vijaya Lakshmi[2] Dr.Dennis Joseph[3]
1,3Faculty of operations & IT ,2 Professor-Faculty of Finance
IFHE University, IBS Hyderabad.

Abstract—**Technology brings images as a communication media for humans. Image communication used today in many fields such as education, media, healthcare and in other domains. Based on image retrieval user input selection one of the most powerful technique and has been an active research direction for the couple of years. Various features are used for image retrieval. Most of the retrieval technique used image multi level features for the user feed back. But this features are used retrieve only image low level features and it never retrieve the image based on the content. In the proposed technique content based retrieval used for retrieve the images which is most similar to the input image.. Here we are taking the texture, color and shape of the image and stored in the database. When the user asks query, then it will be matched with the database and retrieve the image. It will retrieve the exact image by comparing the texture, color and shape.**

Keywords-**Image Retrieval, Data Mining, Relevance Feedback, Content Model, Multilevel Image.**

I. INTRODUCTION

With the increasing availability of digital images, automatic image retrieval tools provide an efficient means for users to navigate through them. Even though traditional methods allow the user to post queries and obtain results, the retrieval accuracy is severely limited because of the inherent complexity of the images for users' to describe exactly [1]. The more recent relevance feedback approach, on the other hand, reduces the needs for a user to provide accurate Initial queries by estimating the user's ideal query using the positive and negative examples given by the user. The current relevance feedback based systems estimate the ideal query parameters on only the low-level image features such as colour, texture, and shape. These systems work well if the feature vectors can capture the essence of the query. For example, if the user is searching for an image with complex textures having a particular combination of colours, this query would be extremely difficult to describe but can be reasonably represented by a combination of colour and texture features[2][14]. Therefore, with a few positive and negative examples, the relevance feedback system will be able to return reasonably accurate results.

To address the limitations of the current relevance feedback systems, we propose a framework that performs relevance feedback on both the images' semantic contents represented by keywords and the low-level feature vectors such as colour, texture, and shape. The contribution of our work is twofold [3] [4]. First, it introduces a method to construct a semantic network on top of an image database and uses a simple machine learning technique to learn from user queries and feedbacks to further improve this semantic network. In addition, we propose a framework in which semantic and low-level feature based relevance feedback can be seamlessly integrated.

2. EXISTING TECHNIQUES

A symbolic image is an array representing a set of objects and a set of spatial relations among them. Symbolic images and related structures have been used in a number of applications including Image Databases, Spatial Reasoning, Path Planning and Spatial Pattern Matching. In this paper we describe a Pictorial Query-By-Example (PQBE) language aimed at the retrieval of direction relations from symbolic images. As in the case of verbal Query-By-Example, PQBE generalises from the example given by the user, but instead of having queries in the form of skeleton tables showing the relation scheme, we have skeleton images which are they symbolic images [5]. In this article, we give an overview of the main tasks involved in designing a platform for the evaluation of content-based image retrieval systems. A number of issues should be addressed from the construction of an image collection to the definition of standard performance measures.

The relevance feedback approach to image retrieval is a powerful technique and has been an active research direction for the past few years [15] however, these methods only perform relevance feedback on the low-level image features and fail to address the images' semantic content. In this paper, we propose a relevance feedback technique, iFind, to take advantage of the semantic contents of the images in addition to the low-level features. By forming a semantic network on top of the keyword association on the images, we are able to accurately deduce and utilize the images' semantic contents for retrieval purposes [6]. The accuracy and effectiveness of our method is demonstrated with experimental results on real-world image collections.

Role of mobile banking servicescape on customer attitude and engagement

An empirical investigation in India

Debjani Sahoo

Received 29 September 2015
Revised 10 March 2016
15 August 2016
1 November 2016
Accepted 3 December 2016

Abstract

Purpose – The purpose of this paper is to examine the potential influence of the mobile banking (M banking) servicescape on customer attitude and engagement. The stimulus-organism-response framework was adapted to formulate a conceptual model, in which the M banking servicescape was modelled as an antecedent (stimulus) of customer attitudes towards M banking (organism), in turn directing customer behaviour (response), namely, customer engagement.

Design/methodology/approach – A web-based survey of 345 M banking users was conducted to gather data. The structural equation modelling technique was employed to analyse the conceptual model and test the proposed set of hypotheses.

Findings – The results of data analyses showed that M banking servicescape is a strong predictor of customer attitude towards M banking, which then influences customer engagement. The findings also demonstrate that customer attitudes towards M banking mediate both the M banking servicescape and engagement.

Originality/value – The extension of servicescape literature from the physical to the online context of M banking provides a notable new realm in which academicians can extend the current paradigms. This study also enhances understanding of potential improvements to customer attitude towards and engagement with M banking.

Keywords Marketing, India, Engagement, Consumer attitudes, E-commerce, Mobile banking, Servicescape

Paper type Research paper

1. Introduction

As part of the electronic banking strategy, the importance of managing mobile banking (M banking) transactions has emerged as a major priority in banking services (Laukkanen and Kiviniemi, 2010; Laukkanen, 2016; Tam and Oliveira, 2016). M banking is as an electronic form of transaction that enable the customer to perform banking-related transactions through a personal mobile platform (Chen, 2008; Mallat *et al.*, 2004; Moser, 2015; Suoranta and Mattila, 2004; Weber and Darbellay, 2010; Wessels and Drennan, 2010). In recent years, this mode of transaction has become popularised among the public, since this mode of transaction includes carrying out common activities such as account balance and transaction history inquiries, money transfer, bill payment, trading stocks, managing portfolios, payment of insurance policies, and so on (Baptista and Oliveira, 2016). Such an M banking platform offers a number of advantages for both customers and the bank. For customers, usage of M banking facilitates time saving, convenience, and mobility (Anckar and D'Incau, 2002; Luarn and Lin, 2005). Moreover, this medium represents an additional service to customers many circumstances, adding the element of true mobility to conventional internet banking conducted over fixed networks (Laukkanen and Kiviniemi, 2010). Additionally, as a form of self-service, M banking allows banks to offer more

Abstract

The chapter highlights the principles of Integrated Water Resources Management (IWRM) in the context of sustainable development of water resources. The problems associated with water management in the country are discussed. The concept of capacity building has been defined; the three elements of capacity development at the context, organizational/human resources and strategic levels are explained and the need for continuity of capacity development projects emphasized. The advantages of predetermining the threshold levels of capacity for planning and monitoring purposes have been illustrated. The Government of India has formulated several programmes to achieve capacity development in the country. The initiatives taken by the Government of India for capacity building in the water sector have been described. The partnership with Water and Sanitation Programme – South Asia and other international agencies – has considerably helped in capacity development. The role played by the state governments and other stakeholders has been briefly discussed. A few shortcomings in capacity building efforts are identified. The way forward highlights the important areas to be considered while planning for capacity enhancement in the area of water management.

Role of Renewable Energy in Indian Power Sector

Vijayalakshmi S[1], Girish G P*[1], Keshav Singhania[2]

[1]Department of Finance, IBS Hyderabad, IFHE University, India
[2]Ernst & Young LLP, India

Abstract

Renewable energy in the form of small hydro, biomass, solar, urban waste, industrial waste and wind together accounts for 14.8% of the total installed power generation capacity in India (as on Dec 2016). Deregulation, liberalization and opening up of Indian electricity market post enactment of Indian Electricity Act 2003 has ensured complete participation by private producers. Today 99% of total installed generation capacity using Renewable energy (other than Hydro) is by private producers. In this study we review the role played by Renewable Energy in Indian Power sector, REC trading and the role played by power/energy exchanges in Indian electricity market with the objective of aiding policymakers to bring forth further measures to stimulate future growth of Renewable energy in India for decades to come.

1. Introduction

India is one of the largest electricity producers (7th) in the world using Renewable energy sources according to International Energy Agency [1] and Central Electricity Authority of India [2] with electricity generated from Renewable energy sources accounting for 28.7% of the total installed electricity generation capacity which is majorly contributed by Hydro (48.4%). Renewable energy in the form of small hydro, biomass, solar, urban waste, industrial waste and wind together accounts for 14.8% of the total installed power generation capacity in India (as on Dec 2016). Table 1 reveals details about total electricity generation capacity in India region-wise as on 31st

Relative importance of service value by customer relationship stages

Evidence from the Indian retail banking

Abhilash Ponnam and Rik Paul
Department of Marketing and Strategy, IBS Hyderabad, IFHE University, Hyderabad, India

Received 27 April 2016
Revised 2 July 2016
22 July 2016
Accepted 22 July 2016

Abstract

Purpose – The purpose of this paper is to empirically sketch the phenomenon about the nature of service value expected in different stages of relationship over time in Indian retail banking context.

Design/methodology/approach – Customer service value dimensions pertinent to Indian retail banking context were explored psychometrically. Later, mean factor scores of obtained service value dimensions across relationship stages (early, intermediate, and advanced) were calculated and fed into PERMAP software to graphically depict the relationship between value dimensions and relationship stages. To validate the PERMAP solution, one-way ANOVA was run for each value dimension with independent variable as a relationship level.

Findings – The service value dimensions pertinent to Indian banking context are customer intimacy, product leadership, service equity, perceived sacrifice, service quality, and operational excellence. The authors could empirically prove that except for operational excellence and service quality, all the other value dimensions exhibited variation in importance over time. Results reveal that customers in the early stages of relationship value tangible value dimensions and the ones in advanced stages of relationship value intangible dimensions.

Practical implications – Managers should formulate marketing strategies which will signal the customers, the superiority of the bank in delivering performance on tangible dimensions during the early stages of relationship, whereas understanding and addressing unique customer needs and establishing an emotional bonding with customers should be emphasized in the advanced stages of relationship.

Originality/value – The current research could adequately establish the essential role of tangible value dimensions in shaping service value during the early stages of relationship and intangible value dimensions in the later stages of relationship.

Introduction

All marketing exchanges can be viewed as exchange of values (Holbrook, 1994). However, some marketing exchanges occur repetitively between the same exchange partners and last for long durations. These repetitive transactions can be discussed under the gamut of relational exchanges (Dwyer *et al.*, 1987). Such repetitive exchanges happen because of many reasons; it could be due to the nature of the product which will require the buyer and seller to constantly interact and transact with each other, such as banking and financial products. It could also be due to the nature of the contractual agreement between the buyer and seller which precludes the participation of other viable parties for a predefined period of time, or it could be due to the optimal value preposition offered by each partner which obviates the search for other viable partners.

In a contractual agreement, explicit prospecting about expectations of other partner is not required as the performances of actors are decided a priori. Furthermore, services are orchestrated according to a defined contract with minimal scope for modifications during service delivery and emoluments are fixed as per contract. However, in other forms of relational exchange where exchange partners are not bound by any contract regarding the

Sing Hosanna for the brands: the process of substituting religion with brand

Abhigyan Sarkar
Institute of Management Technology – Ghaziabad, Ghaziabad, India, and
Juhi Gahlot Sarkar
IBS Hyderabad, Hyderabad, India

Received 12 February 2016
Accepted 21 April 2016

Abstract

Purpose – Extant research shows that individual's relationship with brand can be structurally similar to both interpersonal love relationship and religious relationship. A stream of consumer research states that individual can love a brand like a person loves another person. Another stream of consumer research postulates that individual can perceive brand equivalent to religion, and even substitute religion with brand. Research is scarce connecting these two different paradigms of brand relationship, given that interpersonal relationship is not necessarily as devotional as religious relationship. The purpose of this paper is to conceptualize the psychological process through which an individual can substitute his/her religion with brand. The basic theoretical premise of this substitution behaviour is the proposition that brand meanings can be perceived as equivalent to religious meanings.

Design/methodology/approach – This paper has conducted an integrative review of selected extant research related to individual-brand relationships, interpersonal relationships and religiosity.

Findings – This paper develops a consumer response hierarchy model showing the inter-related psychological processes through which an individual can substitute his/her religion with brand. The model forms the basis for the discussion of theoretical contributions and managerial implications.

Originality/value – The value of this conceptual paper lies in developing a process model for the first time in the area of consumer-brand relationship domain explaining the stage-wise psychological processes through which individual can move from mere cognitive brand satisfaction towards perceiving brand as substitute of religion.

Keywords Brand community, Brand religiosity

Paper type Conceptual paper

Introduction

A significant amount of prior research in the domain of consumer-brand relationship states that the relationship between a brand and an individual consumer can be structurally equivalent to interpersonal love relationship (Shimp and Madden, 1988; Thomson *et al.*, 2005; Carroll and Ahuvia, 2006; Batra *et al.*, 2012; Sarkar *et al.*, 2012). In other words, an individual can love a brand in the same way he/she loves another person. This brand love is dyadic in nature and operative only between two partners, namely, individual and brand. Based on this premise, some important dyadic consumer-object (where object refers to product or brand or any consumable marketing entity) emotional relationship constructs like brand love (Ahuvia, 2005; Carroll and Ahuvia, 2006; Batra *et al.*, 2012; Bergkvist and Bech-Larsen, 2010; Sarkar *et al.*, 2012), emotional brand attachment (Thomson *et al.*, 2005) and brand devotion (Pichler and Hemetsberger, 2007) have been conceptualized. Brand love can be of different types depending on the presence or absence of its various constituent components (Shimp and Madden, 1988).

Abstract

India's information technology (IT) industry is the world's largest sourcing destination, which accounts for approximately 67% of the US$ 124-130 billion market. The Indian IT industry provides direct employment to 3 million people and indirect employment to about 10 million. Most of the projects handled by the IT companies are for the companies located in developed countries; hence, the companies need to match their working hours and working style according to their international clients' requirements. In order to fetch more projects, software companies promise their clients the delivery of the projects in the shortest span possible, which may lead to tough deadlines. This paper attempted to explore the impact of occupational stress on the work - life balance of employees working in IT organizations in Chennai city. This study followed descriptive research design with a sample of 600 employees from various IT companies located at DLF IT Park, Chennai. The data were analyzed through independent samples t - test and structural equation modelling approach. The outcome of the analysis revealed that there was an impact of occupational stress on the work-life balance of the employees. It was concluded that minimizing occupational stress may lead to better work-life balance.

Validating fashion brand centrality scale amongst young adults

Abhigyan Sarkar
Institute of Management Technology Ghaziabad, Ghaziabad, India, and
Juhi Gahlot Sarkar
IBS Hyderabad, Hyderabad, India

Received 9 May 2016
Revised 12 September 2016
10 October 2016
Accepted 22 December 2016

Abstract

Purpose – The purpose of this paper is to develop and validate a psychometrically reliable scale to measure centrality of brand (CoB) or brand centrality construct in the domain of fashion apparel brands. The scale quantitatively validates that brand relationship can be of equivalent importance to religious relationship in an individual fashion brand lover's life.

Design/methodology/approach – Based on a previous literature review, brand centrality has been conceptualized. Following that, CoB scale has been validated in a step-by-step process following the scale validation methodology suggested by Churchill (1979).

Findings – The final outcome of the study is a psychometrically reliable CoB scale. The study results validate the relationships between CoB, and other important theoretical antecedents and consequences of brand centrality.

Originality/value – This study contributes to the existing body of fashion branding research by showing that a consumer-fashion brand relationship can be of importance akin to a religious relationship in an individual's life.

Keywords Centrality of brand, Fashion brand devotion, Centrality of religiosity, Transcendent brand experience, Brand evangelism

Paper type Research paper

Introduction

To date, significant research has been conducted on consumer-brand love relationships (Carroll and Ahuvia, 2006; Hemetsberger *et al.*, 2009; Bergkvist and Bech-Larsen, 2010; Batra *et al.*, 2012; Sarkar *et al.*, 2012). Some of these previous studies proposed scales to quantitatively measure individual consumers' brand love (Carroll and Ahuvia, 2006; Bergkvist and Bech-Larsen, 2010; Batra *et al.*, 2012; Sarkar *et al.*, 2012). Majority of the previous research on brand love cited above conceptualized brand love based on the premise that brand love is structurally analogous to interpersonal love. In other words, the brand is personified in the eyes of the consumer. This structural similarity between interpersonal and brand relationship was first proposed by Shimp and Madden (1988). This brand love is dyadic in nature as it involves two parties, namely, the individual and the brand.

A few previous studies on brand love also posit that brand love can be structurally similar to religious devotion or religiosity in an individual's life (Muniz and Schau, 2005; Pichler and Hemetsberger, 2007; Sarkar *et al.*, 2015). However, it can be seen that the majority of previous research works (Muniz and Schau, 2005; Pichler and Hemetsberger, 2007; Hemetsberger *et al.*, 2009; Sarkar *et al.*, 2015) investigating the similarities between brand relationship and religious relationship are mostly qualitative in nature. previous research that quantitatively validates brand relationship in the light of religious relationship in an individual's life is scarce, except the study carried out by Shachar *et al.* (2011). Shachar *et al.*'s (2011) study quantitatively investigates the equivalence between religiosity in a religious devotee's life and brand reliance in a non-religious individual's life in term of expressing self-worth. As future research scope, Shachar *et al.* (2011) state, "Although we view the identification of the

What Really Leads to Partner Relationship Management? A Review of Literature

Anuja Agarwal[a], Deepali Singh[b], and Arun Kumar Agariya[c]

[a]IFIM Business School, Bengaluru, India; [b]ABV-Indian Institute of Information Technology, Gwalior, India; [c]Department of Management, Birla Institute of Technology & Science, Pilani, Rajasthan, India

ABSTRACT

This research article aims at providing a comprehensive overview of the Partner Relationship Management (PRM) domain through an exhaustive literature survey. Current scenario, definitions/perspectives, breakdown of studies by nation, PRM as a software application, the need for PRM, the process of developing partner relationships, and major models, along with major defining constructs and other major insights, have been summarized in the area of partner relationship management using content analysis. The focus is on bridging the gap in the existing academic literature by providing a comprehensive compilation of partner relationship management literature inclusive of B2B and B2C scenarios for future researchers. A list of select premier academic databases has been used to identify the relevant research papers in the domain. This article will help in reducing the time and efforts of researchers by quickly providing a comprehensive view of the PRM literature.

Introduction

Globalization, technological advancement, market diversity, market entry barriers, enhanced competitiveness, transparent pricing policy and other factors have enforced hyper-competitive scenarios worldwide, prompting most economies, including India's, to adjust. This scenario has impacted the members of the value chain, including suppliers, manufacturers, channel partners and customers, in various ways, such as increased cost of products, delayed delivery and low satisfaction level. In order to successfully deal with these issues, companies are focusing on building strong relationship networks and forging stronger bonds. The process of building, maintaining and enhancing relationships is popularly known as relationship management. Relationship management may benefit organizations by helping them expand market share, optimize inventory levels, offer mass customization, meet customer expectations, improve delivery performance and cut costs.

Abstract

The objective of the study is to identify various factors responsible for women's workforce attrition in Indian IT/ITES sector. Thematic analysis was used to generate the factors affecting women's workforce attrition. For the purpose of the study, semi-structured in depth interviews were conducted with some of the women employees of different IT companies. Interviews can be broadly classified into four sections. The first section dealt with personal profiles; second part contained a discussion on the benefits provided by organizations; third part elaborates on factors responsible for women's workforce attrition; and the last part dealt with suggestions on reducing attrition rate among women's workforce in India IT/ITES industry. Thematic analysis of the interview scripts provided two broad themes, namely intrinsic factors and extrinsic factors. Intrinsic factors consist of work life balance and motherhood whereas extrinsic factors include work pressure, long working hour, faulty appraisal practices, forceful transfers, and less cooperative colleagues. The will help the IT/ITES companies to understand the factors responsible for high attrition rate among women workforce. It helps in understanding the psyche of women workforce, which in turn can help the managers to build and retain their talent pool. The study also provides a holistic view to human resource strategies and policies that accommodate the work life need of the diverse women workforce in the current business environment.

You are an embarrassment

A qualitative investigation of brand embarrassment among young adolescents

Juhi Gahlot Sarkar
IBS Hyderabad, Hyderabad, India, and

Abhigyan Sarkar
Department of Marketing, Institute of Management Technology Ghaziabad, New Delhi, India

Received 28 March 2016
Revised 9 January 2017
Accepted 12 January 2017

Abstract

Purpose – The purposes of this qualitative study are to investigate brand embarrassment which is a unique social consumption emotion and to identify possible antecedents, consequences and moderating factors associated with it.

Design/methodology/approach – The study reviewed a large volume of literature on embarrassment. The literature review was followed by a series of semi-structured, in-depth interviews of selected brand-conscious young adult informants in India. The data collected through such interviews were coded following grounded theory method.

Findings – The final outcome of the study is a comprehensive grounded theory framework. The framework depicts various antecedents and consequences of brand embarrassment and specific moderating factors shaping the influences of specific antecedents on brand embarrassment.

Originality/value – The value of this qualitative study lies in developing an elaborate grounded theory framework showing the inter-relationships between brand embarrassment and other related concepts.

Keywords Brand emotion, Brand prestige, Brand embarrassment, Brand publicity

Paper type Research paper

Introduction

Embarrassment is an emotion which individuals normally try to avoid; yet, it is widely experienced in our daily lives. Miller (1995, p. 316) states that every individual encounters embarrassment at certain points in life, and this embarrassment is a "uniquely social emotion". Embarrassment occurs when an individual feels that he/she has made an incompatible projection of himself or herself in front of significant others present in a social establishment, where the principle of compatibility is considered to be important (Goffman, 1956). A person might get embarrassed due to the perception of getting unfavorably judged by the social members (Miller, 1995).

Consumer researchers have recognized the presence of embarrassment in consumption domain. For example, Grant and Walsh's (2009) study shows that consumer experiences embarrassment in the context of brand consumption in terms of personal-self and relationships with brands. The authors state that future research should be conducted to further investigate the causes, nature and consequences of brand embarrassment. Miller (1995, p. 316) states, "Key causes of embarrassment are uncertain". Majority of the prior studies (Dahl *et al.*, 2001; Iacobucci, Calder *et al.*, 2003; Moore *et al.*, 2006; Grace, 2007), except Grant and Walsh (2009), investigated embarrassment in the contexts of good and/or service categories. Research focusing exclusively on brand embarrassment is scarce. This study

Do S&P CNX Nifty Options Lead Underlying Nifty in Price Discovery?

V.D.M.V. LAKSHMI*
MEDHA JOSHI**

Abstract

Paper aims at observing if S&P CNX Nifty Options lead the underlying Nifty in price discovery. In other words, the study observes the lead-lag relationship between S&P CNX Nifty options market and Nifty spot market. S&P CNX Nifty implied index values are derived for near the money call and put options separately using Black & Scholes option pricing model. The study applies Co-integration and Vector Error Correction Models to test the lead-lag relationship between S&P CNX Nifty Underlying values and S&P CNX Implied Index values. There is a strong evidence of call options market leading the spot market during the period under consideration. Such evidence is much strong during expiration day of the contracts. However, there is no such evidence in case of put options. The findings of study enable the investors to develop better trading strategies; regulators to formulate better policies to ensure efficient price discovery and reduce mishaps in the market. Regulator can take necessary steps to nullify the informational asymmetries to bring market efficiencies.

I. Introduction

SECURITIES EXCHANGE BOARD of India (SEBI), the Capital Market Regulator, as a part of its attempt to make the Indian market more efficient in price discovery and to provide a tool for risk management and hedging; permitted the introduction of Index based options on Indian bourses on June 4th 2001. Empirical research done till now in this area reveals that any piece of information initially reaches derivatives market due to the low cost of transactions and leverage; and subsequently gets reflected in the spot market. Thus, there is a flow of information from one market to another market. The existence of this type of predictability provides a scope for arbitrage profits to some traders in the market. The role of Regulatory

Growth and Income Inequalities in India – A State Level Analysis

Madhubanti Dutta and Koti Reddy Tamma

I. INTRODUCTION

The issues of regional economic growth and inequality have attracted considerable attention among researchers, planners and policy makers. Since Independence, the Indian government has been concerned about how to strengthen national unity and promote economic growth with regional equality. Balanced growth of all the regions of the country has been considered essential for national integration, political stability and economic viability. Naturally, the issue of regional balance has been given sharp focus in all the Plans, and various policies and programmes have been adopted for achieving regional balance in the economy. Ghosh et al. (1998) argue that the disbursement of funds has been made in such a manner that the poorer states have received proportionately larger amount of funds for development purpose relative to the richer ones. Rao et al. (2008) argue that the equalization observed in the total inter-governmental transfers is mainly due to finance commission's transfers; while the finance commission's transfers have a significant equalising impact largely due to the progressive distribution of tax devolution, grants for the state plan and centrally sponsored schemes have no equalising impact. In this context, it seems pertinent toexamine whether a considerable degree of regional inequality is persisting despite the Indian government's concern for its reduction.

The Eleventh Five-Year Plan (2007-12) has chosen 'faster and more inclusive growth' as its central theme. It recognized the need to make growth 'more inclusive' in terms of benefits of growth flowing to those sections of population, which have been bypassed by high rates of economic growth achieved in recent years. It has also been perceived that disparities among regions have been increasing steadily and the gains of the rapid growth have not reached all parts of the country in an equitable manner. Hence, for growth to be 'more inclusive' regionally, it is necessary that the benefits of rapid growth be shared equally by all the regions of the country. In the present juncture of the economy, the issue of inclusive growth is highly relevant, and it seems useful to investigate how far economic growth has been 'inclusive', and to what extent the benefits of growth have been shared by different regions of the country. During the 12th five-year plan, the special attention has given to the laggard States to accelerate their economic growth. In order to achieve this, it

Relationship between Industrial Expenditure and Industrial Growth Rate: The Case of India

KOTI REDDY TAMMA

The study aims at testing the relationship between industrial expenditure and industrial growth rate for the period 1950–51 to 2013–14. The study applies Johansen Co-integration and Vector Error Correction Model to test the long-term relationship between industrial expenditure and industrial growth rate. The National Accounts Statistics (NAS) was used for the data on private investment for the analysis of this study.

The study reveals that during the post-reform period, the rate of capital formation had decreased in the public sector and increased in the private sector. The study concludes that there is a long-term association between industrial expenditure and industrial growth rate, implying that the industrial expenditure contributes significantly to the industrial growth rate. The author suggests that in order to expand the scope of long-term finance for industrial sector, securities market needs to be developed and strengthened.

1. Introduction

In the post-Independence period, India started to develop different types of industries during the five-year plans process. The index of industrial production (Base 1980–81=100) had increased from 18.3 in 1950–51 to 65.3 in 1970–71. Some basic and heavy industries were developed in the country during those 20 years. Moreover, with the expansion of public sector enterprises, joint-sector enterprises and private sector enterprises in the later period, various types of industries developed in the country. The number of public sector enterprises had increased from a mere five in 1951 to 290 CPSEs that existed under the administrative control of various ministries/departments as on 31 March 2014 (Economic Survey 2015–16).

The public sector enterprises in India are engaged in producing goods like coal, steel, light and heavy engineering goods, power, petroleum, minerals and metals, fertilizers, chemicals and pharmaceuticals, textiles transportation equipments and consumer goods. Since Independence, industrial sector has achieved a significant achievement in diversifying its productive capacities. In respect of almost all consumer goods, both durable and non-durable, the stage of self-sufficiency has already been attained.

A substantial increase in the production of capital goods has also been achieved. The country has also achieved an impressive industrial productive capacity in respect of mining and metallurgical industries, capital goods industries (even producing highly sophisticated equipments necessary for the production of steel, chemical, fertilizer, software, refinery products, etc.) chemical and petro-chemical industries, medium and heavy engineering industries, fertilizer and paper industry, power and transportation industry, construction industry, etc.

INFORMATION RETRIEVAL USING TEXT LEVEL CLUSTERING USING PAGE RANKING TECHNIQUE

D.Saravanan.

Faculty of operations & IT, IFHE University, IBS Hyderabad, India.

Abstract

In the aspects of mining, it is used to extract the data's in the efficient manner and then fast retrieval of data's. The current aspect is to clustering the sentence level text by using the proposed algorithm. By means of that, it allows patterns to all clusters .we give a text in a sentence or a sentence that has to be relatively present in documents or a set of documents. Every clustering algorithm finds the association between the data points. Based on the closeness between the data points clustering are take place. Item are very close each other they are all in one group. Items are not similar they are all form in other groups Techniques are finding similarities between the given text. Based on data and the data objects by using the novel fuzzy clustering pattern.

Key terms: Information extraction, Clustering, Spectral grouping, Similarity indexing, Outlier.

I. INTRODUCTION

Clustering is the technique form the similar items in one groups, unsimilar items are in other groups [1]. Based on the input data forming cluster are vary, if the data set are consisting of pure data without any noise and repeated data, clustering output also very high. Cluster can have applied to every field today it helps to form the group between the item sets. Technique applied image, text and other data type [2]. In text data mining it brings similar text are in one group. Different techniques are used to group the similar text. Text mining and clustering both output is same, both techniques are forming the similar text in one group. Vector match technique are used to forming the clustering of text data, this technique is performing the clustering based on the similarity based on the give input text data set. After forming groups cluster process continues finds similarity between the groups. Text mining techniques are different from other type of clustering, technique based on the sentence length formation of cluster are get differed based on the available text length. Another major challenge in this text mining, language difference based on the language this formation get differ. For small phrases this formation gets varied. In some language one sentence gives the different meaning, it gives challenge to the researchers and developers. This formation used for many text mining applications in day to life. Most of the search engines are used this technique to find user most relevant information Mining are take place based on the group or categories or topics based on that text classification are done effectively. Today most of the developers used this technique for classify the content and also improve the users searching functionality. This technique used for other application such as construction the decision trees based on the division, categorization of information. Hierarchical structures are constructed very effectively by using this. Another most important application of text mining is rule based operation. Based on the rules information are classified, this application are widely used in banking sector to find the credit balance to the customer also to sanction any loans are done by this. Based on rule based classification find easily particular customer are eligible or not for certain loan process.

II. LITERATURE REVIEW

Pedrycz, et al., [3] proposed the new idea in fuzzy clustering technique, technique used for unsupervised learning methodology. Fuzzy based type of clustering is used for grouping the image, pattern type of data sets effectively. Here based on the similarities between the data points are consider for clustering the information. If data points similarities are more than they are all grouped into one cluster, followed by next higher similarity like cluster formations are done. Clustering also done with labeled grouping. Because of this tech-nique clustering performance get improved this proved in the experimental results. Experimental outcomes also verified that proposed technique efficiency get improved than the existing techniques.

Yuhua et al., [4] proposed idea about text based techniques using sentence based uniqueness. Existing technique are based on the log based approach this give long sentence of information, this bring the time complexity. This paper reduces the problem find in the existing technique, technique used in this paper using lexical data base model. This bring instead of using long sentence, information is used small text. With help of shorter text finding the similarities between the text are evaluated. Testing are done with help of two pair of sentence are selected. Entire technique used for short text of sentences. Because of this input techniques are implemented in variety of applications. Every short or long sentence are made of words, based on this word comparison technique method got t implemented.

Lu, et al., [5] proposed the similarity between the sentence based on the distance. Either long sentence or short sentence, sentence is placed a distance. Distance parameter used to find the similarity between the sentence. Between the strings weights are calculated using probabilistic technique.

XiaoyanCai, et al., [6] proposed various sentence and words, topics, sub topics. Based on this information clustering are take place. For example, all subtopic is extracted and finding the similarities based on that information. Existing technique based on the ranking, high ranking information's are placed in one group. This technique based on the ranking, so cluster performance always depends on ranking factor. This is the main drawback of existing technique, this problem overcome on the proposed system, here they used reinforcement approach. This proposed technique clustering and ranking are joining to gather so that either ranking or grouping updating take place any one of that criteria get satisfied. Experiments verified that propo-

Retail Banking in India: Trends and Progress

B Amarender Reddy and
D Sreenivasa Chary

Retail banking facilitates sourcing funds from public at a cheaper rate and lending them to public at a comparatively higher rate. Unlike corporate and institutional deposits, a major portion of retail deposits is stable. Similarly, retail loans form a good source of income as the interest rate depends on the market sources and not on the bargaining power of the customer. It is for this reason that the banks are concentrating more on this segment of banking. However, it has become more challenging for banks on account of the ever increasing expectations of the customer and practical difficulties in designing innovative products for the customers on an ongoing basis.

Banking is accepting of deposits of money from public for the purpose of lending and investment. The nature of banking differs depending on the segment of clients serviced by it. It can be retail banking, corporate banking, wholesale banking, etc. The classification of banking based on the client groups is furnished in Figure 1. The segment of banking which caters to the requirements of individuals is called retail banking. Retail banking has attained significance after the advent of financial sector reforms in the country and the emergence of tech savvy new generation private sector banks. This segment of banking aims at tapping the household savings for catering to the financial needs of individuals and industries. Retail banking constitutes about 66% in deposits and around 23% in loans of the total banking business. The retail banking is now characterized by different customer groups, different channels and innovative products. Some banks have even set up retail banking branches or personal segment branches exclusively to cater to the needs of individuals. Apart from branch banking, retail banks are serving the customers through different channels like mobile banking, internet banking, ATMs, call centers, etc. to suit the convenience of different categories of customers. Technology facilitated the banks to extend 24×7 banking.

Service sector contributes 53.66% of India's total gross value added for the financial year 2016-17. It accounts for about 42% of employment in India. The share of service sector in India's GDP is expected to reach 62% by FY 2020. The service sector accounts for about 42% of employment in India. The scope for retail banking is relatively more from service sector.

Abstract

Student engagement is associated with numerous positive consequences. The Student Version of Utrecht Work Engagement Scale (UWES-S) is increasingly being employed to assess student engagement without sufficient evidence for its validity, reliability and generalizability across cultures. This research therefore seeks to validate the UWES-S in the Indian context. Towards this objective, two studies are reported. In Study 1 (N = 207), evidence for factorial validity, convergent validity and internal consistency of 14-item UWES-S(Schaufeli et al., 2002b) is provided. Further, a 9-item UWES-S is proposed based on psychometric properties and item analysis. Study 2 (N = 279) revalidates the proposed 9-item measure and explores its relationship with student burnout and student life satisfaction.Discussion and limitations follow.

MONITORING ROUTINE IN WEB EXPLORATION ENVIRONMENTS

D. Saravanan

Faculty of operations & IT, IFHE University, IBS Hyderabad

ABSTRACT

Technology brings every-thing in our finger tips, the problems of bringing this information most existing algorithm applied to every user retrieval in the same technique. Users information's are handled with special way it means quires priorities based on the searching. In such a case, simply leveraging pages visited by this user in the history may achieve better performance. Based on the users search information extraction in web pages are reacted differently. Even if search histories are enough to infer general user interests, users often search for short-term information needs that may be inconsistent with general user interest. In such cases, long-term user profiles are useless or even harmful, whereas a short-term query context is more useful. This proposed done on how personalization strategies perform under real-world search engine conditions faced by users. In this paper, we address these problems and make some contributions.

Key words: Personalization, Web Search, Query, Search Contexts, Effectiveness.

1. INTRODUCTION

Current web search engines are built to serve all users, independent of the special need of any individual user. Search engines are used more and more as referrals to web sites rather than direct navigation via hyperlinks. Personalization of web search is to carry out retrieval for each user incorporating his/her interests. We propose a personalized technique to learn user profiles from users' search histories. The user profiles are then used to improve retrieval effectiveness in web search. A user profile and a general profile are learned from the user's search history and a category hierarchy respectively. These two profiles are combined to map a user query into a set of categories, which represent the user's search intention and serve as a context to disambiguate the words in the user's query. Web search is conducted based on both the user query and the set of categories. In most previous work on personalized Web search, all queries were usually personalized in the same manner. Personalized search is considered a solution to address this problem, since it can provide different search results based upon the preferences of users. However, they are far from optimal. One problem of current personalized search Personalization algorithms has strengths and weaknesses for different queries. We reveal that personalized Web search has different levels of effectiveness for different queries, users, and search contexts. Web search results can be improved using a personalization method based on a user's long-term interests. Here we developing an evaluation framework based on real query logs to enable large-scale evaluation of personalized search. [1] In a query logs is used to evaluate the personalized search. In our experiments, click-based personalization algorithms worked well. Although the algorithms work only for repeated queries, they are simple and stable. In this search engines take advantage of user histories in search if privacy issues do not prohibit it. Experimental results show that using the personalization algorithm for queries selected by our prediction model is better. In most previous work on personalized Web search, all queries were usually personalized in the same manner. That personalization does not work equally well under various situations. We defined the click entropy to measure variation in information needs of users under a query. Experimental results showed that personalized Web search yields significant improvements over generic Web search for queries with a click entropy. For the queries with click entropy, personalization methods performed similarly or even worse than generic search. As personalized search had different effectiveness for different kinds of queries, we argued that queries should not be handled in the same manner with regard to personalization. Our proposed click entropy can be used as a simple measurement on whether a query should be personalized.

1.1 Existing System

- In most previous work on personalized Web search, all queries were usually personalized in the same manner.
- We revealed in this paper is that personalization does not work equally well under various situations.
- As personalized search had different effectiveness for different kinds of queries, we argued that queries should not be handled in the same manner with regard to personalization.

1.1.1 Advantages and Disadvantages

One problem of current personalized search Personalization algorithms has strengths and weaknesses for different queries. We reveal that personalized Web search has different levels of effectiveness for different queries, users, and search contexts. Web search results can be improved using a personalization method based on a user's long-term interests.

1.2 Proposed System

- Our proposed click entropy can be used as a simple measurement on whether a query should be personalized.
- We use clustering gaming algorithm concept for efficient retrieval and hence results in high efficiency.
- Personalization can be formed by creating a buffer where we introduce a threshold value to remove the query which is not frequently used.

1.2.1 Advantages Of Proposed System

In this paper they explored using the variation in search result click-through to identify queries that can benefit from personalization.

BANDHAN: Commercializing a Social Cause

Case Details | Case Intro 1 | Case Intro 2 | Excerpts

Abstract

Bandhan Financial Services Pvt. Ltd. (Bandhan), the largest microfinance institution in India, got an 'in principle' approval in April 2014 from India's central bank, the Reserve Bank of India (RBI), to start full-fledged banking operations. Bandhan, which had been formed by Chandra Shekhar Ghosh (Ghosh) with the social motive of giving small loans to the asset-less poor in unbanked regions of India, would now have to change its business model to play on a bigger turf and on a larger scale.

While transforming itself into a bank would give it benefits like access to cheaper funds and increased scope of operations, but the considerable liberty it enjoyed by being a microfinance entity would be lost....

Issues

The case is structured to achieve the following teaching objectives:

Understand various issues and challenges in managing the growth and opportunities of an entrepreneurial venture, especially a social venture

Understand the operations of a microfinance institution taking Bandhan as a case in point and appreciate the constraints and the challenges faced by it, with the prime focus on India.

Analyze the challenges lying ahead for Bandhan and explore ways and means to overcome those challenges

Recognize and evaluate the challenges faced in the transformation of an organization, particularly of a social venture into a commercial one and study how to unite their goals and actions.

Efficiency of Futures Market in India: Evidence from Agricultural Commodities

*VDMV Lakshmi**

The study aims at examining the efficiency of futures market with a sample of 11 commodities traded on National Commodity and Derivatives Exchange Limited (NCDEX). Augmented Dickey-Fuller (ADF) and Phillips-Perron (PP) tests are applied for testing stationarity and order of integration of both spot and futures market. Zivot-Andrews test of unit root is also applied to ensure reliable results in the event of structural break. Stationarity in spot and futures series at level is observed in case of three commodities, viz., barely, jeera and soybean, and non-stationary at level and stationarity in return series is observed in the case of the remaining eight commodities. To test the cointegrating relationship between both the markets, Johansen test of cointegration is used and finally to observe the direction of causality, Granger causality test is applied. There is evidence of cointegrating relationship indicating the presence of long-run relationship between spot and futures market in eight agricultural commodities. There is also evidence of futures Granger causing spot in the case of six commodities, i.e., barley, castor seed, cotton seed oilcake, gur, mustard seed and refined soya oil. However, there is evidence of bidirectional relationship in the case of remaining five commodities; coriander, jeera, soybean, sugar M grade and wheat. As a whole, it is observed that agricultural commodity futures market is efficient in India.

Introduction

Although commodity derivatives trading in India was initiated in 1875 with the formation of Bombay Cotton Trade Association Ltd., organized trading in commodities commenced in 2003 with the launch of three national level electronic exchanges, namely, Multi Commodity Exchange of India Limited, National Commodity and Derivatives Exchange Limited, and National Multi Commodity Exchange of India Limited. In India, there are six national commodity exchanges, i.e., Multi Commodity Exchange of India Limited (MCX), National Commodity and Derivatives Exchange Limited (NCDEX), Mumbai, National Multi Commodity Exchange of India Limited (NMCE), Ahmedabad, Indian Commodity Exchange (ICEX), New Delhi, ACE Derivatives and Commodity Exchange Limited, Mumbai and Universal Commodity Exchange Limited (UCX), Navi Mumbai. 99.88% of total trading comes from

these six exchanges and the remaining trading takes place in 24 regional commodity exchanges which were existent even before the formation of national level exchanges. However, most of them have hardly had any trading for the last 10 years. Among national level exchanges, MCX and NCDEX lead in market share. 85% of MCX's total trading business comes from gold, silver, copper and crude oil and a majority of agricultural and metal commodities like refined soya oil, guar seed, and soy bean trade on NCDEX. As on March 31, 2016, NCDEX traded in 27 commodities, of which 21 are agricultural commodities, three bullion commodities, two metal and one is in energy sector. As per the reports by *Mint*, agricultural commodities contribute 98.6% of the NCDEX turnover, while bullion contributes 1.4%. Hence, the study considers select agricultural commodities traded on NCDEX for testing efficiency of commodity futures market in India. In India, as of now only futures and forwards are available on commodities and options are not yet operational. On September 28, 2016, Capital Market Regulator, Securities and Exchange Board of India (SEBI) permitted commodity derivatives exchanges to introduce option contracts on commodity exchanges to facilitate active participation by a good number of players and to increase the liquidity in commodities market. This move came exactly a year after the former commodity markets regulator, the Forward Markets Commission was merged with SEBI.

Commodity derivatives are expected to perform two economically significant functions—price discovery and risk management. The presence of different players like hedgers, speculators and arbitragers ensures better price discovery in futures markets. Speculators usually act as counterparties to hedgers thereby helping them in managing the risk. Arbitragers in an attempt to gain from the advantage of mispricing help in better price discovery. The survey with brokers by Gupta *et al.* (2016) reveals that there is a significant contribution of high net worth individuals to trading volume of commodity derivatives. They also opine that all commodity futures, except energy futures, perform price discovery and hedging functions effectively, as energy commodities are the most volatile commodities. Bose (2008) argues that commodity futures help risk allocation across investors, firms and small producers and reduce the cost of diversifying portfolios.

Commodity exchanges act as centralized platforms for buyers and sellers to undertake transactions with or without physical commodities, under a set of predetermined rules and regulations. Commodity exchanges are expected to contribute to market development through reduced transaction costs, improved price discovery and reduced risks. This is because, a centralized location helps in reducing the cost involved in identifying counterparties and physical inspection of product quality. However, in a few countries, exchanges could not perform this function effectively due to government interventions. Trading in exchange traded equity futures which was introduced in 2000 has grown in leaps and bounds. However, trading in commodity futures which was introduced in 2004, just four years after the launch of equity futures, is still in its nascent phase due to various complexities. Hence, the study attempts to examine the efficiency of futures market in select commodities in India.

Market efficiency implies the speed and the accuracy with which information gets reflected in asset prices. With the introduction of futures, the same commodity is available for trading

Abstract | References | Citations | Supplementary Data | Suggestions

Previous research in advertising has shown a substantial interest in studying the critical role of advertisement (ad)-context congruity as a topic of ad effectiveness. Studies show that both ad-context congruity and ad-context incongruity have an effect on ad effectiveness. However, less attention has been devoted to identify the process through which, and the conditions under which, these effects occur. The current study explores this topic following the Elaboration Likelihood Model (ELM) as a theoretical framework, and hypothesises that the effect of ad-context congruity on ad persuasion varies according to consumers' motives and the strength of the argument presented in the ad. Further, consumers' felt involvement with the ad will mediate the persuasion outcome. The study will make significant contributions to the advertising literature by incorporating importance of customer motive, argument strength, and felt involvement. The study results will also support marketers to better understand the ways to make their ads more effective and increase the persuasiveness of ads for e-magazines in this technology era.

VALIDATION OF SECRET CODE USING IMAGE BASED TECHNIQUE

D. Saravanan*
IFHE University, IBS Hyderabad, Telangana State, India 501 203.
Email:sa_roin@yahoo.com

Received on: 07-08-2017 Accepted on: 19-09-2017

Abstract

Background and Objective: Text Based password technique is fighting fit and easy for the user to enter their password. But this type of password is hard to remember by the user and at the same time it is very easy for the attackers to identify the password.

Methods: The proposed technique called Image based authentication password generation is a user created point image technique method. In this proposed technique user generates single hint from each image and this process is repeated for all input images. Users preferred image based authentication method selects single points which are easy to remember instead of remembering multi points. Image based authentication password generation gives higher protection than existing technique because it is difficult the attacker to identify the correct hit point in the selected image.

Results: The hint or make sense points consist of ordered images with which user interacted and chose a point on every image and the selected points serve as a password. In addition these points user also creates an audio authentication corresponding to the selected points. This audio authentication will be used in recalling the make sense points on images. Users preferred Image based authentication password generation helps to remember single point additionally audio verification helps to improve the selection process. The user can have an alphanumeric password with selected image.

Conclusion: This will help to increase the security level. The main purpose of this work is to maintain a higher level of security for user login. The proposed technique is very difficult to guess the hackers against password prediction.

Keywords:

Graphical Password, Pass points, Image Selection, Data Mining, Image Authentication, Point Selection, Password generation, Image mining.

Abstract: In the automobile industry, after-sales service plays an important role whether it is before buying a product or after buying the product. One of the necessary evaluation criteria for customer satisfaction is availability of after-sales service. In today's situation, after-sales service quality can be measured by administering a customer satisfaction survey. This paper focuses on after-sale service quality and customer satisfaction. In this paper SERVQUAL model was applied for measuring quality of service given to the customers and customer satisfaction in an automobile industry. Structural equation modelling (SEM) with partial least squares (PLS) was used to simultaneously evaluate both the measurement and structural models. The analysis of customer satisfaction through after-sales service quality gave the result in which tangibility, reliability, assurance, responsiveness and empathy were seen to have a significant positive effect on customer satisfaction. In light of the SERVQUAL model, this paper discusses practical implications and focuses on recommendations on how to manage and improve service quality in after-sales service in the Indian automobile industry. This study presents a model for improving customer satisfaction in terms of service quality dimensions.

Keywords: service quality; customer satisfaction; automobile, after-sales service; India.

Reference to this paper should be made as follows: Yadav, S.K. and Joseph, D. (2017) 'After-sales service quality satisfaction in Indian automobile industry', *Int. J. Business Information Systems*, Vol. 26, No. 3, pp.362–377.

Role of Goods and Service Tax in Improving The Indirect Tax to GDP Ratio – A Leap Forward

Tamma Koti Reddy and Madhubanti Dutta

I. INTRODUCTION

Indian Constitution has made a provision for the introduction of federal tax structure. The Constitution has made a detail provision for the imposition of various types of taxes by both Central and State governments. Since independence India has maintained a broad-based and extensive tax structure. Various types of taxes are being levied in the country which are broadly classified between direct and indirect taxes. In terms of the tax structure, India is considered as one of the highly taxed countries. Although the rate of taxes is quite heavy but coverage of such taxes is not very wide in the country. The tax system suffers from various anomalies which have significant adverse effects on equity, efficiency and allocative efficiency.

The 1990s tax reforms brought structural changes in the tax system. These reforms aimed at correcting imbalances in the sources of revenues through increasing the share of direct taxes. A striking feature of the composition of tax revenue is the high ratio of indirect taxes in total tax receipts from 1950-51to 2007-08. However, in 2007-08 the share of direct taxes became higher than that of the indirect taxes for the first time. The principal indirect taxes levied in India are Customs duties, Excise duties,Value Added Tax, Service tax, Entertainment Tan and Luxury Tax. Customs duties had remained the most important source of revenue until the beginning of the World War II. Now the excise duties have emerged as the biggest source of revenue. In the 25-year period from 1965 to 1990, India's tax-to-GDP increased steadily from 10% to 16% while GDP increased 2.8-fold. In the subsequent 25-year period from 1991 to 2014, India's tax-to-GDP stayed roughly constant between 16% and 17% while GDP increased 4.5-fold. It is puzzling to us that just as India broke away from its clichéd Hindu rate of growth post the 1991 economic reforms to grow much more rapidly, its tax-to-GDP ratio stayed constant, belying those who would have predicted an increase. That, curiously, India's rate of tax revenues did not grow commensurate with its GDP growth post the 1991 reforms is inexplicable.

The present structure of Indirect Taxes is very complex in India and tax rates differ from State to State. The tax structure is also highly complicated and riddled with elaborate laws and administrative rules,many of which are obsolete and unenforceable. As a result

Bradley Tilden's Dilemma Following the Alaska Airlines – Virgin America Deal

-- Syeda Maseeha Qumer and Debapratim Purkayastha

In April 2016, Alaska Air Group acquired Virgin America for $2.6 bn, bringing together two airlines known for their distinct customer service, low fares and operational consistency. The case discusses the challenges Bradley Tilden (Tilden), CEO of the Alaska Air Group, faced in taking the merger forward. These included the cultural differences between the two airlines, diverse customer bases, integration issues and concerns over short-term profitability. For some analysts, the merger seemed to be an odd fit as Virgin America was known for its trendy and flashy image, while Alaska Airlines was seen as more traditional. The loyal customers of both the airlines expressed fear that the combination would kill off what they loved about their respective airline. According to Tilden, retaining customers who were loyal to Virgin America would be one of the major challenges for him. While the merger was awaiting regulatory approval, the dilemma before Tilden was whether to retain the Virgin America brand or absorb it into Alaska Airlines. How will Tilden respond to the needs of the loyal customers of Virgin America? Will he adopt or dissolve the Virgin America brand? Which parts of the Virgin experience should Tilden adopt for the combined airline?

Growth Through Co-Ventures: Etihad's Strategy in the Competitive Aviation Industry

-- Namratha V Prasad and G V Muralidhara

The case talks about the growth of Abu Dhabi-based Etihad Airways (Etihad) into one of the leading airlines in the world through a co-venturing strategy with other airlines. The case starts out by providing details about the initial days of Etihad's operations and its financial troubles. The case then documents the adoption of its unique 'equity alliance' strategy, wherein Etihad took stakes in troubled, but regionally important airlines in Europe and Asia. The case describes how Etihad capitalized on its various partnerships to build a large network that spurred revenues. The case concludes with an insight into the potential risks of such a strategy, including the exposure of Etihad to regulatory scrutiny in Europe and the US.

Navigating the Unchartered Path to Shared Value at GlaxoSmithKline (GSK) in the Philippines

-- Austin Chia and Prakash J Singh

GlaxoSmithKline (GSK), a multinational pharmaceutical company, has, for many years, produced a medicine for acute management of asthma and Chronic Obstructive Pulmonary Disease (COPD). It is predominantly marketed in a multi-dose inhaler canister that is generally unaffordable for the majority of people living in poorer countries. GSK has recently relaunched a single unit dose presentation of this medicine for acute management of asthma and in salbutamol capsule in an inhaler device as an affordable solution. In developing this product, the company has sought to generate social outcomes (in terms of improved healthcare outcomes for poor people), whilst making a profit on the sales of the product. Based in the Philippines and with salbutamol capsule in an inhaler device as the foci, this case provides a detailed account of the executive motivations and tactical challenges of pursuing a shared value strategy in the Philippines. The case provides students with

Automated Teller Machines (ATMs): The Changing Face of Banking in India

Bank Management

Information and communication technology has changed the way in which banks provide services to its customers. These days the customers are able to perform their routine banking transactions without even entering the bank premises. ATM is one such development in recent years, which provides remote banking services all over the world, including India. This paper analyzes the development of this self-service banking in India based on the secondary data.

The Information and Communication Technology (ICT) is playing a very important role in the progress and advancement in almost all walks of life. The deregulated environment has provided an opportunity to restructure the means and methods of delivery of services in many areas, including the banking sector. The ICT has been a focused issue in the past two decades in Indian banking. In fact, ICTs are enabling the banks to change the way in which they are functioning. Improved customer service has become very important for the very survival and growth of banking sector in the reforms era. The technological advancements, deregulations, and intense competition due to the entry of private sector and foreign banks have altered the face of banking from one of mere intermediation to one of provider of quick, efficient and customer-friendly services. With the introduction and adoption of ICT in the banking sector, the customers are fast moving away from the traditional branch banking system to the convenient and comfort of virtual banking. The most important virtual banking services are phone banking, mobile banking, Internet banking and ATM banking. These electronic channels have enhanced the delivery of banking services accurately and efficiently to the customers. The

Comprehending Technology Attachment In The Case Of Smart Phone-Applications: An Empirical Study

Souvik Roy, IBS, Hyderabad, India
Abhilash Ponnam, IBS, Hyderabad, India
Santanu Mandal, IBS, Hyderabad, India

ABSTRACT

The purpose of this paper is to comprehend the causes and outcomes of smart phone application retention. To address this question, the authors propose a construct called app attachment and establish antecedents and consequences of the same. This study conceptualizes attachment with smart phone application as app attachment from a brand attachment perspective. Accordingly, app attachment is viewed as a two-dimensional construct composing of two measurement constructs namely app-self connection and app-prominence. Based on insights from information technology literature and marketing perspectives, antecedents, and consequents of app attachment are identified. Structural equation modeling was used for confirming the relationship of app attachment with proposed antecedents and consequences. On the managerial front, this paper explicates various strategies that a manager should adopt to improve app retention amongst its targeted users.

KEYWORDS:

App Attachment, App prominence, App-Self Connection, Brand Attachment, Mobile Apps, Presentation Style, Relationship Features

The future of mobile means a more intricately connected ecosystem of applications. The "walled greens" will be torn down and roads and bridges between apps will be constructed. The relationships between the apps that a user has installed on their phone will become exponentially more important, to both the consumer and the business themselves. – Nate Smith (URX.com)
End users not technologies shape the market. Consequently, marketers need to stay abreast not only of technological developments but also of the way people respond to them. –Matt Haig (Author of "Mobile Marketing-The Message Revolution")

1. INTRODUCTION

The mobile applications industry is booming only lately. According to a report by Portio Research (2013), approximately 1.2 billion people were using mobile phone apps by the end of 2012. This figure is expected to grow at a yearly rate of 29.8 percent to have 4.4 billion mobile app users worldwide by the end of 2017. Also, the increasing number of Android1, iOS2, and Windows3 applications has outmatched one million (Bohmer et al., 2011), with Apple App Store and Google Play jointly having more that 3.5 million apps (statistica.com, 2016). The development in smart phone application
